FRY, JAMES BARNET (1827-94). An American soldier. He was born in Carrollton, Ill.; graduated at West Point in 1847, served for a time as assistant instructor of artillery there, was stationed successively in Oregon, Louisiana, and Texas, was instructor at West Point in 1853-54, and was adjutant of the Academy from 1854 to 1859. In March, 1861, he was appointed Assistant Adjutant-General, and later in the year acted as chief of staff to General McDowell. In 1862 he held a similar position under General Buell. He was then Provost-Marshal-General of the United States, with the staff rank of brigadier-general from March, 1863, until August, 1866, when this office was abolished. He subsequently served as Adjutant-General, with the regular rank of colonel, in the divisions of the Pacific, the Missouri, and the Atlantic, until 1881, when he retired. In July, 1866, he was brevetted major-general, and in June, 1868, brigadier-general. He published: *A Sketch of the Adjutant-General's Department, United States Army, from 1775 to 1875* (1875); *History and Legal Effects of Brevets in the Armies of Great Britain and the United States, from Their Origin in 1692 to the Present Time* (1877); *Army Sacrifices* (1879); *Operations of the Army Under Buell* (1884); *McDowell and Tyler in the Campaign of Bull Run* (1884); *New York and Conscript* (1885); *Military Miscellanies*, and *The Conkling and Blaine-Fry Controversy in 1866* (1893).

FRY, WILLIAM HENRY (1815-64). An American composer, journalist, and critic. He was born in Philadelphia, where his father, William Fry, was the proprietor of the *Philadelphia National Gazette*. He studied harmony under Meignen, and in 1835 the Philadelphia Philharmonic Society performed his first orchestral compositions, which consisted of four overtures. Ten years later he produced the opera *Leonora*, which was given in Philadelphia and New York; and in 1863 *Notre Dame de Paris*. He was the composer of several Church pieces, which have been much used. After six years in Paris as a newspaper correspondent, he returned to New York, and lectured upon the history and science of music. Besides his connection with his father's paper, he undertook the editorship of the *Philadelphia Ledger* in 1844. On his first return to New York, he joined the staff of the *Tribune* as musical editor, retaining the position up to his death, which occurred at Santa Cruz, W. I.

FRYE, WILLIAM PIERCE (1831-). An American legislator, born in Lewiston, Maine. He graduated at Bowdoin College in 1850, and after studying law in the office of William Pitt Fessenden, practiced his profession at Rockford and later at Lewiston. He was a member of the State Legislature in 1861-62, was a Presidential elector on the Lincoln ticket in 1864, and was again a member of the Legislature in 1866-67, serving at the same time as Mayor of Lewiston. In the fall of 1867 he was elected Attorney-General of the State, holding the office from 1867 to 1870. In 1871 he was elected to the National House of Representatives, and was reelected five

times, resigning his seat in 1881 to accept a seat in the United States Senate, to which he was promoted to fill the vacancy caused by the resignation of James G. Blaine to enter Garfield's Cabinet as Secretary of State. He was elected for the full term in 1883, and was reelected in 1889, 1895, and 1901. He was elected president *pro tempore* of the Senate in 1896, and has twice been called upon to act as the permanent presiding officer of that body—after the death of Vice-President Hobart, in 1899, and again after the elevation of Vice-President Roosevelt to the Presidency in 1901. In 1898, after the close of the Spanish War, Senator Frye was a member of the Peace Commission at Paris. He has had a great influence on national legislation, his services as chairman of the important Committee on Commerce, in which capacity he has framed the legislation and proposed legislation in regard to American shipping, being particularly notable.

FRYING. See COOKERY.

FRYKEN, frý'ken. A series of small lakes in the southern part of Sweden, north of Lake Wenern, and famed for beautiful scenery. They are arranged in three main groups, and are connected by narrow channels, the whole forming a river of irregular width.

FRYXELL, frýks'el, ANDERS (1795-1881). A Swedish historian. He was born at Edsleskog in Dalsland, and after studying at the University of Upsala became in 1819 instructor at the Djurgårdsskole in Stockholm, from which he went in 1822 to the Maria-Skole in the same city. From 1828 to 1836 he was rector of that institution. His interest lay chiefly in questions of public education. In 1835 he became pastor at Sunne, and in 1836 Bishop of Northern Wermland. From 1847 till his death, March 21, 1881, he devoted himself exclusively to historical research. His great work is the *Berättelser ur Svenska historien*, "Contributions to Swedish History" (46 vols., 1823-79), dealing with the history of his country till 1711. These narratives are marked not only by their patriotic sentiment, but by their fresh and natural conception, their richness of biographic detail, and their naïve and vivacious style. They possess, too, the faults of their kind, and have been criticised for their diffuseness and lack of critical insight. The *Berättelser* have nevertheless become a national classic. His *Characteristics of the Period from 1592 to 1600 in Sweden* (1831) received the grand prize of the Swedish Academy. Between 1845 and 1850 he published *Om aristokrat-fördömandet i Svenska historien*, "The Role of the Aristocracy in Swedish History." This was in the nature of a defense of the Swedish nobility, and brought upon him the hatred of the Liberal element in Sweden. Fryxell's minor works include: *Handlingar rörande Sveriges historia*, "Studies in Swedish History" (1836-43); and *Bidrag till Sveriges litteratur-historia*, "Contributions to the History of Swedish Literature" (1860-62). His autobiography, *Min historias historia*, appeared at Stockholm in 1884.

F'S AUNT, MR. A character in Dickens's *Little Dorrit*. She was left to Mrs. F. by her husband as a not very acceptable legacy.

FUAD PASHA, fú'ád pá-shá' (1814-69). A Turkish statesman and scholar, born in Constantinople.

He was the son of the poet Izzet Mollah, and nephew of Leila Khatun, one of the very few Turkish poetesses. He studied medicine at Galata-Serai from 1828 to 1832. In 1834 he was appointed Admiralty physician, and accompanied the Grand Admiral in his expedition against Tripoli. On his return to Constantinople he forsook medicine and entered the Bureau of Interpreters for the Porte. In 1840 he became First Secretary to the Turkish Embassy at London, and served in various diplomatic positions until in 1848 he was appointed Grand Interpreter to the Porte. In 1850 he went on a mission to Saint Petersburg, and in 1853 on another to Egypt. On his return from the first of these he became Minister of Foreign Affairs under the Grand Viziership of Aali Pasha. In 1854 Fuad went to Epirus along with Omer Pasha, where he suppressed the insurrection with great energy. In the following year he received the title of pasha, and was again appointed Minister of Foreign Affairs, and represented Turkey at Paris in the regulation of the affairs of the Danubian Principalities. In 1860 he was sent to Damascus in consequence of the disorders in the Lebanon. (See DRUSES.) In 1861 he held the office of Grand Vizier. In 1862 he became Minister of Finance, and in 1867 again Minister of Foreign Affairs. He died in 1869. When the Turkish Academy of Science and Belles-Lettres was established, in 1851, Fuad became one of the first members, and in the following year he published a Turkish grammar, which is highly esteemed by native scholars. He also wrote a poem on the Alhambra. He received many honors and decorations from European sovereigns.

FUCA, fú'ká, JUAN DE (?-1602). A Greek navigator, whose real name was Apostolos Valerianos. He was born in Cephalonia, and is celebrated as the discoverer of the straits named after him, and separating the island of Vancouver from Washington and connecting the Pacific with the Gulf of Georgia. Little is known of his career, except that he served for more than thirty-five years in the East Indies as a pilot in the Spanish Navy, and that in 1506 he applied for admission to the English service. In his report he claims to have discovered a strait uniting the Pacific with the Atlantic.

FUCA, JUAN DE, STRAIT OF. A passage separating the State of Washington, in the United States, from Vancouver Island. It connects the Pacific Ocean with the Strait of Georgia on the north and Puget Sound on the south, having its outer, or western, entrance in latitude 48° 30' N. and longitude 124° 40' W. (Map: Washington, A 1). It is important as the water route from Vancouver and the Puget Sound cities to the Pacific Ocean. It is about 100 miles long from east to west, and about 15 miles wide in the western part; but expands to double that width in the eastern section. It contains several islands in its eastern part, one of which (San Juan) became the subject of a dispute between Great Britain and the United States, the question being whether it was to be regarded as an appendage of Washington Territory or of British Columbia. The question was submitted in 1872 to the Emperor of Germany as arbiter, and he decided that the line of boundary should be run through the Strait of Haro, west of San Juan, thus awarding that island to the United States.

FU-CHAU, fū'chou'. See **FU-CHOW**.

FU-CHOW, or **FOO-CHOW** (Chin., Happy Region). A walled city of China, capital of the Province of Fu-kien, and one of the five ports opened to foreign residence and trade by the treaty negotiated by the British at Nanking in 1842. The name is also sometimes spelled Fuh-chow, Fuh-chau, Foo-choo, and Fu-chou, and sometimes has appended to it the syllable fu, or foo, meaning 'department' or 'departmental city.' In the local dialect it is pronounced Hok-chiu.

Fu-chow is well situated in a beautiful and fertile plain, 34 miles from the mouth of the river Min, and about two miles back from the north bank of the northern branch of the river, opposite the long, narrow island called Nan-t'ai. Its walls, which have a circuit of about 6½ miles, and are pierced with seven massive gates, surmounted with lofty towers, inclose three finely wooded hills—'Black Rock Hill,' in the southwest angle; the 'Hill of the Nine Genii,' in the southeast; and 'Screen Hill,' in the northeast. The eastern part of the inclosure is known as the Tatar town, a garrison having been established here by the conquering Manchus in the seventeenth century. The principal street of the city runs from north to south, and is continued through the south gate by a long causeway to and through the city's most populous and most important suburb on the river bank. From this point a celebrated stone bridge—the 'Bridge of Ten Thousand Ages'—leads across the river to a densely peopled little island, Tong-chiu ('Middle Island'), and from this island another stone bridge 300 feet in length completes the line of communication with the foreign settlement on the island of Nan-t'ai. The Bridge of Ten Thousand Ages is said to have been built over eight centuries ago. It is 1350 feet long, about 14 feet in width, and is formed of a granite causeway laid upon thick stone slabs 45 feet long, which rest on about 40 immense stone piers. Strong stone parapets mortised into large stone pillars protect pedestrians. This is the limit of navigation for sea-going junks; but barges and smaller craft with movable masts may pass under the bridge. Foreign vessels, except those of very light draught, anchor ten miles lower down, off a small island with a pagoda on it, which lies off the lower end of Nan-t'ai Island.

Near here, on the left bank of the river, are the arsenal and navy-yard, established in 1867, and managed by Frenchmen. Many war vessels have been launched here, and most of the naval officers of China were trained in the school of navigation attached to the arsenal. In 1884, during hostilities with France, the arsenal and the fortifications in the neighborhood suffered greatly from a brief bombardment by the French. There is also a dry-dock, 300 feet long, with powerful pumps and steel caissons.

Cotton-mills, with special concessions from the Government, have been established here, and more recently a match-factory. The mint is now issuing one-cent, ten-cent, and twenty-cent pieces, which are gradually finding their way over the country. Among the other articles produced are 'soapstone' or steatite figures, vases, and other ornamental objects, artificial flowers, and figures of birds carved in charcoal and colored to represent the living originals. Fu-chow lacquer is also well known.

Fu-chow was opened to foreign commerce in 1842, but it was not until 1853 that the tea trade of the port began to assume any importance. Since 1880 it has dwindled greatly. In 1900 the net value of the trade of the port was \$11,045,800, of which \$3,889,490 represented native produce of local origin sent to foreign countries; \$1,166,030 native produce of local origin sent to Chinese ports; and \$1,926,835 native produce imported chiefly from Shanghai. In the same year the gross value of foreign imports—that is, including reexports—was \$4,088,560, of which goods to the value of \$3,476,560 came from foreign countries or through Hong Kong, and the rest from Chinese ports. The chief articles imported from foreign countries were opium, cotton goods, lead, tin, tinplate, steel, kerosene oil, machinery, flour, and sugar, and the chief exports were timber, wood for kerosene-oil cases, tea, canes, matches, and various kinds of fruit.

The shipping returns show that 291 steamers, with a tonnage of 351,661 tons, entered inward, the different nationalities being represented as follows:

	Steamers	Tons
British	174	249,908
United States.....	3	2,386
German.....	15	38,660
Dutch.....	1	1,968
Swedish and Norwegian.....	5	8,027
Russian.....	1	542
Japanese.....	50	15,537
Chinese.....	42	34,643

The port is now connected by telegraph with the principal cities of China, and by cable with Formosa, Hong Kong, and Europe.

Fu-chow is the residence of the Governor of Fu-kien Province, and of the Viceroy, or Governor-General, of the united provinces of Che-kiang and Fu-kien, officially known as Che-Min, Min being the ancient name of this region.

The population of the city, including its seven suburbs, has been estimated at 636,000.

BIBLIOGRAPHY. For a good description of the city, see Doolittle, *Social Life of the Chinese* (New York, 1867), and Mayer and others, *The Treaty Ports of China and Japan* (London, 1867). For statistics, consult: The annual reports of the Imperial Maritime Customs of China, and *Commercial China in 1899*, issued by the United States Treasury Department Bureau of Statistics (Washington, D. C.). For the language, consult: Maclay, *Manual of the Foo-chow Dialect*, and Maclay and Baldwin, *Chinese-English Dictionary* (1871).

FUCHS, fooks, ERNST (1851—). A German ophthalmologist. He was born and educated at Vienna, and after holding a professorship at the University of Liège (1881-86) was appointed to the chair of ophthalmology at the University of Vienna. His principal publications, most of which are translated into German and French, include: *Das Sarcom des Uvealtractus* (1882); *Die Ursachen und die Verhütung der Blindheit* (1885); *Lehrbuch der Augenheilkunde* (1889).

FUCHS, IMMANUEL LAZARUS, also called LUDWIG (1833-1902). A German mathematician, born at Moschin, in Posen. After teaching mathematics in several institutions, he became professor extraordinary at Berlin in 1866, and full professor of mathematics at Greifswald in 1869,

at Göttingen in 1874, at Heidelberg in 1875, and at Berlin in 1884. His principal contributions bear upon the theory of functions and the theory of linear differential equations. After Kronecker's death, in 1891, he became editor of the *Journal für die reine und angewandte Mathematik*. His name has been connected by Poincaré with a discontinuous group ('Fuchsians') which is very important in the general theory of functions, and is frequently discussed by Poincaré in the volumes of *Acta Mathematica* (Stockholm).

FUCHS, JOHANN NEPOMUK VON (1774-1856). A German chemist and mineralogist. He was born at Mattenzell, studied at Freiberg, Berlin, and Paris, was professor at Landshut and Munich, and was curator of the mineralogical collection and a member of the Academy at Munich. He published a number of interesting papers on chemistry, mineralogy, and crystallography, and his *Gesammelte Schriften* were published at Munich in 1856. He is known for his process of making a soluble glass used in fixing fresco colors.

FUCHS, KONRAD HEINRICH (1803-55). A German physician, born at Bamberg, and educated at Würzburg. He was professor of pathology and therapy at Göttingen from 1838 until his death, and wrote the important work entitled *Lehrbuch der speziellen Nosologie und Therapie* (1844-48). He also published an edition of the earliest writers on syphilis in Germany, *Die ältesten Schriftsteller über die Lustseuche in Deutschland* (1843). The pathologico-anatomical collection at the University of Göttingen was founded by him.

FUCHS, or **FUCHSIUS**, fook'sé-foos, LEONHARD (1501-66). A celebrated German botanist. He was born at Wemdingen, in Bavaria, studied at Ingolstadt, under Reuchlin, and in 1535 became professor of medicine at Tübingen. He published a number of excellent works on botany, the most important of which is his beautifully illustrated *De Historia Stirpium Commentarii Insignes* (1545). This is one of the books with which the modern science of botany began to exist. The fanciful speculations of the Middle Ages were abandoned, and men began to study the facts and phenomena of real nature. Fuchs described with great clearness a large number of plants, and even endeavored to establish a rational system of nomenclature. He is justly known as one of the fathers of scientific botany.

FUCHSIA (Neo-Lat., named in honor of Leonhard Fuchs). A genus of plants of the natural order Onagraceæ, which contains about 70 species, mostly natives of tropical America. Some are climbers, some small trees, but the majority are shrubs or half-shrubby herbs. The leaves are opposite. The flowers, which are solitary and axillary, or sometimes arranged in terminal racemes, are generally pendulous, have a funnel-shaped, four-cleft, finely colored calyx, a four-petaled, usually red, corolla, and a four-celled berry, which in some species is edible. Several species are largely employed as greenhouse plants, and in climates not too rigorous they are grown out of doors with slight protection during the cold season. They are deservedly popular, because they yield a satisfactory display of bloom with less care in propagation and management than almost any other house plant, and

in consequence of their beauty and gracefulness, they have developed a great number of varieties, not only of the colors and forms they possess in nature, but others, such as white and double, which are not peculiar to the species from which they originate. *Fuchsia macrostemma*, a very variable Chilean species, first attracted European attention about 1790, and for about seventy-five years usurped both name and fame of *Fuchsia coccinea*, which is considered a more attractive and free-blooming species. It has been largely employed, either singly or in crossing with *Fuchsia fulgens*, in the production of cultivated forms. See Bailey, *Cyclopedia of American Horticulture* (New York, 1900).

FUCINO, fōo-ché'nō, LAKE. A former lake in Italy, the ancient Lacus Fucinus, now a vast fertile farm (Map: Italy, H 6). For history of its drainage, see AVEZZANO.

FUDGE FAMILY IN PARIS, THE. A skit by Thomas Moore (1818), satirizing the underbred English in foreign countries. The satire was followed by a sequel, *The Fudge Family in England*.

FUEGIAN, fū-é'ji-an. See TIERRA DEL FUEGO; ONA; YAHGAN.

FUEL (OF. *fouailles*, from ML. *focale*, fuel, from Lat. *focus*, hearth). Any material that is capable of being utilized for the heat it produces upon union with oxygen. (See COMBUSTION.) The fuel of greatest economical importance is coal. Many other substances are, however, rated very high commercially and industrially as fuels. Some of these substances, such as wood, peat, and crude petroleum, are of natural origin; others, such as coke, charcoal, and coal-gas, are formed artificially. A useful classification of fuels is that which divides them according to their state of aggregation, and this classification will be followed in the present article. To enumerate: The principal solid fuels are coal, peat, coke, charcoal, and wood; the liquid fuels include petroleum, shale oils, and vegetable and animal oils; the gaseous fuels include coal-gas, producer gas, water-gas, mixed gas, and natural gas. The heat of combustion—i.e. the heat generated by the combustion of a certain quantity in oxygen—measures the 'calorific power' or 'heat value' of a fuel. However, the terms calorific power and heat value have, in common usage, a slightly wider significance than the term 'heat of combustion.' The latter term is applied only to the quantity of heat generated by the substance when completely burned—that is, when the carbon and hydrogen are completely changed to carbonic acid and water. The terms 'calorific power' and 'heating value,' on the contrary, apply to the measure of an industrial yield as well as to the heat given off by the fuel during its complete combustion. Scientifically, the term 'heat of combustion' is the most nearly correct. The units of measure of the quantity of the heat of combustion are the *calorie* and the *British thermal unit*. The calorie is the quantity of heat required to raise the temperature of one kilogram of water one degree centigrade. The British thermal unit (usually abbreviated, B. T. U.) is the quantity of heat required to raise the temperature of one pound of pure water one degree Fahrenheit.

There are two methods for finding the heat of

combustion of substances: (1) Calculation based on chemical composition, and (2) experimental determination by means of a calorimeter. By the first method the units may be calculated directly from the composition of the substance, or calculation of the heat of combustion from the composition of the substance, or indirectly from the quantity of oxygen consumed during combustion in a crucible. The direct calculation of the heat of combustion from the chemical composition of the fuel is usually performed by means of Dulong's formula. Other general formulas are in use, but they all resemble Dulong's, and are usually only modifications of his. Dulong's formula, with recent average figures for the constants, as given by Mr. William Kent, for coal, is: Heating value per pound in

$$\text{B. T. U. equals } \frac{1}{100} [14,850 C + 62,000 \left(H - \frac{O}{8} \right)$$

+ 4000 S], in which C, H, O, and S are respectively the percentages of carbon, hydrogen, oxygen, and sulphur in the coal. Mr. Kent points out, as the result of a comparison of numerous data, that the relation of the heat of combustion of coal to its ultimate analysis is expressed by Dulong's formula with remarkable accuracy—that is, within a limit of error of usually less than 2 per cent. The method of calculating the heat of combustion indirectly, from the quantity of oxygen consumed, is also expressed by a gen-

the apparatus complete with its accessories, and Fig. 2 shows the combustion-chamber, or bomb, separated from the other apparatus. The combustion-chamber (Fig. 2) consists first of a steel shell, P, and a stopper or cover, E. The shell has a capacity of 40 cubic inches, is nickered on the outside, and has a coating of enamel on the inside. The stopper E screws down tightly into the shell, and is made of iron. It carries a stop-cock, R, of fine nickel, and through its top passes an insulated electrode, D, reaching the interior by a platinum wire. Another platinum wire, suspended from the cover, carries a disk, F, on which the fuel is placed. The bomb is supported inside a cylindrical vessel so as to be surrounded by water, as shown by Fig. 1. In this illustration, L is a pump-like mechanism for agitating the water surrounding the bomb; O is a cylinder containing oxygen under pressure; M is a pressure-gauge; and B is an electric battery. The manipulation of the apparatus and the fuel in making a test is substantially as follows: Weigh one grain of the fuel to be tested and place it on the disk F; then make connection between the electrode D and the disk F; screw down the cover E; put the stop-cock R in connection with the oxygen cylinder O, and open it carefully, so as to allow sufficient oxygen to pass into the bomb for the required pressure; close the cock of the oxygen-chamber, then the

FIG. 2. SECTION OF COMBUSTION CHAMBER OF MAHLER CALORIMETER.

FIG. 1. MAHLER CALORIMETER FOR MEASURING THE HEATING VALUE OF FUEL.

eral formula; but this formula has been shown to be of very questionable value, and is now used only where no other methods of determination are possible.

It is generally conceded that the ultimate test of the heat of combustion of a fuel is its determination by actual combustion in a calorimeter. Calorimeters are made in various forms, but they all consist of a combustion-chamber in which the sample of fuel is burned, surrounded by a chamber containing a known quantity of water, whose rise of temperature is shown by a thermometer. The Mahler calorimeter (one of the most perfect of such devices) is shown in the accompanying engravings, of which Fig. 1 shows

cock R, and then disconnect the oxygen-chamber; place the bomb in the water-chamber, and adjust the agitator L and the thermometer; pour in the previously weighed water, and operate the agitator a few minutes to restore equilibrium of temperature; note the thermometer; connect the electrode with the battery, and thus kindle the fuel; read the thermometer one-half minute after kindling, then at minute intervals until the readings begin to decrease regularly; next open the cock R, and afterwards the bomb, which should be washed inside with distilled water to collect the acids formed, and determine the acids volumetrically. The mode of procedure described furnishes all the data to be obtained by the test proper; the observer then proceeds to calculate the heat of combustion from these data. This calculation is a rather formidable one, and the

interested reader should consult special treatises on calorimetry for its explanation. The result obtained is the heat of combustion expressed in terms of calories or of British thermal units. (See HEAT; THERMO-CHEMISTRY.) When coal is the fuel tested, it is reduced to moderately coarse powder before being placed on the disk. Heavy oils, tars, etc., are weighed directly onto the disk. Volatile oils are inclosed in pointed glass bulbs, which are placed on the disk, and the ends of which are broken off just before closing the bomb. Gases are simply pumped into the bomb. A calorimetric test, in order to give reliable results, requires expert manipulation and extreme care.

SOLID FUELS. Of the solid fuels used at present, coal is by all odds the most important. Coal is a very varied product, and its value as a fuel is correspondingly variable. According to geologists, a bed of coal was many ages ago a mass of damp vegetable fibre, a portion of a peat-bog. Through successive geologic ages the peat-bog was submerged and overlaid with mud and glacial drift, tilted and compressed by upheavals of the earth's crust, and subjected to intense heat. During these processes it underwent a more or less complete destructive distillation. The conditions under which this distillation took place were not uniform; the variable factors were time, depth, and porosity of the overlying strata, pressure and temperature, disturbance of the beds, and the intrusion into them of mineral substances, such as clay, sand, iron, and sulphur. As a consequence, the product of the distillation—namely, coal—varies all the way from the original peat, through brown coal or lignite, bituminous, semi-bituminous, semi-anthracite, and anthracite, to graphitic coal. Graphitic coal has nearly all the volatile

lies in the fact that they determine the relative heating value of the different coals for fuel. An illustration will explain this truth. Coal is composed of four different substances, which may be separated by proximate analysis—namely, fixed carbon, volatile hydrocarbon, ash, and water. When coal is burned the moisture is first driven off at a temperature of 250° to 300° F.; then the volatile matter is driven off at a red heat; then the carbon is burned out of the remaining coke at a white heat, until nothing is left but ash. The fixed carbon has a constant heating value of about 14,600 B. T. U. per pound. The heat value of the volatile hydrocarbon depends on its composition, and that depends chiefly upon the district in which the coal is mined. It may be as high as 21,000 B. T. U. per pound in the best bituminous coals containing very little oxygen, or as low as 10,000 B. T. U. per pound in some of the poorest bituminous coals having a high percentage of oxygen. The ash has no heating value, and the water has in effect less than none, for its evaporation and the superheating of the steam made from it to the temperature of the chimney gases absorb some of the heat generated by the combustion of the fixed carbon and the volatile matter. The heating value per pound varies in different districts, and bears a relation to the percentage of volatile matter. It is the highest in the semi-bituminous coals, being nearly constant at 15,750 B. T. U. per pound; it is between 14,500 and 15,000 B. T. U. in anthracite, and ranges from 15,000 B. T. U. down to 13,000 B. T. U. or less in the bituminous coals, decreasing usually as we go westward, and as the volatile matter contains an increasing percentage of oxygen, as shown by Table II. Tables I. and II. refer only to American coals, and they will be

TABLE I.—CLASSIFICATIONS OF COALS ACCORDING TO THE RELATIVE PERCENTAGE OF CARBON AND VOLATILE MATTER

KINDS OF COAL	Per cent. fixed carbon	Per cent. volatile matter	Heating value B. T. U. per lb.	Relative combustible value
Anthracite.....	97 to 92½	3 to 7½	14,600 to 14,800	93
Semi-anthracite.....	92½ " 87½	7½ " 12½	14,700 " 15,000	94
Semi-bituminous.....	87½ " 75	12½ " 25	15,500 " 16,000	100
Bituminous, Eastern.....	75½ " 60	25 " 40	14,800 " 15,200	95
" Western.....	65 " 50	35 " 50	13,500 " 14,800	90
Lignite.....	under 50	over 50	11,000 " 13,500	77

hydrocarbon gases and oxygen driven off from it, leaving practically only fixed carbon and ash, the carbon being in a form so hard to burn that the coal is not used as a commercial fuel. Lignite is at the extreme opposite end of the scale of coals, it being only one remove from the original peat—that is, the proportion of fixed carbon is small, and the proportion of volatile matter large. Between these two extremes come the other classes of coal. To summarize, we thus have different varieties of coal, due to differences in the extent to which the volatile gases have been driven off from the original peat or other woody coal-forming substance. There are also differences in quality in each variety, due to varying percentages of ash and water. The ash or earthy matter in coal ranges from 2 to over 30 per cent.; the water ranges from less than 1 per cent. in the anthracites up to 14 per cent. or more in some of the bituminous coals, and to 25 per cent. or more in some of the lignites. The importance of stating the preceding circumstances

understood clearly if studied in connection with the preceding discussion, with the exception possibly of the last column of Table II. This column has been inserted to show the relative theoretical value of the different coals for evaporating water from 212° F. to steam at 212° F. The following general figures of the heating value of foreign coals give a basis for a rough comparison between American and foreign products:

COUNTRY	Heating value in B. T. U.
Chile.....	11,758 to 14,954
France.....	15,080 " 16,560
Great Britain.....	14,000 " 15,965
Austria-Hungary.....	12,213 " 15,131
Germany.....	11,045 " 15,847
Spain.....	9,556 " 14,113
Russia.....	8,748 " 15,065
New Zealand.....	9,846 " 15,364

These values are the maximum and minimum in each case from a large number of tests. The purposes for which different kinds of coal are

used do not admit of any very definite classification. The coal used in any particular country or locality is determined nearly always by questions of availability and cost. In America the use of anthracite coal is nearly universal for domestic purposes in the East, and it is also used for industrial purposes in many Eastern cities where public sentiment demands the use of a smokeless fuel. The great industrial fuel, however, is coal of the semi-anthracite and bituminous classes, and the coal used in any particular locality is usually the coal which is most available and the cheapest.

The solid fuels other than coal are coke, charcoal, coal briquettes, coal-dust, peat, wood, sawdust, tanbark, straw, and bagasse. *Coke* is the solid material left after evaporating the volatile ingredients of coal, either by means of partial combustion in furnaces called coke-ovens, or by distillation in the retorts of gas-works. It is considerably used as a domestic fuel, and somewhat used for steam-making where some special condition prevails, such as the necessity for a smokeless fuel. For general steam-making, however, its cost and the difficulty of its combustion in ordinary furnaces place coke rather low in the list of fuels available to the steam-user. For metallurgical processes, an important example of which is iron-smelting, coke is almost an invaluable fuel. Coke is composed mostly of fixed carbon and ash, the percentage of volatile matter

being seldom over two per cent., and often less than one per cent., of the total. Its heating value ranges generally between 14,400 and 14,600 B. T. U. See *Coke*.

Charcoal is the carbonaceous residue of wood which has been subjected to a process of smothered combustion. Its principal use as a fuel is in smelting certain kinds of iron. A small amount is used for domestic heating and cooking, and for heating purposes in certain trades and arts. Pure charcoal is nearly pure carbon, but commercial charcoal contains considerable volatile matter which is a decided advantage to it as a fuel. In fact, it has been shown that half-burned charcoal is superior as a fuel to that more completely burned. The heat value of ordinary commercial charcoal is between 7000 and 7200 calories.

Briquettes, or patent fuel as they are sometimes called, are composed of coal or coke dust mixed with a binder of pitch, tar, or other substance, and pressed or molded into blocks, bricks, ovoids, or other forms. Briquettes are not made to any extent in the United States, but in Great Britain and Continental Europe their manufacture constitutes an important industry. They are used like coal for steam-making, and industrial and domestic purposes generally.

Coal-dust, as the name implies, is coal ground to a fine dust or powder. Theoretically coal-dust should be a most excellent fuel, but it has the

practical objection of requiring a rather costly apparatus for grinding the coal and feeding it to the furnace, and of requiring great care in its combustion. The manner in which coal-dust is burned is to inject it into the furnace through nozzles or burners by means of air-pressure. The furnace used differs from the ordinary coal-burning furnace in being closed and without grates; both the fuel and the air for its combustion enter the furnace through the nozzle or burner. Powdered coal was used as a fuel in England as early as 1873, but without much success, and the same lack of success has distinguished most of the subsequent attempts to employ it in steam-making. Quite recently, however, coal-dust has been used in firing cement-kilns of the rotary type with so much success that it is now the standard fuel for the rotary kiln process of cement manufacture. The heat of combustion of coal-dust is of course the same as that of the coal from which it is ground; its economy as a fuel comes from the fact that in the finely powdered state of dust the coal burns rapidly and thoroughly without the waste of unburned particles and the formation of clinker; that the combustion is smokeless; and that the cost of firing, furnace repairs, and handling of waste is reduced.

Peat is the agglomeration of partly decomposed vegetable matter obtained from peat-bogs, cut into blocks, and dried to serve as a fuel. Its composition varies but little from that of wood, the composition of Irish peat, for example, being carbon 59 per cent., hydrogen 6 per cent., oxygen 30 per cent., nitrogen 1 per cent., and ash 4 per cent. Air-dried peat contains from 10 to 25 per cent. of water. The heat of combustion of peat is lower than that of brown coal or lignite; for dry Irish peat it is about 10,250 B. T. U., and for moist Irish peat it is about 7390 B. T. U. Generally speaking, a pound of peat will evaporate about five pounds of water from and at 212° F. Peat does not rank as a commercial fuel in the United States; but in Ireland, and some of the western countries of Continental Europe, it is so extensively used that the peat industry is one of importance.

Wood is perhaps the most widely known and used of all fuels. Wood when newly felled contains from 30 to 50 per cent. of water, which after from eight to twelve months' drying in air is reduced to from 20 to 25 per cent. When used as a fuel wood should be as dry as possible, as otherwise some of the heat generated by its combustion is wasted in vaporizing the contained moisture. The following table shows the composition and heating value of the more common woods:

KIND	Carbon	Hydrogen	Oxygen	Nitrogen	Ash	B. T. U.
Ash.....	49.18	6.27	43.91	0.07	0.57	8,480
Beech.....	49.06	6.11	44.17	0.09	0.57	8,591
Birch.....	48.88	6.06	44.67	0.10	0.29	8,586
Elm.....	48.89	6.20	44.25	0.06	0.50	8,510
Fir.....	50.36	5.92	43.39	0.06	0.28	9,063
Oak.....	50.16	6.02	43.36	0.09	0.37	8,316
Pine.....	50.31	6.20	43.08	0.04	0.37	9,153

It will be noted that the coniferous woods have the higher heating values, due to the contained hydrocarbons in the form of pitch and turpentine. Pine knot containing much pitch has given as high as 10,863 B. T. U. by test. Wood was formerly much used for steam-raising, and is now

used for this purpose in newly settled countries and where coal cannot be obtained cheaply. The countries using wood for making steam are, however, growing fewer each year, owing to the discovery of new coal deposits, and the development of transportation systems by which coal can be cheaply imported. Evaporative tests made by Brix in Europe gave the following results in pounds of water evaporated per pound of fuel: Pine, 5.5 pounds; elm, 4.6 pounds; birch, 4.5 pounds; oak, 4.56 pounds; ash, 4.63 pounds; and beech, 4.47 pounds.

Sawdust is often used as a fuel in steam saw-mills. The conditions necessary for burning sawdust are that plenty of room be given it in the furnace, and sufficient air supplied on the surface of the mass. It is sometimes burned by blowing it into the furnace by air pressure, much as coal-dust is burned. The heating power of dry sawdust is naturally the same per pound as that of the wood from which it is derived. Generally speaking, sawdust cannot be profitably burned except in furnaces especially designed for its combustion, and where it costs nothing. Sawdust briquettes have been made and utilized as fuel, but only to a very limited extent. *Tanbark* or more correctly the residue of tanbark which has been used in the process of tanning, is sometimes used as a fuel where it can be had at slight cost. The heating value of perfectly dry tan containing 15 per cent. of ash is 6100 B. T. U., according to Peclet. The same authority states that tan in the ordinary state of dryness, containing 30 per cent. of water, has a heating value of only 4284 B. T. U. The weight of water evaporated from and at 212° F. by one pound of tan, equivalent to these heating powers, is, for perfectly dry tan, 5.146 pounds, and for tan with 30 per cent. moisture, 3.84 pounds. *Straw*, like sawdust and tanbark, is used as fuel under special conditions. Experiments have shown dry winter-wheat straw to have a heating value of 6290 B. T. U., and the same straw with 10 per cent. water a value of 5448 B. T. U. *Bagasse* is the refuse of sugarcane after the juice has been extracted. It is much used as a fuel under the boilers of sugar-mills. Its heating value is from 2000 to 3000 B. T. U., depending upon the quality.

LIQUID FUELS. The only liquid fuels of practical importance are the mineral oils. Animal and vegetable oils may be used for fuel, but, on account of their cost and the demand for them for other uses, they are not used in the arts for heating except on very exceptional occasions. A consideration of liquid fuels is, therefore, confined entirely to a consideration of mineral oil, petroleum and its distillates and residues. Crude

petroleum is a hydrocarbon often containing a small percentage of sulphur and oxygen as impurities. It may be broken up by distillation into gasoline, benzine, kerosenes, and other less familiar distillates and residuum of various qualities, any one of which makes a very good fuel un-

der certain conditions. *Gasoline* and its associated distillates are too valuable for other purposes ever to be used as fuel. *Benzine* will also have a restricted use as fuel owing to the difficulty, danger, and expense of transporting it, and to the care with which it must be handled. Were it not for these objections, benzine would be the best of all oil fuels. *Kerosene* is much more suitable for use as a fuel than benzine, because of its portability and the safety and ease with which it can be handled. Roughly speaking, American crude petroleum contains from 50 to 75 per cent. of benzine, and kerosene and Russian crude petroleum contain from 15 to 50 per cent. Peruvian oil is about the same composition as Russian.

The use of kerosene as a fuel is common, but this use is limited by the price of that oil, and its value as an illuminant, to small installations for special purposes. For general industrial purposes, therefore, resort must be had either to the crude petroleum or to the residuum remaining after the kerosene has been distilled off the crude petroleum. In the United States, where the percentage of residuum is so small that its distillation is demanded for lubricating oil, crude petroleum is the only available industrial fuel oil. In Russia, however, the percentage of residuum is so great that only a small portion is required for distillation into machine oil, and the remainder is available for fuel. The residuum is the fuel oil *par excellence*, and in Russia it is used in every possible place. Fuel oils are burned usually in the form of spray, the oil being injected into the furnace through nozzle-like burners by air or steam pressure which breaks it up into fine spray. Their advantages are many, but generally speaking their use must be limited. A few figures will demonstrate the reason for this statement. The coal consumption of the world is probably in the neighborhood of 600,000,000 tons, while that of petroleum is but 17,000,000 tons, of which the greater portion is used for illuminants and lubricating purposes. The amount of petroleum available for fuel purposes is probably, therefore, not more than one per cent. of the coal used. Obviously it cannot be used very extensively as compared with coal. Again, while oil has greater heating value and evaporative efficiency than the best coal, there is always some point where this is counterbalanced by the lesser cost of coal. For example, comparative tests between Lima (Ohio) oil weighing 7.66 pounds per gallon and costing $2\frac{1}{2}$ cents per gallon, and coal giving an evaporation of $7\frac{1}{2}$ pounds of water per pound of coal showed that the two fuels were equally economical when the price of coal was \$3.85 per ton. It must appear from this comparison that the use of oil fuel is limited to countries where coal is high-priced, or to uses where its extra cost is not so important as other considerations, such as lesser bulk, cleanliness, and reduction of labor force. The heating value of fuel oils ranges between about 18,000 and 21,000 B. T. U.

GASEOUS FUELS. For many purposes the best fuel is combustible gas. The ideal fuel is natural gas, but this is obtainable over only a limited area of the earth's surface. Next in value are gases secured by distilling highly gaseous coals or by enriching water-gas. The following are some of the gases which may be used for fuel:

Blast-furnace gas is the gas given off by blast-furnaces for smelting iron ore, and its composition varies with the fuel consumption of the furnace and other conditions. Six analyses made from one blast-furnace by Prof. D. S. Jacobus gave the following average figures: Carbon dioxide, 7.08 per cent.; carbon monoxide, 27.8 per cent.; oxygen, 0.1 per cent.; and nitrogen, 65.02 per cent. The heating value calculated from this analysis was 1175 B. T. U. per pound. At present, blast-furnace gas is more interesting for the possibilities which it offers as a fuel than for the extent to which it is actually used. The quantity of gas which a blast-furnace discharges is much greater than can be used for driving blowing-engines and heating the hot-blast stoves, and this surplus represents a vast waste of fuel which might be utilized were there a demand for it. In modern steel plants some of this waste is saved by installing additional boilers to make steam for the rolling-mills and Bessemer-works. *Coke-retort gas* is the gaseous by-product distilled off coal in making coke. It makes an excellent fuel, but is for the most part wasted in coke-making as practiced in the United States. To secure coke-oven gas for fuel or other purposes special forms of ovens known as retort or by-product ovens must be employed. The gas given off by retort coke-ovens varies in heating value at different stages of the process of coking the coal. According to tests made on retort-oven gas from Cape Breton coal, the heating value increased during the first three hours from 690 to 770 B. T. U. per cubic foot, then it decreased for 18 hours to 630 B. T. U., and then more steadily for 12 hours to 340 B. T. U. There is a wide field for the use of coke-retort gases for fuel, but it has been only slightly worked. *Water-gas* is produced where steam is blown into a bed of white-hot coke; it consists of equal volumes of carbon monoxide and hydrogen or by weight of 28 parts of carbon monoxide and 2 parts of hydrogen. The heating value of pure water-gas is by calculation 343 B. T. U. per cubic foot. A score of years or so ago there was much hope that water-gas could be manufactured and sold extensively as a fuel, but none of the plants established then or since have been commercially successful. It has, however, a field of usefulness in small furnaces in manufacturing plants and in gas-engines. Water-gas enriched by hydrocarbon gases from petroleum or gas-coal has had great success as an illuminant, and is also much used for domestic stoves and cooking-ranges, and in certain of the arts where its convenience counterbalances its cost.

Producer gas, or air-gas, is a mixed gas containing carbonic oxide and hydrogen compounds, and is formed by the incomplete combustion of coal in special retorts or producers. There are a number of producer-gas processes, and the principal ones with the heating values of these products per cubic foot are as follows: Mond, 155 B. T. U.; Siemens, $134\frac{1}{2}$ B. T. U.; Dawson, 160 B. T. U.; Lencauchez, 207 B. T. U. *Retort gas*, or coal-gas, is gas made by distilling coal in closed retorts heated by coke burning beneath them. Before the advent of water-gas, illuminating gas was produced by this process. A typical analysis of coal-gas given by Dr. Gideon E. Moore shows a heating value of 642 B. T. U. per cubic foot. *Oil-gas* is gas made by decom-

posing oil, usually petroleum or its derivatives, by means of heat or steam or by steam and air. Pintsch gas, which is so extensively used for car-lighting, is, for example, made by allowing the oil to fall drop by drop on a highly heated surface, and it has a heating value of about 1320 B. T. U. per cubic foot. Oil-gases resulting from a less perfect process range in heating value in the neighborhood of 870 B. T. U. per cubic foot. *Natural gas* varies in composition and in heating value. The best kinds generally range between 900 and 1100 B. T. U. in value, and the poorest kinds fall as low as 400 B. T. U. Natural gas has been used extensively for domestic purposes, steam-making, glass manufacture, iron-making, brick-making, and for numerous other purposes. Its cheapness has until very recently encouraged wasteful use, with the result that in many places the available supply remaining is very limited.

ECONOMICAL UTILIZATION OF FUEL. The question of the economical use of fuel is one of ever-increasing importance, and is receiving much study by engineers. A high authority, Mr. William Kent, has recently stated the conditions as follows: "A fair estimate of the average cost of coal to the consumer, including transportation charges, is \$2.50 per long ton, which would make the total fuel bill of the United States, in 1899, approximately \$562,757,560. A very large portion of this amount represents a kind of waste that may easily be prevented by means of well-known modern appliances; another portion is waste that is not preventable in the light of our present knowledge; a third is waste that might be saved by the use of appliances which are too expensive to be economically practicable; and a fourth portion is waste that may be saved under some circumstances, and not under others. Examples of the first kind of waste, i.e. that which is easily preventable, are: (1) The use of furnaces for burning soft coal under steam boilers, which are not well adapted to that kind of coal; (2) the discharge of exhaust steam into the atmosphere when all other parts of it might be utilized for heating purposes. An example of the second kind of waste—i.e. that which is not preventable with our present knowledge—is the heat losses in the condensing of water of condensing engines, and in the jacket water of gas-engines. An example of the third kind of waste—i.e. that which may be saved by the use of expensive appliances—is that part of the heat lost in the chimney gases of steam boilers which might be saved by the use of an economizer. An example of the fourth kind of waste, which is preventable under some conditions and not under others, is that of exhaust steam from engines in a factory or other building, which may be utilized for heating purposes in cold weather, but for which there is no use in warm weather."

To the general reader the phase of the subject which is of most direct practical interest is that referring to waste that may be easily prevented by the use of well-known modern appliances. First among these appliances comes the furnace, which if properly designed will insure practically perfect combustion, and if improperly designed will cause a very serious waste of heat-producing fuel. Smokeless combustion of fuel, an important matter in cities, is simply a question of perfect combustion. The second kind of

preventable waste, namely, the discharge of exhaust steam without extracting its useful heat, is less easy to handle. Among the means for saving this exhaust heat are the use of economizers and superheated steam.

A calculation of the possible saving to be accomplished by the use of an economizer has been made by Mr. Kent, as follows:

"Assume a boiler evaporation of 8 pounds of water per pound of coal, and a production of 20 pounds of chimney gas per pound of coal, or 2.5 pounds of gas per pound of water evaporated. If the temperature of the furnace is 2150° F. (a theoretical figure, assuming that there is no direct radiation from the fire to the boiler) and the flue gases are 600° F., the heat wasted in the flue gases will be $600 \div 2150 = 28$ per cent. If by an economizer the temperature of the gases can be reduced to 300° F., half of this waste, or 14 per cent. of the total heating value of the fuel, will be saved. The efficiency of the boiler alone will be 72 per cent. and of the combined boiler and economizer 86 per cent. The gain in economy is $14 \div 72 = 19.3$ per cent. The gain of heat per pound of gas is $300 \times \text{specific heat } 0.24 = 72$ B.T.U., and per pound of water evaporated $72 \times 2.5 = 180$ B.T.U. Also, suppose the feed-water is supplied to the economizer at 100° F. and the steam pressure is 150-pound gauge, corresponding to a temperature of 358° F., and 1213 B.T.U. per pound above 0° F. The heat furnished to the water by the boiler and economizer will be $1213 - 100 = 1113$ B.T.U., of which 180 B.T.U. is supplied by the economizer and 933 by the boiler. The gain in economy is $180 \div 933 = 19.4$ per cent.—a percentage quite possible in practice, provided that there is sufficient heating surface in the economizer and that the feed-water temperature is 100° F., with the gas as hot as 600° F."

After economizers comes the use of steam superheaters. The economy gained by superheating is stated to be from 15 to 20 per cent. with the most economical forms of engines, when the steam is superheated 100° to 150° F. For many purposes the best method of utilizing coal is to convert it into gas, and burn the gas in the furnace, or to grind it to dust, and burn this dust. When all is said, however, the great desiderata in the economical use of fuel are a well-designed and apparent furnace and a similarly perfect boiler.

The literature on fuel and its economical utilization is extensive and widely scattered, but the following two books will be found to meet all the ordinary requirements for information: William Kent, *Steam Boiler Economy* (New York, 1901); Herman Poole, *The Calorific Power of Fuels* (New York, 1898). The following articles in this Encyclopædia may also be consulted with advantage: COMBUSTION; COAL; CHARCOAL; GAS; PETROLEUM; COKE; FURNACES; BOILERS.

FUENTE OVEJUNA, fwān'tā-ō-vā-hōō'nā. A town in the Province of Cordova, Spain, 45 miles northeast of the city of Cordova. It is situated in a well-watered agricultural region. There are deposits of argentiferous lead, calcite, etc., and manufactures of leather, soap, flour, bricks, and tile. The curing of meat is among the industries. In the vicinity are two mineral springs. The parish church occupies the site of the palace of the Knights of Calatrava, to whom the village

was granted by Henry III. in 1430. Some authorities maintain that Fuenteovejuna is the ancient *Mellaria* (named from the abundance of honey). Population, in 1900, 10,717.

FUENTERRABIA, or **FONTARABIA**, fwán'tár-rá-bé'a. A town in the Province of Guipúzcoa, Spain, about ten miles east-northeast of San Sebastian; on the River Bidassoa, near its estuarial expansion (Map: Spain, D 1). It is built on a hill and retains much of the picturesque interest of a ruined mediæval town, though outside of the walls a modern quarter is developing. It has a castle dating from the tenth century, and a pretentious town hall; in the municipal archives are valuable records. Magdalena, situated in the vicinity, is a popular watering-place. The fisheries constitute an important industry; there is some coastwise trade; and particularly in the new quarter manufactures are flourishing. Population, in 1900, 4422. Owing to its position on the French frontier, Fuenterrabia has been the scene of many conflicts between the French and Spaniards, not the least famous of which was the repulse of the Prince of Condé in 1638. It was fortified toward the close of the twelfth century, and in 1524 its defenses were strengthened; but in 1794 the town was captured by the French, and its works were destroyed. In 1813 the Duke of Wellington succeeded in crossing the Bidassoa near Fuenterrabia in spite of the valiant opposition of the French under Marshal Soult. The town played a part also in the Carlist wars of the nineteenth century. Latin inscriptions found in the vicinity gave basis to the theory that this locality was known to the Romans.

FUENTES, fwán'tás, or **FORTE**, fón'tá, BARTOLOME. A Spanish or Portuguese navigator, who is said to have discovered in 1640 a passage uniting the Atlantic and Pacific oceans north of the American continent. An account of this voyage first appeared in a letter published in the *Monthly Miscellany* (London, in 1708), but doubt has been cast upon its authenticity, and by many Fuentes is believed to have been a fictitious personage. The mystery attaching to the affair has led to considerable discussion among scholars. Vancouver admitted the possibility of the discoveries of Fuentes. The real or fictitious discoveries assigned to this navigator have frequently been referred to in works published in Paris and in London, and notably in the book entitled *The Great Probability of a Northwest Passage, Deduced from Observations on the Letter of Admiral del Fonte*.

FUENTES, DON PEDRO HENRIQUEZ D'AZEVEDO, Conde de (c.1535-1610). A Spanish soldier and statesman, born at Zanora. He served in the Netherlands, and under Alva in Portugal, where he commanded the Spanish army in 1589, and defended Lisbon with complete success against the English. From 1591 to 1596 he was civil and military assistant to the royal governors in the Netherlands. About 1600 he was appointed Captain-General and Governor at Milan, where he was incessantly busied with crafty political manœuvres. He has often been confused with another of the name (known to the French as *Fontaines*) who fell at his defeat by the Duc d'Enghien, near Rocroi (May 19, 1643). Consult the life by Duro (Madrid, 1884).

FUENTES DE ONORO, fwán'tás dá ó-nó'ró. A village of Spain, on the Portuguese border, 14 miles west of Ciudad Rodrigo. It is celebrated as the scene of a battle between Wellington and the French under Masséna and Bessières, May 3, 1811. The French, by a furious charge, twice drove back the British lines; but each time the latter, at the point of the bayonet, regained the lost ground. When night came on Masséna retreated, with the loss of about a thousand men. The battle, indecisive in itself, served to keep the French out of Portugal and encouraged the English at home.

FUERO, fwá'ró (Sp., jurisdiction). A term applied in Spain originally to courts of local jurisdiction, and transferred later to collections of laws, or to charters of civic rights granted by kings to individual cities. The most famous were those of Leon and Najera. As these city charters contained, for the most part, special liberties and privileges, the word *fueros* became current chiefly in this sense, and was particularly so applied to designate the body of privileges and liberties that made up the Constitution of Navarre and of the three Basque provinces of Vizcaya, Alava, and Guipúzcoa. These are the *fueros* for the maintenance of which the Basques fought in the Carlist wars of the nineteenth century. The *fueros* of other provinces and cities of Spain have been long extinct. The Basque *fueros* were grounded on the old laws of the Visigoths, and grew up in the period between the irruption of the Moors into the Spanish Peninsula and the consolidation of the Spanish monarchy under the House of Hapsburg. The same was the case in the semi-Basque Province of Navarre, which formed an independent kingdom under its own sovereigns. The *fueros* were thus the product of the ancient Gothic laws and the new circumstances under which they were applied. They resulted by degrees, here as elsewhere, in a struggle between the people and the princes; and their development forms an interesting chapter in the history of modern constitutionalism. They were at first only privileges and statutory rights granted to single places, and from these were extended to others. By the introduction of the representative element of the Cortes and the extension of the *fueros* over whole provinces, they were transformed, in virtue of the general law of custom, into constitutional rights of these provinces, and were in time collected and formally embodied and sanctioned as such. It was in this way that the *fueros* of Navarre, which had been growing into consistency for centuries, were, in 1236, during the contests between King Theobald and his Cortes, collected and recorded, being still extant under the title of *Cartulario del rey Tibaldo*. Ferdinand the Catholic, who united Navarre with the Crown of Castile, maintained the *fueros*, adapting them to the new relations existing with Castile. According to the *fueros* of Navarre, the Cortes, chosen for three years, and consisting of the three estates of clergy, nobles, and commons, met yearly; and without their consent no law could be passed or anything of importance undertaken. The Government consisted of the Viceroy, who presided in the Cortes and Great Council; the Great Council of Navarre, a body similar to the old French Parlements; and the *contaduría*, before which all accounts of revenue and expenditure were laid.

There was no custom-house or toll but at the frontier, and except the trifling grant of 176,000 reals, nothing flowed into the royal treasury. All these fueros the King had to bind himself by oath to maintain.

In the Lordship (*señorío*) of Vizcaya, the fueros grew up in the contests of the inhabitants with their counts. They were first collected into a code by Count Juan in 1371; and this, after the final union of Vizcaya with Castile, was recast, completed, and confirmed by King Charles I. (the Emperor Charles V.). According to this charter of rights, every new 'lord'—this being the title given by the Biscayans to the King of Spain as their prince—on attaining the age of fourteen, must come into the country within a year, and in certain places appointed for that purpose take the oath to uphold the fueros. The Government consisted of a *corregidor*, appointed by the 'lord,' and two deputies; and these, aided by six *regidores*, and forming the *regimiento*, conducted the administration. The supreme power resided in the General Assembly (*junta general*), which met yearly under the tree at Guernica, regulated all the affairs of the lordship, and appointed the deputies and *regidores*. Justice was administered, in the first instance, by the lieutenants (*tenientes*) of the Corregidor; in the second by the Corregidor and his deputies; and in the third, by the Royal Court at Valladolid. Other privileges were, that every Biscayan of pure blood was counted noble; that except the post-office there was to be no royal governing board in the province; that Biscayans were not bound to serve in the Spanish Army. The fueros of Alava and Guipúzcoa were of analogous origin and character, but differed in details. Abolished by Espartero, these fueros were restored by Queen Isabella in 1844. In 1876 a law abolishing the Basque fueros was adopted, and in 1877 a decree was passed assimilating the administration of the Basque Provinces to that of the rest of Spain. Consult: Rivero, *Colección de fueros municipales* (Madrid, 1847); id., *Catálogo de fueros y cartas-pueblas de España* (Madrid, 1852); Mari-chalar y Manrique, *Historia de la legislación civil en España* (Madrid, 1868). See the article BASQUE RACE.

FUERO, JOAQUIN (1814-67). A Mexican soldier. He was born at Guadalupe Hidalgo, and was educated at the Military College of Segovia, at which he subsequently became professor and vice-president. After suppressing the insurrection of 1840 he was, in 1843, appointed chief of staff of the army division in Tamaulipas, and also fought with distinction in the war with the United States, and received a wound from which he ultimately died. Besides a Spanish translation of General Makena's *Treatise on Military Tactics*, he published a *Manual del militar, ó tratado completo de instrucción en la ordenanza* (1842).

FUERTE, fwár'tás, ESTEVAN ANTONIO (1838-1903). An American civil engineer and educator, born at San Juan, Porto Rico. He graduated at the Troy (N. Y.) Polytechnic Institute in 1857, became a member of the royal corps of engineers in Puerto Rico, and in 1862-63 was director of public works for the western district of the island. In 1863 and 1864 he was assistant engineer, from 1864 to 1869 engineer on the Croton Aqueduct Board, and in the latter capacity pre-

pared a valuable report on the connection of the Croton water-supply with the manufactures of New York City. In 1870-71 he was the engineer-in-chief of the United States expedition to Tehuantepec and Nicaragua, to investigate the practicability of a trans-isthmian ship-canal. He became dean of the department of civil engineering in Cornell University in 1873, and from 1890 to 1902 was director of the college of civil engineering, and obtained for Cornell an excellent special equipment for this work. He was a member of the American Society of Civil Engineers and other learned organizations, and published numerous scientific articles and reports.

FUERTEVENTURA fwár'tá-vén-tōō'rá. One of the Canary Islands (q.v.), situated south of Lanzarote, across the Straits of Bacayna (Map: Spain, B 5). Its area is over 650 square miles. There are a number of extinct volcanoes, with a maximum elevation reaching 2800 feet. The soil is only slightly productive, the larger portion being best adapted for grazing. Tree-growth is almost entirely lacking except in the case of a few fruit and nut trees. Population, in 1900, 11,662. Cabras, on the east coast, has a good harbor.

FÜESSLI, fus'lé, or **FÜSSLI**. A Swiss family, originally from Zurich, several members of which were artists. MATTHIAS, called The Old (1598-1665), the first engraver-painter of the family, studied in Italy, and produced some excellent battle-pictures and portraits. A descendant, JOHANN KASPAR (1707-82), also an artist, painted portraits, but is celebrated for his work on Swiss artists, *Geschichte und Abbildungen der besten Künstler in der Schweiz* (1769-79). Another descendant was JOHANN HEINRICH (1742-1825), born at Zurich, and called in England Henry Fuseli. He studied in Berlin, London, and Italy, and finally made his home in London. In 1786 he painted a series of pictures illustrating Shakespeare, and these were followed in 1799 by forty-nine paintings for *Paradise Lost*. His powerful imagination makes these curious works, often purely metaphysical, very interesting; but he was not a colorist, and he never considered the factor of beauty. He became professor at the Royal Academy, and gave some lectures on art which were in many ways remarkable. He wrote a dictionary of painters, some notes on Swiss art, and a study of Michelangelo. An edition of most of his works was published in Zurich (1808).

FUGA, fōō'gá, FERDINANDO (1699-1784). A prominent Italian architect of the Barocco period, born in Florence in 1699. He worked principally at Rome, where his masterpiece is the Corsini Palace. He then went to Southern Italy, and died while engaged in reconstructing the Cathedral of Palermo.

FUGARA, fōō-gá'rá (It., from *fugare*, to flee). The name of a well-known organ stop of four or eight feet pitch, with metal flue-pipes generally of a small scale. The tone has a sharp, 'stringy' quality.

FUGATO, fōō-gá'tō (It., p.p. of *fugare*, to put to flight). A passage consisting of fugal imitations. Only the entrances of the several voices are given. After the first development is completed the composition continues in the free style. See FUGUE.

FÜGER, fū'gër, HEINRICH (1751-1818). A German painter, born at Heilbronn, Württemberg. He was a pupil of Guibal in Stuttgart, and of Oeser in Leipzig. Afterwards he traveled, and spent some time in Rome. In 1806 he became director of the Belvedere Gallery, Vienna. Among his historical paintings are: "The Death of Germanicus" (1789); "The Murder of Cæsar;" "The Farewell of Coriolanus;" "Allegory on the Peace of Vienna" (1801); "Achilles at the Body of Patroclus;" "Apollo and the Muses;" and among his portraits those of the Emperor Joseph II., the Grand Duchess Elizabeth, and Queen Caroline of Naples. He painted in the classic style of the school of David.

FUGGER, fū'gër. A German family of Augsburg, important in Continental financial history. The founder of the family was JOHANN FUGGER, master-weaver in Graben, near Augsburg, about the middle of the fourteenth century, who married Marie Meissner of Kirchheim. His eldest son, JOHANN, acquired by marriage in 1370 the freedom of Augsburg, and began to carry on a trade in linen together with weaving. By a second marriage in 1382, with the daughter of a councilor, he had two sons and four daughters. This Johann Fugger was one of the council of twelve (*Die Zwölfer*), in the weaving guild, and an assessor of the famous Vehmgericht or secret tribunal of Westphalia. He died in 1409, and left a considerable fortune. His eldest son, ANDREAS, made such good use of his share of the inheritance that he was known as 'the rich Fugger.' He founded a noble line, which died out in 1586. Johann's second son, JAKOB, who died in 1469, was the first of the Fuggers who had a house in Augsburg, and carried on an extensive commerce. Of his seven sons, three, ULRICH, GEORG, and JAKOB II., by industry, ability, and integrity, laid the foundation of the princely prosperity of the family. Its members married into the noblest houses, and were raised by the Emperor Maximilian to the rank of nobles. The Emperor mortgaged to them, for 70,000 gulden, the county of Kirchberg and the lordship of Weissenhorn, and received from them afterwards, through the mediation of Pope Julius II., 170,000 ducats, to assist him in carrying on the war against Venice. ULRICH (1441-1510) devoted himself specially to commerce with Austria, and there was hardly an object that did not enter into his speculations. JAKOB (1459-1525) engaged in mining; he farmed the mines in Tyrol, and accumulated immense wealth; he lent to the Archduke of Austria 150,000 gulden, and built the magnificent castle of Fuggerau, in Carinthia. Under Charles V. the house attained its greatest splendor. Jakob having died childless, and the family of Ulrich being also extinct, the fortune of the house rested with the sons of Georg (died 1506), one of whom, MARKUS, entered the Church. The two younger, RAIMUND and ANTONIUS, carried on the business, and became the founders of the two chief and still flourishing lines of the House of Fugger. The two brothers were zealous Catholics, and with their wealth supported Eck in his opposition to Luther. During the Diet held by Charles V. at Augsburg, in 1530, the Emperor lived in Antonius Fugger's splendid house on the Weinmarkt. On this occasion he raised both brothers to the rank of counts, and invested them with the still mortgaged properties of Kirchberg and Weissen-

horn; and a letter under the Imperial seal conferred on them the rights of princes. In 1535 they received the right of coining money. Antonius, at his death (1560), left 6,000,000 gold crowns in ready money, besides jewels and possessions in all parts of Europe and in both Indies. Ferdinand II. confirmed the Imperial letter of Charles V., and conferred additional privileges on the family. The Fuggers continued to carry on commerce, attained the highest posts in the Empire, and several princely houses prided themselves on their alliance with the House of Fugger. They possessed the most extensive libraries and collections of art, maintained painters and musicians, and liberally encouraged art and science. Ulrich, Georg, and Jakob, the sons of the first Jakob, bought houses in one of the suburbs of Augsburg, pulled them down, and built 108 smaller houses, which they let to poor citizens at a low rent. This was the origin of the 'Fuggerei,' which still remains under the same name, with its own walls and gates. Many other benevolent institutions were set on foot by Antonius and his sons. The race is continued in the two principal lines of Raimund and Antonius, besides collateral branches. The domains are chiefly in Bavaria. A collection of portraits of the most important members of this great house, executed by Dominicus Custos, of Antwerp, appeared at Augsburg (1593, et seq.). This collection, increased to 127, with genealogies written in Latin, was republished by the brothers Kilian (Augsburg, 1618), and in 1754 a new edition of the work, still further improved, and containing 139 portraits, was published at Ulm, under the title *Pinacotheca Fuggerorum*. Consult Stauber, *Das Haus Fugger von seinen Anfängen bis zur Gegenwart* (Augsburg, 1900).

FUGITIVE SLAVE LAW. In the history of the United States, the name of two statutes enacted for the purpose of securing to the slave-owners their rights in slaves who had escaped from the State in which they were held in servitude. Such statutes were directed to the enforcement of Article IV., section 2 of the Constitution, which provides that "persons held to service or labor in one State, under the laws thereof," escaping into another, "shall be delivered up on claim of the party to whom such service or labor may be due." The existence of slavery depended entirely upon the sanction of State laws, and could in no way be affected by Federal laws. If, however, slavery was merely a status dependent upon positive enactment, such status ceased when the slave entered a State where slavery was prohibited. On the other hand, if the master's right in the slave was a property right, the situation was quite different. Property rights were defined by State laws, and the protection of such property rights in all other States was guaranteed by the Federal Constitution. Upon the 'property' theory of slavery, it was thus possible to pass such an enactment as that of February 12, 1793. This gave the owner or supposed owner of a fugitive slave the right to seize the alleged fugitive, to take him before any Federal judge or certain local magistrates, and, upon satisfying the judge or magistrates of his ownership, to secure a warrant for removing the slave, or alleged slave, to the State of the owner's domicile. There was no provision for a jury in this preliminary trial; the warrant might be secured

upon the testimony of the owner alone, and a heavy fine was imposed for obstructing the owner or rescuing or concealing the alleged fugitive. The rigor of the act gave opportunity for considerable laxity in its enforcement, and as soon as the controversy over slavery became acute, efforts were made to amend the act or to nullify its effect. A way toward the latter end seemed to be opened by the decision of the Supreme Court in the case of *Prigg against Pennsylvania* (q.v.), in which it was held that the duty of enforcing the statute rested solely upon the Federal authorities. Thereupon various States passed laws prohibiting State officials from assisting in the enforcement of this Federal statute, and forbidding the use of State jails for such a purpose.

The continued and vigorous demands of the South for a more complete recognition of its rights led to the inclusion in the Compromise Measures of 1850 (q.v.) of a new Fugitive Slave Law, the statute of September 18, 1850. This included many features of the old act, and in addition provided for certain commissioners, with jurisdiction concurrent with that of the courts, who received a larger fee in case they decided in favor of the claimant than if they decided in favor of the fugitive. *Ex parte* testimony was sufficient to determine even the identity of the fugitive; the testimony of the alleged slave was expressly barred, and he was denied a jury trial, even after being returned to the State whence he had fled. The enforcement of the law was placed wholly in the hands of Federal officials, and heavier penalties were imposed upon violators of the law. The extreme anti-slavery element in the Northern States soon forced the issue by refusing to recognize the 'finality' of the Compromise of 1850, and by securing the passage of the so-called 'personal liberty' laws. These prescribed heavy penalties for the seizure of free persons, forbade State officials to aid in enforcing the Federal act, and provided that the fugitive should be entitled to a writ of *habeas corpus*, and to a trial by jury. Other requirements of the State laws served to minimize the effect of the Federal statute, and in some cases almost to nullify it. Ten States passed such laws, and thus afforded the South an available ground of complaint. The second Fugitive Slave Law was finally repealed on June 28, 1864. Consult McDougall, *Fugitive Slaves* (Boston, 1891). See SLAVERY; UNDERGROUND RAILWAY.

FUGLEMAN, fū'g'l-mān (from Ger. *Flügelmann*, file-leader, from *Flügel*, wing, file + *Mann*, man). A term more common in Europe than in the United States and used to denote a soldier posted a little in advance of the body of troops of which he is a part, to give the time to his fellows, in the execution of an order entailing more than one distinct movement. Fixing and unfixing bayonets and drawing or returning swords are instances in point. He is usually a flank man, hence the name.

FUGUE, fūg (Fr., from It. *fuga*, fugue, flight, from Lat. *fuga*, flight, from *fugere*, Gk. *φεβγειν*, *pheugein*, to flee, Skt. *bhuj*, AS. *bāgan*, to bend). In music, the name of a composition wherein the parts do not all begin at once, but follow or pursue one another at certain distances; hence the name *fuga*, a flight or chase, each part successively taking up the subject or mel-

ody. Any voice may begin the fugue, but the others follow according to fixed rules. The *subject* is generally a few bars of melody, which is given out in the principal key by the voice which begins. The subject of a fugue should always be short—three or four bars—so that it impresses itself upon the memory, and can be followed and distinguished in the course of the composition. Also, it must *never* be constructed periodically. (See FORM.) After the subject (*dur*) has been announced, the second voice repeats it a fifth above or a fourth below. It is then called the *answer* (*comes*). The first voice meanwhile proceeds with a counterpoint, as does every successive voice upon the completion of the fugue theme. This counterpoint is constructed so as to afford the composer opportunities for ingenious contrapuntal combinations in the further development of the fugue. The third voice follows with the subject again in the principal key, but an octave higher or lower than the first voice, and is answered by the fourth voice in the same manner as the second voice answers the first. When the subject and answer have been introduced in all the parts, the first section or first *development* of the fugue is said to be completed; an episode of a few bars then follows, sometimes in its form like part of the subject, and with a modulation into a nearly related key. The subject and answer are again brought forward, but following in a different order from the first section; while at the same time all the parts are continued, and in some of them the original counterpoint appears either simply or inverted, the subject and answer forming the predominating idea throughout the whole composition.

This is the second development, and is again followed by an episode. The greater the number of voices that are employed in a fugue, the greater will be the number of development sections. A four-part fugue admits of no less than 24 possible development sections; while in a five-part fugue the composer may use any number of developments out of a possible 120. In extended fugues the composer must exercise all his ingenuity on the episodes, otherwise the frequent repetitions of the development section will tire the hearer. Beginning with the third or fourth development, the answer is often given in another interval than the fifth, so as to avoid monotony. Even transposition into other keys is permissible. Masters of the fugue sometimes give the answer in *inversion*, *augmentation*, or *diminution*. (See the separate articles.) The last development is generally an exhibition of all the composer's contrapuntal art. Bach generally closes with a *stretto* (q.v.), where the subject and answer are crowded together, so that the latter begins before the former is completed. Often the *stretto* is elaborated over an organ-point (q.v.). When the subject does not extend in compass beyond the half of an octave, the answer is invariably made in the other half, and to avoid modulation out of the key, the progression of a fifth is answered by a fourth. A fugue consisting of one subject with a counterpoint throughout is called a *strict fugue*.

When a second subject is introduced in the middle of the composition and afterwards worked up with the first subject, it is then called a *fugue on two subjects*.

A *double fugue* begins at once with two subjects in different parts, both of which are strictly treated throughout.

Frescobaldi, Pasquini. It reached its highest development in the eighteenth century, in the works of Bach (instrumental) and Handel (vocal). Bach's fugues have never been equaled, and are, in fact, musical problems of great depth. He devoted a special work to the subject, *Die Kunst der Fuge* (1749). His *Inventionen* and *Das wohltemperirte Klavier* (1722) are necessary to every pianist, and his *Musikalisches Opfer*, elaborated on a theme given to him by Frederick the Great in 1747, are among his best examples. Handel ranks next to Bach. Cele-

There are also fugues with three subjects (*triple fugue*); a famous example is that in the finale of Mozart's C Major (Jupiter) Symphony. A *free fugue* is that in which the subject and counterpoint are not strictly treated throughout, but mixed up with episodes and ideas not connected with the subject. The fugue is not, as has been erroneously believed, a production of German genius. This form was gradually developed from the canonic tricks of the Dutch masters by the great Italian masters of the sixteenth and seventeenth centuries — Merulo,

brated treatises on fugues are by Mattheson, Marpur, Fux, Albrechtsberger, André, Marx, Lobe, Jadassohn, Cherubini, and Fétis.

FUH-CHOW, fŭ'chou'. See Fu-CHOW.

FUH-HI, or **FO-HI**, fŭ'hĕ'. A legendary or semi-mythical chieftain of China, the first of the Wu-ti or 'Five Rulers,' who emerge in succession from the haze of the purely mythical period of Chinese history, and who were succeeded about B.C. 2356 by Yao, with whose reign the Chinese historical classic known as the *Shu King* opens.

The first year of his reign is usually placed in B.C. 2852, though some make it earlier.

Fuh-hi is the reputed founder of the Chinese nation, and is said to have laid the foundations of civilization among a people who were still little better than beasts, eating raw flesh, clothed with the skins of wild animals, pairing promiscuously, and destitute of even the rudest arts of life. He taught them the arts of fishing, hunting, and pasturage, and instituted marriage, dividing the people into 100 families or clans, to which he gave a name, and ordaining that persons of the same clan should not intermarry, a custom observed in China to the present day.

His own surname was *Féng*, 'wind,' and his birth was miraculous, having been carried in his mother's womb for twelve years. Among many other things, he is reputed to have discovered the elements of writing on the back of a tortoise or dragon, which rose from the waters of the Yellow River. From thence he evolved the *Pak-Kwa* (q.v.), or 'eight trigrams,' which by combination and multiplication form the sixty-four hexagrams, on which is based the text of the *Yih-King*, the oldest book in China, and one of the five *King*, or classics. He died in B.C. 2738, and was succeeded by *Shing-Nung*, the 'Divine Husbandman,' who introduced agriculture, and continued the task of civilizing and uplifting his people. Consult: Mayer, *Chinese Reader's Manual* (Shanghai, 1875); La Couperie, *Western Origin of the Early Chinese Civilization* (London, 1894); and Legge, "The Yih-King," in *Sacred Books of the East*, vol. xvi. (Oxford, 1882).

FÜHRICH, fū'rīk, JOSEPH VON (1800-76). An Austrian historical painter and engraver. He was born at Kratzau, Bohemia, February 9, 1800, and studied under Bergler at the Prague Academy, where he became greatly influenced by the literary works of Schlegel and Tieck, designing fifteen plates for the latter's *Genoveva* before going to Rome. In that city he joined the German Pre-Raphaelites, and while there collaborated with Overbeck, Veit, and Koch, in painting the frescoes in the Villa Massimi. They represented illustrations of Dante's *Divine Comedy*, Ariosto's *Orlando Furioso*, and Tasso's *Jerusalem Delivered*, and reveal in their execution the first note of modern German art. Born and bred a country boy, Führich felt the beauty and influence of landscape as a background to biblical subjects, and the study of Dürer made him lean toward the portrayal of patriarchal scenes. His painting of "Ruth and Boaz" is idyllic in its representation, and his "Jacob and Rachel" is similarly treated. In 1841 he was appointed professor at the Academy in Vienna, but continued many of his important works. For his fresco painted in the Church of Altlerchenfeld, a work which occupied the years between 1854 and 1861, he was knighted and received the decoration of the Order of the Iron Crown. Among his works are "Joshua Before Jericho," the "Mourning Jews," "Christ on His Way to the Mount of Olives," "Peter's Draught of Fish," the "Prodigal Son," and "Mary's Journey Over the Mountain," in the Gallery of Vienna, his best work. At the age of seventy-one he illustrated the legend of Saint Gwendolen. Führich died at Vienna. Consult: His autobiography (Vienna, 1875); and the mon-

ograph by his son Lucas (ib., 1886); also Muther, *History of Modern Painting* (London, 1895).

FUJI-SAN, fō'jē-sān'. See FUJIYAMA.

FUJIWARA, fō'jē-wā'rā. The name of one of the most renowned noble families in Japan, eminent in civil affairs, as the Taira and Minamoto were in military, and the Tatchibana were in religious affairs. The founder was Kamatari, Regent of the Empire A.D. 645-49, reputed to be the twenty-first in descent from his heavenly ancestor who served the great-grandfather of the first Mikado. The family was most powerful at Court from the eighth to the twelfth century, and down to the present time has been notably productive of statesmen, artists, poets, authors, scholars, historians, etc. (Consult Mentchikoff, *Empire du Japon*, vol. i., Geneva, 1881, for a list of these.) The Princess Sada, wife of the Crown Prince of Japan, is of the Fujiwara family, of the fortieth generation in descent from Kamatari, the founder, the eighteenth from Tadamitsu, the founder of the Kujo family.

FUJIYAMA, fō'jē-yā'mā (more correctly FUJI-NO-YAMA, or FUJI-SAN; frequently but incorrectly called FUSUYAMA). The highest mountain of Japan, situated in the Province of Suruga, 60 miles west of Tokio, and visible from fourteen provinces, as well as far out at sea; height, 12,365 feet. It is a volcano, with a crater 500 feet deep, and about 2½ miles in circuit. Tradition says that it rose from the plain in a single night, B.C. 285, while at the same moment Lake Biwa (q.v.), near Kioto, was formed. The last recorded eruption began November 24, 1707, and lasted until January 22d of the following year. A hump called Hō-yeizan (9400 feet), noticeable on its south side, was then produced. As the sacred mountain of Japan, it is annually frequented by many thousands of pilgrims from all parts of the empire. Its summit may be reached by five different paths. Shrines and temples are numerous. Fuji-San is the focus of Japanese legend, the frequent theme of the poet, and a familiar object in Japanese art.

Consult: Chamberlain, *Things Japanese* (London, 1892); Griffis, *The Mikado's Empire* (New York, 1900); Satow and Hawes, *Handbook for Travelers in Central and Northern Japan* (Yokohama, 1881); and the ordinary books of travel.

FU-KIEN, fō'kē-en, or **FO-KIEN**, fō'kē-en'; in the local dialect HOK-KIEN. A maritime province of China, bounded on the north by Che-kiang, on the northwest and west by Kiang-si, on the south by Kwang-tung, and on the east by the Formosa Channel; area, 38,400 square miles; population, about 25,000,000; capital, Fu-chow (q.v.). In 1886 Formosa (now belonging to Japan) was detached from it and made a separate province. The general surface is hilly, in some places quite mountainous, especially along its western boundary. The only comparatively level alluvial tracts are found near the mouths of the great rivers, the Min and the Lung, and their numerous tributaries. The soil is fertile and in a high state of cultivation, producing tea, rice, wheat, barley, sweet potatoes, indigo, and sugar. Quantities of timber are obtained from the mountainous districts of the interior, and floated down the Min to Fu-chow, where it is transhipped to Shanghai and other ports. The manufactures are few.

Tea is extensively grown and exported, and it is a noteworthy fact that the first tea imported into England in 1666 (known as Bohea) came from the Wu-yi (pronounced *boo-he*) in this province.

The Province of Fu-kien has long been noted for its production of porcelain. That produced in the Sung Dynasty (960-1280) was originally made at Chien-an Hien, and is described by an author of the eleventh century as being "invested with a soft black glaze flecked with lighter spots, like the fur of a hare." Fu-kien porcelain of the present day is white instead of black, and is produced at the potteries of Teh-hwa Hien, established in the early part of the Ming Dynasty (1368-1644).

Fu-kien was the great centre of the early trade with the Arabs and Sumatra, and is noted historically for its close relations with the Japanese, and its stubborn resistance to Manchu rule. In our day it is noted for its reformers and 'progressives.'

Its two treaty ports are Fu-chow and Amoy (q.v.). In 1899 another port, San Tu Ao (Sam-sah Inlet), further north, was voluntarily opened to foreign trade by the Chinese authorities.

FUKUI, fōō'kōō'ē. The name of seven or more places in Japan, but especially of the chief city of the Province of Echizen, and the ken or prefecture of the same name. Population of the ken, in 1898, 632,580; of the city, 44,290. Fukui is situated on both sides of the Ashiwa River, five miles from the sea. The chief manufacture is habutai, a thin white silk, the production of which in recent years has reached a value of over \$10,000,000. The city is clean and cheerful, and has had a famous history. In the modern renaissance of the nation, Fukui was one of the first educational centres, and it is at once the stronghold of Buddhism and the seat of thriving Christian missions. Consult Griffiths, *The Mikado's Empire* (New York, 1900).

FUKUOKA, fōō'kōō-ō'kā. A prefectural town of Japan, situated on the northern coast of Kiushiu, about 50 miles from Kokura (Map: Japan, B 7). It has a number of fine streets, an old castle now occupied by a garrison, and a public garden. Population, in 1898, 66,190.

FUKUSHIMA, fōō'kōō-shē'mā. A prefectural town of Japan, situated in the Province of Iwashira, 49 miles by rail from Sendai, and 168 miles from Tokio (Map: Japan, G 5). It lies in a very picturesque region, and is an important centre for trade in raw silk and cocoons. Population, in 1898, 20,624.

FUKUYAMA, fōō'kōō-yā'mā. A seaport of Japan, situated at the southern end of the island of Yezo, over 60 miles from Hakodate (Map: Japan, C 6). It was formerly the seat of the lords of Matsumai, and was the chief outlet for the trade of Yezo. Since the abolition of feudalism the town has lost its commercial importance and has been superseded by Hakodate. It contains a number of interesting temples and has an estimated population of 15,000.

FUKUZAWA, fōō'kōō-zā'wā, YUKICHI (1834-1901). A Japanese author and journalist, born in the Province of Buzen. Going to Yedo (Tokio) in 1858, he was so fortunate as to be invited to accompany Katsu Awa in the first Japanese steamer that crossed the Pacific, remaining

several months in the United States. In 1862 he accompanied a Japanese embassy to Europe and improved his opportunity while in London to purchase a library of foreign books and to improve his knowledge of English. In 1866 he published a work, the first of its kind, in several volumes, called *Sei Yō Jijō* (Western Manners and Customs), which became immensely popular and probably did more than any other publication or event to turn the minds of the Japanese toward Western civilization. He again visited the United States, and on his return was appointed an instructor in the Government College in Yedo, where he continued until the civil war in 1868. He then entered upon that systematic course of literary labor by which, through his books and his newspaper, the *Jiji Shimpō*, he has influenced the reconstruction of Japanese literary style. He wrote on an amazing variety of subjects, criticising old Japanese traditions, opinions, and customs, opened lecture halls and helped to form the scholarly Meï Roku Sha, or Society of the Sixth Year of Meïji (1874). On the thirtieth anniversary of the Emperor's accession to the throne, Fukuzawa, having steadfastly declined all offers of Government office as well as a title of nobility, was honored by the Emperor with a gift of 50,000 yen. He died February 3, 1901. Consult Chamberlain, *Things Japanese* (London, 1891).

FULAH, fōō'la (or *Pulo*, plural *Fulbe*). An important Hamite-Negro people on the upper Senegal River in "Futa-Toro and Futa Jallon in compact masses; elsewhere in scattered groups from Senegambia east to Darfur, and south to Adamawa." They are of good stature (1.75 m.) and light brown or copper color, having long heads (index 74.3), Caucasoid features, black and frizzled, but not woolly, hair, and negroid speech. There are four great branches of the Fulah, the *Jel*, the *Baa*, the *So*, and the *Beri*, and many tribes in each. Their name undergoes many changes in the mouths of their neighbors, being variously known as Fula (Mandingan), Fulaji, Fellani (Hausa); Fulata, Fellata (Kanuri); Fullan (Arab); Ufut, Ifulan (Southern Tuaregs); Afellen, Ifellen (Northern Tuaregs); Peul, Poul (French); Fulah (English). In the term Fulah-Zavdeh are sometimes included all peoples resulting from the mixing of Ethiopians with Sudanese Negroes, extending from east to west across the whole of Africa over a belt of five to six degrees in width.

FULBERT, ful'bar' (c.950-1029). A French bishop and scholar. He was a charity student in the school at Rheims under Gerbert, and afterwards was connected with the Church of Chartres. Here he taught, and under his direction the schools of the Academy of Chartres attained a European reputation. In 1007 he was elected Bishop of Chartres. He caused the burned cathedral to be rebuilt (1020), and part of the present edifice dates from his episcopate. He was an active participant in the political affairs of the time, and was on intimate terms with King Robert. His correspondence has been published in volume 141 of the *Patrologiæ* of Migne, and is contained in his *Opera Omnia* (1853). It is a valuable history of those days, and shows the bishop to have been a man of character and piety.

FULCO, or **FOULQUES**, 1061k, of NEUILLY. A famous pulpit orator of the twelfth century, the preacher of the Fourth Crusade. His early life was careless, and his ignorance brought him into contempt in his parish of Neuilly, just outside the walls of Paris. A change came over him, however, and he became an austere ascetic. He commenced a series of journeys as a preacher, exhorting to repentance, and by the rigor of his asceticism enforcing his sermons. He began to preach the Crusade in 1198. In 1201 he asserted that he had induced 200,000 to accept the Cross. He did not live to hear of the result, for he died at Neuilly, March, 1202. Consult Villehardouin, *La conquête de Constantinople*, edited by Wailly (Paris, 1874).

FULDA, ful'dā. The capital of a circle in the Prussian Province of Hesse-Nassau, situated on the river Fulda, 69 miles by rail northeast of Frankfort (Map: Prussia, C 3). The most prominent buildings are the noble cathedral erected at the beginning of the eighteenth century, containing the remains of Saint Boniface; the Church of Saint Michael, consecrated in 822; the old palace of the prince-bishops, and the former Benedictine convent. The Catholic gymnasium of Fulda is believed to be the oldest establishment of its kind in Germany. The manufactures include different kinds of textiles, plush, leather, metal goods, farm machinery, musical instruments, vinegar, and many other important products. Fulda is an important cattle market. Population, in 1890, 13,000; in 1900, 16,900. The town figures in religious history, being especially identified with the life of Saint Boniface, who founded an abbey here in 744. In the eighteenth century it was the seat of a university. It has belonged to Prussia since 1866.

FULDA, MONASTERY OF. One of the most famous of the Benedictine abbeys in Germany. It was founded in 744 by Boniface, the apostle of Germany, who desired to establish safe headquarters for further missionary efforts. A grant of the spot, with four miles of surrounding territory, was obtained from Karlmann, son of Charles Martel. Boniface superintended the clearing of the ground and erection of the building, while his disciple Sturm, destined to be the first abbot, spent a year in Italy, visiting the monasteries, and studying the mode of life pursued at the celebrated Benedictine convent of Monte Cassino. The abbey soon became a centre of education and civilization for the surrounding tribes, and for centuries maintained its position as a place of learning, to which, for example, Alcuin looked for help in his great educational schemes. Many privileges were given to it; in 968 the abbot was made primate of the abbeys of Germany, and he was later created a prince of the Empire. But with the advance in influence and wealth there was an increasing corruption in many of the monasteries, and from this Fulda did not escape. At the beginning of the eleventh century a reform was attempted by substituting new monks from Scotland for the old, and reestablishing in all its strictness the Benedictine rule. The Reformation of the sixteenth century brought discord into the community; but Balthasar von Dermbach (abbot

1570-1606) effected the suppression of the new doctrines. Abbot Schenk von Schweinsberg (1623-32) completed the work of reformation, supported by Pope Urban VIII. In 1626 he brought seventeen monks from Saint Gall to set a good example. With the election of Joachim von Gravenegg, in 1654, the abbey entered upon a new period of prosperity. Benedict XIV., in 1752, created the Abbot Prince Bishop of Fulda. The diocese was secularized in 1802, to be restored, with somewhat different boundaries, in 1829. The buildings of the old monastery were occupied by a clerical seminary, which was one of the first points of attack in the *Kulturkampf* of 1874. Consult: Arnd, *Geschichte des Hochstifts Fulda* (Frankfort, 1862); Hartmann, *Zeitgeschichte von Fulda* (Fulda, 1895).

FULDA, LUDWIG (1862—). A German dramatic author, born at Frankfort-on-the-Main. He studied at Heidelberg, Berlin, and Leipzig, and in 1882 obtained a prize in competition by his one-act verse comedy, *Die Aufrichtigen* (1883). After the appearance of a series of comedies, including *Ein Meteor* (1887) and *Die wilde Jagd* (1888), he assumed the manner of the so-called Berlin School of Realism. In 1893 he won the Schiller prize with his *Der Talisman* (1892), but the Emperor refused to approve the award. Subsequent works are *Jugendfreunde* (1897) and *Die Zwillingsschwester* (1901), an English version of which by Louis N. Parker was presented in America. Fulda's verses are distinguished by their epigrammatic wit and his plays are skillfully contrived. He translated Rostand's *Les Romanesques* and *Cyrano de Bergerac*.

FULGENTIUS, fül-jën'shí-ús, FABIUS PLACIDIUS (c.480-c.550). An African grammarian, of whose life and personality nothing is known save from internal evidence. His style is typically African. Besides a *Liber de Ficticiis Poetarum* and *Liber Physiologus*, both now lost, he wrote: *Mythologicon Libri III.*, with etymological explanations after the manner of Martianus Capella; *Expositio Vergilianæ Continentiæ*, which interprets the Æneid allegorically; a history, *De Etatibus Mundi*; and the very untrustworthy *Expositio Sermonum Antiquorum*, which contains many fictitious quotations. Helm edited *Fulgentii Opera* (1898). His relative Fulgentius (468-533), Bishop of Ruspe, is not to be confused with him.

FULGENTIUS, SAINT, OF RUSPE (468-533). A Latin Christian Father. He was born at Telepte, Northern Africa, of senatorial family. He received a good education, and became first procurator of his province. Disturbed by the turbulence of the times, he retired to a monastery near Telepte. Persecution drove the monks elsewhere, and Fulgentius went to Rome in 500. Returning to Africa, he founded a monastery. He was made Bishop of Ruspe in 508. About 510 he was banished, and again in 515, and suffered other persecutions from the Vandal King Thrasimund (496-523). On the death of the King he was recalled and passed his later years in peace. He died at Ruspe, January 1, 533, and is commemorated on that day by the Catholic Church. Fulgentius was

an ardent admirer of monasticism and a rigorous ascetic; he was recognized as one of the ablest defenders of Christianity against Arianism and Pelagianism. His works are in Migne, *Patrol. Lat.*, lxx. His life by his pupil, Fulgentius Ferrandus (c.540), is contained in Migne, *Patrol. Lat.*, lxxvii. His letters have been edited by Hurter (Innsbruck, 1884). Consult Mally, *Das Leben des heiligen Fulgentius* (Vienna, 1885).

FULGURITE, fŭl'gŭ-rit (from Lat. *fulgur*, lightning, from *fulgere*, to flash; connected with *flagare*, to blaze). A name given to tubes or pipes found in rocks and sands and formed by the actual fusion of these materials by lightning. Such tubes may have a diameter of from one to two inches at the surface, but as they descend in a vertical or oblique direction they branch and rapidly lessen in size. They are commonly found in such regions as are visited by frequent and violent storms, often on mountain peaks.

FULHAM, fŭl'am. A metropolitan borough of London, England, formerly a suburban village, six miles southwest of Saint Paul's Cathedral, on the left bank of the Thames, opposite Putney, with which it is connected by two bridges (Map: London, E 6). Its distinction dates from the reign of Henry VII., when it was chosen as the summer residence of the Bishop of London. The episcopal palace, an extensive brick building, parts of which date from the sixteenth century, stands in fine grounds girded by a moat, one mile in circuit. The parish church, restored in 1881, with a picturesque perpendicular tower of the fourteenth century, contains the tombs of several bishops of London. The borough maintains electric lighting, public libraries, baths, hospitals, and charitable institutions. Population of borough, in 1891, 189,073; in 1901, 249,534.

FULK, FULC, or FOULQUES. The name of several counts of Anjou. **FULK II.** (938-58), called "the Good," is remembered for his saying that "An illiterate king is a crowned ass." **FULK III.**, called "the Black" (972-1040), became count in 987. He was a successful and indefatigable warrior, but was renowned chiefly for his repeated pilgrimages to the Holy Land, whither he went as a penance for his many crimes. **FULK V.**, called "the Young" (1090-1142), became count in 1109. In 1129 he went to Jerusalem, where he married Melisande, the daughter of King Baldwin II. In 1131 he succeeded his father-in-law as King, and reigned until 1143.

FULKE, WILLIAM (1538-89). A Puritan controversialist. He was born in London, graduated from Cambridge, and began the study of law, but gave it up for theology. He became fellow of his college (Saint John's) in 1564, rector of Warley and Dennington in 1569, and master of Pembroke Hall, Cambridge, 1578. He was a Puritan of the most extreme type and particularly delighted in controversy. His *Defense of the Sincere and True Translations of the Holy Scriptures into the English Tongue Against the Cavils of Gregory Martin* (1583); *Stapleton's Fortres Overthrown* (1580); *Rejoinder to Marttall's Reply Against the Answer of Martin Calfhill* (1580); and *Discovery of the Dangerous Rock of the Popish Church* have been reprinted by the Parker Society, with a memoir (Cambridge, 1843-48).

FULLER, ANDREW (1754-1815). An English

Baptist minister, controversial writer, and promoter of foreign missions. He was born at Wicken, Cambridgeshire, February 5, 1754. He received the rudiments of an education at the free school of Soham, and in 1775 was chosen pastor of the Baptist congregation of that place. In 1782 he removed to Kettering, Northamptonshire, to take the pastorate of a congregation there, and remained there till his death, May 7, 1815. His first interest in foreign missions was shown in 1784, and his sermon, *The Gospel of Christ Worthy of All Acceptation* (Northampton, 1785), greatly impressed Carey, the first Baptist missionary. When the Baptist Missionary Society was formed at Kettering in 1792, he became its secretary, and gave the remainder of his life to its affairs. His writings were very popular; they include: *The Calvinistic and Socinian Systems Examined and Compared as to Their Moral Tendency* (1794); *The Gospel Its Own Witness* (1799); *An Apology for the Late Christian Mission to India* (1808). There are several editions of his collected works. For his biography, consult: Rylands (London, 1816); T. E. Fuller (London, 1863); and A. G. Fuller (London, 1882).

FULLER, ARTHUR BUCKMINSTER (1822-62). An American Unitarian clergyman. He was born at Cambridgeport, Mass., graduated at Harvard College in 1843, and studied theology in the Harvard Divinity School. He was a teacher and preacher in Illinois, and pastor at Manchester, N. H., Boston and Watertown, Mass. He volunteered in the Federal Army in the Civil War, was made chaplain in a Massachusetts regiment, and was killed at Fredericksburg. He was a brother of Margaret Fuller (Marchioness d'Ossoli), and edited several of her works (1855). Consult: R. E. Fuller (his brother), *Life of Arthur B. Fuller* (Boston, 1863), and a sketch by Higginson in *Harvard Memorial Biographies*, vol. i. (Cambridge, Mass., 1866).

FULLER, GEORGE (1822-84). An American figure, portrait, and landscape painter, born at Deerfield, Mass. From 1836 to 1838 he was in Illinois with a party of civil engineers, and was associated with Henry Kirke Brown, the sculptor. Returning to Deerfield, he completed his education in four years, giving considerable attention to portrait painting. In 1842-43 he studied with Brown in Albany. He spent several years in Boston, portrait painting, then removed to New York, and continued his studies at the Academy. He was elected associate of the National Academy in 1867, upon an exhibition of a portrait of his first master, Henry Kirke Brown. He went South for three years, making many studies of negro life. In 1860 he went to Europe. He returned to Deerfield, where he combined his interests as an artist and farmer. In 1876 he exhibited fourteen pictures in Boston which were received with enthusiasm. This was followed by frequent exhibitions at the Academy. In 1879 Mr. Fuller showed the "Romany Girl," and "She Was a Witch." In 1880, the "Quadroom"; and in 1881, the loveliest of all his works—the "Winifred Dysart." "Turkey Pasture in Kentucky" is one of his finest examples. The subjects of Fuller's pictures are extremely simple, conceived in a pictorial spirit. His landscapes are not so much definite pictures of localities as idealized studies of color, light, and foliage, with a poetic expression of sun and

shadow. He preserved all the large lines of form, sacrificing the minor details to the beauty of the whole. The essence of his art was selection. Fuller was the forerunner of a new tendency in art, that of the Idealistic School.

FULLER, HENRY BLAKE (1857—). An American novelist and story-writer, born in Chicago. His first story, *The Chevalier of Pensierivani*, was published anonymously, won favor in the eyes of Professors Norton and Lowell, and, on its republication (1892), became popular. In the same year appeared *The Chatelaine of La Trinité*. Both were remotely romantic. *The Cliff Dwellers* (1893) was an essay in relentless realism. This picture of Chicago life was followed by another, *With the Procession* (1895), kindlier in touch, with humor playing over its seriousness, and *Sicilian Romance* (1900). He has also written twelve one-act plays collected in *The Puppet Booth*.

FULLER, LOIE. An American actress, noted for her invention of the 'Serpentine Dance.' She was born near Chicago, and as a child appeared at the Academy of Music there. Subsequently she appeared in a variety of characters (including Ustane in *She*) before devoting herself to her specialty. She has in recent years resided chiefly in Paris, where she has appeared at the Folies-Bergère, and in 1900 in a theatre of her own.

FULLER, MELVILLE WESTON (1833—). An American jurist, born in Augusta, Me. He graduated at Bowdoin College in 1853, studied at the Harvard Law School, began legal practice at Augusta in 1855, and was also there for a time an associate editor of *The Age*, a Democratic newspaper. In 1856 he was president of the Augusta Common Council and city attorney, but in the same year resigned his offices and established himself at Chicago, Ill. He was a member of the Illinois State Constitutional Convention of 1862, and in 1863 sat in the Lower House of the Illinois Legislature. In 1864, 1872, 1876 (when he placed T. A. Hendricks in nomination), and 1880, in which year he withdrew from active politics, he was a delegate to the Democratic National Convention. As a lawyer he attained prominent rank, and in 1888 he was appointed by President Cleveland Chief Justice of the United States Supreme Court, to succeed M. R. Waite (q.v.), deceased. His term witnessed an expansion of the Federal powers by means of the decision asserting the implied authority of the Executive to protect the Federal judges on occasions when there is just reason to believe that, while in the exercise of official duties, they are exposed to personal danger. In 1899 he was a member of the Arbitration Commission convened at Paris for the adjustment of the Anglo-Venezuelan boundary question. The degree of LL.D. was conferred upon him by Harvard in 1891.

FULLER, RICHARD (1804-76). An American clergyman. He was born in Beaufort, S. C., studied at Harvard, was admitted to the bar, and subsequently entered the Baptist ministry. From 1846 until his death he was pastor of the Seventh Baptist Church in Baltimore. He published *Letters on the Roman Chancery; Correspondence on Domestic Slavery; and Baptism and Communion*. Consult Cuthbert, *Memoir of Richard Fuller* (New York, 1879).

FULLER, SARAH MARGARET (OSSOLI) (1810-50). An American critic and essayist, born at Cambridgeport, Mass., May 23, 1810. The eldest of the eight children of Timothy Fuller, a Massachusetts lawyer and politician, she was strenuously educated by her father, by Dr. Park of Boston, and in the Misses Prescott's School of Groton, beginning Latin at six and Greek at thirteen, and permanently injuring her health by over-application. On the death of her father (1835) she supported her brothers and sisters by public and private teaching in Boston and Providence. She was a frequent guest at Brook Farm, though never sharing its enthusiasms, held intellectual conversations in Boston, conducted the Transcendental organ, *The Dial* (1840-42), made translations from the German, and published in 1844 her first volume, *Summer on the Lakes*, the record of a season of travel in 1843. In December (1844) she went to New York as literary critic of the *Tribune*, taking active part in the philanthropic, literary and artistic life of the city. In 1846 she went to Europe, residing for some time at Rome, where she married (December, 1847) Giovanni Angelo, Marquis d'Ossoli, by whom she had one child. She took an active part in the Italian struggle for independence, and served heroically in the hospitals during the French siege of Rome. On its capture (July, 1849) she took refuge with her husband first in the mountains of Abruzzi, then at Florence, and on May 17, 1850, sailed for America, but with her husband and son was drowned off Fire Island Beach just as they were approaching New York on July 16.

Her life falls naturally into three periods. Till 1844 she lived an intense life seeking self-culture in the exciting stimulation of the Transcendental circle. The two years from 1844 till her visit to Italy are those of original literary production. *Women in the Nineteenth Century* (1844) and *Papers on Literature and Art* (1846) are its monuments. Her activities in Rome found a literary expression in a book on the Roman Republic, the manuscript of which was lost with her. With all her tact and brilliancy, she was not an original genius; she needed the inspiration of an audience, talking better than she wrote. Her *Letters* are, therefore, the most readable of her works, and the position that she held in Boston and in New York is hardly to be understood from her writings. It was a natural instinct that led her to select for translation Eckermann's *Conversations with Goethe* (1839) and *The Correspondence of Fräulein Gündert and Bettina von Arnim* (1840-42). The impression that she made upon the circle of her intimates is attested by three notable biographies, for which consult: Emerson, Clarke, and Channing (Boston, 1852); Julia Ward Howe (ib., 1883); and Thomas Wentworth Higginson (ib., 1884). There is also a *Memoir* by her brother, Arthur B. Fuller (Boston, 1855).

FULLER, THOMAS (1608-61). An English author and divine. He was born at Aldwincle, Northamptonshire, of which parish his father was rector, and was educated at Queen's College, Cambridge, graduating A.B. in 1625 and M.A. in 1628. Two years later he was appointed to the curacy of Saint Benet's. The next year he was collated to a prebend in Salisbury Cathedral, and in 1634 he was appointed to the rectory of

Broadwindsor, Dorsetshire. Abandoning both his living and his prebend in 1641, he settled in London, where he soon became curate of the Savoy, a church in the Strand. In the meantime he had published an account of the Crusades, entitled *History of the Holy War* (1639), and the *Holy and Profane State* (1642), the most characteristic of his works. During the Civil War he adhered firmly to the Royal cause, and shared in its reverses. He was a chaplain in the Royal army, when he wrote for the encourage-

Cretaceous beds, and it was at one time considered so valuable that its exportation from England was prohibited under severe penalties. A variety of fuller's earth, known as cimolite, occurs in the island of Argintiera, Greece, and has been mined since ancient times. More recently fuller's earth deposits have been discovered near Quincy, Fla.; Fairburn, So. Dak.; and at other localities in the United States. The following analyses of fuller's earth show the composition of the material: 1 is from Reigate,

	SiO ₂	Al ₂ O ₃	Fe ₂ O ₃	CaO	MgO	Na ₂ O	K ₂ O	H ₂ O	Moisture
1.....	52.81	6.92	3.78	7.40	2.2774	14.27
2.....	62.83	10.35	2.45	2.43	3.12	.20	.74	7.72	6.41

ment of his men a manual of prayers and meditations entitled *Good Thoughts in Bad Times* (1645), and a sequel, *Better Thoughts in Worse Times* (1647). About 1648 he was presented to the living of Waltham, in Essex. In 1650 he published a geographical account of the Holy Land, entitled *A Pisgah Sight of Palestine and the Confines Thereof*, with maps and views. In 1655 appeared *The Church History of Britain, from the Birth of Christ Until the Year 1648*. In 1658 he received the living of Cranford, Middlesex, and at the Restoration he was reinstated in his prebend of Salisbury, of which he had been deprived by the Parliamentarians. He was also appointed Chaplain Extraordinary to the King. He died in London. The next year (1662) appeared *The Worthies of England*, valuable for the information it contains on provincial history, and abounding in biographical anecdote, witty remark, and acute observation on men and manners. Quaint humor is one of Fuller's peculiar characteristics; but his writings are no less remarkable for wisdom, imagination, and, when occasion demands, even for pathos. Consult Bailey, *Life of Thomas Fuller, with Notices of his Books*, etc. (London, 1874).

FULLER-MAITLAND, JOHN ALEXANDER (1856—). An English writer on music, born in London. He graduated at Trinity College, Cambridge, in 1879, and, after having contributed for a number of years to the London papers, became in 1889 music critic of *The Times*. He wrote many articles for the *Dictionary of National Biography*, for *Grove's Dictionary of Music and Musicians* (the appendix of which he edited), and for some of the leading periodicals. He also wrote a standard life of Schumann in the "Great Musicians Series" (1884); *Master of German Music* (1894); *The Musician's Pilgrimage: A Study in Artistic Development* (1899); and was joint translator with Clara Bell of Spitta's *Life of J. S. Bach* (1884). In addition he compiled a number of collections of music:

FULLER'S EARTH (AS. *fullere*, from Lat. *fullo*, fuller). A material resembling clay in appearance, but commonly lacking plasticity. It is fine-grained, of variable color, and has a specific gravity of from 1.8 to 2.2. It derives its name from the fact that its principal use once was for fulling cloth and wool, that is, cleansing these materials of grease. At the present day a much more important application is for clarifying cottonseed and lubricating oil, by filtering them through the earth, which absorbs the impurities. Fuller's earth was originally mined only in England, especially at Nutfield, near Reigate, in Surrey, where it occurs in

England, and 2 from Quincy, Fla. The output of fuller's earth in the United States in 1900 was 11,813 short tons, valued at \$70,565. Consult: "Mineral Resources of the United States," issued by the *United States Geological Survey* (Washington, annually).

FULLER'S THISTLE. See TEASEL.

FULLERTON, Lady GEORGIANA (1812-85). An English novelist and philanthropist, daughter of the first Earl of Granville. She was born at Tixall Hall, Staffordshire, and in 1833 married Alexander Fullerton. In 1844 she published her first novel, *Ellen Middleton*. Her second work, *Grantley Manor*, was written in the interest of the High Church party. In 1846 she entered the Roman Catholic Church, and afterwards published a number of controversial novels, chief among which are: *Lady Bird* (1852); *Too Strange Not to be True* (1864); and *Constance Sherwood* (1865). After 1854 she devoted much time to charity. Consult Coleridge, *The Life of Lady Georgiana Fullerton*, translated from the French of Mme. Augustus Craven (London, 1888).

FULMAR (special use of *fulmar*, *fulmart*, *foulmart*, polecat, from AS. *fúl*, Eng. *foul* + OF. *marte*, Fr. *martre*, from OHG. *mardar*, Ger. *Marder*, AS. *mearps*, Eng. *marten*). Any of several species of strictly oceanic petrels. (See PETREL.) The common northern fulmar (*Fulmarus glacialis*), the 'malle-muck' of sailors, is a bird about the size of a duck, gray above, white beneath; head, neck, and tail pure white; bill yellow; the young are brownish gray. It inhabits the most northern seas, in which its numbers are prodigious, breeds on the rocky shores of the Faroe Islands, Iceland, Greenland, Spitzbergen, etc., on the grassy shelves of the precipices, making a slight nest or a mere excavation, in which it lays one egg. It is rarely to be seen on the United States coast south of Massachusetts, or on the southern coasts of Great Britain, but breeds in great numbers in Saint Kilda and adjacent islets. It is extraordinarily abundant about these isles, and is of importance to the inhabitants of Saint Kilda, who esteem its eggs and flesh above those of any other bird, and gather them in the most perilous manner, descending by ropes from the summit of the precipices. The fulmars are also valued for their feathers, down, and oil; the last is one of the principal products of Saint Kilda, and is obtained from their stomachs. The old are said to feed the young with it, and when they are caught or assailed these birds lighten themselves by disgorging it. It is amber-colored, and

has a peculiar and nauseous odor. Fulmars feed on all animal substances which come in their way, giving an evident preference to fat and delighting in the blubber of whales. Another important species is the giant fulmar (*Ossifraga gigantea*), notable for its size, which equals that of a small albatross. It is found in the Pacific Ocean, and is known to sailors as 'bone-breaker,' because of the observed crushing power of its great hooked beak. The slender-billed fulmar (*Fulmarus glacialis*) is a very widely ranging form which occurs on the Alaskan coast of Bering Sea. It is of the same size as the common fulmar, but the bill is much longer and more slender. Several of the fulmars are remarkable for their dichromatism. See Plate of FISHING BIRDS.

FULMINE OF MERCURY (from Lat. *fulminare*, to lighten, from *fulmen*, lightning, from *fulgere*, to flash), or FULMINATING MERCURY, $C_2HgN_2O_2 \cdot \frac{1}{2}H_2O$. A highly explosive crystalline organic compound, sparingly soluble in cold water, freely soluble in hot water. It is obtained by dissolving mercury in an excess of nitric acid, and gradually adding the solution to alcohol. The operation is attended with considerable danger and should not be conducted in the neighborhood of flames, as the vapors evolved during the reaction are very inflammable. On cooling, fulminating mercury separates out in crystalline form. When moist, it may be handled without much danger; but when dry, it explodes with violence if struck by a hard body or if heated. Mixtures of fulminating mercury with nitre or with chlorate of potash are employed as the primary of percussion caps.

FULMINE OF SILVER, or FULMINATING SILVER, $C_2AgN_2O_2$. A chemical compound, prepared by heating an aqueous solution of silver nitrate with nitric acid and alcohol. It is more powerfully explosive than the fulminate of mercury; for even if it is moist or under water, pressure with a hard body will cause its explosion; and when it is quite dry, the slightest friction between two hard bodies produces a similar result.

FULMINATES. A term applied to a class of salts having the same percentage composition as the cyanates, but, unlike them, exploding violently when heated or struck. There are many fulminates, corresponding to the different metals. The preparation of the fulminates is attended with very considerable danger and should not be attempted by inexperienced persons. The structural formulas at present usually assigned to the acid ('fulminic acid,' $C_2H_2N_2O_2$) combined in the fulminates are:

This acid has not yet been isolated in the uncombined state.

FULMINIC ACID. See FULMINATES.

FULTON. A city in Whiteside County, Ill., 36 miles northeast of Rock Island, on the Mississippi River, and on the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, and the Chicago, Burlington and Northern railroads (Map: Illinois, B 2). It is the seat of the North-

ern Illinois College, opened in 1865. There are manufactures of lumber, clay pipe, stoves, metal roofing and siding, etc., and an extensive trade in grain, lumber, and produce. Population, in 1890, 2099; in 1900, 2685.

FULTON. A city and the county-seat of Callaway County, Mo., 120 miles west of Saint Louis, on the Chicago and Alton Railroad (Map: Missouri, E 3). It is the seat of the State Institution for the Deaf and Dumb, State Lunatic Asylum No. 1, Westminster College (Presbyterian), founded in 1852, Synodical College, and Conservatory of Music for Young Ladies, founded in 1874, and the William Woods College of the Christian Church of Missouri. The city has an extensive supply of coal and fire-clay of excellent quality, and manufactures fire-brick and pottery of various kinds. Settled in 1821, Fulton was incorporated in 1859, the charter of that date being still in operation. Its government is administered by an annually elected mayor and a council elected on a general ticket. Town meetings are held monthly to discuss topics of general civic interest. The city owns and operates its water-works and electric-light plant. Population, in 1890, 4314; in 1900, 4883.

FULTON. A city in Oswego County, N. Y., 25 miles northwest of Syracuse, on the Oswego River, the Oswego Canal, and the New York Central, the Lackawanna, and the New York, Ontario and Western railroads (Map: New York, D 2). It has a public library. The city carries on an extensive trade in cheese, and there are manufactures of flour, woolen goods, paper pulp, firearms, tools, pocket cutlery, butchers' supplies, excelsior, water-motors, ensilage and straw cutters, paper-mill machinery, condensed milk, canned goods, etc. Population, in 1890, 4214; in 1900, 5281. Fulton was settled about 1791, and was first incorporated in 1835. In April, 1902, the villages of Fulton and Oswego Falls, with an aggregate population of 8206 (census of 1900), were consolidated and chartered as a city, the government of which is administered by a mayor and common council. The water-works are owned and operated by the municipality.

FULTON. The first steam war vessel, designed by Robert Fulton, and built in New York in 1815. The *Fulton* was a vessel of 38 tons, provided with central paddle-wheels. She was accidentally blown up in 1829.

FULTON, JUSTIN DEWEY (1828-1901). An American clergyman. He was born in Earlville, N. Y.; graduated at Rochester University in 1851, studied in the Rochester Theological Seminary, and was ordained in 1854 to the Baptist ministry in Saint Louis, where he was editor of the *Gospel Banner*. Subsequently he had pastoral charges in Sandusky, Ohio; Albany; Boston; Brooklyn, N. Y.; and Montreal, Canada. Among his works are: *Roman Catholic Elements in American History* (1859); *Woman as God Made Her* (1867); *Rome in America* (1884); *Radicalism*; and *The Sabbath*.

FULTON, ROBERT (1765-1815). A celebrated American engineer, born at Little Britain, Pa., of Irish parents, who were in such poor circumstances that all the education young Fulton acquired was the ability to read and write. He made good use, however, of his opportunities and passed in study the time allowed him for recrea-

tion. At an early age he was apprenticed to a jeweler in Philadelphia, and in addition to devoting himself to this trade, he applied himself to painting. The sale of his portraits and landscapes enabled him, in the space of four years, to buy a small farm, on which he placed his widowed mother. At the age of twenty-two he proceeded to London, where he studied painting under Sir Benjamin West; but after several years thus spent he abandoned painting to devote himself wholly to mechanics. Some works that he executed in Devonshire obtained for him the patronage of the Duke of Bridgewater and of the Earl of Stanhope. In 1794 he obtained from the British Government a patent for an inclined plane, the object of which was to displace canal locks, and in the same year he invented a mill for sawing and polishing marble. His next invention was a machine for spinning flax, followed by one for making ropes. He was received as a civil engineer in 1795, and wrote a work on canals, in which he developed his system and ideas. Accepting an invitation from the United States Minister at Paris, he proceeded to that city in 1796, and remained there for seven years, devoting himself to new projects and inventions. Among the inventions developed here was the *Nautilus*, or submarine boat, carrying torpedoes, invented to be used in naval warfare; but he was unable to secure its adoption by either the French, British, or United States Government. He next turned his attention to a subject that had frequently occupied his mind before, and about which he had written a treatise in 1793, viz. the application of steam to navigation.

In 1803 he constructed a small steamboat, and his experiments with it on the Seine were attended with great success. The French Government, however, did not give him any encouragement, but he had the coöperation of Robert Livingston, the Minister of the United States to France, who assisted Fulton in his experiments. Returning in 1806 to New York, Fulton superintended the construction of a larger steamship provided with an English engine. In 1807 he launched the *Clermont* upon the Hudson, which started off on her trip to Albany in the presence of thousands of astonished spectators. At the beginning the average speed was only about five miles an hour, which was considered a great achievement. From this period steamers, for the use of which on the waters of New York State Fulton and Livingston were granted a monopoly by the Legislature, came into general use upon the rivers of the United States. Although Fulton was not the first to apply steam to navigation, as a steam-vessel had been tried upon the Forth and Clyde Canal as early as 1789, and by Rumsey and Fitch in America in 1786-87, yet he was the first to do so with any degree of success. His reputation as an engineer and inventor was now firmly established, and he was employed by the United States Government in the execution of various projects with reference to canals and other engineering works. In 1814 he obtained the assent of Congress to construct a steam-frigate, which was launched in the following year. Though the labors of Fulton were attended with such great success, various lawsuits in which he was engaged in reference to the use of some of his patents prevented him from ever becoming

wealthy; and anxiety, as well as excessive application, tended to shorten his days. His death in New York, February 24, 1815, produced extraordinary demonstrations of mourning throughout the United States. He married, in 1806, a niece of Robert Livingston, United States Minister to France. His published works included: *A Treatise on the Improvement of Canal Navigation* (1796); *Letters on Submarine Navigation* (1806); *Torpedo War* (1810); *Letter to the Secretary of the Navy on the Practical Use of the Torpedo* (1811); *Report on the Practicability of Navigating with Steamboats on the Southern Waters of the United States* (1813); *Memorial of Robert Fulton and Edward P. Livingston in Regard to Steamboats* (1814); *Advantages of the Proposed Canal from Lake Erie to the Hudson River* (1814). Consult: Thurston, *History of the Growth of the Steam Engine* (New York, 1878); Colden, *Life of Robert Fulton* (New York, 1817); Reixart, *Life of Fulton* (Philadelphia, 1856); Knox, *Fulton and Steam Navigation* (New York, 1886).

FULVIA. Daughter of M. Fulvius Bambalio of Tusculum. She married first P. Clodius, and their daughter afterwards became the wife of Octavianus (Augustus). In B.C. 44 she married Marcus Antonius, with whom she was deeply in love, and into all whose ambitious plans she entered with enthusiasm. Cicero was murdered in 43, and when his head was brought to Antonius, Fulvia is said to have pierced with her needle, in vindictive spite, the tongue that had uttered so many reproaches against her husband. But Antonius in the East fell into the snares of Cleopatra, and Fulvia attempted to stir up a riot in order to secure his recall to Rome, but failed and was banished from Italy. At Athens Fulvia and Antonius met, and he reproached her so bitterly for her part in political affairs that she retired to Sicyon in despair, and died there shortly after (B.C. 40).

FUMAGE (OF. *fumage*, ML. *fumagium*, fuel, from Lat. *fumus*, smoke). In the law of England, a chimney tax, commonly called smoke-farthing. This tax is mentioned in Domesday as paid by custom to the King for every chimney in the house. Edward, the Black Prince, is said to have imposed a tax of a florin for every hearth in his French dominions. The first statutory enactment on the subject in England is 13 and 14 Car. II., ch. 10, whereby a tax of 2s. on every hearth in all houses paying to Church and poor was granted to the King forever. This tax was abolished in 1689.

FUMARIA'CEÆ (Neo-Lat. nom. pl., from *Fumaria*, from Lat. *fumus*, smoke). An order of herbaceous plants with watery juice; alternate, much divided leaves; calyx of two deciduous sepals; corolla of four very irregular, white, yellow, pale red, crimson, or purplish petals; stamens sometimes four and distinct, more generally six, and in two bundles; ovary free, one-celled, one-seeded, or many seeded; and seeds with large albumen. Botanically, the Fumariaceæ are regarded as most nearly approaching the Papaveraceæ (poppy, etc.); but their general aspect is very different, and they do not possess the same powerful properties. More than one hundred species are known, mostly natives of temperate climates in the Northern Hemisphere, some of great beauty in both flower and foliage. Bleeding-heart (*Di-*

centra spectabilis), a native of China, is a well-known favorite in gardens and greenhouses. Several species of *Dicentra* and *Corydalis* are natives of America. The common fumitory (*Fumaria officinalis*), a rather delicate and beautiful weed of frequent occurrence in gardens and fields, is an annual of easy extirpation. Its leaves, which have an intensely bitter, saline taste, were formerly much employed in medicine as a tonic and diaphoretic, and although disused in America, are still esteemed in France as a remedy for scorbutic affections, chronic eruptions, etc. Some other species are credited with anthelmintic, anti-periodic, emmenagogue, and similar properties, but except in household or in foreign medicine they are now little used.

FUMARIC AND MALEIC ACIDS (from Neo-Lat. *Fumaria*, the type of the herbaceous order Fumariaceæ). Two organic substances having not only the same composition and molecular weight ($C_4H_4O_4$), but the same chemical constitution ($COOH \cdot CH : CH \cdot COOH$), yet differing considerably in both their chemical and physical properties. Fumaric acid crystallizes in fine needles and sublimes without melting and without decomposition at $200^\circ C$; at higher temperatures it is converted into the anhydride of maleic acid; and it is sparingly soluble in water. Maleic acid crystallizes in rhombic prisms that melt at $130^\circ C$, and if heated to 160° , loses the elements of water and is converted into maleic anhydride; it is readily soluble in water. Both fumaric and maleic acids may be obtained by heating malic (oxy-succinic) acid. Maleic acid is, however, more conveniently prepared by distilling the acetyl derivative of malic acid. Both fumaric and maleic acids readily form addition products with the halogens and are therefore classed with the unsaturated compounds. The relation between the two acids is explained by the modern stereo-chemical theory, according to which the atomic groups composing their molecules, though the same in kind and number, are in two cases differently arranged in space. See STEREO-CHEMISTRY.

FUMBINA, foom-bě'ná. See ADAMAWA.

FUMIGATION (from *fumigate*, from Lat. *fumigare*, to fumigate, from *fumus*, smoke). The cleansing or medicating of the air of an apartment by means of vapors, employed chiefly for the purpose of destroying odors or disinfecting the room, as well as clothing, furniture, etc. (See CONTAGION; INFECTION.) Most of the methods of fumigation formerly employed have little real value, and are to be looked on chiefly as grateful to the senses; as, for instance, the burning of frankincense, camphor, etc. The really active processes are noticed under DISINFECTANTS. The application of fumes of medicines to the respiratory tract is also called fumigation. For this purpose fumes of tobacco, stramonium, nitrate of potash, muriate of ammonium, and various gums are employed.

FUNCHAL, foon-shál' (Port., place of fennel). The capital of Madeira, situated on the southern side of the island. It is a picturesque and well-built town, and contains a cathedral, an opera house, and a museum. Its streets are mostly narrow, and, owing to their steepness, sleds, drawn by oxen, and sometimes luxuriously fitted up, take the place of wheeled vehicles. The

principal streets are lighted by electricity. The harbor, which is well fortified, is not very safe, but it is the only port in Madeira for ocean-going steamers. Funchal is the seat of the government and a bishop. Owing to its mild climate, the town has come into prominence as a health resort. The neighboring mountains present magnificent scenery. Population, about 19,000.

FUNCK - BRENTANO, fúnk'brán'tá'nó', THÉOPHILE (1830—). A French philosopher, born at Luxemburg. He studied law and medicine in France and abroad. In 1893 he became professor at the School of Political Sciences, in Paris. His works include: *Les sciences humaines* (1869); *La civilisation et ses lois* (1876); *Nouveau précis d'économie politique* (1887); *La logique de Port-Royal et la science moderne* (1891); *L'homme et sa destinée* (1895); *La science sociale, morale, politique* (1897), and he translated and published Bismarck's correspondence (1883).

FUNCKE, foon'ke, OTTO (1836—). A German Protestant theologian. He was born at Wülfrath, near Elberfeld, and was educated at Halle, Tübingen, and Bonn. After holding positions in various parts of Germany he began in 1868 to preach at the Friedenskirche, Bremen, where he also published a great number of devotional works which have made him widely known. Among these are: *Christliche Fragezeichen* (14th ed. 1896; Eng. trans. by E. Sterling under the title *Self Will and God's Will, or How to Discover what is God's Will in the Perplexing Question of Life*, 1887); *Reisebilder und Heimatklänge*, three series (1869, 14th ed. 1896; 1871, 8th ed. 1899; 1872, 6th ed. 1893); *St. Paulus zu Wasser und zu Land* (8th ed. 1891); *Die Welt des Glaubens und die Alltagswelt* (9th ed. 1895); *Gottes Weisheit in der Kinderstube* (5th ed. 1890). His collected works were published in 1893.

FUNCTION (from Lat. *functio*, use, from *fungi*, to employ, Skt. *bhuj*, to enjoy, to be useful). The specific physiological processes of a part or organ. In the ameba all the functions of the organism are performed by the same protoplasmic mass. In higher forms, both plant and animal, where division of labor is established, certain parts take in water, digest food, or excrete waste for the benefit of the whole body. This assumption of particular function by certain parts must necessarily involve great changes in form and structure of the organism. Any subsequent change in function that an organ may undergo brings about far-reaching changes in structure. Many organs, like the liver and the brain, have many functions. Some of these functions we speak of as primary, others as secondary. Thus the primary functions of an insect's wing is locomotor, while secondarily the wing may serve in respiration. What are secondary functions may at times or in certain animals become primary; thus the allantois is an unimportant bladder in frogs; in birds and reptiles it is the chief fetal respiratory organ, while in many mammals it forms part of the placenta. With the change in function, and consequently in form and structure, are correlated changes in various other organs; hence any change in one organ is of far-reaching importance to the whole organism.

FUNCTION. A mathematical term due to Leibnitz (1692), but first defined in its present sense by Johann Bernoulli (1718). In this sense a function is a quantity whose value depends upon that of another quantity. E.g. in the formula for the circumference of a circle, $c = 2\pi r$, c depends upon r for its value; c is therefore said to be a function of r . Likewise, in the equation $y = x^2 + 2x + 3$, the value of y depends upon the value of x , so that if $x = \dots -2, -1, 0, 1, 2$, etc., $y = \dots 3, 2, 3, 6, 11$, etc.; y is therefore a function of x , and this is expressed by the symbol $y = f(x)$, which was first employed almost simultaneously by Euler (1734) and Clairaut. Instead of $f(x)$ other symbols are often used, as $F(x)$, $\phi(x)$, $\psi(x)$, etc. In $y = f(x)$, the value of y depending upon that of x , x is called the *independent* and y the *dependent* variable. In a function like $y = ax + b$, y is called an *explicit* function of x ; in the expression $x^2 + 2xy + b = 0$, y is an *implicit* function, and this is indicated by the symbols $f(x, y) = 0$. In the same way we may have $f(x, y, z) = 0$, $f(x_1, x_2, \dots, x_n) = 0$, or we may have $z = f(x, y)$, $y = f(x_1, x_2, \dots, x_n)$. If a function has only one value for each given value of the variable, it is called a *uniform* (monodromic, monotropic, *eindeutig*) function, as in the case of $y = x^2 + 2x + 3$. But if a function has more than one value for any given value of the variable, or if its value can be changed by modifying the path in which the variable reaches that given value, the function is said to be *multiform* (polytropic, *mehr-*

deutig), as in the case of $y = \sqrt{x}$. If the equation $y = f(x)$ be solved for x , then x will equal some function of y , i.e. $x = \phi(y)$, and the latter function is called the inverse of the former. E.g. in the case of a sphere $v = f(r) = \frac{4}{3}\pi r^3$, and $r = \sqrt[3]{\frac{3v}{4\pi}} = \phi(v)$,

$v = f(r)$ and $r = \phi(v)$ being inverse functions.

Functions were classified by Leibnitz as algebraic or transcendental. The former are such as include only the four fundamental operations together with the use of constant exponents, their simplest forms being $a + x$, ax , $\frac{a}{x}$, x^a , and their most general form being

$$\frac{(a + bx + cx^2 + \dots)^m}{(a' + b'x + c'x^2 + \dots)^{m'}}$$

In the broadest sense we say that y is an *algebraic* function of x when $A_0y^n + A_1y^{n-1} + A_2y^{n-2} + \dots + A_{n-1}y + A_n = 0$, where A_i is a polynomial in x of the form $A_i = a_0x^m + a_1x^{m-1} + \dots + a_{m-1}x + a_m$. The *transcendental* functions include all other functions, to which, from the domain of the common operations, powers with variable exponents, the so-called *exponential* functions and their inverse, *logarithms*, chiefly belong.

An important class of transcendental functions is known as circular functions. These include the goniometric functions, $y = \sin x$, $\cos x$, $\tan x$, $\cot x$, etc. (see TRIGONOMETRY), and their inverses, the *cyclometric* functions, $x = \sin^{-1}y$ or *arcsin*, etc. It is shown in trigonometry that $y = \sin x = \sin(x \pm 2k\pi)$, where k is any integer, so that x may be increased or decreased by $2\pi, 4\pi, 6\pi, \dots$ without altering the value of

y ; the function is then called *simply periodic*. In the inverse function, $x = \sin^{-1}y$, x evidently may have, for any value of y , an infinite number of values; this function is therefore called *infinitely multiform*. The inverse exponential function (i.e. the logarithm) and the circular function are integrals of algebraic functions. Thus,

$$\int \frac{dx}{x} = \log x, \int \frac{dx}{\sqrt{1-x^2}} = \sin^{-1}x,$$

$$\int \frac{dx}{1+x^2} = \tan^{-1}x, \int \frac{dx}{x\sqrt{x^2-1}} = \sec^{-1}x,$$

etc., all with the proper constants.

If a function $y = f(x)$, or $\phi(x, y) = 0$, be plotted, the figure is a curve with infinitely many points in immediate succession. The continuity of the curve and, corresponding to it, the continuity of the function, consist in this, that any two successive points lie infinitely near each other, so that an infinitely small variation of the abscissas is attended by an infinitely small variation of the ordinates. This suffices to explain what is meant by a *continuous* function, the meaning of the term *discontinuous* function being easily inferred. E.g. the functions $a + x$, ax , a^x , $\sin x$, $\cos x$, are continuous in the domain $(-\infty, +\infty)$ of the variable x , as is also x^n when n is a positive integer. The functions \sqrt{x} , $\log x$ are continuous in the domain $(0, +\infty)$.

The function $\frac{a}{x^n}$, where n is a positive integer, is continuous in the domains $(-\infty, 0 - \epsilon)$, $(0 + \epsilon, +\infty)$, however small ϵ may be; but for $x = 0$ it breaks its continuity and $y = \pm \infty$.

The term 'theory of functions' was first used by Lagrange (*Théorie des fonctions analytiques*, Paris, 1797). The branch thus denoted deals with functions of more general form than those described above. E.g. in the equation $w = f(z)$, z must, in general, be taken to be a complex number (q.v.), $x + yi$, where i stands for $\sqrt{-1}$. The theory, therefore, has for its object the study of functions of one or more variables, in which either the variables or the coefficients, or both, are complex numbers. This general theory may be said to have been founded by Lagrange (1772, 1797, 1806), although Newton, Leibnitz, Johann Bernoulli, Clairaut (1734), D'Alembert (1747), and Euler (1753) had already worked toward it. Gauss contributed to the theory, especially in its application to the fundamental theorem of algebra. Cauchy, starting from Lagrange's work, greatly developed it, and numerous propositions due to him are found in the various text-books on the subject. His memoirs extend over a period of nearly forty years (1814-51), covering a large part of the general theory as known to-day, and placing the subject upon a firm foundation. The historical development after Cauchy's time becomes interwoven with that of special functions, notably the elliptic and Abelian.

Elliptic functions arose from the consideration of the integral $\int \frac{Rdx}{\sqrt{X}}$, where R is a rational $f(x)$, and X is the general rational and integral quartic $a_0x^4 + a_1x^3 + a_2x^2 + a_3x + a_4$. The theory of these functions had been suggested by Jakob Bernoulli (1691) and by Maclaurin (1742), and D'Alembert (1746) had approached it. Euler

had gone further (from 1761) and had prophesied (1766) that there would come "a new sort of calculus of which I have here attempted the exposition of the first elements." To Landen (1775), however, the honor is usually given of founding the theory. But it is to Legendre that its real development is due. He worked forty years in perfecting it, his labor culminating in his *Traité des fonctions elliptiques et des intégrales Euleriennes* (1825-28). At the same time that Legendre published this work, Abel and Jacobi began their great contributions. Abel, whose fundamental theorem was not published until after his death, discovered the double periodicity of elliptic functions. Jacobi created a new notation and gave name to the 'modular equations' of which he made use. Cayley contributed to the subject in England, his only book being devoted to it.

The general theory of functions has received its present form largely from the works of Cauchy, Riemann, and Weierstrass. Endeavoring to subject all natural laws to mathematical interpretation, Riemann attacked the subject from the standpoint of the concrete, while Weierstrass proceeded from a purely analytic point of view. Riemann's theories have been elaborated by Clebsch, and also by Klein, who has materially extended the theory of Riemann's surfaces, and who has generalized Clebsch's application of modern geometry to the study of elliptic functions in his *Theorie der elliptischen Modulfunctionen*. This last-named theory had its origin in a memoir of Eisenstein (1847), and in the lectures of Weierstrass on elliptic functions.

In the theory of functions, the number of special functions is very great. For the list at the present time, consult: Müller, "Mathematische Terminologie," in *Bibliotheca Mathematica* (Leipzig, 1901), where some two hundred are mentioned. The most notable work on the historic development of functions is that of Brill and Noether, "Die Entwicklung der Theorie der algebraischen Functionen in älterer und neuerer Zeit," in *Jahresbericht der deutschen Mathematiker Vereinigung*, vol. ii. (Berlin, 1894). For theory, bibliography, and historical notes, consult: Harkness and Morley, *Theory of Functions* (New York, 1893); and Forsyth, *Theory of Functions* (Cambridge, 1893). For further bibliography of historical development, and for articles on the theory of functions, consult Merriman and Woodward, *Higher Mathematics* (New York, 1896).

FUNCTION CHANGE. The disuse of an organ for one function, and its modification for the performance of another; thus an organ may be transformed into another homologous with it, but performing a different function, serving a quite different use. It originates in a series of functions performed by one and the same organ. Of these several functions one is the chief or primary, while the rest are secondary. If the primary function is for any reason suppressed, some one of the secondary functions becomes the chief one, and the final result of these processes is the transformation of the organ.

As an example may be mentioned the change of function in the anterior limbs of certain crustaceans from swimming and breathing uses to organs of mastication (mandibles, maxillæ, and maxillipeds), the outer division, or 'expodite,'

undergoing reduction from disuse. Thus the original or chief function is suppressed, and what was an accessory or minor function becomes the chief one. More apparent examples are the change from the five-toed legs of the reptilian ancestor of birds into the wings, and of the fore legs of the ancestors of whales into the paddles of existing cetaceans. All such changes of function are the result of change of environment, of habits, and of instincts.

Still another good example of the principle of change of function is afforded by the swimming-bladder of fishes. This in most fishes is a closed sac lying directly beneath the backbone. In the gar-pike it has acquired a connection by a duct with the throat. It then becomes an accessory breathing organ in such fishes as the *Protopterus* of Africa, which is able temporarily to live out of water. Finally, by further change in habit and structure, this bladder with its pneumatic duct has become transformed into the lung of the amphibians, reptiles, and higher vertebrates. The transformation is due to change of surroundings and of habit, resulting in the changes of function.

This principle is pure Lamarckian doctrine; i.e. that changes of surroundings and of habits bring about changes of function or use, and finally of structure. Yet there are very numerous examples of this principle, and it has been most active in the origination of the classes and orders of animals.

BIBLIOGRAPHY. Saint George Mivart, *Genesis of Species* (New York, 1871); Darwin, *Origin of Species* (6th ed., London, 1882); A. Dohrn, *Der Ursprung der Wirbelthiere und das Princip des Functionswechsels* (Leipzig, 1875); A. M. Marshall, *Biological Lectures and Addresses* (London, 1894).

FUNCTUS OFFICIO (Lat., discharged from duty or authority). A phrase applied to something which, having formerly had legal vitality and force, is without any further validity or authority. When an agent or officer has fulfilled the duty assigned him, his office is *functus officio* and his powers are at an end. The same is true of legal instruments which have been duly executed, and have been used for the purpose for which they were created, or on which a judgment has been entered. Thus a warrant of attorney on which a judgment has been entered is *functus officio*, and a second judgment cannot be based upon it. So, also, a bill of exchange paid by the drawee, or passed by him to the credit of the drawer, is *functus officio*, and cannot be further negotiated.

FUNDAMENTAL NOTE (from Lat. *fundamentum*, base, from *fundare*, to found, from *fundus*, bottom). In music, the root or fundamental tone upon which a triad is built. Thus C is the fundamental note of the triad C E G, and remains so in all inversions of the chord; whereas the lowest note is the bass note. Thus in these combinations C E G, E G C, G C E, C is always the fundamental note, while the bass notes are C, E, G, respectively.

FUNDAMENTALS OF CHRISTIAN DOCTRINE. A term much used in Protestant theological discussion, but very difficult to define. It has been said that the fundamental Christian doctrines are those which it is necessary to believe in order to attain salvation. But this logically

involves conclusions concerning the condemnation of large classes of individuals which men, particularly in the later time, shrink from accepting. A distinction has been drawn between truths necessary to salvation and the degree of knowledge necessary in an individual in order that he may be saved. That is, a truth may be necessary to salvation, yet an individual who does not know it may not be condemned, it being assumed that he would believe it if he knew it. It is not involuntary ignorance of the truth, but rejection or denial of it, that results in condemnation. Hence the fundamentals vary for individuals, and it is impossible to draw up a certain definite list which shall hold good in all cases. Another definition would make the fundamental Christian doctrines those which are the essential characteristics of Christianity, differentiating it from other religions. All Christians consider certain truths essential to the Christian system, and others as comparatively unessential. But each Christian body has doctrines essential to its own system which are not held by the entire Christian Church. And a distinction must be made between doctrines fundamental to Christianity and those fundamental to a particular system; that is, between the essential characteristics of a Christian and the criteria of membership in a particular body. Adherents to the various bodies do not always find it easy to draw this distinction, and the best attempts to state the former in terms of doctrine almost inevitably prove unsatisfactory because of the natural tendency to include the latter. In general, however, there is a practical tendency toward agreement between the different Protestant churches, whatever differences there may be upon specific points in their statements of fundamentals of doctrine. And such agreement is increasingly recognized. Modern Protestantism denies that saving faith is an exercise of the intellect; it is an action of the will in respect to what is known. And the characteristics of Christianity are to be found in the sphere of conduct rather than in belief. Roman Catholic theologians claim that they do not use the expression.

The discussion of fundamentals in doctrine has had importance chiefly in attempts to unite the various Christian bodies, particularly the Lutheran and Reformed churches. It was actively carried on in Germany in the early post-Reformation period. In England a committee of clergymen was appointed in 1653 to draw up a list of 'fundamentals' and report to Parliament. Richard Baxter, who was one of the committee, proposed that it should consist of the Apostles' Creed, the Lord's Prayer, and the Ten Commandments. A catalogue of sixteen articles was adopted, however, including doctrines concerning God, Christ, divine worship, faith, sin, the resurrection, the judgment, everlasting life and everlasting condemnation. The aim seems to have been to exclude rather than to furnish common ground for agreement.

FUNDI, fūn'dī, or **FUNDUNGI** (West African word). A kind of grain, *Paspalum exile*, much cultivated in the west of Africa. It is allied to the millets, and still more nearly to some of the kinds of grain cultivated in India. It is wholesome and nutritious, and has been recommended as a light and delicate food for invalids. The

natives of Western Africa throw it into boiling water, pour off the water, and add palm-oil, butter, or milk. In Sierra Leone it is much used with stewed meat, and sometimes made into porridge with milk. See **PASPALUM**.

FUNDY, BAY OF (from Fr. *fond de la baie*, head of the bay). An arm of the Atlantic, separating Nova Scotia from New Brunswick and the State of Maine (Map: Nova Scotia, D 4). With an average breadth of 35 miles, it extends 180 miles in length from northeast to southwest. It forks, at its head, into two inlets, the northern, called Chignecto Bay, and the southern, Minas Channel, which are divided by narrow necks of land from the Gulf of Saint Lawrence. Along its northwest side it receives the Saint John, the principal river of New Brunswick, and the Saint Croix, which, through its entire course, forms the international boundary. The navigation is rendered perilous by the peculiarity of the tides, which have a rise and fall of 53 feet at certain seasons, and produce dangerous bores in the upper reaches. The shores present a very bare appearance at low tide, with long expanses of mud flats and in-reaching estuaries completely drained.

FÜNEN, fy'nēn (Dan. *Fyen*). The largest of the Danish islands after Zealand, situated between the Great and Little Belts (Map: Denmark, D 3). It is about 50 miles long and over 40 miles in its greatest width, with an area of over 1100 square miles. Its surface is slightly elevated in the south and west, where it rises to an altitude of over 400 feet. The larger part, however, is flat. The soil is fertile and well watered. Grain is produced and considerable amounts are exported. The raising of domestic animals is also extensively carried on. Administratively the island forms, together with the adjacent islands of Langeland and Ærø, and a number of smaller islands, the province or stift of Fünen, which is divided into the two bailiwicks of Odense and Svendborg. The principal towns are Odense (q.v.), the capital, Svendborg, and Nyborg (q.v.). The population of the province in 1890 was 256,827; in 1901, 279,501.

FUNERAL, THE, or **GRIEF À-LA-MODE**. A comedy by Steele, acted in 1701. Hazlitt calls it "trite, tedious, and full of formal grimace."

FUNERAL RITES. See **MORTUARY CUSTOMS**.

FUNES, fū'nās, GREGORIO (1749-1830). An Argentine historian. He was rector of the University of Córdoba, and as such introduced numerous reforms. He was highly distinguished as a lecturer, and counted among his pupils many men afterwards famous. He was also celebrated as an historian and pulpit orator, and in the latter capacity was probably unexcelled in his day in South America. His qualifications ultimately secured for him an appointment to the deanship of the Cathedral of Córdoba. His chief publication is entitled *Ensayo de la historia civil del Paraguay, Buenos Ayres y Tucumán* (1816).

FÜNFKIRCHEN, fūnf'kērk-en, or **PÉCS**, capital of the County of Baranya, Hungary, and an important garrison town, 248 miles southeast of Vienna by rail. It is picturesquely situated on the southern vine-clad slopes of the Mecsek Mountains. It has been the see of a Roman

Catholic bishop since 1009, and has a handsome twelfth-century Romanesque cathedral with four towers, which has been restored since 1887. Three of the five Turkish mosques from which the town derives its German and Hungarian names are in ruins, but the remaining two are now respectively the Stadtkirche and a Franciscan church. Other important buildings are the episcopal palace, the town hall, and a fine synagogue. There is a considerable trade in coal, marble, wine, fruit, tobacco, gall-nuts, and hogs; and it has important manufactures of leather, cloth, and pottery. Fünfkirchen is thought to be the Roman *Colonia Serbinum*. It was occupied by the Turks from 1543 to 1686. Population, in 1890, 34,067; in 1900, 43,982.

FÜNG-HWANG, or **FENG-HWANG**, füng'-hwäng'. A fabulous Chinese bird which figures largely in Chinese poetry, art, and folk-lore. *Füng* is the male and *hwang* the female, and as the two are inseparable they are considered models of conjugal love. The füng-hwang is the second of the four supernatural creatures of Chinese mythology, and has many symbolical analogies to the Greek phoenix. It is immortal, lives in the highest air, and its appearance on earth presages the advent of a virtuous monarch, or is emblematic of a prosperous reign. It appeared several times in antiquity. In China it is the special emblem of the Empress; in Japan (where it is called Hō-wō), of the Mikado. In art it is usually depicted with the head of a pheasant, the beak of a swallow, a long flexible neck, plumage of many gorgeous colors, a flowing tail, and long claws pointed backward as it flies. Each of the five colors of its plumage typifies one of the five cardinal virtues. The flowers usually associated with it are sprays of the tree-peony. Consult: Mayer, *Chinese Reader's Manual* (Shanghai, 1875); and Griffiths, *The Mikado's Empire* (New York, 1900).

FUNGI, fūn'jt (Lat., mushrooms; connected with Gk. σφγγος, *sphongos*, σπγγος, *spongus*, sponge). A group of non-chlorophyll-bearing plants. They constitute the second division of the thallophytes (the lowest primary division of plants), and because they lack the green coloring matter, chlorophyll, or pigments related to chlorophyll, they are forced to live as parasites on living plants and animals, or as saprophytes on dead organisms or their products. As stated under ALGÆ, the fungi are believed to have been derived from that group, and to have arisen at different times from several stocks; in other words, the fungi constitute a polyphyletic group. Consequently, the fungi do not present a continuous series of related forms. On the contrary, there are at least two lines (Schizomycetes, Myxomycetes) which have little resemblance either to one another or to the great body of higher fungi, except through a general similarity of physiological processes. Indeed, in some classifications the name fungi is restricted to the higher forms, whose bodies are usually made up of filaments. It seems probable, however, that the terms fungi and algæ will be given a more general application, as a matter of convenience, and cease to have special significance in classification.

The fungi include five large classes: Bacteria (Schizomycetes), slime-molds (Myxomycetes), alga-like fungi (Phycomycetes), sac-fungi (As-

comycetes), and toadstools and their allies (Basidiomycetes). A sixth class, the yeasts (Saccharomycetes), is much smaller than the others. The habits and some of the striking peculiarities of these groups are discussed in special articles under the above names. This article considers points of morphology with especial bearing on classification, and includes an account of certain biological principles.

SCHIZOMYCETES. The Schizomycetes (Bacteria) present the same simplicity of cell structure as do the Cyanophyceæ (blue-green algæ). It is doubtful if they ever have a well-defined nucleus—the most conspicuous cell organ. There is likewise a resemblance to the blue-green algæ in many points of cell arrangement, and in the general character of the higher filamentous forms. These resemblances have led to a very generally accepted view that the Bacteria have come from the blue-green algæ under the influence of an environment that encouraged saprophytism (living on dead organic material). A group, called the Schizophytes, has been proposed to hold both these lowest groups of the algæ and fungi. However, some botanists relate the Bacteria to certain Flagellata (q.v.).

MYXOMYCETES. The Myxomycetes (slime-molds) occupy a position quite apart from other fungi. The plasmodium phase (the ordinary slimy body) has no parallel in the life histories of other groups, and there is no condition comparable to a mycelium (a thready body). Indeed, the vegetative period of the life history of a slime-mold is wonderfully animal-like. But the fructification resembles that of plants, in that there is developed a complex spore-case (sporangium), frequently stalked, containing thousands of reproductive cells essentially like the spores of fungi. There is likewise a capillitium, a plant-like device of a fibrous network, which by expanding and contracting aids in distributing the spores. The substance of the sporangium wall and of the capillitium is, in part, cellulose (the peculiar substance of the cell-walls of plants).

Setting aside the Bacteria and the slime-molds, there is left the vast assemblage of fungi whose working body is usually made up of hyphæ (filaments) more or less closely united with one another, the entire mass being called the mycelium.

PHYCOMYCETES. In the Phycomycetes (alga-like fungi) there is a very interesting assemblage of types almost all presenting some alga-like characters, but sufficiently diverse from one another to suggest that there may have been several points of origin. The most alga-like are the water-molds (Saprolegniales) and the downy mildews (Peronosporales). Here, in addition to the cœnocyctic body (see CœNOCYTE), similar to that of the Siphonales among the algæ, there are present swimming spores produced in terminal spore-cases, and sexual organs (oögonia and antheridia) very similar to those of Vaucheria. One genus (*Monoblepharis*) has motile sperms, but in the other types the male organ (antheridium) puts out a tube that enters the female organ (oögonium) and discharges some of its contents. There is to be noted among these forms a tendency to give up some of the alga-like characters. Thus, in certain of the downy mildews (Peronosporales) the organ cor-

TYPES OF FUNGI

1. SPORE CASES OF A SLIME MOULD.

2. SPORANGIA OF BLACK MOULD.

3. DEVELOPMENT OF ZYGOSPORE OF BLACK MOULD.

4. WATER MOULD, (a) growing on a fly; (b), Sporangia with Zoospores; and (c), Oospores and eggs.

5. SPORE CASE OF CORDYCEPS (An Insect parasite).

6. MILDEW ON LILAC.

7. LILAC MILDEW, Showing (a) Ascocarp; and (b), Ascus with spores.

8. GREEN MOULD WITH SPOROPHORES.

responding to the spore-case has ceased to produce swimming spores, but has become itself an aerial reproductive cell (conidia, q.v.). In the water-molds (*Saprolegniales*) sexuality has so degenerated that the male organs, although frequently present, are rarely, if ever, functional. The *Chytridiales* include many one-celled forms whose life history presents a continuous alternation of motile and non-motile conditions, reminding one of the life histories of some of the green slimes (*Protococcales*) among the algae. It has been suggested that the *Chytridiales* have come from the *Protococcales*, a group of algae much lower than the ancestors of the downy mildews and the water-molds. It is possible, however, that the *Chytridiales* are degenerate forms of higher fungi. The common black molds (*Mucorales*) have less of the algal characters than other *Phycomycetes*, but the terminal spore-cases and sexual organs recall the downy mildews. The *Entomophthorales* are a highly specialized group of insect parasites whose relationships are very obscure.

ASCOMYCETES. The *Ascomycetes* (sac-fungi) present structures and life histories that are very difficult to correlate with those of the *Phycomycetes*. Some of the lower forms are undoubtedly sexual. There is present a female cell (ascogonium or archicarp) fertilized by a discharge from a neighboring male cell (antheridium), the condition recalling at once that in the downy mildews. The fertilized female cell, however, develops a special system of filaments that finally produce the characteristic spore-containing sacs (asci). These filaments are generally associated with sterile portions of the original body to form a fructification called the ascocarp. The ascocarp may be compared to a similar growth (cystocarp) produced from the fertilized egg of the red algae (*Rhodophyceæ*). The subject becomes further complicated, however, by an apparent tendency among the *Ascomycetes* to give up sexuality. In some higher groups repeated investigations have failed to demonstrate sexual organs, and the ascocarp in consequence probably develops without a sexual act. There have been attempts to homologize the ascus (spore-sac) with the sporangium (spore-case) of the black molds, assuming that the large and variable number of spores in the latter structure became reduced and fixed to eight, the usual number in the former. Later studies upon the development of the spores, however, indicate that the two structures are not related. It is then possible that the ascus is a special form of spore-case peculiar to the *Ascomycetes*. There are a number of peculiar forms of spores in the *Ascomycetes*, developed at various periods in the life history, manifestly for purposes of distribution. They have been named conidia, pycnidia, etc. There are a great many fungi known only through some fructification of this character. For convenience they are placed in a group called the *Hyphomycetes* or *Fungi Imperfecti*. Most of the *Hyphomycetes* are believed to be imperfect forms of *Ascomycetes*, but among them there are also large numbers of species that undoubtedly belong to other groups. There are practical reasons for this artificial group, as many of the species are economically important. Studies in their life histories are constantly bringing to light phases which determine their place among the

natural groups, so that species are constantly being removed from this artificial assemblage.

BASIDIOMYCETES. The *Basidiomycetes* (mushrooms, toadstools, etc.) are a remarkable class. There is no trace of sexuality in the group, not even the vestiges of sexual organs which generally remain even when plants reproduce without them. Apart from certain peculiar phenomena of fusing nuclei, there are no clues to the problem of the origin of the group. The diverse orders are held together by a phase common to all the life histories, namely, the basidium, which is the swollen tip of a filament bearing spores on slender branches. It has been found that this basidium of the toadstools and the puffballs is represented by the promycelium of the smuts (*Ustilaginales*, q.v.) and rusts (*Uredinales*, q.v.). This promycelium arises from the winter spore (teleutospore), which is essentially only a resting spore to tide the parasite over an unfavorable season. There are kinds of rusts (*Leptopuccinia*) in which the teleutospores form promycelia directly upon the host plant, and these conditions resemble strikingly the basidia of certain toadstool forms. The winter spore (teleutospore) of the rusts and the smuts is then merely an adaptation related to the parasitic habit, and unnecessary for saprophytes such as the toadstools, bracket fungi, and puffballs. It must not be supposed, however, that there is only one conspicuous line of development among the *Basidiomycetes*, for there are several divergent lines, prominent among which are the rusts (*Uredinales*), smuts (*Ustilaginales*), and certain orders of the toadstools (*Hymenomycetes*), and puffballs (*Gasteromycetes*). The relation of the *Basidiomycetes* to the other groups of fungi is problematical.

SACCHAROMYCETES. The group *Saccharomycetes* (yeasts) is a very problematical one. The fact that the spores of many fungi pass into yeast conditions when placed in the proper nutrient solutions, suggests the derivation of this interesting group from one of several sources. In a sense the yeasts are degenerate forms, for they have adopted a simple life history and morphology, but physiologically they are highly differentiated.

BIOLOGIC PRINCIPLES ILLUSTRATED BY FUNGI. Some general biological principles are admirably illustrated by the fungi. Probably no other of the lower plants are so varied in their adaptation to special life conditions as are the fungi. The fact is shown by the immense number of species, for the fungi are far more numerous than the algae, and they present more varied methods of asexual reproduction than does any other group of plants. Besides the specialized spores for rapid distribution, there are devices by which the protoplasm of the fungus may at any time pass into a resting state, and so survive unfavorable conditions. When the entire plant body is affected, the resting condition is called a sclerotium, and if small portions are so specialized they are called chlamydospores. As would be expected, the development of a large number and variety of reproductive conditions makes possible very complicated life histories (polymorphism), and in this respect the fungi are the most remarkable of all plants. This astonishing development of polymorphism, with its varied and specialized reproductive phases, is directly traceable to the parasitic or the sapro-

phytic life which a fungus must always lead. The evolutionary influences work constantly toward the special and successful adaptation of the parasite to the host in the one case, or of the saprophyte to its particular nutrient substances in the other. The result of fungal evolution is necessarily immense diversity, shown not only by the number of species, but also by the wonderful variety of things that fungi can do. Species of *Bacillus* among the Bacteria have a general similarity of form and structure, but some are mere saprophytes, concerned only with some phase of decomposition, and others are parasites in the higher animals, even man, and are the cause of subtle diseases. It is important to note that the life of fungi has led to the degeneration of sexual organs, and finally to their entire suppression. Yet some of the groups in which sexuality is entirely lost are the most successful in establishing themselves, as is exemplified by the toadstools and rusts.

In conclusion, the conception of the fungi should be an immense assemblage of parasites and saprophytes with several points of origin from different stocks of the algae, and branching out into innumerable species, each adjusting itself to the peculiarities of a life leading to constant specialization. There can be, in evolution of this character, no general structural results, such as are exhibited, for example, by sexual evolution and by the differentiation of the sexual (gametophyte) and sexless (sporophyte) generations among the algae by the increasing importance of the sexless generation through the mosses and ferns, and by heterospory and the reduction of the sexual generation (gametophyte) in certain fern-plants and in all the seed-plants.

For general treatment of the fungi, consult: Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig, 1887); De Bary, *Comparative Morphology and Biology of the Fungi, Mycetozoa, and Bacteria*, translated by Garnsey (London, 1887); Zopf, *Die Pilze* (Breslau, 1890); von Tavel, *Vergleichende Morphologie der Pilze* (Jena, 1892). Some special works are listed in the articles on the various groups of fungi.

FOSSIL FUNGI. Although fossil remains of fungi are sufficiently common to indicate that these plants were important members of the floras of all periods from the Carboniferous to recent time, comparatively little has been done toward studying them, and the sum total of our knowledge of fossil fungi is small. There seems to be no great difference between the ancient and the modern forms. The earliest known fossil fungi have been described as Peronosporites from the Silurian system. They occur as mycelial threads with frequent bulbous expansions in limestones of the Clinton series in western New York, and were detected in thin sections of the rock that were being studied under the microscope. The Carboniferous fungi consist largely also of mycelia, referred to the same genus Peronosporites, the threads and bulbs of which have been found in the stems of *Lepidodendrons* from the British coal measures. Similar forms have been found in fossil fruits (carpoliths) from the coal measures of France.

The Tertiary deposits have afforded many fossil fungi. The silicified woods of Egypt, Europe, and North America contain many species.

Fossil leaves from the Tertiary shales and sandstones often bear patches of the parasitic Ascomycetes, which are very difficult to study in the fossil state. The leaves in amber also carry Ascomycetes, and amber insects infested with mucorine fungi have been found. Toadstools, and other members of the Hymenomycetes, are rarely represented in rocks of Tertiary and post-Tertiary age. They appear in the Tertiary lignites of Europe and North America, with the genera *Hydnum*, *Lenzites*, and *Polyporus*. Interesting, though indirect, evidence that toadstools and similar forms were far more abundant during the Tertiary times than is indicated by their meagre fossil representatives, is afforded by the fact that large numbers of fossil beetles and flies found in the rocks of that period belong to genera which at the present time are wholly fungus-eaters.

Consult: Zittel, Schimper, and Barrois, *Traité de paléontologie*, part ii.; *Paleophytologie* (Paris, Munich, Leipzig, 1891); Solms-Laubach, *Fossil Botany* (Oxford, 1891); Loomis, "Siluric Fungi from Western New York," in *Bulletin of the New York State Museum*, No. 39 (Albany, 1900).

FUNGI, ECONOMIC. Species of fungi that may directly or indirectly affect man's welfare. Of those that affect man directly, the edible and poisonous species and some parasites, such as ringworm, barber's itch, etc., may be mentioned as examples (see FUNGI, EDIBLE AND POISONOUS; MUSHROOM; TRUFFLE); of those that affect him indirectly are plant diseases, molds, some animal diseases, etc., whose functional activity may result in monetary or some other kind of loss. A large majority of fungi (saprophytes) are capable of living only on decaying organic matter, and since they do not ordinarily attack living plants, they do not produce plant diseases. They are therefore of little economic importance except as they occur on fruits and other food-stuffs, timber, clothing, etc., when they may be considered harmful. On the other hand, many of these organisms are more or less beneficial, since they act as scavengers in the destruction of organic matter which would long cumber the earth if dependent upon the slow process of chemical oxidation. Under abnormal conditions of moisture, temperature, etc., some saprophytic fungi (usually called facultative parasites) are able to attack and injure living plants. The parasitic species (another large group) occur normally upon living plants and animals, from which they derive their sustenance. The plant or animal upon which they live is called the host. The relationship between host and parasite is more or less intimate, and as the economic plants are affected, the importance of the parasite is the greater. In some cases the fungi are of positive benefit to man because they (entomogenous fungi) destroy noxious insects, as locusts, grasshoppers, flies, scale-insects, etc.; others live at the expense of fungi that are themselves injurious to plants of value to man, as in the case of *Darlucella*, a parasite of the injurious asparagus rust. The number of fungi that attack living animals is large, and in some cases the attack is very destructive. Young fish in hatcheries are subject to diseases due to fungi; and higher animals often suffer similar attacks. A lung disease of horses is caused by the presence of the fungus *Botriomyces*, and the

various forms of ringworms, favus, barber's itch, etc., are all due to fungi.

When mention is made of fungous diseases the term commonly refers to diseases of plants caused by attacks of parasitic fungi. The number of species of such parasitic fungi is very large, and nearly every garden, orchard, and greenhouse crop may be attacked by one or many. The various parts of the maize-plant are subject to the attack of at least seventy species of fungi; the common tulip-tree, or yellow poplar, is reported as the host of nearly one hundred species; the oat-plant has a dozen such enemies, and so on. The annual loss attributed to the attacks of fungi, to which the reduced yield and inferior quality of the product are largely due, amounts to hundreds of millions of dollars. It has been estimated that the average loss due to oat-smut in the United States alone amounts to more than \$18,000,000 annually. If to this sum be added the similar losses of other great economic crops, the total would be enormous. Cereal rusts in the United States are believed to cause more loss than any other source of injury, and often the loss amounts to more than the damage done by all other enemies, fungous and insect, added together. In certain localities the grape crops have been almost wholly destroyed by parasitic fungi, and certain truck crops have suffered similarly. The great famine in Ireland during 1846-47 has been largely attributed to the almost total destruction of the potato crop, through the attack of the potato rot (*Phytophthora infestans*).

The general classification of the fungi, aside from the Myxomycetes and the Bacteria, some of which are of great economic importance, is divided into four main groups: (1) The Phycmycetes, which include the water-molds destructive to young fish; the well-known fly-fungus, by which flies are often fixed to window-panes, particularly in the autumn; the black mold of food-stuffs, manure heaps, etc.; the downy mildews, as the potato rot, peronospora of grape, etc. (2) The Ascomycetes, or sac-fungi, which include the powdery mildews of grape, gooseberry, cherry; the blue molds, the black knot of plums, ergot of rye, peach leaf-curl, the black wart-like growths on many trees; the cup fungi, so called from the shape of their fruiting organs, etc. (3) The Æcidiumycetes, which include the rusts and smuts of various plants. (4) The Basidiomycetes, which embrace the mushrooms, toadstools, coral fungi, shelf fungi, etc. From an economic standpoint the parasitic species of the second and third groups are of the greatest importance. Fortunately, many of the diseases caused by these parasites may be prevented by the adoption of certain precautionary measures, by the application of a fungicide (q.v.), and by the exercise of proper methods of cultivation by which the general vigor of the plant is improved. See DISEASES OF PLANTS; also diseases of specific crops: e.g. APPLE; GRAPE; POTATO; WHEAT; MAIZE, etc.

FUNGI, EDIBLE AND POISONOUS. A general name given to mushrooms, toadstools, puffballs, etc., that may or may not be eaten with safety by man.

EDIBLE FUNGI. More than 700 species have been found to be safe, and many are considered very nutritious. (See MUSHROOM.) Perhaps

the principal reason that fungi are not more generally eaten is not so much that their value is unknown, as that people are afraid even to touch the plants because certain species are known to produce illness and even death. In the interests of safety, therefore, every writer upon the subject of edible and poisonous fungi iterates the warning to avoid eating any fungus the edible qualities of which are not positively known to the would-be consumer beyond the slightest shadow of doubt. Since certain toadstools (especially *Amanita phalloides* and *Amanita muscaria*, described below) are mistaken by the uninitiated for the common mushroom, all fungi found in the woods or in shady places (until they are proved to be wholesome) and all that have white or yellow gills should be avoided: the common mushroom grows in the open fields, and has pink gills which gradually turn to purplish-brown or black. A safe plan for the novice to adopt, even on becoming familiar with the twelve edible species described and illustrated, after being satisfied with their identification, is to eat only a small portion of a fungus new to him, to note the results carefully, and to allow several hours to elapse before indulging more freely. In no case should he be guided by pleasant taste alone, because some of the species considered unwholesome do not manifest any disagreeable quality.

(1) *Chanterelle (Cantharellus cibarius)*, common in light woods and on high ground, grows from two to four inches tall, expands from two to three inches, and has an irregular lobed orange or yellow cap, which when young is dome-like, but with age becomes expanded, and depressed at the centre. The gills are thick, short, branching, and wide apart. The stem, at first white and solid, later becomes hollow. Since this species is rather tough and dry, only crisp heavy specimens should be selected for the table. A closely related poisonous species, *Cantharellus aurantiacus*, found in rank or decaying grass, closely resembles the above in color, but has thin, crowded gills of deeper tint than the cap. (2) The common field mushroom (*Agaricus campestris*), which grows from two to four inches tall, is probably the commonest, best known, and most easily distinguished of all. It is the only one that is cultivated to any extent. (See MUSHROOM.) The cap is fleshy, from one and one-quarter to four inches broad, usually white, but sometimes tawny or brownish above, and when in prime condition, pink below. With age, it changes to dark brown. Upon the stem is a collar, the remains of a veil, which in the young mushroom joins the margin of the cap to the stem. This mushroom has never been found growing in woods or shady places, but always in open pastures, fields, and lawns. (3) The edible pore mushroom (*Boletus edulis*), found most abundantly during the autumn in pine, oak, and chestnut woods, has a brown white-fleshed cap from four to six inches across, with convex tubes at first white, but changing to yellow and then greenish. When in the pale-yellow stage the plants are most tender and edible. The two to six inch stem becomes light brown, with a network of pinkish veins near the top. (4) The variable mushroom (*Russula heterophylla*), a common species found in woods from July to November, is usually some shade of dingy green, never

reddish or purple. The stem is white, solid, and firm; the gills, white, narrow, crowded, forked. The fleshy cap when peeled is white, of firm texture, and mild, sweet, nutty flavor while young and fresh; wilted and old specimens are not desirable even when free from grubs, which are specially fond of the plant. (5) Oyster mushroom (*Agaricus ostreatus*), common on moist, decaying tree-trunks throughout the United States. The cap is shell-shaped, three to five inches broad, dark when young, soon bleaching to brownish, and later yellow; stem white, short, or wanting, thickened upward; gills broad, rather distant, white or sometimes yellowish. Flesh tender, except in old specimens, of pleasant, but not pronounced, flavor. Especially good when dipped in egg, and fried slowly like an oyster. (6) The fairy-ring (*Marasmius oreades*) grows in short grass of lawns, pastures, etc., but never in woods. Its common name is derived from its habit of growing in ring-like patches, which increase in diameter as the plants reach outward to new feeding ground. The mushrooms are small (one to two inches broad, and two to three inches tall), reddish at first, pale afterwards, solid, very tough, with broad, distant, free gills, alternately long and short. They have a weak but agreeable odor, and mild, sweet, and nutty taste, which is retained well when the mushrooms are dried by exposure to air or sun—the simplest way to preserve them. It is one of the best and the most easily digested. The hairy-foot (*Marasmius personatus*) which grows in woods on dead leaves, etc., must not be mistaken for the fairy-ring, since it is unwholesome. This species has darker and narrower gills, and a hairy down at the base of the stem. (7) Morel (*Morchella esculenta*), common in spring in old apple orchards and in woods, especially under butternut trees and on burned-over surfaces or places where wood ashes have been scattered. The pale yellow, buff, or tawny cap is attached to the stout whitish hollow or stuffed stem by its base, is ribbed and pitted like honeycomb. The morel is one of the most easily recognized and the choicest species of edible fungi. Its near relatives (genus *Morchella*), which more or less closely resemble it, are all edible. (8) *Clavaria cinerea*, a fungus without a cap, which may be found in the woods from June until frost, grows from one to three inches high, in tufts or colonies, and has thin or thick stems lighter than the numerous irregular, wrinkled gray branches. It is considered the best of the *Clavarias*, but is said to be injurious in large quantities and to be digested with difficulty by weak stomachs. (9) Horse-mushroom (*Agaricus arvensis*) is considered by some writers to be a variety of the common mushroom, which grows in similar places, but is slightly larger (two to five inches tall, three to five inches or more broad), has gills which turn from whitish to pink, and then dark brown, and a stem which is either hollow or stuffed with floccose pith. By some it is considered inferior and by others superior to the common mushroom. (10) *Cortinarius caruleus*, an almost odorless species found among moss in woods, has a convex or plane yellowish cap two to three inches across, slightly rounded, thin, closely crowded, blue or purplish gills, which change to a dull cinnamon with age; and firm violet, pale or whitish stems about two inches long, which rise from bulbs more than an inch thick. (11) Horse-tail fungus (*Copri-*

nus comatus) may be found after hard rains from August until frost, sometimes in spring, singly or in clusters, in a great variety of places, from rich soil to dumping-grounds. The cap is fleshy, at first oblong and white, but later a ragged bell-shape, and purplish black; the gills are crowded, broad, free from the stem, at first white, then pink, after which the plant becomes unfit for food, since it turns from purple to black, and dissolves into ink-like drops. The stem is hollow, often ten inches long, but mostly hidden under the cap. It is not of high flavor, but is of great delicacy when young. (12) Liver-fungus (*Fistulina hepatica*) is a juicy red, fibrous-fleshed, non-rooting fungus, which may be found upon decaying trees and stumps, especially on oak, beech, and chestnut, after rains in summer and autumn. Under the name of beefsteak fungus it is highly esteemed everywhere for its rich nutritious flesh of acid flavor and agreeable odor.

POISONOUS FUNGI. The number of fungi formerly considered poisonous was very large; investigation, however, has proved that many so regarded are not merely innocuous, but are good for food. The results are that not a few old beliefs have been upset, and others are made to totter. Poisonous fungi may be divided into two groups: those that contain local irritant poisons, which quickly act on the alimentary tract; and those that contain poisons which, after the lapse of several hours, act on the nerve-centres. Members of the first group, though exceedingly disagreeable in their effects, produce no serious disturbance, and unless eaten in very large quantities or by persons in ill health, need not be considered dangerous. The administration of an emetic, followed after action by doses of sweet oil and whisky, or sweet oil and vinegar, is recommended. Unfortunately, members of the second group give no warning of their harmfulness either by an unpleasant taste or by local action on the digestive tract, and toxic quantities of the poison are usually absorbed before symptoms appear. Should a poisonous *Amanita* be eaten by mistake or through carelessness, "take an emetic at once, and send for a physician, with instructions to bring hypodermic syringe and atropine sulphate. The dose is $\frac{1}{10}$ of a grain, and doses should be continued heroically until the $\frac{1}{2}$ of a grain is administered, or until, in the physician's opinion, a proper quantity has been injected. Where the patient is critically ill, $\frac{1}{4}$ of a grain may be administered." The treatment is effective only when the first symptoms manifest themselves, and not when late effects of the dangerous toadstool poisons are evident.

The species illustrated and described herewith have, until recently, been considered poisonous, but some of them are either merely innocuous, injurious to only certain individuals in the same way that strawberries are, or are even more generally wholesome. Every one, even the fungi expert, should consider himself a novice until he has personally determined these two points.

(1) Fly amanita or fly mushroom (*Amanita muscaria*), common in woods, especially of pine and birch, has a cap four or more inches broad, which, in its varieties, exhibits many colors—blood-red, bay-brown, orange, lemon, white, and the tint of cooked liver. Usually the skin, which

is at first thick (sticky in damp weather), checks more or less and peels in angular fragments. The flesh is yellow just beneath the skin, otherwise white and rather loose. The stem, which is white, scaly, long, stout, but soon hollow, is bulbous at the base, and bears a very soft torn frill or ring close to or even at its summit. The gills are white, sometimes yellow. This species is everywhere reported as poisonous, but is said to be eaten by the Siberians to produce a sort of intoxication. Its name, *muscaria*, is derived from its property of killing flies. (2) Satan's mushroom (*Boletus satanas*) is a somewhat rare species which grows in woods. Its cap, three to eight inches across, is usually brownish, yellow, or whitish, and rather sticky; tubes yellow, with bright red mouths, which later become orange; stem two or three inches long, thick and reticulated above. Its flesh, which is whitish, turning to reddish or bluish where injured, is mild, reputed poisonous, but eaten without discomfort by many. Since its evil effects seem to vary with the individual who partakes, it should either be avoided or tested with extreme care. (3) The emetic mushroom (*Russula emetica*) has a cap three to four inches broad, rosy, changing to blood-red, then tawny; sometimes yellow at first and later white. Its shape changes from bell-form to flat, or with a depressed centre, and a furrowed tubular margin. The gills are white, rather free, broad, and distant. Reputed to be emetic and poisonous, but eaten with impunity by many. (4) Ruddy-milk mushroom (*Lactarius rufus*) is a rare species which grows in damp woods and swamps. Its cap is two to four inches broad, at first convex, later concave, usually shining brownish-red; gills narrow, sometimes forked, yellowish or reddish; stem, two to four inches long, lighter than the cap; flesh, pinkish, extremely acrid, reputed very poisonous. (5) Trelliced clathrus (*Clathrus cancellatus*), a reputed poisonous fungus of beautiful red, white, or yellowish lattice-like form, and of very offensive odor. The latticed part rises from a white or fawn-colored cup. (6) Fiery Boletus (*Boletus piperatus*), a common but variable species in woods and open places, is one to three inches in diameter, yellowish, light-brown, or reddish, convex or almost flat, on a stem one and one-half to three inches tall, reddish or bright yellow at its base. The flesh, white or yellowish, loses its acrid peppery flavor when cooked. Though reputed poisonous, this species has been eaten with enjoyment by many. (7) Deadly agaric, deadly amanita, death-cup (*Amanita phalloides*), a common and very variable species found in woods from June until frost, is one of the most poisonous of mushrooms. The cap is three to four inches across, shining white, lemon, grayish-brown, blackish-brown, or grayish-brown with a black disk sometimes dotted, viscid in damp weather; stem, three to five inches long, sometimes much longer, white and rather smooth, hollow above, larger, solid, and bulb-like below, rising from a sort of cup—hence the name 'death-cup'; and bearing near its summit a reflexed, swollen, white, usually entire ring; gills white, free. This species is perhaps most dangerous, because most often mistaken for the common mushroom (*Agaricus campestris*). Since it grows in the woods, has white gills, white spores, and a cup-like base, the collector is to blame if he

makes any mistake: the common mushroom does not grow in the woods, has pink gills, dark spores, and no cup at its base. (8) Spring mushroom (*Agaricus* or *Amanita vernus*), considered to be a variety of the preceding, which grows in similar places, but during spring and summer. (9) The verdigris mushroom (*Agaricus aeruginosus*), common from July to November in woods and meadows, has a cap about three inches in diameter, covered with a green or blue slime; a long, scaly, hollow, bluish stem, and brown or purplish gills. It is reputed poisonous, probably because of its disagreeable odor, color, and taste. (10) The fetid wood-witch (*Phallus impudicus*) grows during summer and autumn in woods, fence-corners, kitchen yards, and under wooden steps. Its cap expands but little, is about two inches from edge to summit, and is borne in a thick (1¼-inch) stem, six to eight inches tall, which rises from a white or pinkish cup two inches in diameter. This toadstool cannot be mistaken when full grown, because of its exceedingly offensive odor, which attracts blow-flies and carrion-beetles. The young plants are said to be very good when fried, but when mature the odor is against this species, and it is then considered unwholesome. (11) Red-juice mushroom (*Hygrophorus conicus*), found in woods and open places from August to October, has a thin, fragile, acutely or obtusely conical yellow, bright red, or scarlet cap one-half to one inch across, with a lobed margin; rather close, broad, yellow, free gills; and a hollow yellow stem, three to six inches long. Formerly this species was considered poisonous, probably on account of its color; it is now proved not to be merely harmless, but good for food.

FUNGIBLES. In the civil law, articles of personal property, such as food, fuel, etc., loaned to another for the purpose of being consumed: that is, such objects as cannot be used without being given away or consumed, which were the subjects of the civil law contract of *mutuum*. Objects of this nature, from the fact that they were got rid of one for another (*fungantur*), were called fungibles. See *MUTUUM*.

FUNGICIDE, fūn'jī-sīd (from Lat. *fungus*, mushroom + *cædere*, to kill). Any material that will destroy fungi or prevent the germination of their spores. Fortunately for agriculture, there are a number of substances which may be

employed for this purpose. On account of their destructive influence, copper salts, which form the basis of many fungicides, are used in several of the most important. A few of the commonest and best fungicides are given herewith. When used upon foliage, the liquids must all be applied as a mist-like spray, especially to the under sides of the leaves, where many of the fungi gain entrance through the stomata, and only in sufficient quantity to moisten the surfaces, without standing on them or running off in drops. Neither should they trickle off dormant wood.

Bordeaux mixture, accidentally discovered in France about 1882, is the best general fungicide known. It consists of a solution of copper sulphate and lime. The corrosive action of the former upon many kinds of foliage is neutralized by the lime, which also makes the mixture more adhesive. The following is considered the best method of preparation: In a wooden vessel dissolve copper sulphate at the rate of one pound to a gallon of water by suspending the salt in a coarse bag just below the surface of the water. It will dissolve more quickly if suspended than if placed at the bottom. In another vessel slake stone lime with just enough water to cover it. This lime should contain little or no magnesium. When slaked, add water until the proportion is one pound of lime to one gallon of water. When needed for use, these two stock-solutions, as they are called, are diluted with water, and then mixed with as much agitation or stirring as possible. The proportions in the final mixture should be six pounds of copper sulphate, four pounds of lime, fifty gallons of water for applying to dormant wood and strong foliage, such as apples and currants; for young and for tender foliage, such as peach and plum, an extra pound of lime and twenty-five gallons more of water should be added. To test the neutrality of the mixture, a drop of ferrocyanide of potassium is added to a little of the compound, and if a brown color is observed, more lime must be added; if none, then the fungicide may be applied with safety. The stock-solution of copper sulphate may be kept indefinitely; the lime for only a few days. Since the mixture deteriorates rapidly by the flocculation of lime particles, it should be mixed fresh for each application.

Ammoniacal copper carbonate solution is almost as good as Bordeaux mixture, and since it is clear, and therefore produces no stain, it is better than Bordeaux mixture for spraying on ornamentals and ripening fruits. It is made by dissolving one ounce of copper carbonate in one pint of ammonia, and adding ten gallons of water.

Eau celeste is an important fungicide, but in inexperienced hands it may burn the foliage of many plants. It is made by dissolving one pound of copper sulphate in two gallons of water, adding one and a half pints of ammonia when cooled, and diluting with water to twenty-five gallons.

Copper sulphate dissolved in water at the rate of one pound to ten gallons of water is of great value as a spray for fungi, lichens, algae, etc., upon dormant trees and vines. It should not be used on foliage because of its corrosive action. The seed of oats, wheat, barley, etc., may be soaked in this solution to destroy the spores of smut (q.v.).

Sulphur has an important rank among fungicides, especially as a remedy for powdery mildews. In outdoor use it is dusted upon the foliage, but in greenhouses it is generally evaporated. Either the steam-pipes are coated with it, or it is more rapidly volatilized by heating it in a sand bath over an oil stove. Extreme care must be exercised to prevent ignition, since the fumes of burning sulphur are fatal to plants, as may be seen from their use in ridding greenhouses of plant growths and spores upon the soil, benches, walks, etc. Of course, when so used, the houses are emptied of useful plants.

Hot water may be applied when nearly boiling to kill certain fungi and insects without injuring the plants. Its more valuable use, however, is for the destruction of smuts of cereals. For this purpose, also, solutions of formalin and of corrosive sublimate may be successfully employed. The methods of using these fungicides will be described more fully in the article on SMUTS.

METHODS OF APPLICATION. The apparatus needed to obtain the mist-like spray referred to above are nozzles, hose, and a force-pump. The nozzles are the most important part of the machine. Those of the 'Vermorel' type are con-

A FORM OF SPRAY-CART.

sidered the most satisfactory for short range, and the McGowan for long. Most progressive orchardists use the former upon the ends of long bamboo tubes, the operators often being raised upon platforms as shown in the figure. A common form of apparatus is the so-called 'knapsack' pump, a tank which is strapped over the shoulders like a knapsack. It contains a very compact and powerful pump, and is convenient for small plots and for crops that have grown too large to permit the entrance of a wagon sprayer. Success in combating plant diseases depends upon the thoroughness with which the fungicides are applied. No fixed rules can be given as to times for spraying, but in general three or four applications should be given at intervals of ten days or two weeks. If much rainy weather intervene, one or two additional sprayings may be profitably given. In spraying fruit-trees and vines of all kinds, the first application should be given just as the buds begin to swell, but before they show characteristic color. No spraying should be given when the plants are in blossom, but one should follow the fall of the petals. Plant diseases are worse during some seasons than during others; hot, moist weather favors the rapid growth of many fungi. Perennial

plants should be sprayed every season to keep them in good condition; the increased yields of better crops will more than pay for the trouble and expense of spraying. Spraying is preventive, not remedial.

See also FUNGI; BACTERIA; BASIDIOMYCETES; ASCOMYCETES, etc.

FUNGOID PARASITE. A name occasionally used for fungi which are parasitic upon plants or animals. See FUNGI, ECONOMIC.

FUNGUS. A term applied in pathology, with several different meanings. Almost any growth from the skin or mucous membranes which has a cauliflower-like or excrecent character may be referred to as a fungoid growth. The term fungus is also used in connection with certain vegetable parasites which incite disease. These may be divided into three groups: (1) Bacteria or fission fungi (*Schizomycetes*); (2) yeast-fungi (*Blastomycetes*); and (3) mold-fungi (*Hyphomycetes*). Bacteria and their relation to disease will be found fully described under BACTERIA and DISEASE, GERM THEORY OF; also found under their respective titles. Yeasts occur in the stomach in some forms of indigestion, and have been found in the bladder in diabetes. A few cases of skin diseases have been reported in which the yeast-fungus was apparently the exciting agent. The most common molds which are met with in pathology are (1) the *Trychophyton tonsurans*, which is the active agent in the disease known as *tinea sycosis* or ringworm (q.v.); (2) the *Achorion Schoenleinii*, which is the parasite of favus (q.v.); and (3) the *Microporon furfur*, which is the cause of pityriasis versicolor, a skin disease.

FUNGUS-BEETLE, or FIDDLE. An extraordinary carabid beetle (*Mormolyce phyllodes*) of Java and the neighboring mainland, very variable

FUNGUS-BEETLE.

in size, but sometimes three inches long, yet so flat as to be able to creep into surprisingly thin crevices. It is brown, with black legs and antennæ, and the elytra are thin, soft, translucent, and greatly expanded, giving it a very strange form. These beetles remain in dark places, under bark, etc., during the day, and are particularly fond of hiding behind the fungi growing on trees. Within these their eggs are laid, and the larvæ make their home, feeding, it is believed, on the larvæ of other insects. This insect is known to the English residents about Penang as the fiddle-beetle, in allusion to the outline of its body.

FUNGUS-GNAT. One of the little flies of the family Mycetophilidæ, so called from the fact that many of them breed in fungi, including edible mushrooms. They are as a rule delicate and rather slender, with clear wings, but sometimes the wings are smoky or have large dark spots. The larvæ are slender, cylindrical maggots, more or less worm-like in appearance. The damage which they do in mushroom-beds is sometimes very great, and it becomes necessary at certain seasons of the year to cover the growing mushrooms with gauze.

FUNJ, fūnj, or FUNG. A mixed Hamite-Negro people on the Upper Nile. They have not the woolly hair nor the flat nose of the negro, and the color varies much as that of the mulattoes in the United States. Their language also betrays their Abyssinian origin. The Shilluks and Dinkas are of the same stock. The Kingdom of Sennar was founded by them in the seventeenth century and lasted until overthrown by Mehemet Ali, in 1821. See Bruce, *Travels* (Edinburgh, 1805).

FUNK, fōŭk, FRANZ XAVIER VON (1840—). A Catholic theologian. He was born at Abts-Gmünd, Württemberg, and was educated at Tübingen, at the Seminary of Rottenburg, and in Paris, where he devoted himself chiefly to the study of political economy. In 1870 he was appointed professor of theology at Tübingen. His principal publications are: *Opera Patrum Apostolicorum* (2d ed. 1901); *Lehrbuch der Kirchengeschichte* (3d ed. 1898); *Kirchengeschichtliche Abhandlungen und Untersuchungen* (1897-99).

FUNK, HEINRICH (1807-77). A German landscape painter, born at Herford, Westphalia, pupil of Schirmer at the Düsseldorf Academy. In 1836 he settled at Frankfurt, and from 1854 to 1876 was professor at the Royal School of Art in Stuttgart. He was gifted with keen observation, a fine sense of beauty of form and line, and his pictures are notable for perfect drawing, minute execution, and poetic conception, often combined with splendid light effects. Among those in public galleries are: "Castle Ruin in the Gloaming" (1834), National Gallery, Berlin; "Lower Inn Valley" (1846), and "Ruin by the Lake" (1852), Stadel Institute, Frankfurt; "The Kaisergebirge in the Inn Valley," and "Stormy Weather in the Eifel," Stuttgart Museum. He also left more than five hundred charcoal and pencil drawings of sterling quality.

FUNK, ISAAC KAUFFMAN (1839—). An American clergyman, editor, and publisher. He was born at Clifton, Ohio, and was educated at Wittenberg College, in his native State. After being pastor of Saint Matthews English Lutheran Church, in Brooklyn, N. Y., for seven years, he made an extensive tour through Europe, Northern Africa, and Asia Minor (1872). Among the numerous religious publications founded by him after 1876 are the following: *Metropolitan Pulpit* (now the *Homiletic Review*), the *Voice*, a well-known prohibition paper, and the *Missionary Review*. In 1889 the *Literary Digest* was established, and in 1895 the *Standard Dictionary* was published. One of the more recent projects undertaken by Dr. Funk is the *Jewish Encyclopedia*, a repository of the history and traditions of the Jewish people from the earliest times to the present day, the first volume of which appeared in 1901.

FUNK, PETER. A name used of persons employed at auctions to offer bogus bids in order to raise the price.

FUNNY BONE. A term used to designate really not a bone, but the ulnar nerve, which is so slightly protected in the groove where it passes behind the internal condyle of the humerus (q.v.) that it is often affected by blows on that part. (See ARM.) A peculiar electric thrill passes along the arm to the fingers whenever the nerve is struck or pressed.

FUNSTON, FREDERICK (1865—). An American soldier, born at New Carlisle, Clark County, Ohio. He studied for two years at the Kansas State University (Lawrence, Kan.); was a member of the reportorial staff of the *Kansas City Journal*; became connected with the United States Department of Agriculture, in 1891; accompanied the Death Valley expedition to southern California as assistant botanist; and in 1893-94 was in Alaska, where he made for the Department a collection of the local flora and obtained material for the field-report included in F. V. Coville's *Botany of Yakutat Bay* (Washington, 1895). In 1896 he was appointed deputy comptroller of the Atchison, Topeka and Santa Fé Railway; during the same year offered his services to the Cuban Junta; and later was commissioned captain of artillery, and distinguished himself as such at La Machuca. He was promoted successively to be major and lieutenant-colonel (for bravery at Las Tunas); endeavored, by reason of wounds and illness, to escape to the United States; was captured by the Spanish, and, although condemned to death, was finally set free. At the outbreak of the Spanish-American War he organized the Twentieth Kansas Volunteers, a force very similar to the well-known 'Rough Riders,' and became its colonel. From November, 1898, he served in the Philippine Islands, where, for bravery at Calumpit, he was appointed brigadier-general of volunteers in 1899. Owing to illness, he was relieved in 1899, and returned to the United States. He later returned to the Philippines, and on March 23, 1901, succeeded in capturing Emilio Aguinaldo, the insurgent leader, thus dealing an effective blow at serious native resistance. On March 30 he was commissioned brigadier-general, U. S. A. Consult the article by Scott in the *Independent*, vol. liii. (New York, 1901).

FUR AND THE FUR TRADE. (OF. *forre*, *fuerre*, It. *fodero*, case, sheath, from Goth. *fōdr*, AS. *fōdder*, OHG. *fuotar*, Ger. *Futter*, sheath). Many species of animals, especially those living in cold climates, have a soft, silky covering called fur, which in some animals is mixed with a covering entirely different in texture, long and straight, called the over-hair. It is often this over-hair which gives the distinctive peculiarity and beauty to the fur. The use of the skins of beasts with the fur still on them, as clothing, is of very ancient origin. The Chinese and Japanese used furs as articles of luxury at least 2500 years ago. Herodotus mentions their use by other ancient peoples. By the Romans furs were much prized, especially during the later days of the Empire. The Saracens also made great use of them, and from them the Crusaders brought them into general favor in Europe, where so much extravagance was exhibited in their use that in both France and England sumptuary edicts were

issued against this fashion. But such laws, like most regulations of the sort, had little effect, and the demand for furs continued among all classes of people. It was to meet this demand that those pioneer explorers, the trappers and traders, penetrated the northern forests of America, and established little trading stations which proved the vanguards of civilization. Albany and Saint Louis, and many other flourishing American cities, are the outgrowth of these stations. In the early days the most valuable furs could be obtained from the Indians in exchange for glass beads or other trifles. At one time this trade was carried on, especially in Canada, by *coureurs des bois*; but the scandalous practices of these reckless rangers brought the trade into such disrepute that a licensing system was established.

Beaver-skins were used in New Amsterdam and elsewhere in place of gold and silver for currency, and the figure of a beaver is a conspicuous device on the escutcheon of the city of New York. The search for furs was one of the objects of the daring expeditions of the voyagers of French Canada, as the search for gold was the motive of the Spanish invasion of Mexico and South America. The famous Hudson Bay Company originated in 1670, and claimed the entire country from the Bay to the Pacific, and from the Great Lakes to the Arctic Ocean, except such portions as were then occupied by Frenchmen and Russians. Toward the close of the eighteenth century, certain Canadian merchants formed the Northwest Fur Company, having their headquarters at Montreal, their operations being carried on in the districts watered by rivers that flow to the Pacific. This organization soon became a formidable competitor to the Hudson Bay Company. In 1821 the two companies united. In 1763 some merchants of New Orleans established a fur-trading post where Saint Louis now stands, under the management of the brothers Chouteau. For the first half of the nineteenth century the Saint Louis trade was from \$200,000 to \$300,000 a year. One of the most famous of early American fur-traders was John Jacob Astor, of New York, who began by trading in a small way after his arrival in the country in 1784. By 1810-12 his trade, conducted under the name of the American Fur Company, was enormous. An entirely new field for American enterprise was opened by the purchase of Alaska in 1867, which secured complete control of an important seal-fishery. This field was so eagerly worked that it was found necessary to limit the taking of seals to the bachelor males, lest the animals should be altogether exterminated.

Collectors and dealers in Canada and the United States forward their furs to the seaboard, chiefly to New York, for sale there, or for consignment principally to London and Leipzig. Of the fur marts, London is the chief; for thither tends, by the laws of trade, not only much of the produce of Asia and Europe, but also the fine peltries of Chile and Peru, the nutria from Buenos Ayres, the fur-seal of Cape Horn and South Shetland, the hair-seal from Newfoundland, as well as the inferior peltries of Africa. To prepare fur skins in a way to endure this long transportation is a simple and easy matter. When stripped from the animal the flesh and fat are carefully removed, and the pelts hung

in a cool place to dry and harden; nothing is added to protect them. Care is taken that they do not heat after packing, and that they are occasionally beaten to destroy worms. A marked exception is the case of the fur-seal, which is best preserved by liberal salting and packing in hogheads. All other raw furs are marketed in bales.

Few kinds of animals furnish a pelt of suitable weight and pliability, and all of them differ widely in elegance of texture, delicacy of shade, and fineness of over-hair; and these differences determine their place in the catalogue of merchandise. These few animals are not very prolific, and many of them attain their greatest beauty in wild and uncultivated regions, although there are some notable exceptions. Being thus few in kind, and limited in quantity, the extinction of the several choice varieties has been threatened through the persistent energy of trappers.

The principal North American fur-bearing animals are beaver, muskrat, hare, and squirrel; the mink, sable, fisher, ermine, weasel, raccoon, badger, and skunk; the lynx, northern and southern; bears of several kinds; foxes of three or four varieties; two wolves; and most valuable of all, musk-ox, seal, and sea-otter. Of foreign fur-bearing animals the most highly prized are the chinchilla, coypu (nutria), and various monkeys, marsupials (opossum, kangaroo, etc.), and cats. (See articles under their names; also, FUR-BEARING ANIMALS.) Many of the animals, however, enumerated in the American list are also natives of Northern Europe, whence their pelts come to market under other names.

For manufacturing purposes, furs are classified into *felted* and *dressed*. Felted furs, such as beaver, nutria, hare, and rabbit, are used for hats and other felted fabrics, in which the hairs or filaments are made so to interlace or entangle as to form a very strong and close plexus. The quality of the fur is better when the skin is taken from the animal in winter than in any other season, giving rise to the distinction between 'seasoned' and 'unseasoned' skins. The removal of the fur from the pelt is a necessary preliminary to the preparation of fur for felting purposes. The long hairs are cut off by a kind of shears; and the true fur is then removed by the action of a knife, requiring much care in its management. In some sorts of skin the long hairs are removed by pulling instead of shearing; in others, the greasiness of the pelt renders necessary a cleansing process, with the aid of soap and boiling water, before the shearing can be conducted; and in others, both pelt and fur are so full of grease as to require many repetitions of cleansing. For beaver-skins a machine of special construction is employed in cutting the fur from the pelt.

Furs have their felting property sometimes increased by the process of *carroting*, in which the action of heat is combined with that of sulphuric acid. The chief employment of felted furs is described under HAT, section *Manufacture*. See also FELT.

Dressed furs are those to which the art of the *furrier* is applied for making muffs, boas, and fur trimmings for garments. The fur is not separated from the pelt for these purposes; the two are used together; and the pelt is converted

into a kind of leather to fit it for being so employed.

The process of dressing furs, while in its general outlines the same, differs in its details with the character of the fur. The fur of the seal is prepared as follows: The salt used in packing is first thoroughly washed out, and every particle of flesh is carefully removed from the inside of the hide, after which the skins are stretched on frames and slowly dried. The process of thorough washing, this time in soapsuds, is repeated, and while the skin is still moist the long over-hair is removed with a knife, leaving only the short soft fur. This process is a delicate and tedious one. The skin side of the pelts, after being subjected to moist heat, is shaved down until a smooth, even surface is obtained. When the skin is again dry it is placed in a tub filled with fine hardwood sawdust, which absorbs any moisture remaining, and is softened and rendered flexible by treading with the bare feet. It is now ready to be dyed. The coloring matter is applied with a brush to the tips of the fur and distributed by shaking the fur. It is then dried and brushed. The process of dyeing, drying, and brushing is often repeated as many as twelve times.

FUR-BEARING ANIMALS. The group of animals whose pelts are utilized as fur garments or ornaments, forming the carnivorous family Mustelidæ. This family, which includes, besides its typical weasels (Mustelinæ), the skunks (Mephitinæ), the badgers (Melinæ), the otters (Lutrinæ), and the sea-otters (Enhydrinæ), the honey-badgers, ratels, etc., is world-wide in its spread outside of Australia. It is in the Northern Hemisphere, however, that the family is now most numerous and well represented; and it is in response to the demand of the cold winters of the subarctic regions, to which the most valuable of these animals are confined, that their coats have become the warm felts which mankind finds so serviceable and attractive. All are small animals, the largest (the wolverine) being only about three feet long. Their bodies are in most cases slender, their legs rather short, their heads round, with very powerful jaws and teeth, and their tails (except in the skunks) are rather short. Great strength, nimbleness, and courage characterize them, and many exhibit a blood-thirst beyond that of any other carnivore; nevertheless, they have been tamed. Weasels have always acted as mousers in the East, and were so used in ancient Greco-Roman civilization. Ferrets still serve as vermin-catchers, and otters have been taught to fish, while badgers were formerly used in cruel sport. Most of them are terrestrial and live in burrows of their own digging, but some are arboreal. They feed upon small mammals, birds, birds' eggs, fish, crustaceans, and insects; and all possess, in a greater or less degree, anal glands, from which they can discharge at will (sometimes shooting it a long distance) an acrid fluid, which is intensely offensive to the nostrils and mucous membrane of other animals. The chase of the leading members of this family has long been and still is an important industry on the frontiers of Europe and North America, and thousands of pelts have been gathered annually without exterminating any of the race, though the habitats of many species have been much reduced. Statistics of the trade in furs in London show that during the last

century the receipts of pelts there of Mustelidæ alone, from North America exclusively, amounted to about 3,250,000 sables, 1,500,000 otters, 100,000 wolverines, 3,000,000 minks, 25,000 sea-otters, 500,000 skunks, and 500,000 badgers, besides an unknown number of ermines, fishers, etc. "The scientific interest with which the zoölogist, as simply such, may regard this family of animals, yields to those practical considerations of every-day life which render the history of the Mustelidæ so important." Consult authorities mentioned under MAMMALIA, especially Coues, *Fur-Bearing Animals* (Washington, 1877). See BADGER; ERMINE; FERRET; FISHER; MARTEN; OTTER; POLECAT; SABLE; SEA-OTTER; SKUNK; WEASEL; WOLVERINE; and similar titles.

FÜRBRINGER, fūr'brīng-ēr, MAX KARL (1846—). A German anatomist and writer on comparative morphology. He was born at Wittenberg, and was educated at Jena and Berlin. In 1888 he was appointed to a professorship at Jena. His publications include several valuable works on the anatomical structure and development of the Vertebrata, such as: *Die Knochen und Muskeln der Extremitäten bei den schlangennähnlichen Saurien* (1870); *Zur Entwicklung der Amphibienniere* (1877); and *Untersuchungen zur Morphologie und Systematik der Vögel* (1888).

FURCA ET FLAGEL/LUM (Lat., gallows and whip). In feudal relations, the lowest of servile tenures, in which the bondman was entirely at the lord's mercy, both in life and limb.

FURETIÈRE, fūr'tyār', ANTOINE (1620-88). A noted French philologist, lexicographer, and novelistic satirist. He was born in Paris, was trained for the law and the Church, but afterwards gave his life to letters. He published a volume of verse (1655), and two satires, the *Nouvelle allégorique, ou Histoire des derniers troubles arrivés au royaume d'éloquence* (1658), and *Voyage de Mercure* (1659). These won him an academic seat (1662). Already he had begun the preparation of a dictionary which, as its copyright 'privilege' states, was to contain all French words, old as well as modern. For twelve years he labored on it, when in 1674 a royal decree was issued forbidding any one to publish a dictionary till that of the Academy should appear. He published his own dictionary, notwithstanding, in 1694, ten years before the first dictionary of the Academy was ready. That body behind closed doors condemned him for plagiarism, a slander tardily refuted by the appearance of their own dictionary in 1694. Furetière was expelled from the Academy (1685), and his right to print in France revoked. He resisted with wit and courage in a shower of epigrams, but under the strain and the disappointment, he died in Paris, May 14, 1688, two years before his dictionary appeared at Rotterdam (1690). He was also a realistic novelist. Among his novels is *Le roman bourgeois* (1666). Furetière's dictionary was edited by Basnage in 1701, and again revised in 1725. It furnished the basis for the *Dictionnaire de Trévoux* that at length displaced it. Consult Körting, *Geschichte des französischen Romans*, vol. ii. (2d ed., Oppeln, 1891).

FURFOOZ (fūr'fōz') **RACE**. From brachycephalic skulls found at the Trou de Frontal, Furfooz, Belgium, this type of mankind is sup-

posed to date from the end of the Quaternary period, just at the commencement of the Polished Stone age. The first appearance of broad-headed man in Europe at Furfooz, as well as at Grenelle and Cro-Magnon, associated with longheads, took place at different dates in the Neolithic period. Mortillet places the Furfooz man in the Robenhausean epoch of the Neolithic period, and also says that the associated relics have been disturbed. Consult: *Le Préhistorique* (Paris, 1900); Deniker, *Races of Man* (1900); Sergi, *The Mediterranean Race* (London, 1901).

FURIES. See EUMENIDES.

FURIOSO, fūr-ré-ō'só, BOMBASTES. See BOMBASTES FURIOSO.

FURIOSO, ORLANDO. See ORLANDO FURIOSO.

FURIUS, MARCUS FURIUS BIBACULUS (c.103 B.C.—?). A Latin poet, born at Cremona. He wrote iambics, epigrams, and a poem on Cæsar's Gallic wars. "Jupiter hibernas cana nive conspuet Alpes," the opening line in the poem on Cæsar, is parodied by Horace (Sat. II., 5, 41), who substitutes Furius for Jupiter, and speaks of the poet as *pingui tentus omaso*, "distended with his fat paunch." It is probable that Furius also wrote the poem *Æthiops*, containing an account of the death of Memnon, and that the *turgidus Alpinus* of Horace is really Bibaculus. He is compared by Diomedes with Horace and Catullus, and is enumerated among the Roman iambic poets by Quintilian (X. 1, 96). Consult: Bährens, *Fragmenta Poetarum Romanorum* (Leipzig, 1886); and Weichert, *Dissertatio de Turgido Alpino S. M. F. Bibaculo* (1822).

FURLOUGH, fūr'ló (Dutch *verlof*, from Dan. *forlov*, leave, from *for*, Eng. *for* + *-lof*, Dan. *lov*, Ger. *Laube*, Eng. *leave*, permission). A military term, applied to the leave of absence of the rank and file. It does not apply to commissioned officers. In the United States Army furloughs in the prescribed form for periods of 20 days may be granted to enlisted men by commanding officers of posts, or by regimental commanders, if the companies to which they belong are under their control.

The number of men furloughed at any one time is not to exceed five per cent. of the enlisted strength. In England the furlough season is confined to the winter months, generally from the 15th of October to the 15th of March. All soldiers with over twelve months' service, and qualified in conduct and musketry ability are entitled to six weeks' furlough. In France and Continental Europe generally, soldiers in the active army who have qualified in their duties, and can read and write, may, at the end of twelve months' service, be sent on furlough for an indefinite period.

FURMAN, fūr'màn. RICHARD (1755-1825). An American Baptist clergyman, born at Esopus, N. Y. He was pastor of the First Baptist Church of Charleston, S. C., from 1787 until 1822. During this period he was also active as a legislator, and took part in the deliberations on the first Constitution of South Carolina. As one of the foremost promoters of the Baptist movement, he was elected in 1814 first president of the Triennial Convention of Baptists.

FURNACE (from OF. *fornais*, Fr. *fournaise*, It. *fornace*, from Lat. *fornax*, furnace, from *for-*

FUR-BEARING ANIMALS

1. WEASEL (*Mustela erminea*), in white winter or Ermine dress.
2. WEASEL (*Mustela erminea*), in brown summer or Stoat dress.

3. SABLE (*Mustela zibellina*).
4. WOLVERENE OR GLUTTON (*Gulo luscus*).
5. FERRET OR POLECAT (*Mustela putorius*).
6. SEA OTTER (*Lutra lutra*).
7. AMERICAN PINE MARTEN (*Mustela Americana*).

ness, oven; connected with Lat. *formus*, Gk. *θερμός*, *thermos*, Skt. *gharma*, hot, Eng. *warm*). A structure in which to make and maintain a fire, the heat of which is used for heating, generating steam, smelting ores, melting metals and glass, baking pottery, and for a great variety of other purposes in science and the arts. Furnaces may be divided into the following classes: (1) Furnaces in which the fire and the material to be heated are placed in contact. To this class belong the open blacksmith fire (see *FORCE*), blast-furnace, cupola or foundry furnace, etc. (See *FOUNDING* and *IRON AND STEEL* for descriptions of blast-furnaces and converters and foundry furnaces.) (2) Furnaces in which the fuel is in one compartment and the material to be heated in another, the material being heated by the flame and hot gases from the burning fuel. The most familiar form of this class of furnace is the reverberatory, employed in heating and melting iron and steel. (See *IRON AND STEEL*.) (3) Furnaces in which the material to be heated is within a close chamber or retort which is heated externally by the fire or by flame and gases from the fire. Pot furnaces for making glass (see *GLASS*), and crucible furnaces for making crucible steel (see *IRON AND STEEL*) are examples. Furnaces may employ gas, powdered coal, and oil as fuel. The Siemens gas furnace is used in steel manufacture. (See *IRON AND STEEL*.) Furnaces for generating steam and those for heating form in a measure classes in themselves. See *BOILERS*; *FUEL*; *HEATING AND VENTILATION*; *KILNS*.

FURNEAUX, fŭr-nŭ', TOBIAS (1735-81). An English navigator and discoverer, born at Swilly, near Plymouth. In 1766 he accompanied Wallis in the latter's voyage around the world. Three years after his return in 1768, he commanded the *Adventure* in Captain Cook's voyage, but became separated from him, and continued his exploration independently along the coast of Tasmania, naming the principal points on it. A group of the Low Archipelago was subsequently named after him by Cook.

FURNEAUX ISLANDS. An Australasian group lying in latitude 17° S. and in longitude 143° 6' E., between Australia and Tasmania (Map: Australia, H 6). They were discovered in 1773 by Tobias Furneaux.

FURNESS, HORACE HOWARD (1833—). An American Shakespeare scholar, born in Philadelphia. The son of William Henry Furness, a Unitarian clergyman and author, he graduated at Harvard in 1854. After a period in Europe, during which he received from Halle the degree of Ph.D., he returned home, studied law, and was admitted to the bar in 1859. He contributed to Troubat and Haly's *Practice on Ejectment*, etc., and was a member of the Seybert commission to investigate modern spiritualism, but his *Variorum Shakespeare* is his peculiar work. This he began early, and during the next twenty years issued thirteen volumes, as follows: *Romeo and Juliet* (1871); *Macbeth* (1873); *Hamlet* (2 vols., 1877); *Lear* (1880); *Othello* (1886); *Merchant of Venice* (1888); *As You Like It* (1890); *Tempest* (1892); *Midsummer Night's Dream* (1895); *Winter's Tale* (1898); *Much Ado About Nothing* (1899); and *Twelfth Night* (1891). Associated with him in his work was his wife, herself author of a *Concordance to Shakespeare's poems*, and his son, Horace How-

VOL. VIII.—22

ard Furness, Jr. Everywhere the Variorum edition has been received as a monument of scholarship, and the adoption, since 1886, of the text of the First Folio as the basis of the work, will by many be thought a distinct gain. Dr. Furness's services to learning were recognized by Columbia and Harvard in the respective bestowments of Litt.D. and of LL.D.

FURNESS, WILLIAM HENRY (1802-96). A Unitarian clergyman. He was born in Boston, graduated from Harvard, studied theology at Cambridge, and was minister of the First Unitarian Church of Philadelphia from 1825 to 1875. He was prominent in the anti-slavery movement. His writings include: *Remarks on the Four Gospels* (1838); *History of Jesus* (1850); *The Unconscious Truth of the Four Gospels* (1868); *The Power of Spirit Manifested in Jesus of Nazareth* (1877); *The Story of the Resurrection Told Once More* (1895).

FURNESS, WILLIAM HENRY, JR. (1828-67). An American artist. He was born in Philadelphia, early became interested in art, and studied in various cities of Europe. He commenced his career as portrait painter in Philadelphia, but soon afterwards removed to Boston, where he met with great success. Among his sitters were Charles Sumner, Lucretia Mott, and many other celebrities of the day. His portraits are exceptional for good drawing and color, and their expression of characteristic traits.

FURNESS, WILLIAM HENRY, 3D (1866—). An American ethnologist, born at Wallingford, Delaware County, Pa. He was educated at Saint Paul's School, Concord, N. H., at Harvard, where he graduated in 1888, and at the medical school of the University of Pennsylvania (1891). For scientific purposes he traveled much in South America, and writes interestingly of his researches there and elsewhere, in such books as *Folklore in Borneo* (1899); *Life in the Luchu Islands* (1899); and *Home Life of the Borneo Head-Hunters, Its Festivals, and Folk-Lore* (1902). In recognition of this and similar work, he was made a fellow of the Royal Geographical Society and a member of other scientific associations.

FURNI ISLANDS, fŭr-nĕ (Lat. *Corassia* or *Corseæ*). A group of small islands in the Grecian Archipelago, in about latitude 37° 35' N., and longitude 26° 30' E., between Nikaria and Samos; the largest of them is Furni.

FURNISS, HARRY (1854—). An English caricature artist. He was born at Wexford, Ireland, in 1854, of English parents. He began to figure as an illustrator at a very early age. At the age of 19 he went to London, contributed for many years to the *Illustrated London News*, and in 1880 began to draw for *Punch*. Four years later he joined the *Punch* staff, and his "Parliamentary Views" in that journal became especially popular. He withdrew from *Punch* in 1894, started the *New Budget* in 1895, and visited the United States in 1896-97. He is thoroughly English in sentiment, and depicts middle-class English life with a fine sense of humor.

FURNITURE. Properly, that which furnishes, of whatever nature it may be; and in this sense we speak of house furniture, table furniture, church furniture; and until very modern times

the term included the fixed woodwork of a house or the like. Much the more general application of the term is, since the middle of the nineteenth century, to the articles constructed of wood intended for the use of persons occupying a house, and this with but an infrequent extension to articles of crockery, or metal, or of textile fabric. Thus, in speaking of the furniture of a bedroom, the mirror, the articles of pottery or porcelain upon the washstand, the bed curtains and coverings may indeed be included in the general phrase bedroom furniture, but in saying that one is about to purchase bedroom furniture the idea would be generally that of the bedstead, the bureau, tables, chairs, and the like. It is in this limited and modern sense that the term is used in this article.

The uses of furniture are chiefly these: Seats, because to many races of men it is found expedient to rest the body, that is, the trunk, upon a surface raised from ten to eighteen inches above the floor upon which the feet are supported; tables, which, being raised to a reasonable height above the floor (28 to 36 inches), are convenient alike to one sitting or standing, and may be used for permanent or temporary deposit of articles and for the food and the dishes which contain it at mealtime; simple receptacles, as chests, and, for very small articles, caskets, coffers, and the like; receptacles of more complex character and intended for the frequent deposit and frequent removal of the contents, as cabinets (a general term covering pieces of furniture of various forms), and chests of drawers under the different foreign names adopted into the language, as bureau, chiffonnier, commode; and also wardrobes, for hanging or with shelves for the deposit of folded garments. These last named, in either form, are often confused with cupboards, and are called by names introduced from the French, as *armoire*; structures of shelving for the deposit of books and objects of art and curiosity, which structures may be either open or closed, and are covered by such names as bookcase, whatnot, and by foreign terms, such as *étagère*; and finally, conveniences for writing, combined with some moderate storage of stationery and books which, if they are classed by themselves, are not only tables, or chests of drawers, or sets of shelves, but are often a combination of all three, and are known by such names as writing-desk, writing-table; secretary, davenport, and by foreign names, such as *escritoire* and *secrétaire*.

In Asia generally there is no such general use of raised seats as has become a matter of course to Europeans. They are known, but are rather places of honor. They are not necessarily 'thrones' in the technical sense, because indeed the great throne of Persia and many chairs of state among the peoples of Northern India are large and square and cushioned, and are intended for cross-legged sitting; but those articles that most resemble European chairs are, at all events, the 'seats of the mighty.' In general the people of India sit on rugs and hard, flat cushions like small mattresses. Places for sleeping are, on the other hand, very commonly raised from the floor, and bedsteads of some sort are in use throughout the Peninsula of India by all natives who are not of the very poorest class. This may be accounted for perhaps by the great number of poisonous serpents which in India more than elsewhere in

the world are allowed to coexist even with the somewhat dense population. The furniture of the modern inhabitants of the Levant, such as the city dwellers of Cairo, Damascus, and Basra, consists primarily of a raised platform, called a *deewan* (divan). This is essentially a somewhat soft body, like a mattress, covered with a carpet or rugs, upon which it is agreeable to sit cross-legged or to recline or lie down, the head, shoulders, or the whole body being partly supported by cushions of different sizes and shapes. This *deewan* may be raised to the height of sixteen inches or so, either by a solid structure or by light woodwork. As a general thing it is, whatever its height or size, set upon a raised part of the floor. Although this mattress is movable, and is frequently moved for purposes of cleaning the floor and walls beneath and behind it, it is not adjustable, and cannot be shifted about to different parts of the room, as can a sofa or chair. In some large rooms the raised floor is made so large that the *deewan* may be carried along three sides of it. Thus, in a plate given by Lane (*The Modern Egyptians*) of an interior in Cairo, the raised part of the floor is perhaps six inches above the rest, and upon this there is laid a mattress only about four feet wide and extending across the end of the room and along both sides for the whole length of the raised platform. Upon this mattress cushions are ranged along the wall, but all these are movable, and can be used in any way, one or two at a time to support the arm or the back of the sitting person, or the head of one who would lie down.

Of other furniture in a Levantine house there are chiefly fixed shelves along the walls, upon which are set the more decorative objects of utility, as vases and bowls, and small and low tables entirely movable, with no permanent place in the room, but carried about as the persons seated on the *deewan* have occasion to eat, to smoke, or to play at some game. There is occasionally a sort of cabinet, usually open, affording merely two or three shelves for the temporary deposit of a water-bottle or the like. The need of further furniture is removed by the use of cupboards in the wall, of which there are a great number of different sizes and fitted with shelves of different depth and of different heights between the shelves. The absence of any distinction between dining-room, sitting-room, and reception-room destroys entirely our notions of the proper furnishing of each kind of room.

In a Japanese home simplicity of furnishing is carried still further than in the Moslem East. Closets in the walls fitted with shelves of different sizes in length, width, and height between shelves, and usually closed by sliding doors, are used for clothing, and also for the storage of considerable quantities of as yet uncut pieces. The space under an ordinary staircase may be occupied by shelves and drawers; shelves along the walls are used for lanterns, which are taken out at night, and for hats and the like; lengths of bamboo prettily combined serve for towel-racks and to suspend out-of-door garments; and a curious structure, composed of a vertical strip, which may be either a stiff board or a piece of textile fabric, carries a number of vases, cups, or round boxes of wood or bamboo, arranged in vertical series, into which receptacles many utensils may be thrust for safe keeping, and when made

more decorative may serve for fresh flowers. The simplicity and obvious cheapness of all these things is very remarkable. Almost no attempt is made, even in the palaces of the old daimios, or in such parts of the Imperial palace as have not been altered in very recent times, to give to the interior that costly and luxurious air which Europeans think essential to their own dignity, or which they consider inseparable from beauty of design and perfect taste. To the Japanese, the most refined of decorative artists, simplicity is thought to be the most attractive effect, except for a given piece, upon which the full resources of art are to be lavished. In a room used for the reception of visitors there will be no wall decoration at all, because the walls are either occupied with cupboards or the like, or are opened up into recesses, of which something is said below, or are represented by sliding screens of paper strained on light wooden frames. These paper screens may indeed be richly painted with flowers and birds, or, in many cases, are covered with those colored, flowered, and embossed papers which we in the West purchase under the erroneous name of 'Japanese wall-paper.' This, however, is rare; the decorative papers or the painted surfaces spoken of are used generally for the entirely movable screens in two, three, or four leaves, which are sometimes very low (three feet), as suiting the needs of people who are seated upon the floor, and sometimes of full height (six feet and six inches or even seven feet). It is sometimes asserted that the sliding screens themselves, which form a part of the inclosure of the house, are never decorated, but there is positive evidence that in many cases richly adorned surfaces are applied here as elsewhere.

Of movable furniture, then, there is chiefly the cabinet with drawers and shelves, which is used mainly for the storage of very delicate objects; the writing-table, which may be five, six, or seven inches high, and from a foot to two and a half feet in length and of proportionate width; the boxes which contain paper for writing, which is often very decorative and needs especial care; and the small, light cases which contain a fire-box or fire-pot, and are intended for the use of smokers; the sword-rack, upon which the gentleman of old Japan always laid his sword or swords on entering the house, the use being temporary only, for no sword would be kept there for any length of time; and, finally, very small stands, such as we use to set off vases and other ornamental objects, but which in Japan are used for actual utility, as, for example, to raise a dish with fruit or the like to a convenient height. Of utensils which are not commonly made of wood, except in a few cases, the fire-pot is the most important, and this, which is not unlike the brazero of older Italian usage, may sometimes be a heavy and almost permanent piece of furniture. In all the above list it is noticeable that hardly anything is more than three feet long or more than two feet high. The larger chests of drawers which are occasionally brought here from Japan seem to have been rather traveling conveniences, as they were commonly arranged for transportation on the shoulders of men by means of a long pole passed through rings or slots.

The more elaborate decoration of such a room is confined to one small part of it, a kind of recess, single or double, within which is hung

a picture mounted upon a scroll and unrolled for the occasion, or perhaps two such pictures, and in front of these a vase of flowers upon a rich stand. Even the possessor of a great collection of paintings, of bronzes, porcelains, lacquered boxes, and trays would show in this way but two or three of his possessions at a time. All the rest are kept stored away in the *Kura* or fireproof storehouse, attached to each dwelling of any importance. As for the bed, it consists of quilts, perhaps two or three, laid upon one another, and primarily upon the rice-straw mats which cover the floor. A wooden pillow supports the head—that is to say, the nape of the neck; and these pillows are often topped with a roll of some textile fabric stuffed with straw or perhaps buckwheat hulls, upon which are laid sheets of paper fastened down by strings, and these sheets are pulled off one at a time, so that a clean surface is provided. Even where a mosquito-net is needed it is usually held upon a very light frame, without the slightest attempt at elaboration of any sort, so that even for these transparent curtains there are no bedposts and no testers.

From the moment that one must have a chair or a bench or a couch to sit upon, it becomes natural and in a sense essential to have a raised bed-frame as well, and, moreover, with the chair comes, of course, the high table in all its forms, for eating, for writing, for the playing of games. The Japanese writing-table may weigh a pound, but that of a family using chairs will be thirty inches high, and therefore wide and long in proportion, and may weigh forty pounds even when in the simplest and most utilitarian form; while its size and shape invite elaboration and make it often massive and very costly. Alone among the peoples of Asia the Chinese have used, as far back as our knowledge goes, raised chairs and settles with such results as have been noted in Europe. The Chinese raised seat is indeed usually very high, and either fitted with a footstool or so broad and long that the feet can be drawn up upon it; then this is made of solid and heavy wood, and often the larger surfaces, such as would in Europe be wooden panels, are pieces of marble or other decorative stone inlaid flush with the wooden frame. The use of this material, conducting heat from the body and therefore feeling cold to the touch, points to a custom which is known to exist of covering the whole piece of furniture with such a loose 'slip' as the French call the *houssse*, and it is probable that beneath this *houssse* a thin cushion is sometimes laid upon the seat proper. Tables are made of many sizes; bedsteads are wrought into elaborate designs peculiar to the Chinese, as when the *ciel* or tester is supported, not by vertical posts, but by curved ends, which combine overhead to make an almost circular frame—a cylinder within which is placed the horizontal surface which serves as the bed proper. All this furniture in the more stately interiors is wrought into elaborate carvings invested with that smooth and permanent painting which we call, for want of a better name, lacquer-painting, and with gilding or the imitation of gilding in the same material as the solid color. A throne-like chair will have the horizontals of the back terminating in dragon-heads, each one holding in its mouth a gilded ball, which is loose and yet cannot be withdrawn; the arms and the supports of the seat will be carved in leafage of

brilliant design; the whole will often be excellent in composition, denoting the presence of ancestral types of indefinitely great antiquity. And the reader is reminded that the furniture carved in dark-red wood, of which so much exists in the old families of Canton merchants, is not Chinese except in make—this is not the furniture which the Chinese would make for themselves.

With respect, then, to the high seat and what depends upon it, the furniture of the most ancient nations of Europe and the immediate neighborhood of Europe, such as the Egyptians, seems to have taken the form which has never been, in essentials, abandoned since that time. Painted bas-reliefs and flat wall paintings of all historic epochs except the very earliest are known to us, and they never fail to contain representations of thrones and of chairs, stools and couches which are treated decoratively and shown in such flat projection that their entire structure is sometimes doubtful, but which, when the pieces preserved in European museums are compared with the paintings, may be sufficiently well understood. The use of metal, such as bronze, for such furniture as chairs and couches is peculiar, but such use existed still in the times of the early Roman Empire, as we know from the discoveries at Pompeii, and it need not be supposed that the majority of seats and bedsteads were made in this way—the bronze pieces have been preserved, while the wooden ones have decayed or have been destroyed by the earliest discoveries. There is in the Louvre a piece of wooden furniture composed of four solid uprights inclining inward very slightly, and having at top a box and below a compartment opened by doors in the sides. In other words, this is a small cabinet with two compartments. In the British Museum there are several pieces of furniture made of wood, though none of very great elaboration. The paintings above mentioned leave it generally uncertain whether the pieces represented are of wood or metal. One thing, however, is certain, that Perrot (see *Bibliography*) is correct in his remark that "the interior of the Egyptian house was not empty and bare, like that of a modern Oriental house; there were to be seen everywhere seats with or without arms, tables of varied form, folding seats, stools upon which to put the feet, consoles upon which are placed vases full of flowers, and cabinets for locking up articles of value." That the decoration by carving and color applied to such wooden furniture was rich and varied is known by the singular collection of small wooden objects, such as spoons and ladles and small trays, which are found in great numbers in the museum at Cairo and in the Louvre.

The Greeks, in the earlier historic days, lived a simpler life than the Egyptians. It must have been very rare in the time of Pisistratus of Athens, or at any time before the Persian War, that a household possessed more than one or two raised seats, which seats could be called chairs and were considered as places of honor. There were stools (*klismos*, *threnus*, *klisië*, *diphros*), of which, however, the exact forms cannot be distinguished one from the other. And it is probable that the exact use of each name varied from time to time, and even from town to town. The name *thronos* was applied to a dignified seat probably always furnished with a back and arms. Such a seat was given to each guest to whom

honor was to be done. It appears, then, that the table used for eating was small and low, not necessarily lower than the *thronos* or couch, as shown in ancient bas-reliefs and the like, because in these an effort at perspective or at showing the whole figure of the person seated or reclining may be allowed for, but the table was evidently a movable object, brought on occasion and set beside the chair or couch. One is reminded of the similar custom during the Middle Ages, when, a guest of honor being seated in his armchair with a canopy over his head, a table was brought by the servants and put before him, upon which his meal was served, and which was then removed. A Greek interior was undoubtedly very bare of furniture. On the other hand, the beginnings of disposable wealth and of the taste for luxury are marked by the introduction of such massive and solid pieces as marble seats in courtyards, and in gardens fountains with decorated basins to receive the water, and tables of marble with massive uprights, while at the same time what few pieces of wooden and metallic furniture were placed in the living rooms were more richly adorned. Paintings upon the walls and mosaic floors were more in the way of Greek taste in the matter of decorative interiors than were pieces of movable furniture.

The Roman world under the later Republic and the Empire, recognizing both Oriental and Greek customs, and introducing other conveniences and richer adornments, used seats of many forms, among others bronze throne-like chairs and marble chairs of very rich sculpture for the atrium and the peristyle or inclosed garden. Such seats as these required cushions, and the modern artist of archæological proclivities who represents Greek ladies in their thin and scanty dress, seated upon marble *exedre*, is undoubtedly guilty of an error which is not to be excused by the fact that he finds such things in ancient bas-reliefs. Cushions were used in the amphitheatres to lay upon the stone seats, and so they were by the rowers of galleys. It does not follow that all representations in ancient art are accurate in minute detail, a fact which is well known to those who have tried to restore Greek and Roman costume from the statues and relief sculpture of antiquity.

With both Greek and Roman antiquity we have to keep in mind the much less universal closing of the apartments. It is a matter not perfectly understood how the people of Central Italy could have lived so much in the open air, and the same is true of Greece, where, though there is a warm summer, there is cool weather in the autumn and spring, and in the winter there are cold rains. Something like it is seen in Central Italy of our own time. Interiors so imperfectly closed were not likely to be very much filled with movable furniture. The tendency would be always toward a few massive and costly pieces, and everything else of a slight and temporary character.

Similar traditions seem to have been of weight under the Byzantine emperors, but with this beginning of modern times there is noticeable a great addition to the elaboration of forms applied to seats and other utensils of woodwork. The number of pieces, bedsteads, couches, thrones, or armchairs of different kinds, is constantly increasing throughout the Middle Ages, both in the

Byzantine Empire and in the kingdoms of Western Europe, and this distinction is maintained: that in the East inlaying and painting in brilliant colors is the accepted form of decoration, while in the West at a very early time carving begins to supersede such flat adornment and becomes very soon the one chosen style of decoration. A Byzantine armchair or small square table will be covered with the most delicate zig-zags and simple alternations of rounded and angular forms, inlaid in ivory and in metal upon wood of different colors, or, in cheaper pieces, these simple patterns are reproduced with painting. But this custom, which still held in the countries which are now France, Germany, Spain, and Great Britain until the twelfth century, was even then modified by the use of carving, and in the thirteenth century elaborate sculpture drove it out completely. Then was seen the more curious phenomenon which occurs under the Romans; as the form in sculpture becomes more complicated and takes the eye more perfectly, so that it comes to be thought a nobler thing than color, so painting ceases to be applied to statuary and even to architectural relief. In the same manner in France in the thirteenth century the elaborate sculpture in wood was still touched with gold and color, but with the fourteenth century that seems to have been abandoned and a court cupboard or a chair covered with carving was left in the natural color of the wood, the slightest protection only, by means of oil or the like, being allowed it. The small number of pieces of furniture which even a wealthy family would possess made possible the rich decoration bestowed upon each piece. In a strong castle of the fourteenth century the mistress might have indeed possessed her own large bedroom high in the walls, and with large windows opening on the court, and perhaps a spacious closet, or even a considerable series of closets for storage in immediate connection with it, but in her bedroom she lived, going only to the great hall for one meal in the day, and this rather from a sense of duty as the *châtelaine* than because it was agreeable to her. Her bedroom then would be furnished with a very elaborate carved and perhaps painted and inlaid bedstead, which might be entirely fixed like a bunk in an officer's cabin in modern times, or the closed bedplace of a French peasant down to the middle of the nineteenth century, or might be movable in itself, but having a permanent and heavy tester from which curtains hung around the bed. It would have also a great bench on either side of the fireplace, and perhaps a carved and cushioned throne near the bed, which throne was the consecrated and traditional seat of the lord of the manor, the *seigneur*. Other seats were afforded by stone benches in the deep jambs of the windows and by light and not decorative wooden stools which could be moved about freely. There would be in addition only a table of no great pretensions, because it was continually covered by one or another form of cloth, and at least one cabinet with richly carved doors opening into one, two, or three compartments not very elaborately subdivided. The greater part of the clothing of the family and of the curtains and the like which were not in immediate use were stored away in chests, which might be arranged along the walls of corridors or among the closets of which men-

tion has been made. Only a few and more costly articles would be kept in the cabinet of the bedroom, and with these the two or three manuscript volumes of some importance in leather covers and with clasps, which formed the only accessible books. Writing materials and the necessity of writing materials were unknown to the lords. These were the business of their secretary or scribe or clerk, usually an ecclesiastic, who would carry his inkhorn and tablets about with him. The conditions were altogether favorable for the production of furniture of extreme richness and of great beauty. There was so little of it to make, and that little was so universally a matter of careful thought and preparation, that adornment came as a matter of course.

With the beginning of the Renaissance in art, at the close of the Middle Ages, the constantly increasing tendency toward modern habits caused a great increase in the number of separate pieces of furniture; and with this came at once the disposition toward slighter methods of work and a less careful system of design. It is not to be denied that very magnificent single pieces were made at this time. The single armchair and the small or the larger cabinet would be massive and splendidly carved, with elaborately wrought iron hinges and with extreme beauty of design. Indeed, it is known that such pieces were modeled in clay exactly as a modern sculptor models his group of human figures. The chief object of the designer of such a cabinet as we are considering would be the general dignity of form set off and aided by the carving upon all its surfaces, this carving being appropriate now to the panel and now to the square or rounded upright. Architectural forms were introduced into these cabinets also, and this, though of questionable propriety, has taken such strong hold upon our minds that it amounts to a traditional standard from which we cannot escape altogether. Still in connection with these pieces of exceptional splendor, set off as they were by tapestries and by mural paintings of interest and importance, of religious or of legendary subject, there were multitudes of plain stools and tables, and the like, which were easily made by village carpenters, and of which a few have come down to us. Some trace of this custom is seen in the curious stools still in use in the choirs and sacristies of ancient European churches. These will be absolutely plain in form and an oval hole through the top allows of easy grasping by the hand; they have no carving, no molding, no chamfering, nor are they elaborate in form, but they are painted in some brilliant color, and have, perhaps, the emblem of a saint, perhaps the arms of the bishop upon them. The praying-chair (*prie-dieu*), as a piece of domestic furniture, seems to have been introduced in the fifteenth century. It is a modification of the ordinary church chair, a form which has existed since the Middle Ages, upon the low seat of which one might kneel, and upon the back of which is secured a small shelf to support the service book. There was, however, another form, more resembling a small bookcase with shelves below and a sloping top, and this allowed of considerable sculpture of its panels and frame. Such a praying-desk as this would have no kneeling place; one kneeled upon a footstool or piled cushions.

It is impracticable to follow the changing

forms of the richer furniture during the sixteenth and seventeenth centuries. The marked changes seen in the eighteenth century are chiefly in the increase of the desire for luxurious comfort, that is to say, for low and soft seats with sloping backs, and tables of very diverse forms and of elaboration of outline and construction—all these refinements tending toward that exact fitting of the utensil to the immediate need which we think necessary to-day. In the eighteenth century, however, the ancient traditions of decorative splendor had not lost their power as much as they have to-day, and a person who could afford to have a large and well-made writing-table would not be content with plain wood and machine methods of building and adorning with moldings and the like; he would have fewer pieces and they would be richer. The furniture of Louis XIV.'s time is still made for large and high and somewhat bare palace halls, and is bulky and massive, but here, as early as 1650, the use of veneering and the inlaying of different colored woods, and the use of gilded bronze for metal hinges and lock plates, and even for adornments of the angles and fittings of chests of drawers and tables, shows a marked change from the straightforward woodwork of early times. In this connection we are reminded of the silver furniture with which Versailles seems to have been supplied, in so far, at least, as the royal apartments were concerned, which furniture was sent to the melting-pot during the pecuniary distress of the last years of that long reign. In the next reign, that of Louis XV., silver furniture was used again, and in considerable quantities. In the Paris Exhibition of 1900 the splendid collection of French paintings of the time, made by Frederick the Great, was sent from Sans-souci to the Prussian royal pavilion on the Seine, and with this came, that the setting might be complete, the bronze busts and statues and the solid silver tables which adorned the Potsdam rooms where the pictures were hung. It is probable that none of the original make still exists in France. During the reign of Louis XV. the elaboration of form surpassed anything known to previous times; the legs of tables were carved, the shape of the tops also was no longer square-cornered, but uneven, bounded on every side by curves which flow into one another, the upright sides of chests of drawers and bookcases were also worked into slight but telling curvature, and this tendency toward softened lines was emphasized by the mounting of every part with scrollwork and floral adornment of gilded bronze. The furniture of the time of Louis XV. marks, indeed, the culmination of the easy and luxurious habits of Europe before the French Revolution. There was a sudden change at the close of this reign, and the style named from the succeeding reign, that of Louis Seize, is marked by severe lines, straight and slight tapering legs of tables and the like, and minuteness of decoration, the inlaid patterns and the slight carvings being extremely refined in detail and small in their parts, and the inlay of delicate medallions of porcelain and the like being introduced for the first time, as if mere woodwork were unable to give the high finish and the minute subdivision required.

Contemporaneous with the rich and splendid forms which we call by the names of the last three

kings of the old monarchy there was made in England, and, to a certain extent, in the American colonies, a simpler kind of furniture; at first square and plain in its forms, although elaborately carved over large parts of the surface, but, after about 1720, with forms suggested by the rich decorative work of France. Curved legs, with goats' feet and lions' paws, are given to tables, 'tallboys,' *escri-toires*, and armchairs throughout the eighteenth century, and the forms were not abandoned until the more delicate designs of Sheraton, Heppelwhite, and their contemporaries in London had made familiar to English-speaking people the refinements of the Louis Seize style. This Georgian furniture, often called in America Old Colonial, has the same charm which the contemporary English architecture has—it is not stately, it is not very graceful, but it is felt to correspond with and to fit the small rooms, the quiet domestic interiors for which it was designed. In France, a very dignified style existed in the provinces, carving in low relief in the solid wood replacing the *marqueterie* and the gilded metal mountings of the capital. In Germany there existed during the seventeenth and eighteenth centuries a school of brilliant and somewhat fantastic decoration in color applied to standing bed-places, wardrobes, and the cases of tall clocks. (See Zell, *Bauern-Möbel*.) In Holland, in consequence of the strong feeling for landscape art, resulting from the achievements of the Dutch seventeenth-century painters, such pieces of furniture as were susceptible of it were often covered with landscape painting, or, the panels being painted thus, the uprights were covered with floral decoration.

The course of natural development and change in all matters of decorative art was broken rudely by the French Revolution, and the political changes and aspirations which it brought with it. Even in France, where the instinct for fine art applied to the purposes of daily life was far more powerful than elsewhere, the years from 1800 to 1850 were marked by ill-calculated attempts to secure novelty, and by continued decline. The famous style of the Empire was almost wholly the creation of two or three designers trying to please Napoleon I., and it deserves little of the attention it has received in late years. (See De Champeaux in bibliography.) In the rest of Europe the furniture of the years before the great Exhibition of 1851 was clumsy and funereal in aspect, and generally tasteless in decorative detail. With the close of this epoch began the years of rapid and cheap manufacture of furniture in large factories, by means of which the requisite bedsteads, tables, and chairs of what might be thought elegant appearance were turned out at a surprisingly low price. No refinement of design is possible in such work as this where a vast number of pieces are made from one design, itself calculated to offend no one and to seem respectable to many rather than attractive to one person. The consequence of this rapid and cheap manufacture is that even the little hand work that is done tends to share the same characteristics of design, and a general reign of bad taste is the inevitable consequence. A reaction begins every few years, and has a little effect; it passes out of general notice, and is succeeded by another movement for bettering the condition of things. Thus, the Morris furniture of 1865 and following years was

an attempted return to great simplicity of parts, an obvious constructive character in all the designs. Partly founded upon this, a system of design existed in England from 1875 to the close of the century, in which no past style could be said to dictate the disposition, but common sense and utility were carefully considered; all this, however, without great charm of form or delicacy of detail. On the Continent the forms of the eighteenth century were repeated again and again with generally a negative good taste seen in their use, but without anything very attractive—the furniture might be inoffensive, but it was without charm. On the whole, the best thing that the years from 1850 have to show is the work done by the few upholsterers, furniture-makers, and decorators of considerable pretensions and doing a large business even at high prices. Some of the designs turned out by such houses in the American cities, as well as in the principal cities of Europe, are really of surprising elegance and fitness for their purpose, but all this is done at prices which put such furniture wholly out of the reach of all but a few wealthy householders. The attempts made since 1895 to create what is called a new art are as yet too recent to be judged; it may be said, however, that the use of abstract curves, however appropriate to metal-work or to mural painting, has less application to wood on account of the very nature of the material, its strength lying in the direction of its straight parallel fibres. There is still no school of good furniture; the only chance of obtaining any is to employ a designer of individual force and large acquaintance with past styles, and to have his designs carried out by first-rate workmen.

BIBLIOGRAPHY. The general history of furniture is traceable in Racinet, *Le costume historique* (London, 1876), as the plates and text of that work deal with the whole life of the peoples whose costume is considered. To a less extent this is true of the lesser works named in the bibliography under **COSTUME**; also Viollet-le-Duc's *Histoire de l'habitation humaine* (Paris, 1875). The illustrated history of furniture by Frederick Litchfield (London, 1893) attempts to cover the whole subject, but is, in the main, a compilation. It is valuable for reference. For antiquity, consult the plates of the works named in the bibliography under **ASSYRIA**, **EGYPT**, and other articles; also Perrot and Chipiez, *Histoire de l'art dans l'antiquité* (Paris, 1882 et seq.), of which seven volumes had appeared in 1892, those for the historic ages of Greece and for Roman art not having appeared; for furniture since the beginning of the Middle Ages, De Champeaux, *Le meuble* (Paris, 1885), which forms two volumes of the *Bibliothèque de l'Enseignement des Beaux-Arts*, and is an excellent work showing great knowledge of the subject; also Jacquemart, *Histoire du mobilier* (Paris, 1876); *Ancient and Modern Furniture and Woodwork in the South Kensington Museum*, with an Introduction by Pollen (London, 1874). For special epochs, consult: Viollet-le-Duc, *Histoire du mobilier français*; Zell, *Bauern-Möbel aus dem bayerischen Hochland* (Frankfort, 1899), a folio with valuable colored plates; for English oak of the sixteenth and following centuries, Sanders, *Half-Timbered Houses and Carved Woodwork* (London, 1894); Hurrel, *Measured Drawings of*

Old Oak Furniture; and several other books, consisting chiefly of plates; also for the Georgian period, Lyon, *The Colonial Furniture of New England* (Boston, 1891); Singleton, *The Furniture of Our Forefathers*, with description of the plates by Russell Sturgis (New York, 1900); Lockwood, *Colonial Furniture in America* (New York, 1901); Morse, *Furniture of the Olden Time* (New York, 1902). For Japan, consult Morse, *Japanese Homes and Their Surroundings* (Boston, 1886); for the Orient, Lane, *An Account of the Manners and Customs of the Modern Egyptians* (London, 1871), and books of travel in the nearer East; also the numerous notes added to Sir Richard Burton's translation of *The Thousand and One Nights* (London, 1886-87), and the text of this and other literal and minute translations from books written in Oriental languages.

Numerous volumes of large plates, photographic and other, including catalogues of famous sales and of temporary expositions, universal and local, furnish an unlimited supply of illustrations of furniture, sometimes accompanied by valuable comment. See **BOULLE**; **CHIPPENDALE FURNITURE**; **SHERATON**; **RIESENER**, etc.

FURNIVALL, fūr'nī-val, **FREDERICK JAMES** (1825—). An English philologist. He was born at Egham, Surrey, England, February 4, 1825, and was educated at University College, London, and at Trinity Hall, Cambridge, where he was graduated B.A. in 1846, and M.A. in 1848. He was called to the bar in 1849. For ten years he was associated in philanthropic work with F. D. Maurice, teaching in the Workingmen's College. Devoting himself to philology, he succeeded in founding, for the publication of texts, the Early English Text Society (1864), the Chaucer Society (1868), the Ballad Society (1868), the New Shakespeare Society (1874), the Browning Society (1881), the Wiclif Society (1882), and the Shelley Society (1885). He has been honorary secretary of the Philological Society since 1854, and for some years edited their great English dictionary. He has personally edited numerous works, chiefly through the medium of the above societies, one of the most notable being *A Six-Text Print of Chaucer's Canterbury Tales* (1868-75). This he followed with the publication of a seventh text, and the MSS. of Chaucer's minor poems. Under his supervision were published forty-three facsimiles of the quartos of Shakespeare's plays. His introduction to the *Leopold Shakespeare* has been extensively circulated. In 1884 he was granted a Civil List pension of £150. On his sixtieth birthday the University of Berlin conferred on him the honorary degree of Ph.D.; and on his seventy-fifth birthday he was elected member of the German Shakespeare Society.

FURNIVAL'S INN. One of the ancient inns of chancery, affiliated to the more famous Lincoln's Inn. It derives its name from Sir William Furnival, whose family became extinct in the reign of Richard II. The inn stood in Holborn, and came into the possession of the society in the first year of Edward VI. (1547). It had a long and honorable existence, but with the other chancery inns fell into disuse, and went out of existence about the middle of the eighteenth century. For a description of the various inns or guilds of lawyers and their functions, see **INNS OF COURT**.

FUROR. A madman, representing intemperance wrath, in Spenser's *Faerie Queene*. He and his mother, Occasion, are overcome by Sir Guyon, the Knight of Temperance.

FURRER, fūr'ēr, JONAS (1805-61). A Swiss statesman. He was born at Winterthur, and was educated at Zurich, Heidelberg, and Göttingen. In 1839, and again in 1844, he was president of the Grand Council, and in 1845 he was appointed president of the Cantonal Diet. As one of the foremost advocates of the new Federal Constitution, he was elected President of the Swiss Confederation upon its adoption. He was three times reelected, and was a member of the Federal Council until his death. He wrote a work entitled *Das Erbrecht der Stadt Winterthur* (1832).

FURBUCKABAD, fūr'rūk-a-bād'. See FA-BUKHABAD.

FURS. In heraldry (q.v.), one of the three classes of tinctures, the other two being metals and colors.

FURS, fōōrz, **FOBS**, fōrz, or **FURANI**, fōōrā'nē. The Moslem negroes dominant in Darfur (Fur Land), in Eastern Sudan, between Kordofan and Wadai. They are tall (1.730 mm., or 67 inches), very black and prognathic, and have woolly hair. Their language is related to Nuba, and they, with the Nubas and Nubians, are placed with the Nigritians, or negro race once dominant throughout Egyptian Sudan. The political history of the Furs, their dynastic wars of the sixteenth century, the prosperity of the monarchy under Solomon Solon at the beginning of the seventeenth, the ascendancy of Islam with the development of agriculture and other industries, the conquest of the country by the slave-dealer Zebehr Pasha in 1874, and the Mahdist revolt, 1881-92, are the prominent events in their history during the last four hundred years.

FURSCH-MADI, fōōrsh'māi'dē, EMMA (1847-94). A French singer, born at Bayonne. She studied at the Paris Conservatory, and first appeared in a symphony concert conducted by Padeloup. She created the title rôle in Verdi's opera *Aida* when it was first sung in French at the Théâtre de la Monnaie, Brussels. After this she sang in London with much success for three years. In 1884 she came to New York, and sang at the Academy of Music, under Mapleson's management. She was engaged by Henry E. Abbey for the Metropolitan Opera House, and appeared there for the last time as Ortrud in *Lohengrin* (February 6, 1894). She taught singing in the New York College of Music from 1891 until her death, at Warrentonville, N. J. Fursch-Madi was a great favorite in America, and was often heard in concert. She was three times married—first to M. Madior de Montjan, then to M. Verle, and lastly to Wurtz, the painter.

FUR-SEAL. See SEAL.

FÜRST, fūrst, JULIUS (1805-73). A distinguished German Orientalist, born of Jewish parentage, at Zerkow, Posen. He was educated for the rabbinical profession, and displayed at a very early age a remarkable power of acquiring knowledge. He studied at a gymnasium in Berlin, and entered the university there, but soon after returned to Posen, in 1825, to take a post as teacher. Gradually his convictions led him away from the faith of orthodox Judaism, and in 1829 he abandoned the idea of entering the ministry and pro-

ceeded to Breslau, where he continued his Oriental, theological, and antiquarian studies, which were completed at Halle, under Gesenius, Wegscheider, and Tholuck. In 1833 he went to Leipzig, where he was first tutor (1833), and from 1864 professor, in the university. His labors in the Oriental field now continued uninterruptedly until his death, in 1873. His chief works are the following: *Lehrgebäude der aramäischen Idiome* (1835), a work which brought the Semitic languages within the field of comparative grammar, then in its infancy; *Concordantiæ Librorum Sacrorum Veteris Testamenti Hebraicæ et Chaldaicæ* (1837-40), a painstaking revision of Buxtorf's *Concordance of the Old Testament*; *Hebräisches und Chaldäisches Handwörterbuch* (1857); and his *Geschichte der biblischen Litteratur und des jüdisch-hellenistischen Schrifttums* (1867-70). He also wrote a *Geschichte des Karäertums* (1862-65), compiled a *Bibliotheca Judaica* (1849-63), and was editor (1840-51) of *Der Orient*.

FÜRSTENAU, fūr'ste-nou, ANTON BERNHARD (1792-1852). A German flute virtuoso and composer for that instrument, born at Münster, Westphalia. He made numerous concert tours throughout Holland, Germany, and Russia, and in 1819 was appointed royal chamber-musician to the King of Saxony. In 1826 he accompanied C. M. von Weber upon the latter's ill-fated voyage to England. His works comprise more than 150 compositions for the flute. His son MORITZ (1824-89) was also a flute virtuoso and a writer on music. He became president of the Society of Musicians at Dresden and custodian of the department of music in the Royal Library (1852). As the result of his researches in the history of music and kindred topics he published *Zur Geschichte der Musik und des Theaters am Hofe zu Dresden* (1861-62); *Die Fabrikation musikalischer Instrumente im sächsischen Vogtland* (with T. Berthold, 1870).

FÜRSTENBERG, fūr'sten-bērk. A media-tized principality in Southern Swabia, now divided among Baden, Württemberg, and Hohenzollern. It gives its name to a noble family, branches of which exist in Baden and Austria. The Austrian family consists of the princes of Fürstenberg, whose estates are in Bohemia, and of the landgraves of Fürstenberg, who reside in Lower Austria. Other branches of the family are the counts of Fürstenberg, in Westphalia and Rhenish Prussia.

FÜRSTENBUND, fūr'sten-bunt (Ger., league of princes). THE. A league of German princes, formed about 1780, under Prussian leadership, to resist the encroachments of Austria. Its founding was almost the last important act of Frederick the Great, and was premonitory of the future strife between Austria and Prussia for preëminence in Germany; but the importance of the union was lost sight of, for the time, in the events of the French Revolution.

FÜRSTENWALDE, fūr'sten-väl-de. A town in the Prussian Province of Brandenburg, situated on the right bank of the Spree, 30 miles east-southeast of Berlin (Map: Prussia, F 2). It has a gymnasium, several fine churches, and monuments to Emperors William I. and Frederick III. There are manufactures of woollens, electric lamps, etc. Owing to its ownership of an adjoin-

ing forest, 19 square miles in extent, Fürstenwalde is, in proportion to its population, among the richest towns in Germany. Population, in 1890, 12,900; in 1900, 16,662, chiefly Protestants. It is one of the oldest cities of Brandenburg, having obtained municipal rights in 1285.

FURTADO, foor-tá'do, FRANCISCO JOSÉ (1818-70). A Brazilian statesman. He was born at Oeiras (Piahy), and was educated at the Academy of Law at Caxias, Province of Maranhão, where he subsequently occupied the highest municipal offices. During the three years of his administration as President of Amazonas (1856-59), the new province had a marked development. Still more efficient were his labors in behalf of the restoration of the finances after his appointment as Minister of State in 1864. He was a resolute opponent of slavery, and as a member of the Senate in 1870 was instrumental in securing the adoption of the initial legal measures toward its abolition.

FÜRTH, furt. A town of Middle Franconia, Bavaria, situated at the confluence of the Rednitz with the Pegnitz, five miles northwest of Nuremberg (Map: Germany, D 4). It has a modern Rathaus, built in Italian style, with a lofty tower, and a seventeenth-century synagogue. In the Church of Saint Michael there is an excellent late-Gothic ciborium. Fürth vies with Nuremberg in the manufacture of the famous 'Nuremberg Goods.' Among its chief manufactures are accordingly mirrors, toys, gold leaf, bronzes, spectacles and optical instruments, wooden articles, etc. The trade in these manufactures and in hops is very active and extensive. Population, in 1890, 43,206; in 1900, 54,142, including 12,480 Roman Catholics, and 3017 Hebrews. Although mentioned as early as the beginning of the tenth century, Fürth did not obtain a municipal charter until 1818. It was burned by the Croats in 1634, and passed from Prussia to Bavaria in 1806. At the Alte Veste, three miles southwest of the city, Gustavus Adolphus was defeated by Wallenstein in a memorable battle in 1632. The first steam railway in Germany was that between Nuremberg and Fürth, opened in 1835.

FURTHER INDIA. See INDO-CHINA.

FURTWÄNGLER, furt'väng-lër, ADOLF (1853-). A German archaeologist. He was born at Freiburg, and studied in his native city and at Leipzig and Munich. In 1876 he obtained the scholarship of the German Archaeological Society, which enabled him to travel for two years abroad. During his sojourn in Greece (1878-79) he participated in the archaeological excavation at Olympia. Afterwards, with the exception of four years at the University and Museum at Berlin (1880-84), he occupied the chair of archaeology at Munich. Besides several valuable treatises on the excavations at Olympia, and various descriptive catalogues of the vases and other antiquities in the museums at Berlin and Munich, his publications include: *Plinius und seine Quellen über die bildenden Künste* (1877); *Meisterwerke der griechischen Plastik* (1893, Eng. trans. 1894); *Ueber Statuenkopien im Altertum* (1896).

FURY AND HEC'LA STRAIT. A narrow channel in the Arctic regions, lying in latitude 70° N. and longitude from 82° to 86° W., which separates Melville Peninsula on the south

from Cockburn Island on the north, and connects Fox Channel on the east with the Gulf of Boothia on the west (Map: Canada, O 3). According to its discoverer and explorer, Captain Parry, it is impassable on account of the accumulated ice with which it is packed. It received its name from the vessels used by Captain Parry on his voyage in 1822.

FURZE, fûrz (AS. *fyrz*, of unknown origin), *Ulex*. A genus of plants of the order Leguminosæ. The common furze (*Ulex Europæus*), also called whin and gorse, is a shrub about two or three feet high, extremely branched; the branches green, striated, and terminating in spines; the leaves few and lanceolate; the flowers numerous, solitary, and yellow. It is common in many of the southern parts of Europe, and in Great Britain, although it does not reach any considerable elevation on the British mountains, and often suffers from the frost of severe winters. Furze is sometimes planted for hedges, but is not well suited for the purpose, occupying a great breadth of ground, and not readily acquiring sufficient strength; besides, it does not, when cut, tend to acquire a denser habit. It is useful as affording winter food for sheep, and on this account is burned down to the ground by sheepherders when its stems become high and woody, so that a supply of green succulent shoots may be secured. It is sometimes cut and fed to other animals. A double-flowering variety is common in gardens. A very beautiful variety, called Irish furze, because originally found in Ireland, is remarkable for its dense, compact, and erect branches. A dwarf kind of furze (*Ulex nanus*) occurs in some places, and is perhaps only a mere variety; if so, there is but one species known.

FURZE-CHAT. See WHINCHAT.

FUSAN, foor'sin', or **PUSAN**. The chief seaport of the populous Province of Kiung-sang, in Southeastern Korea, seven miles from the mouth of Nan-tong River, in latitude 35° 6' N., longitude 129° 3' E., and the terminus of the railway from Seoul, of which the first section to Chon-yang was opened in October, 1902. The port was opened by treaty to Japanese trade in 1876, and to general trade November 26, 1883. The native town has about 600 houses, with a population of 5000 souls. The Japanese settlement is opposite Deer Island, under the control of the consul, assisted by the elective municipal council, and a police force in uniform of Western style. Locally, it is called Kan (the post), the Japanese having maintained a military post there since 1592. The town is supplied with water from the neighboring hills by pipes and hydrants. In 1902 there were 10,000 foreign residents, of whom 85 were Chinese, 22 Europeans, and the rest Japanese. The harbor is formed by several islands, the largest of which is Deer Island, and the largest vessels can come close to the landing-places. The tide rises seven feet. The climate is very healthful, summer bringing perfect sea-bathing. There are hot springs at Tong-nai, a city distant eight miles, and the local centre of trade, with a population of 33,160. Lines of steamers connect Fusan with Japan, Shanghai, and Vladivostok. A submarine cable to Nagasaki has been in operation since November, 1883. The chief imports are cotton

goods, petroleum, and Japanese manufactures; the exports are hides, beans, dried fish, whale-meat, and rice. In 1899 the imports amounted to \$2,389,000, and the exports \$1,822,000, against \$4,700,000 in 1897. Consult Bishop, *Korea and Her Neighbors* (New York, 1898).

FUSARO, fŭ-zŭ'rŏ, LAKE. A lake, $3\frac{1}{2}$ miles long, in the Province of Naples, Italy, one-half mile west of Baja and one and one-quarter miles south of the ruins of Cumæ (q.v.), of which it was perhaps the harbor (Map: Italy, C 11). It has always been famous for its oysters, and the restaurant and gardens of the Ostricoltura, and the casino built on the lake by Ferdinand I., have many visitors in spring and autumn. The ancients called it Acherusia Palus. Two canals connect it with the sea.

FUSBERTA, fŭz-bĕr'tă. The name of Rinaldo's sword in Ariosto's *Orlando Furioso*.

FUS'BOS. The Minister of State, who kills Bombastes, in Rhodes's burlesque *Bombastes Furioso*.

FUSE. See FUZE.

FUSEE, fŭ-zĕ' (from OF. *fusee*, thread, from ML. *fusata*, spindleful, from Lat. *fusus*, spindle). A spirally grooved cone in a watch or chronometer, connected at its base with a chain which is wound up on the pyramidal cone. The opposite end of this chain is attached to the box containing the spring, which rotates by the force of the uncoiling spring. The object of the peculiar form of the fusee is, as the force of the spring is weakened by uncoiling, to give a longer leverage at the other end of the chain (on the fusee), and so to counteract the loss of power in the spring, thereby maintaining as nearly as possible a uniform rate of driving force. See WATCH.

FUSEL (fŭ'sel) OIL, or **FOUSEL OIL** (Ger. *Fusel*, spirits of low grade; perhaps from Lat. *fusilis*, fluid, from *fundere*, to pour). A frequent impurity in spirits distilled from fermented potatoes, barley, rye, etc., to which it communicates a peculiar and offensive odor and taste, and an unwholesome property. (See ALCOHOL.) It is obtained from impure spirits in the form of an oily liquid having a penetrating odor, boiling at 131° to 132° C., and having a specific gravity of about 0.811 at 19° C. It has a much stronger intoxicating effect than ordinary alcohol, and is highly injurious to health. The substances found in fusel oil belong to three classes of carbon compounds—viz. alcohols, acids, and esters. The alcohols of fusel oil include: Methyl alcohol (wood spirit, CH_3OH); ethyl alcohol (spirits of wine, $\text{C}_2\text{H}_5\text{OH}$); propyl alcohol ($\text{C}_3\text{H}_7\text{OH}$); isobutyl alcohol ($\text{C}_4\text{H}_9\text{OH}$); amyl alcohol ($\text{C}_5\text{H}_{11}\text{OH}$); and hexyl alcohol ($\text{C}_6\text{H}_{13}\text{OH}$). The acids found, either free or combined in fusel oil, include: Formic acid (HCO_2H); acetic acid ($\text{CH}_3\text{CO}_2\text{H}$); propionic acid ($\text{C}_2\text{H}_5\text{CO}_2\text{H}$); butyric acid ($\text{C}_3\text{H}_7\text{CO}_2\text{H}$); valeric acid ($\text{C}_4\text{H}_9\text{CO}_2\text{H}$); caproic acid ($\text{C}_5\text{H}_{11}\text{CO}_2\text{H}$); α -naphthyl acid ($\text{C}_6\text{H}_5\text{CO}_2\text{H}$); caprylic acid ($\text{C}_7\text{H}_{13}\text{CO}_2\text{H}$); pelargonic acid ($\text{C}_8\text{H}_{17}\text{CO}_2\text{H}$); and capric acid ($\text{C}_9\text{H}_{19}\text{CO}_2\text{H}$). The principal constituents of fusel oil are the amyl alcohols. The composition of fusel oil contained in different spirits varies with the source from which the spirits are derived. Fusel oil is used in making artificial fruit essences and in the manufacture of alkaloids. See AMYL ALCOHOLS; DISTILLED LIQUORS.

FUSELI, fŭ'ze-lĕ, HENRY. See FÜESSELI.

FUSHIKI, fŭ-shĕ'kĕ, or **FUSHIGI**. A sea-port town of Japan, situated on the western coast of Nippon, 32 miles northeast of Kanazawa. It was made a free port in 1889. Population, about 19,000.

FUSHIMI, fŭ-shĕ'mĕ. A town of Japan, situated on both banks of the river Uji-gawa, $3\frac{1}{4}$ miles from Kyoto (Map: Japan, D 6). It is noted as the place where a battle occurred between the Imperialists and the adherents of the Shogun, in January, 1868. Population, in 1898, 21,515.

FUSIBLE METAL. A term applied to certain metallic alloys characterized by the relatively low temperatures at which they melt. Among the more important of these alloys are d'Arcet's metal, Rose's metal, Wood's metal, and Lipowitz's metal. *D'Arcet's metal* consists of 8 parts of bismuth, 8 parts of lead, and 3 parts of tin; it melts at 79° C. (174.2° F.). *Rose's metal* consists of 1 part of lead, 1 part of tin, and 2 parts of bismuth; it melts at 94° C. (201.2° F.). *Wood's metal* consists of 4 parts of tin, 3 parts of cadmium, and 15 parts of bismuth; it melts at 60° C. (140° F.). *Lipowitz's metal* consists of 8 parts of lead, 4 parts of tin, 3 parts of cadmium, and 15 parts of bismuth; it melts at 65° C. (149° F.). Of course, by varying the relative composition of these alloys a variety of other fusible metals may be obtained, and the melting-points of these may be made to answer the purposes for which they are intended. For example, the constituents of d'Arcet's metal may be mixed in the proportion of 5 parts of lead, 8 parts of bismuth, and 3 parts of tin, and then the melting-point will be 94.5° C. (202.1° F.). Many fusible metals, especially d'Arcet's, have the property of expanding as they cool, while still soft, and are therefore used for taking proof impressions of dies, each line being exactly reproduced in the cast made of the alloy. Fusible metals have also been employed for making safety plugs for boilers. When the steam reaches a pressure corresponding to the melting-point of the alloy, the plug gives way and the steam escapes. It is found, however, that the melting-point of the alloys is liable to change, and hence these metallic safety plugs are hardly reliable. See HEAT.

FUSILIERS, fŭ'zil-ĕrz' (Fr. *fusilier*, from *fusil*, musket, It., ML. *foclie*, steel for striking fire, from Lat. *focus*, hearth). Historic regiments of the British Army, deriving their title from the fact that they originally carried a lighter fusil or musket than the remainder of the army. In point of age the fusilier regiments are next in seniority to the Coldstreams and other guard regiments, and consequently are more or less prominent in the military history of Great Britain. In time of peace their uniform differs from other infantry regiments only in the matter of headgear, which in their case is a busby (q.v.) similar, though smaller, in shape to the one worn by the Footguards.

FUSING-POINT. See HEAT.

FUSION. See HEAT.

FUSION (Lat. *fusio*, fusion, from *fundere*, to pour). A concept which has played a large part in recent psychological discussion, but the mean-

ing of which cannot be said to be finally and precisely settled. It denotes a connection of sense elements of an extremely intimate kind—a connection so close that the resultant compound process seems rather to be a fusion or weld than a mere association of elements. The best instance of a fusion is the sound of a musical note or clang in which a number of tonal elements are blended to give a single resultant perception which, in certain cases, may counterfeit the simplicity of sensation itself. See CLANG-TINT.

Fusion, as thus defined, might be nothing more than a limiting form of simultaneous association (q.v.). Wundt accordingly classifies simultaneous associations as: (1) Fusions (intensive, e.g. tones, and extensive, e.g. sights and touches); (2) assimilations, including discrimination and recognition; and (3) complications, connections of elements from different sense departments (e.g. of visual impressions and the organic sensations accompanying bodily movement). As thus understood, fusion does not necessarily imply any change in the connected sensations. We may suppose that they are intimately associated, owing to their habitual and constant concurrence; some one of them dominates the group, forcing the others into obscurity, so that the whole is apprehended as a whole, and not as a sum; but still analysis is possible, and when it takes place the obscure components may turn out to be the same in all respects as they would be if given in isolation. Fusion, in other words, might be merely a modern name for James Mill's indissoluble association. In point of fact, the question is more complicated.

(1) We must, in the first place, take account of Wundt's law of psychical resultants. This law declares that "every mental complex shows attributes which may, indeed, be understood from the attributes of its elements, when these elements have been once presented, but which are by no means to be regarded as the mere sum of the attributes of these elements." Thus the musical note or chord has attributes, on its perceptive and affective sides, which do not attach to the component simple tones. So, too, spatial and temporal arrangement—extension, duration, order in space or time—is conditioned upon a certain collocation of sense elements; but neither space nor time is an intrinsic attribute of any sensation. It follows, then, that for Wundt both the intensive and the extensive fusions are, in reality, something more than indissoluble associations; the fusion is not only a whole, but a new whole, something that can be understood but not predicted from the nature of its elemental constituents. The law of psychical resultants has been much criticised, on the ground that it involves a belief in 'mental chemistry' for which the facts give no warrant; on the ground, more particularly, that it is impossible to derive space from the non-spatial and time from the non-temporal. Nevertheless, many psychologists of high standing accept the doctrine of 'consolidated contents' or 'consolidated attributes'—the doctrine that associated complexes contain processes or show attributes which are set up by the association as such, and are not discoverable when the elements are separately examined; and this doctrine is but a variant of Wundt's law.

(2) The laws of tonal fusion have been worked out in great detail by Stumpf. This author is

very far from accepting a principle of mental chemistry; but, at the same time, he differentiates fusion from simple association. According to Stumpf, there is in a collocation of tones, after all other hindrances to analysis have been removed, a tendency to fusion, or to a resultant oneness of impression, due to the character of the sense material itself. When full allowance is made for habitual association, for misdirection or distraction of attention, for lack of practice, and what not, this 'sense phenomenon' of being fused still remains. It is not that a new process or attribute is set up; it is simply that, just as visual extents, owing to their intrinsic nature, associate, so do tonal qualities, owing to their nature as tones, fuse or blend. This position has recently been disputed; but the evidence for it is too strong to be lightly overthrown.

We turn to a consideration of the laws of tonal fusion. (1) If we grant Stumpf's postulate, it is clear that we may speak of *degrees* of fusion, according as the tendency to fusion, inherent in tonal material, is more or less completely realized. The musical interval of the octave may readily be confused, even by practiced observers, with a simple tone; the octave, then, represents the highest degree of fusion. On the other hand, the intervals of the major and minor second and major and minor seventh are rarely taken to be unitary, even by unpracticed and unmusical hearers; these intervals, then, represent the lowest degree of fusion. Between the two extremes stand, in order from better to worse fusion, the intervals of the fifth, of the fourth, of the major and minor thirds and sixths, and of the subminor or natural seventh and the tritone. We have, in other words, a scale of six fusion degrees within the octave of the musical scale. The facts are summed up in the primary fusion law that "the degree of fusion is a function of the vibration ratio of the component tones" (Stumpf). In general, the consonances are the best fusions, the dissonances are the worst, and the imperfect consonances occupy an intermediate position.

Certain other laws of fusion may be formulated as follows: (2) The dependence of intra-octave fusion upon the vibration ratio of the component tones persists over all regions of the musical scale. Above and below the limits of this scale the discrimination of degrees of fusion becomes difficult or impossible. (3) The degree of fusion is independent of the intensity, absolute and relative, of the component tones. A weak chord fuses as does a loud chord; and a loud tone, accompanied by weak tones, gives the same fusion degree as would be produced if the same tones were all sounded at equal intensities. (4) Stumpf asserts that the fusion degrees of intervals wider than the octave are identical with those of the corresponding intra-octave intervals. Thus, the "ninths have the same fusion as the seconds, the tenths as the thirds, the double octave and triple octave as the octave." This law is not generally accepted. We must, of course, not be misled by the fact that discrimination of the tones of the tenth, as compared with those of the third, is facilitated by the greater distance separating them upon the tonal scale. This has nothing to do with degree of fusion; our analysis may be made easier or more difficult by the concurrence of extrinsic conditions, while the

degree of fusion remains absolutely the same. The question is: When analysis of the third and of the tenth has been performed, and the observer is able by effort of attention to single out the component tones in both complexes, do the third tones 'go together' (blend) as well as or better than the tenth tones? Is the sense relationship, which we term fusion degree, the same or different in the two cases? The answer seems to be that the tenth, though a better fusion than, e.g. the tritone (a member of the intra-octave group lying next below the group of thirds and sixths), is still a worse fusion than the third, to which it corresponds. (5) Except in certain specific cases, falling under the laws already formulated, clang-tint does not influence degree of fusion. (6) Spatial separation of the tones, though it facilitates analysis, does not affect degree of fusion. (7) If two tones are simultaneously ideated (reproduced, as sounding together, in memory or imagination), the resultant idea always evinces the degree of fusion that the same tones would show in perception. (8) The pitch of a fusion is never that of a tone lying midway between the pitches of the component tones, but rather the pitch of some one of these components. "In a continuously sounding compound clang," as heard by a musical observer, "the whole appears to possess the pitch of its deepest tone, even if this be not the loudest" (Stumpf). Unmusical observers are apt to estimate the pitch of a simple clang as somewhat lower than that of a compound clang based upon the same fundamental tone.

Other instances of fusion are to be found in the complexes of organic sensation that form the body of the feelings (q.v.); in the qualitative taste-smell mixtures (the taste of coffee or lemonade); in the perceptions (weight, resistance) mediated both by external skin and by the sense organs of muscle, tendon, and joint; perhaps in all the impressions that we call colors (mixtures of color proper and of brightness); and, according to Kuelpe, in such affective formations as emotion, impulse, and feeling. It is, however, doubtful whether the connections of sensation and affection can be brought under the same conceptual heading as the fusion connections of sensations.

(Leipzig, 1890); Wundt, *Grundriss der Psychologie* (Leipzig, 1897; Eng. trans., London, 1898); id., *Grundzüge der physiologischen Psychologie* (4th ed., Leipzig, 1893); Kuelpe, *Outlines of Psychology*, translated by Pillsbury and Titchener (London, 1895); Titchener, *Experimental Psychology* (New York, 1901).

FUSION DISK, or FUSING DISK. See METAL-WORKING MACHINERY.

FUSIYAMA, fōō'sé-yā'mā. See FUJIYAMA.

FUST, fōōst, or **FAUST**, JOHANN (?-c.1466). A German promoter of the invention of printing. He was a well-to-do citizen of Mainz, and became Gutenberg's partner in the new business of printing. He furnished the capital and took a mortgage upon the business, being shrewd enough to realize the value of Gutenberg's discovery. Gutenberg, on his part, provided the necessary apparatus. In 1455 Fust prosecuted Gutenberg for money advanced, and upon the latter's non-payment seized enough of the apparatus to cover the

mortgage, and continued the business with his son-in-law, Peter Schöffer. In 1462, at the sack of Mainz, the workmen were scattered and the secret of the art of printing became common property. By 1465 their shop was again active. Copies of the work of Fust and his partners are still in existence. The best-known publication of himself and Gutenberg is the Latin 'Bible of forty-two lines,' or the Mazarin Bible; of Fust and Schöffer, a *Psalter* (1457), the first book published with a complete date, and especially remarkable for the beauty of the initials, which are printed in red and blue from types made in two pieces. See GUTENBERG; PRINTING.

FUSTEL DE COULANGES, fus'tél' de kōō-lānz', NUMA DENIS (1830-89). A French historian, born in Paris. After teaching history in Amiens, Paris, and Strassburg, he returned in 1871 to Paris, where he became the successor of Geffroy at the university, and several years later was appointed to the chair of mediæval history (1878). His principal works are: *Mémoire sur l'île de Chio* (1857); *Polybe, ou la Grèce conquise par les Romains* (1858); *La cité antique, Étude sur le culte, le droit, les institutions de la Grèce et de Rome* (14th ed. 1895); *Histoire des institutions politiques de l'ancienne France* (1875-90); and *La Gaule romaine, l'invasion germanique et le royaume des Francs* (1888-91), which was awarded the *grand prix* 'Jean Raynaud.' For his biography, consult Guiraud (Paris, 1896).

FUSTIAN, fūs'chan (from OF. *fustaine*, from ML. *fustianum*, fustian, from Ar. *Fustāt*, a suburb of Cairo, from which the material first came). A cotton fabric which has a pile like velvet, but shorter, and which is manufactured in nearly the same manner as velvet, by leaving loops standing upon the face of the fabric, and then cutting them through so as to form upright threads, which are afterwards smoothed by shearing, singeing, and brushing. See VELVET.

The different names given to fustian cloths depend upon their degree of fineness, and the manner in which they are woven and finished. Thus, smooth kinds, of a strong twilled texture, are called *moleskins* when shorn before dyeing, and *beaverteens* when cropped after dyeing. Corduroy, or king's cord, is produced by a peculiar disposition of the pile-threads. In all fustians there is a warp and filling, or weft thread, independent of the additional filling-thread forming the pile; but in corduroys the pile-thread is only 'thrown in' where the corded portions are, and is absent in the narrow spaces between them. For a technical description of fustians, velveteens, and corduroys, see Posselt, *Technology of Textile Design* (Philadelphia, 1895).

FUSTIAN. See SYLVESTER DAGGERWOOD.

FUSTIC (from Fr. *fustoc*; ultimately connected with Lat. *fustis*, stick). A name given to two kinds of dye-wood used for producing a yellow color, and, with chemical additions, other colors, such as brown, olive, and green. The name in France (fustic) seems to be connected with fustet, name of the Venice sumac (*Rhus cotinus*), a shrub found in the south of Europe, and to have been transferred to a very different plant (*Chlorophora tinctoria*), a tree of the natural order Moraceæ, a native of the West Indies, Mexico, and Northern South America. Fustic is a large and handsome tree with wood which is

sometimes used in mosaic cabinet-work and turning, but chiefly in dyeing, for which its large content of yellow coloring matter specially fits it. Since the color is rather dull, it is more used for producing other colors. Old fustic, or yellow-wood, is employed for dyeing woollens and also to impart to them, when mixed with indigo and salts of iron, green and olive colors. It furnishes a yellow coloring matter termed moritannic acid, which may be obtained in crystals by evaporating its watery solution. The bichromates of potash and of lead, as well as some of the coal-tar products, have to a great degree superseded the use of old fustic. Young fustic, the wood of *Rhus cotinus*, contains a yellow coloring matter, to which the name fusteric has been given. It is generally used in combination with other dyes, in order to strike some particular tint. These terms, old and young, began to be employed about the beginning of the eighteenth century, from the mistaken notion that the one, in small pieces, was the wood of the young tree, and the other, in comparatively large logs, of the same tree in a more mature state. The osage orange (*Maclura aurantiaca*) of North America is nearly allied to old fustic, and its wood also affords a yellow dye. See OSAGE ORANGE; SUMACH.

FUSULINA, fū'sŭ-lī'nā (Neo-Lat., from Lat. *fusus*, spindle). An important genus of fossil perforate Foraminifera, characteristic of the Upper Carboniferous and Permian limestones. The shell, which varies in size from one-quarter to one-half inch among the different species, is usually fusiform in shape, and is made up of a number of spirally inrolled whorls, of which the chambers are divided into many chamberlets by primary and secondary partitions. The known species, about fifteen in number, are found in the Upper Carboniferous limestones, and often also in those of the Permian age, and in many places are so abundant that they actually constitute the mass of the rocks. Such Fusulina limestones, appearing as if made up of grains of wheat, are common in certain parts of Europe, Asia, Japan, and are also found in the Mississippian and Southwestern States of the United States and elsewhere in North America. The Fusulina limestone of Japan has a fine dark-gray ground with brighter colored Fusulina grains scattered over the surface, and because of its beauty has been extensively cut into vases and other ornamental objects, in which form it may be seen in nearly every collection of Japanese curios. Schwagerina, with shell of spherical form, is an allied genus of quite similar horizon and distribution. See FORAMINIFERA; CARBONIFEROUS SYSTEM.

FUSUS (Lat., spindle). A genus of large gastropod mollusks, the spindle-shells, allied to the British whelks and American conchs, and containing many well-known shells. For particulars and illustrations, see ROARING BUCKIE; SPINDLE-SHELL; WHELK.

FUTA-JALLON, fu'tā' zhā'lŏn', or **FOOTA-JALLON**. A mountainous region in West Africa, a part of French Guinea, and bordered by Senegal on the north and Portuguese Guinea on the west. Its area is about 42,500 square miles. Owing mainly to the elevation, which is about 4000 feet, the climate is rather favorable; and the fine forests lend beauty to the region. The Senegal, Gambia, and other rivers head within its

confines. It is a mineral district, furnishing copper, iron, and some gold. Its fertile soil produces coffee, rice, maize, and cotton. The country is well adapted for stock-raising, and the number of cattle is considerable. The territory is regarded as among the best in that part of Africa, but it is as yet little developed.

Futa-Jallon was divided into four administrative circles by the French in 1902, each circle being under the French commandant of the region. At the head of the native government are the princes, called Almami, of the two leading ancient families. Each prince rules for two years, and his powers are subject to the action of an assembly of nobles. The crowning of the Almami takes place amid great festivities in the university town of Fugumba, in the oldest mosque in the land. The capital is Timbo, a village of 1500 inhabitants, and interesting for its palaces. Tuba is the largest city. Labé, also, is important, and Sokokoro is in a charming locality. The population of Futa-Jallon is given as about 600,000, mostly Fulbe. They came from Senegal in the sixteenth century and subjugated the natives. (See FULAH.) In 1881 the French, through a representative of the French administration in Senegambia, first concluded a treaty of peace with the Almami rulers of Futa-Jallon. It was not, however, until 1893 that a French protectorate was established, and a firm footing secured in connection with the Government of French Guinea (q.v.). Consult: Dölter, *Ueber die Capverden nach dem Rio Grande und Futa Dschallon* (Leipzig, 1884); Noïrot, *A travers le Fouta-Diallon et le Bambouc* (Paris, 1885).

FUTA-TORO, or **FOOTA-TORO**, tŏ'rŏ'. A territory in West Africa, in the northern part of French Senegal. A portion of it was annexed by France in 1860. It is, for the most part, a level and fertile country, with extensive tamarind forests. There is iron ore, and considerable pig iron is produced. The estimated population is 114,000, chiefly Fulbe.

FUTTEHPUR, füt'te-pŭr'. See FATHIPUR.

FUTTIGARH, füt'ti-gŭr', or **FATHIGARH**. The military cantonment of Farukhabad (q.v.). Population, about 12,400.

FUTTYGURH, füt'ti-gŭr'. See FUTTIGARH.

FUTURE ESTATE. An estate in lands which is limited to come into possession and enjoyment at some time in the future. By the common law of England the number of such estates was strictly limited, being confined to reversions and remainders. These had the common characteristic of fitting exactly upon some precedent estate less than a fee simple, and could not take effect in derogation of a fee nor after an interval of time during which the fee was suspended or in abeyance. Thus a future gift to B one year after A's death, or to C one year from date, would, at common law, have been simply void, as not coming within the description of a remainder. See REMAINDER; REVERSION.

As a consequence of the ancient practice of conveying land to one man to the use of another, and as the result of the Statute of Uses, passed in the twenty-seventh year of Henry VIII. (1535), and of the Statute of Wills, five years thereafter, new classes of future estates of a more flexible character became possible. These were known as springing and shifting uses, and

executory devises. They consisted in future limitations, not coming under the description of remainders and reversions, but taking effect in the future without a preceding 'particular' estate, or in derogation of a preceding estate in fee. Thus a gift of land to the use of B, to take effect on the happening of some future event, or to the use of A and his heirs, and, in the event of B's returning from abroad, to the use of B and his heirs, would vest a future estate in B, the former as a springing use (q.v.), and the latter as a shifting use (q.v.). Either of these estates, if given by last will and testament, would take effect as an executory devise (q.v.). Though these distinctions are still valid in England and many of the United States, they have in many jurisdictions been abolished by statute, while in a few States, as in New York, all future estates of real property have been put on the same footing, even the fundamental distinction between remainders and the executory limitations above described having been done away with. In general, therefore, future estates of all kinds can now be directly created by deed as well as by last will and testament.

Strictly speaking, there can be no such thing as an estate in personal property, and it was formerly the law that the ownership of such property was indivisible. This meant that if a chattel, as a jewel or a leasehold estate, was given to one for life, it became his absolutely, and no legal interest therein could be given over to any one else. But by a series of judicial decisions of the last century in England and America this narrow rule of the common law has been changed, and it is now possible to create legal future estates, or interests, in personal property as well as in real. Such interests are not deemed to be remainders, however, even where they take effect, like legal remainders of real property, upon the determination of a precedent interest therein, but are classified as future interests of the executory type, like springing and shifting uses, and the like.

The foregoing enumeration exhausts the list of the future estates generally recognized in our legal system. Other rights in land looking to a future enjoyment thereof may, indeed, exist, but they all fall short of being estates or interests in the land, as those terms are understood in law. Of this character are rights of entry for condition broken, rights of forfeiture for waste or other cause, rights of escheat and eminent domain, and the right remaining in one who has conveyed away a qualified or limited fee. None of these reach the dignity of future estates, though one of them, the right of entry for breach of condition, has been rendered alienable by statute in England and a few of the United States. Of an intermediate character, also, are the respective interests of husband and wife in the estate of the other, while the relation of coverture continues. The 'inchoate' dower right of the wife and the curtesy 'inchoate' of the husband are not, strictly speaking, future estates, but they approach closely to that description. See ESTATE.

Future estates of all kinds are generally alienable by deed or will, and, if estates of inheritance, are transmissible by descent just like present estates. Though the property in which the estate is claimed is for the time being in the lawful possession of another, the future estate

is secure from loss or destruction. It is unaffected by any conveyance or other act of absolute ownership which the present, or particular, tenant may choose to exercise over it. In this respect it differs from a mere equitable interest, present or future, in property, which may be lost by conveyance of the property to an innocent purchaser. But all future estates that are contingent in character are subject to the rule against perpetuities, which renders void any future interest which is not to rest within a lifetime and twenty-one years after the date of the creation of the estate. See PERPETUITY.

FUX, fooks, JOHANN JOSEPH (1660-1741). A musical composer and theoretician, born at Hirtensfeld, in Styria. Until his appointment as organist at the Schottenkirche, Vienna, in 1696, nothing authentic is known of him. In 1715, having held several court offices, he was appointed first or head kapellmeister, an office which he held up to the date of his death, serving with marked favor under three successive emperors. His secular compositions, and his operas in particular, give little evidence of genius; his fame as a composer resting more on his sacred music, and especially on the celebrated *Missa Canonica*, a contrapuntal masterpiece written entirely in canon form. His treatise on counterpoint, written in Latin originally, and entitled *Gradus ad Parnassum*, was first published at Vienna in 1725, meeting with so much favor that by the year 1791 it had been published in English, French, Italian, and German. Haydn and Mozart are known to have studied and profited by it, while Cherubini, Aibrechtsberger, Piccini, Martini, Vogler, and numerous other well-known composers and teachers either adopted or sanctioned it. Although he wrote or composed over 400 works, few of them were ever published. He died in Vienna. A very excellent biography is Köchel, *Johann Joseph Fux* (Vienna, 1872).

FUZE, or **FUSE** (abbreviation of *fusee*, from Fr. *fusil*, gun, steel for striking fire, It., *ML. focile*, steel for striking fire). The name of a variety of devices employed for firing explosives in military shells and mines and in blasting operations, etc. The simplest form of fuze, and the one which is most familiar, consists of a rope-like tube filled with some slow-burning compound, one end of which is inserted in the explosive, and to the other end of which the light is applied. Such fuzes are made to burn at a certain rate of speed, and the time of explosion can, therefore, be regulated definitely by varying the length of the fuze. The Bickford match, which is used in blasting, burns at the rate of from two feet to four feet per minute. In modern practice blasts are most generally fired by electric fuzes. These are of two general classes. In both two naked copper wires pass through a cork or plug of some non-conducting material, and project inside a metal cylinder in the open end of which the plug is inserted. In tension fuzes the ends of the wires are not connected, and in quantity fuzes the ends of the large copper wires are connected by a very fine wire, commonly of platinum. The metal cylinder is filled with some explosive compound, commonly fulminate of mercury, which explodes with a detonation. The outer ends of the two copper wires are connected with two wires which lead to the poles of a battery

or other electrical generator, often a magnetic machine.

In operation, the metal cylinder with its exploding charge is inserted in the mine or blast to be fired, and the wires are connected with the electric generator. Upon completion of the circuit the current passes through the explosive compound in the detonator, forming a spark in the tension fuze and heating the fuze wire in the quantity fuze, and in either case causing the compound to explode and thus explode the mine or blast. Electric fuzes are used for firing submerged mines in warfare. By means of the electric fuze a large number of mines or blasts can be fired simultaneously. See **BLASTING**.

Fuzes for projectiles are either time or percussion, or a combination of both. Percussion fuzes generally have a plunger held by a safety ring or other device away from a cap of fulminate until, by the shock of discharge, they are armed, and the plunger left free to run forward, when the shell strikes its target, and strike the cap. Time fuzes have a plunger held safe by a pin which is taken out when inserted in the gun; the discharge then shears off a frail support (the plunger lugs) and drives the plunger on to the cap at once, igniting a train of powder (time train) which burns during flight. Communication of flame to charge can be made only through the connecting tube, a small hole punched at a point corresponding to the time desired before explosion. The percussion principle is generally combined with this to insure explosion on impact if the time train should fail to act, and the mechanism which is shown in the illustration is generally situated at the base of the fuze.

F.A. Combination Fuze.
in Seconds.

FRANKFORD ARSENAL COMBINATION FUZE.

In spherical shell, a train of powder pressed into a wooden tube was cut to length proportionate to time of bursting. Ignited at the outer end by discharge, this tube conveyed the combustion to the charge. For ricochet fire over water, a water-cap of brass with a zigzag channel prevented extinction by immersion. An improved fuze, chiefly used for spherical shell, was the **Bormann**. It was of pewter and was punched on a time scale. Greater accuracy was obtained by more uniform burning of the better time train.

Consult **Bruff**, *Ordnance and Gunnery* (New York, 1900). See also **PROJECTILES**; **SHRAPNEL**.

FYFFE, *ff*, **CHARLES ALAN** (1845-92). An English historian, born at Blackheath, England, and educated at Balliol College, Oxford, where he graduated in 1868. He took his M.A. in 1870, and in the following year was elected a fellow of University College, and later was appointed bursar, which position he held for many years. He acted as war correspondent for the *London Daily News* during the early months of the Franco-Prussian War, and in the same capacity was in Paris during the Commune, narrowly escaping execution as a spy. He studied law at Lincoln's Inn and the Inner Temple in 1873-76, and in 1877 was admitted to the bar, but never practiced. In 1875 he published a small *History of Greece*, in a series of *History Primers*, which was well received. This success encouraged him to attempt a larger work, and he began writing his *History of Modern Europe*, which was published in three volumes in 1880, 1886, and 1890. It is a vigorous and careful account of the political history of Europe from the outbreak of the French Revolution to the Treaty of Berlin in 1878, and as a clear, concise, and well-proportioned sketch of this period it has not been surpassed. **Fyffe** was a Radical in politics, was one of the founders of the Free Land League, and was an unsuccessful candidate for Parliament from Oxford in 1885.

FYNE, *fin*, **LOCH**. An arm of the sea running north and northeast from the Sound of Bute, in the south of Argyllshire, Scotland, to beyond Inverary, in the north, and bounded by the District of Cowal on the east, and by those of Argyll-Knapdale and part of Cantire on the west (Map: Scotland, C 3). It is 43 miles long, 2 to 8 miles broad, and 40 to 70 fathoms deep, and receives at its head the waters of the Fyne River and a little lower down the Shira and Aray. It has important herring fisheries.

FYRD, *fêrd*. See **MILITIA**.

FYT, *fit*, **JAN** (c.1609-61). A Flemish painter and etcher, born in Antwerp. He was a pupil of Jan van Berch. In 1629 he became member of the Guild of Saint Luke, and in 1650 he was elected member of the Guild of the Romanists, becoming dean in 1652. He visited Italy and spent some time studying in Rome. His painting is characterized by sunny effects, harmony of color, and remarkable detail, especially in the painting of the fur of animals and the plumage of birds. His subjects embrace animals hunting, fighting, and dead. He has been named the greatest animal painter of the Flemish School, and was associated with Jordaens and Willeborts; the latter painted the figures, while **Fyt** added the animals. He died in Antwerp in 1661. His etchings include three series of animal subjects: they show the same vigor and animation in style as his paintings. There are three paintings at the Louvre, Paris; the "Bear Hunt" is in Munich; and he is well represented in Vienna and Paris.

FYZABAD, *fi'zâ-bûd'*. See **FAIZABAD**.

G

G The seventh letter and fifth consonant in the Græco-Roman alphabet. The greatest innovation made by the Romans when they took over the Greek alphabet was in the development of G. Up to the middle of the third century B.C. the letter C was employed in Latin inscriptions for both *c* and *g*. The familiar abbreviations C. and CN. for Gaius and Gnæus prove this fact beyond question. The inconvenience, however, of having only one character to distinguish the two sounds made necessary a slight differentiation, which finally gave the form G for the sonant guttural (*g*), and C for the surd guttural (*c* hard). The new character first appears in the epitaph on Scipio Barbatus, which Ritschl thinks cannot have been carved later than B.C. 234. This G took the seventh place in the alphabet, which had been occupied by Z in the old Italic alphabet. (See ALPHABET; LETTERS.) With reference to the name, it may be added that the Greek designation *gamma* has been usually supposed to be an adaptation of the Semitic *gaml* or *giml*, and to mean a camel. But in fact *giml* and *gaml* mean nothing as words, and although either may be the Semitic triliteral root meaning 'ripe,' there is no word of any such form from that root.

PHONETIC CHARACTER. In English, *g* has the values (1) of a voiced guttural explosive made by voiced breath being checked between the body of the tongue and the palate, as in *got*, *organ*, *glad*; (2) of the so-called 'soft' or palatal *g* (*d* + *zh*), as in *generous*, *gentle* (this sound is sometimes aided orthographically by the addition of a *d*, as in *bridge*, *judge*); (3) in some words taken from French it has the value of *zh*, the voiced, broad sibilant as in *mirage*, *rouge*; (4) it is sometimes silent before *n* and *m*, as *gnaw*, *sign*; (5) in the combination *ng* at the end of syllables it denotes merely that the *n* is a guttural and not a dental nasal; (6) the combination *gh* has frequently the sound of *f*, as *slough*, or of *w*, as *bough*. The voiced explosive *g* comes chiefly from (1) Indo-Ger. *gh*, as in Eng. *long*, Ger. *lang*, Lat. *longus*, Gk. *δολιχός*, Skt. *dirghas*; (2) the *g* of words which have come into English from other languages, as *grain*, Lat. *granum*. The following are some of the changes between *g* and other letters: *Acre*, Lat. *ager*, Gk. *ἄγρος*, or again *knee*, Lat. *genu*; *kin*, Lat. *genus*; *yester* (day), Ger. *gestern*, Lat. *hesternus*. There is a constant tendency toward

palatalization of *g*, as in the Old English participles in *y*, corresponding to Germanic *ge*. A modern instance of this tendency is seen in the pronunciation of *Morgen* as *Moryen* in the so-called *Berliner Dialekt* of Germany. The Normans in England could not sound the *w*, and so substituted for it *gu*. This gives doublets in English like *guard* and *ward*, *guarantee* and *warranty*. G sometimes disappears, as in Eng. *enough*, Ger. *genug*; and Eng. *master*, Lat. *magister*.

AS A SYMBOL. G in music is the fifth tone of the natural diatonic scale of C, and in the treble clef is written on the second line, or in the first space above. In the bass clef it stands in the first line or in the fourth space.

GAAL, gál, JÓZSEF (1811-66). An Hungarian author. He was born at Nagy Károly, in 1811; studied at the College of Buda, and at the University of Pesth, and entered soon afterwards the administrative career, being attached to the Hungarian Council of Lieutenancy. He played a somewhat important part in politics, and took part in the Revolution of 1848. Gaal began writing early, and proved equally successful when gossiping in the columns of Kossuth's famous *Pesti Hírlap*, translating a masterpiece of Cervantes, filling the periodicals with tales and novels, or furnishing original works for the National Theatre. The sketches of country life as it was, and as it still continues on the vast plains of Hungary, are nowhere more vividly and more truly exhibited than in Gaal's comedies and tales. The following are some of Gaal's original compositions: *Szirmay Ilona*, a novel in two volumes (1836); *Peleskei Notarius* (The Notary of Peleske, 1838), a comedy in four acts; *Szvatopluk*, a tragedy in five acts. Tales: *Pusztai Kaland* (An Adventure on the Hungarian Prairies); *Tengeri Kaland az Alföldön* (Seafaring Adventures in Lower Hungary); *Hortobágyi éjszaka* (A Night on the Heath of Hortobágy). During the sojourn of the Hungarian Diet at Debreczin (1849), Gaal was editor of a journal combating extreme radical views. As early as 1837 he was made a member of the Hungarian Academy. Consult the edition of Gaal's novels and tales by Badics (Budapest, 1880-82).

GABARET, gá'bá'rá', JEAN DE (c. 1620-97). A French Colonial Governor, born on the Island of Ré. He was made a commodore in 1653, and lieutenant-general of naval forces in 1689. At the siege of Tobago, West Indies, he was the

first to enter the harbor (February 27, 1677). He also fought in the battle of La Hogue (May 29, 1692), and in 1693 was appointed Governor of Martinique, which island he not only successfully defended against the English, but greatly improved. He improved the 'Black Code,' and, in the interest of the slave population of the island, submitted a report outlining a method of gradual emancipation, and at the same time recommending the deportation of the negroes to the French possessions in South America, where they might ultimately prove valuable as colonists, and pointing out that white immigration to Martinique would thus be encouraged.

GABB, WILLIAM MORE (1839-78). An American paleontologist. He was born in Philadelphia, where he attended the Academy of Natural Sciences. From 1862 to 1865 he was in charge of the paleontological branch of the geological surveying expedition in California under Josiah D. Whitney, and in 1868 and 1873 undertook geological surveys in Santo Domingo and Costa Rica. His principal publications, which refer chiefly to these expeditions, include the first and second volumes of the *Geological Survey of California* (1864); "On the Topography and Geology of Santo Domingo," in *Transactions of the American Philosophical Society* (1873); "On the Topography of Costa Rica, with Map," in *Petermann's Mittheilungen*; and "Ethnology of Costa Rica," in the *Transactions of the American Philosophical Society*.

GAB'BATHA (Gk. Γαββαθά). A proper noun found in John xix. 13, as the Aramaic equivalent of the Greek term Λιθοστρότος, *Lithostrōtos*, Pavement. The Aramaic word represented by the Greek is generally supposed to be *gabbeta*, the status emphaticus of *gabba*, a height or eminence. No such word has yet been discovered in extant Aramaic documents, and the derivation and exact meaning of the term are uncertain. The same uncertainty must be confessed in regard to the location of the 'Pavement' in the city of Jerusalem. No mention of the same is found in other writers, nor is the place where Jesus was tried by Pilate certainly known.

GABBRO (dialectic It., of obscure origin). A crystalline igneous rock of granitic texture, composed largely of the minerals lime-soda feldspar and pyroxene, but often containing also a considerable quantity of olivine. The average chemical composition is silica, 49 per cent.; alumina, 20 per cent.; iron sesquioxide, 3 per cent.; iron protoxide, 7 per cent.; magnesia, 7 per cent.; oxide of lime, 9 per cent.; oxide of sodium, 3 per cent.; water, 2 per cent. The proportions of the constituent feldspar and pyroxene in gabbros vary widely, hence they grade toward peridotite and pyroxenite (qq.v.) on the one hand by reduction of the proportion of feldspar; and on the other toward anorthosite (q.v.), by reduction of the proportion of pyroxene. Gabbro which contains olivine is distinguished as *olivine gabbro*. The usual pyroxene of gabbro is diallage, but when the place of this mineral is partially or wholly taken by hypersthene the rock is known as a *hypersthene gabbro* or *norite*. The processes known as weathering tend to change both the olivine and pyroxene of olivine gabbros into the hydrated magnesium silicate serpentine, hence olivine gabbros are very often

found to alter to serpentinous or serpentine rock (q.v.); the alteration is even more common and complete in peridotite (q.v.). Gabbros have a very large development in the Lake Superior region of America and in the western isles of Scotland. The word gabbro is used in Italy, and is said to have been introduced into geological science by Von Buch in 1809.

GABELENZ, gä'be-lents, HANS CONON VON DER (1807-74). A distinguished German philologist, born at Altenburg. He studied at the universities of Leipzig and Göttingen (1825-28), and held various positions in the Government of Saxe-Altenburg, rising in 1848 to the head of the Ministry. He devoted himself to the study of little-known languages, Asiatic, African, and American, and strove to lay a foundation for the comparative study of all languages. In his work *Ueber das Passivum* (1860) he drew examples from two hundred and eight tongues. Among his other works are: *Eléments de la grammaire mandchoue* (1833); *Grundzüge der syrischen Grammatik* (1841); a critical edition of the Gothic translation of the Bible by Ulfilas, with a Latin translation and a Gothic glossary and grammar (in collaboration with J. Löbe, 2 vols., 1843-46); *Ueber die melanesischen Sprachen* (2 vols., 1860 and 1873). He was one of the founders of the *Zeitschrift für die Kunde des Morgenlandes*, and contributed to it and other periodicals many papers upon obscure languages and general philological science.

GABELENZ, gä'be-lents, HANS GEORG CONON VON DER, son of Hans Conon von der Gabelenz (1840-93). A German philologist, born at Poschwitz, Saxe-Altenburg. After studying law in Jena and Leipzig, and holding several State positions, he was appointed in 1878 professor extraordinary of Oriental languages at the University of Leipzig, and to a similar chair in the University of Berlin in 1889. Besides numerous contributions to the philological journal which his father had founded, he translated a Chinese work on 'The Absolute,' entitled *Thai-Ki-T'u*, and published (1876) a grammar of the Chinese classical language, *Chinesische Grammatik* (Leipzig, 1881); *Die Sprachwissenschaft* (1891); and *Handbuch zur Aufnahme fremder Sprachen* (1892).

GABELLE, gä'bel' (Fr., probably from AS. *gafol*, tax, from the Celtic; cf. Corn. *gavel*, tenure, Ir., Gael. *gabhair*, conquest, from *gab*, to give, to take; connected with Goth. *giban*, Ger. *geben*, Eng. *give*). A term originally used in France to designate every kind of indirect tax, but more especially the tax upon salt. This impost, first established in 1286, in the reign of Philip IV., was meant to be only temporary, but was declared perpetual by Charles V. Salt was made a Government monopoly, and every family in the kingdom was obliged to buy a certain weekly amount at a fixed price. The price varied in the different provinces. Those that were most heavily taxed were called *pays de grande gabelle*, and those that were least heavily taxed, *pays de petite gabelle*. *Les provinces franches* and *les pays rédimés* were those provinces which had purchased exemption from the tax. It was unpopular from the first, and the attempt to collect it occasioned frequent disturbances. It was finally suppressed in 1790. The name *gabelous* is, however, still given by the common people in France to tax-gatherers.

GABELSBERGER, gä'bel's-bêrg-ër, FRANZ XAVER (1789-1849). The founder of stenography in Germany. He was born and educated at Munich, and was long engaged as private secretary in the Ministry of the Interior in that city. After publishing various text-books and charts for schools, he devoted himself exclusively to stenography, repeatedly gave public exhibitions of his proficiency, and ultimately received the unqualified commendation of the Academy of Sciences. His method is based upon phonetics. The system has been widely adopted in Germany, and has been introduced also into about twenty-five European languages. His principal works are: *Anleitung zur deutschen Redenzeichenkunst* (1834; Eng. trans., by Henry Richter under the title of *Graphic Shorthand*, 1899), which has furnished the basis for all further investigations of the kind in Germany, and has passed through numerous editions; *Neue Vervollkommnungen in der deutschen Redeschreibekunst* (2d ed. 1849); and *Stenographische Lesebibliothek* (1838). A monument was erected to his memory in Munich in 1890.

GABERLUN'ZIE MAN, THE. A Scottish ballad which belongs to the early sixteenth century, and has been ascribed to James V. It concerns the fortunes of a wandering beggar.

GABES, gä'bès. See **CABES**.

GABES, GULF OF. See **CABES**, GULF OF.

GABH'RA, BATTLE OF. A battle which the tribe of Fionn waged, about A.D. 284, against its enemies, as recounted by the Irish-Gaelic legends.

GABII, gä'bi-l. An ancient city of Latium, 10 miles east of Rome. It plays an important part in Roman legend, as the city where Romulus and Remus were educated, and later as conquered by Tarquinius Superbus. After this it is seldom mentioned, and though it was later a municipium, gradually fell into complete decay. It again became prosperous during the reign of Tiberius, when its cold sulphur springs attracted attention, and after the time of Hadrian seems to have flourished until the third century, when its name disappears except as the seat of a line of bishops until the ninth century. The principal relic of the ancient city is a ruined temple, probably dedicated to Juno, on a hill now crowned by the ruins of the medieval fortress of Castiglione. Excavations on the site have yielded many noteworthy works of art, as the "Artemis of Gabii" now in Munich. Quarries of an excellent building-stone, peperino, which was largely used by the Romans, existed in the neighborhood of Gabii. The Romans termed a peculiar method of girding the toga *cinctus Gabinus*. It seems to have differed from the ordinary method in that instead of the belt a portion of the toga was itself the girdle, while another part was drawn over the head. Used on certain solemn occasions, as the opening of the Temple of Janus on a declaration of war, and at certain sacrifices, it seems to have been brought to Rome from Gabii at an early date, along with other matters of augury or ritual.

GABINIUS, AULUS (?-c.47 B.C.). A Roman politician. He was tribune of the plebs. B.C. 66, and in that year proposed and carried the famous Gabinian law, conferring upon Pompey the command of the war against the pirates. Afterwards he was prætor (61), and became consul

in 58, when he supported the banishment of Cicero. At the end of his consulship he went to Syria as proconsul (57); invaded Egypt; and against a decree of the Senate, restored Ptolemy Auletes to the Egyptian throne (B.C. 55). On his return to Rome (54) he was accused of treason and extortion. He was acquitted of treason, but though defended by Cicero, was condemned to perpetual banishment for extortion. He was recalled by Cæsar in 49, and in the next year was sent to reinforce Q. Cornificius in Illyricum, where he died.

GAB'ION (OF., Fr. *gabion*, from It. *gabbione*, large basket, gabion, augmentative of *gabbia*, gabbia, cage, Fr., Eng. *cage*, from Lat. *cavea*, hollow place, from *cavus*, hollow). A device for strengthening earthworks, in field or temporary fortifications. It may be constructed of whatever materials the circumstances afford; but usually it is a hollow cylinder of basket-work, varying in diameter from about 20 inches to 6 feet, according to the nature of the work for which it is intended. It has the advantage of being readily portable and capable of many uses. See **FORTIFICATION**.

GABION.

GABIROL, gä'bä-röl', SALOMON BEN. See **AVICEBRON**.

GABL, gä'b'l, ALOYS (1845-93). An Austrian genre painter, born at Wiesen, Tyrol. He was a pupil at the Munich Academy of Schraudolph, Ramberg, and finally of Piloty. His poverty, the result of a disease of the eye, drove him to suicide at Munich. His genre scenes closely resemble in characterization and humorous conception those of his famous countrymen Defregger and Matthias Schmid, but surpass them in striking light effects. They include: "Recruiting in Tyrol" (1873); "His Reverence as Umpire" (1876); "A Munich Tavern" (1880); "Vaccination Room in Tyrol" (1885), the last in the New Pinakothek at Munich, and one of the choice specimens in that collection; and "Return of the Huntsman" (1892).

GABLE (OF., Fr. *gable*, from OHG. *gabala*, *gabal*, Ger. *Gabel*, fork, AS. *geaft*, fork, from Ir. *gabul*, *gobul*, Welsh *gaf*, Bret. *gavl*, *gaol*, fork). The triangular part of an exterior wall at the end of a building having a roof sloping both ways from a longitudinal ridge, between the top of the side walls and the slopes of the roof. The whole wall of which the gable forms the top is called a gable-end. The form appears first in

the pediment (q.v.) of Greek temples which, on account of its rich sculptures, became so important a part of temple architecture. It was not, however, until the Romanesque period of mediæval architecture that the gable came into general use as a constructive and decorative form. Some Romanesque gables in Central France, forming the summits of church façades, are extremely rich in ornamentation. Such gable façades throughout Europe became a decorative feature and often, instead of following the lines of the structure behind, were given independent lines, forming a screen façade. The form was extended, then, to minor parts of the building, often for purely decorative purposes. The development of tracery in the Gothic styles led to the use of delicate openwork gables, adorned with crockets and finials and covered with a lacework of decoration. Such gables—termed *gables* in their smaller forms—were used in great profusion in the more decorative parts of Gothic architecture, such as doorways, windows, canopies, pinnacles, etc., where they are introduced in endless variety. In the mediæval towns of Northern and Central Europe almost all the houses had gabled façades on the street, producing great diversity and picturesqueness of effect, as may still be seen in many towns which have been little modernized. The towns of Belgium and Germany especially still retain this mediæval arrangement. In the Gothic and the Renaissance periods, the simple outline of the gable in these countries became stepped and broken in the most fantastic manner. See CORBIE STEPS.

GABLENZ, gä'blents, LUDWIG KARL WILHELM, Baron (1814-74). An Austrian general. He was born at Jena, Saxe-Weimar; entered the Austrian service in 1833, and fought in Italy and Hungary in 1848. In the war of 1859 against Italy, he took a distinguished part in the battles of Magenta and Solferino; commanded the Austrian army corps in the Austro-Prussian War against Denmark in 1864, at Trautenau, and won the only Austrian victory of the War of 1866 against Prussia. After Sadova he became a member of the Austrian Upper House, was appointed commanding general in Hungary in 1869, and retired in 1871. Financial difficulties drove him to suicide.

GABLONZ, gä'blönts (Bohemian *Jablonec*). A busy manufacturing town of Bohemia, Austria, situated in a mountainous district about 1650 feet above sea-level, on the Neisse, seven miles east-southeast of Reichenberg (Map: Austria, D 1). Gablonz is one of the centres of the Bohemian glass industry, its specialties being glass beads, buttons, and imitation gems. There are also manufactures of bronzes, textiles, belts, and colored papers. The expert firms number over 100. Mineral baths are found in the vicinity. Population, in 1890, 14,653; in 1900, 21,086.

GABOON, gä'bōon'. See GABUN.

GABORIAU, gä'bō're'ō', EMILE (1835-73). A French novelist who conspicuously made crime and its detection his subjects. He was born at Saujon, November 9, 1835. His first popular writings were humorous sketches contributed to minor Parisian journals. With little grasp of character or grace of style, with no true literary qualities indeed, he achieved a European reputation as a reviver of the romances of rascality, and

as an inaugurator of the detective story, in connection with which he made a careful study of the Paris police system of his day. His fiction was thus a direct reflection of phases of the French Romantic School. The best of his numerous and frequently translated volumes are: *L'affaire Lerouge* (1866); *Le dossier No. 113* (1867); *Monsieur Lecoq* (1869); *La corde au cou* (1873); and *La dégringolade* (1876). He died in Paris, September 28, 1873.

GABRIEL (Heb., Man of God). In the Jewish angelology, one of the seven archangels. His function seems to be especially to reveal God's will and purposes. He appears in the Book of Daniel as the interpreter of the prophet's vision regarding the ram and the he-goat (viii. 16), and as bringing the explanation of the seventy weeks (ix. 21). In the New Testament he announces to Zacharias the birth of John the Baptist (Luke i. 19), and to Mary the birth of Christ (Luke i. 26). In post-biblical Jewish literature Gabriel is frequently introduced. The Targum to II. Chron. xxxii. 21 says that Gabriel destroyed the host of Sennacherib. According to the Talmud, it was he who showed Joseph the way to his brothers (Gen. xxxvii. 15-17), and he together with other angels buried the body of Moses (Deut. xxxiv. 6). He is the prince of fire, and the spirit who presides over the thunder and the ripening of fruits. When Nebuchadnezzar besieged Jerusalem, Gabriel is said to have entered the temple by command of God before the Assyrian soldiery, and burned it, thereby frustrating their impious intentions. It was he that prevented Vashti from obeying the King (Esther i. 12), and rewrote the record of Mordecai's service in the history after it had been erased. Gabriel has also the reputation among the rabbis of a most distinguished linguist, having, for example, taught Joseph the 70 languages spoken at Babel. The Mohammedans also hold Gabriel in great reverence. According to the claim of Mohammed in the Koran, it was he who revealed the sacred book. He is called the spirit of truth, and is regarded as the chief of the four most favored angels who form the council of God—a number corresponding to the system in the book of Enoch (ch. xl.), where Gabriel, Michael, Uriel, and Peniel are the angels standing near the throne of God.

GABRIEL, BROTHERS OF SAINT. An organization in the Roman Catholic Church founded in 1835 by a French priest named Deshayes (died 1841). Its purpose was the education of the young, especially the blind and deaf-mutes. By the year 1851 they had 91 houses; and in 1880 they conducted 122 elementary schools, 3 boarding-schools, 8 institutions for deaf-mutes, and 2 for the blind. Their mother house is at Saint Laurent-sur-Sèvre in La Vendée.

GABRIEL HOUNDS. A supernatural pack, which gives tongue at night, and thus gives warning of approaching sorrow. A peculiarity of the phenomenon is that the cry always seems to come from the sky instead of from the earth. The name is also applied to wild geese, whose noise when flying suggests that of hounds. They are introduced in Charles Reade's novel *Put Yourself in His Place*.

GABRIELI, gä'bré-ä'le, ANDREA (c.1510-86). An Italian organist and composer, born in Ven-

ice. He was a pupil in composition of Adrian Wil-laert, and became first organist of Saint Mark's in 1584. In 1574 he wrote the music for the reception of Henry III. of France, two cantatas for eight and twelve voices, respectively, printed in 1587. He was famed for his choral works, masses, motets, and madrigals, and was the first to write a fugue, a form hitherto not attempted by the contrapuntists. His best work is *Psalmi Davidici qui Pœnitentiales Nuncupantur* (1583). A number of his works were printed with those of his nephew Giovanni, such as some organ pieces, *Intonazioni d'organo* (1593, lib. i.), and *Ricercari per l'organo* (1595, lib. ii. and iii.).

GABRIELI, GIOVANNI (1557-1612). An Italian composer, born in Venice. He was the nephew and pupil of Andrea Gabrieli, and became the first organist at Saint Mark's (1585). He was the greatest representative of the contrapuntal school of the sixteenth century, and was considered the peer of Lasso and Palestrina, even surpassing the latter master in the richness of his tone-color. He was noted as a teacher, and had many scholars from Germany, where his compositions were early known and appreciated. He was one of the first to develop independent instrumental music in choral works. The early editions of his works are rare, but single pieces are to be found in many of the sixteenth and seventeenth century collections of music. His works are a *Benedictus* for 12 voices; *Psalmi Pœnitentiales 6 Vocum* (1583); *Madrigali a 6 voci o istromenti* (1585); *Madrigali e ricercari a 4 voci* (1587); *Ecclesiasticæ Cantiones 4-6 Vocum* (1589); *Sacra Symphonice*, for 6-16 voices or instruments (1597); another book for 6-19 voices (1615); and *Canzone e sonate a 3-32 voci* (1615). Consult Winterfeld, *Johann Gabriel und sein Zeitalter* (Berlin, 1834).

GABRIELLI, CATERINA (1730-96). An Italian opera singer. She was born at Rome, the daughter of a cook in the employ of Count Gabrielli, who, accidentally hearing her sing, adopted her as his protégée, and had her voice trained by Garcia and Porpora. Although possessed of a magnificent voice, and meeting with uniform success throughout her career as an artist, she is remembered more as the mistress of Don Ferdinand of Parma, and later as the companion of the profligate Catharine II. of Russia. Her artistic rivalry with Marchesi was felt so keenly in Milan as to lead to popular disturbances. She spent the last years of her life in Rome.

GABRIEL'S INSURRECTION. In American history, an insurrection of negro slaves in the vicinity of Richmond, Va., in August, 1800, organized by a young slave named Gabriel, for the purpose of murdering the whites. The plot was discovered, Governor Monroe ordered out the militia, and many of the blacks were captured and executed.

GABRILOWITCH, gâ-brê'ld'-vich, Ossip (1878-). A Russian pianist. He was born at Saint Petersburg, and when still a child entered the conservatory there. He became one of Rubinstein's favorite pupils, and after winning the Rubinstein prize in 1894, continued his studies with Leschetitzky in Vienna. Two years later he made his début at Berlin, and thereafter gave concerts in Russia, England, Austria, Sweden, and the United States. His first appearance in this country was in 1900, and then, as upon his

subsequent visits, he received an enthusiastic welcome. He is an exceedingly virile and sympathetic player.

GABUN, or GABOON, gâ-bōōn'. A river, or more properly an estuary, on the western coast of French Congo (q.v.), about 45 miles long and about 10 miles wide (Map: Congo Free State, A 2). It admits of the entrance of deep-draught vessels and formerly gave its name to the entire colony of French Congo. It receives the waters of the Como, and some minor tributaries.

GACHARD, gâ'shâr', LOUIS PROSPER (1800-85). A Belgian archivist and historian. He was born in Paris, removed to Belgium in 1830, and became a Belgian subject in 1831. In the same year he was made keeper of the public records. He was a member of the Belgian Academy, secretary of the Royal Historical Institution, and president of the Heraldic Bureau. Gachard traveled extensively in search of documents bearing on Belgian history, and published many authoritative works based on his researches. His principal writings are: *Correspondance de Guillaume le Taciturne* (1847-58); *Correspondance de Philippe II. sur les affaires des Pays-Bas* (1848-59); *Retraite et mort de Charles-Quint* (1854); *Relation des troubles de Gand sous Charles-Quint* (1856); *Don Carlos et Philippe II.* (1863); *Actes des Etats-généraux des Pays-Bas* (1866); *Histoire politique et diplomatique de Pierre-Paul Rubens* (1877).

GAD (perhaps an abbreviation of *Gaddiel*, Gad is god). According to the biblical account, a son of Jacob and his concubine Zilpah (Gen. xxx. 11), the eponymous ancestor of the tribe of Gad. This tribe was promised land on the eastern side of the Jordan on condition that they should help the other tribes to conquer the territory west of the river (Num. xxxii.). This condition they fulfilled (Joshua i. 12-18, iv. 12), and then settled in their own territory (Joshua xii. 1-9). It may be concluded from this tradition that Gad was a warlike tribe (see I. Chron. xii. 8), and secured its east-Jordanic settlement through conquest. The territories of the tribe are ill-defined. They lay between the settlements of Reuben on the south and those of Manasseh on the north, but there is a confusion in the biblical accounts, making it hard to determine the boundaries of the three tribes east of the Jordan. There is no literature preserved which originated in this region. When the kingdom was divided in the days of Rehoboam, Gad joined Jeroboam and the northern kingdom (I. Kings xii. 20). The tribe was taken captive to Assyria by Tiglathpileser (B.C. 734), and is heard of no more. The name Gad, like that given to his brother Asher, may have been originally the designation of a deity of good fortune, worshiped in various parts of Palestine. The fact that a Hebrew clan settled in the district which is embraced under the term Gilead in the broader sense is considered as pointing to the cult of this deity as the patron of the clan, whose connection with the other Hebrew tribes was never very close. The district contained, however, a number of ancient sanctuaries, such as Penuel and Succoth, which must at one time have been places to which pilgrimages were made. See ASHER; GILEAD.

GADAMES, gâ-dâ'mès, GHADAMES, or RHADAMES, râ-dî'mès. An oasis and town in

the Vilayet of Tripoli, North Africa, the centre of divergent routes to Tunis, Tripoli, Ghat, and Tidikelt, on the northern border of the Sahara, 310 miles southwest of Tripoli (Map: Africa, E 1). Gadames is an important entrepôt for manufactures and foreign goods from Tripoli to the interior, and for exports of ivory, beeswax, hides, ostrich-feathers, gold, etc., from the interior of Tripoli. Its gardens produce dates, barley, wheat, millet, etc., and are watered by the hot spring (89° Fahr.) from which the town had its origin. The climate is dry and healthful, though very hot in summer. A wall surrounds the oasis and town, and the streets are covered over for protection from the rain and sand storms. Gadames has six mosques, seven schools, and a Roman Catholic mission. Population, about 7000.

The town is the modern representative of the ancient city of Cydames, a stronghold of the Garamantes, the capture of which by Cornelius Balbus gave the Romans a great part of the wilderness. The town constitutes an ethnic menagerie. The inhabitants, living in well-guarded inclosures, include Berbers, Arabs, the *Atriya*, or negro freedmen, and emancipated half-castes, each group speaking its own language and also Berber as a common medium of intercourse. They are called 'born traders.' Consult Keane, in Stanford's *Africa*, vol. i. (London, 1895), for list of explorers and political history.

GAD'ARA. The modern Umm Keis, or Mkes, once a prominent city of Palestine, now in ruins. It was on the western extremity of a ridge of the Bashan plateau, six and one-half miles east of the Jordan, and six miles southeast of the Sea of Galilee. The site, 1194 feet above sea-level, commands a magnificent view of the Jordan Valley. At the foot of the ridge, three miles to the north, flows the Sheriat el-Menadireh, the ancient Jar-muk or Hieromax.

Gadara is first mentioned in the history of the Greek period. Josephus's statement that it was a Greek city implies that it was one of the many places in Palestine occupied by Greeks after Alexander's conquest. (See DECAPOLIS and PALESTINE.) Polybius states (v. 71, xvi. 39) that it was twice taken by Antiochus III. of Syria, in B.C. 218, and again in B.C. 198, in his wars with Egypt for the possession of Palestine. It remained nominally subject to Syria until about B.C. 100, when with other Greek cities east of the Jordan it was taken, after a ten months' siege, by the Jewish King, Alexander Jannæus, and partially destroyed. When Pompey reduced Syria to a Roman province (B.C. 65-63), he rebuilt Gadara, as a favor to his freedman Demetrius, a Gadarene. The restored city was thenceforward the fast friend of Rome. On its coins it made use of the Pompeian era in commemoration of Pompey's kindness. Augustus, after the battle of Actium, gave Gadara to Herod the Great, much against the wishes of its citizens. For its loyalty to Rome it suffered greatly at the hands of the revolted Jews in the war of 66-70 A.D. At the request of its wealthy citizens, Vespasian gave it a body of troops for protection against the Jews. From notices in ecclesiastical history it appears that it continued to flourish until the Mohammedan conquest.

The situation of Gadara was favorable for commerce, and it was a prosperous city, called by Josephus the metropolis of Perea. It was one

of the important members of the Decapolis (q.v.) and a centre of Greek culture. Meleager the poet, Theodorus the orator, Philodemus the Epicurean, Menippus the cynic, and others prominent in post-classical literature were Gadarenes. Its ruins are extensive and magnificent. It had two theatres, and the remains of the colonnade that once lined the main street are among the most remarkable in Palestine. Its water was supplied by an aqueduct from the Batanean hills, over 40 miles distant. The ancient cemetery east of the city is noted for the construction of its tombs, each with several separate chambers with doors swinging on stone hinges. The present inhabitants live in these tombs. In Roman times the city was famous for its warm springs. They are in the river valley, mainly on the north bank. About them quite a suburb grew up, Amatha by name, and extensive ruins of baths and other buildings of the once famous resort are now found there. The springs are still frequented by Bedawin, who consider the place neutral ground. Probably Gadara has no connection with biblical history. See GERASENES, COUNTRY OF THE.

GADDANE, gād-dii'nā. A wild Malayan people in Isabela and Cagayan provinces, Luzon. See PHILIPPINES.

GADDI, gād'dè. A family of Florentine painters. The founder was GADDO GADDI (c.1259-1332), famous especially for his mosaic pictures, especially the "Coronation of the Virgin" over the door of the Cathedral of Florence, the "Assumption" in the Cathedral of Pisa, and part of the mosaics in the dome of the Florentine baptistery. He was associated with Cimabue.—His son, TADDEO GADDI (c.1300-66), was a pupil of his godfather, Giotto, and preëminently the most talented of his followers. His masterpiece is the "History of the Virgin," in a series of frescoes in the Baroncelli Chapel at Santa Croce, Florence, in which he shows true religious feeling and poetry. Two signed altarpieces by him are at Berlin (1334), at Naples (1336), and others at Megognano, near Poggibonsi. The "History of Christ" and that of Saint Francis, on the presses in the sacristy of Santa Croce, are attributed to him. In his youth he assisted Giotto in the frescoes of Saint Francis at Assisi. As an architect he is reputed, mainly on Vasari's authority, to have continued Giotto's work on the Campanile at Florence, and to have built the Ponte Vecchio. The frescoes of the Cappella degli Spagnuoli, in the cloisters of Santa Maria Novella, are also attributed to him by Vasari. Modern authorities generally discredit these attributions. Many of his numerous works have perished.—His son, AGNOLO GADDI (1333-96), became, after his father's death, the pupil of Giovanni da Milano, and continued the artistic traditions of the family. His finest early work is the series of frescoes on the "Legend of the Virgin's Girdle" in the Cathedral of Prato, which illustrate the lighter, more picturesque and genre-like style which he affected, preparing the way for Masolino (q.v.) and other early Quattrocentists. His ability as a decorator and composer is even better illustrated by the series of the "History of the Finding of the Cross" in the choir of Santa Croce at Florence, with numerous realistic details, which are further important as having

inspired Piero della Francesca in his Arezzo frescoes. Consult: Vasari, *Delle vite de' più eccellenti pittori, scultori ed architetti*, edited by Milanese (Florence, 1878-85); Crowe and Cavalcaselle, *History of Painting in Italy*, vol. i. (London, 1864).

GADE, gä'de, NIELS WILHELM (1817-90). A distinguished Danish musician and composer, and the recognized founder of the Scandinavian school of music. He was born at Copenhagen, the only child of a cabinet and instrument maker, whose trade the son was required to adopt. Within a few months, however, the boy abandoned it, and made known his determination of becoming a musician. A course of study under the leader of the Court orchestra, Wexschall, and the practice and experience gained by his membership in the organization, enabled him at the age of sixteen to make his début as a concert violinist. He also studied theory under Berggreen, a well-known organist, and became a devoted student of the classics and a disciple of the new romantic school of music. In 1841 he won the prize offered by the Copenhagen Musical Association, submitting to the arbiters his first great composition, *Nachklänge von Ossian*. Aided by the King, he was enabled in 1843 to go to Leipzig to complete his studies, and in 1844 undertook, in the absence of Mendelssohn, the direction of the Gewandhaus concerts, becoming permanent conductor upon the latter's death in 1847. In 1850 he settled in Copenhagen, where he became organist, director of music, and master of the Chapel Royal. He was elected one of the foreign members of the Berlin Academy of Arts in 1874, and in 1876 the Danish Folkething voted life pensions of 3000 crowns to the two most eminent musical composers, selecting Gade as one. In addition to his prize compositions, he composed five symphonies, a quintet, an octet, and several vocal pieces, with orchestra, among them the well-known *Erl King's Daughter*; *The Springtide Phantasy*; *The Crusaders*; and many smaller compositions. He died at Copenhagen.

GADES, gä'déz. See CADIZ.

GADFLY, or **HORSE-FLY**. A fly of the family Tabanidæ, distinguished from other two-winged flies by having the last segment of the short antennæ ringed and not terminating in a bristle. The proboscis is fleshy, and envelops pointed horny processes by means of which the skin is punctured. The head is broad and short and the eyes are huge. About 1500 species are named. All are powerful fliers, and the females suck the blood of quadrupeds and man; although they, like the males, can also live on the sweets of plants. As an extreme adaptation the genus *Pangonia* of India and Nubia is remarkable, for the proboscis of the female is in some species three or four times as long as the body, and is stiff and needle-like, so that it can easily pierce thick clothing. The larvæ of the Tabanidæ are some of them aquatic; others live in the earth; others in decaying wood. Like the adults, they are predaceous, sucking the juices of insect-larvæ, of worms, and of snails. The pupa looks much like the chrysalis of a butterfly.

The common representatives of the Tabanidæ may be uniform black, with a bluish tinge, as in the case of the large mourning horse-fly (*Tabanus atratus*), or of medium size, with green

heads or golden eyes; the latter are also known as 'deer-flies.' To protect horses driven over infested roads—such as those passing through pine woods—netting should be used. An application of fish oil and carbolic acid to points not easily reached by the tail is recommended. Consult, in addition to works mentioned under **FLY**: Osten-Sacken, "Prodrome of a Monograph of the Tabanidæ of the United States," in *Memoirs of the Boston Society of Natural History*, vol. ii. (Boston, 1875-78); Williston, "Notes and Descriptions of the North American Tabanidæ," in *Transactions of the Kansas Academy of Science*, vol. x. (Lawrence, 1888).

GADIDÆ (Neo-Lat. nom. pl., from Neo-Lat. *gadus*, cod, from Gk. γάδος, *gados*, sort of fish). A family of soft-rayed fishes of north temperate and Arctic waters, including about 25 genera and 140 species. Except one genus (*Lota*), all are marine, and among them are many of our most important food-fishes, such as the common cod, pollack, haddock, etc. See **COD**; and **FISHERIES**.

GADOLIN, gä'dö-lén, JOHAN (1760-1852). A Swedish chemist. He was professor of chemistry at the University of Åbo, Finland. His writings include: *Einige Bemerkungen über die Natur des Phlogiston* (1788), and *Systema Fossilium, Analysisus Chemicis Examinatorum* (1825). The mineral *gadolinite* was named after him.

GADOLINITE (so called in honor of J. Gadolin). An orthosilicate containing glucinum, iron, yttrium, besides varying amounts of didymium, lanthanum, and other oxides. It crystallizes in the monoclinic system, and is dark green, brown, or black in color. This mineral occurs chiefly in coarse pegmatitic veins associated with allanite. It is found near Falun and Ytterby, Sweden, and also on the island of Hitterö, Norway. The principal locality in the United States is Bluffton, Llano County, Tex. Special interest attaches to gadolinite, owing to the rare metals which it contains. Velvety black, opaque gems have been cut from this mineral, but for collectors' use only.

GADOW, gä'dö, HANS FRIEDRICH (1855—). A German-English naturalist, born in Pomerania. He studied at Berlin, Jena, and Heidelberg. In the last place under Gegenbaur. From 1880 to 1882 he was in the Natural History Department of the British Museum, and since 1884 he has been Strickland curator and lecturer on zoölogy at Cambridge University, England. He has published: *A Classification of Vertebrates* (1898); "Aves," in Bronn's *Classen und Ordnungen des Thierreichs*; and *Amphibia and Reptiles* (1901), besides collaborating with Newton in his *Dictionary of Birds* (1893-96) and contributing extensively to the literature of investigation in zoölogy.

GADSBY, gädz'bi, HENRY ROBERT (1842—). A leading English composer, born at Hackney, London. At seven years of age he became a probationary chorister of Saint Paul's Cathedral, and served nine years in the choir. Although he studied for a little while under a local teacher, he was practically a self-taught musician. His first appointment was as organist of Saint Peter's Church, Brockley, and in 1884 he succeeded Sir John Hullah as professor of harmony at Queen's College, London. He was also on the faculty of the Guildhall School of Music. He is the author

of a standard text-book on harmony, and has published numerous cantatas, part songs, incidental music to plays, church services, anthems, songs, etc., as well as many important orchestral compositions.

GADSBYS, THE STORY OF THE. A story by Rudyard Kipling, published in London in 1890. It is written in dialogue form, and is a study of the effect of matrimony upon an English army officer in India, and the gradual enfeebling of his military ambition through responsibilities and affection for his family.

GADS'DEN. A town and the county-seat of Etowah County, Ala., about 60 miles northeast of Birmingham; on the Coosa River, and on the Chattanooga Southern, the Louisville and Nashville, the Southern, and other railroads (Map: Alabama, D 1). It is in a productive timber and mineral region, and has large trade interests; also lumber-mills, blast-furnaces, foundries, and machine-shops, car-works, and manufactures of handles, sash, doors, and blinds, flour, wagons, etc. Settled about 1845, Gadsden was incorporated in 1867. The government is administered under a charter of 1883, which provides for a mayor, chosen every two years, and a municipal council, elected on a general ticket. Population, in 1890, 2901; in 1900, 4282.

GADSDEN, CHRISTOPHER (1724-1805). An American patriot. He was born in Charleston, S. C., and was sent to England by his father, a wealthy merchant, to be educated. In 1741 he returned to Charleston. For some time he was employed in a counting-house in Philadelphia, where later he embarked in business on his own account. Returning to South Carolina, he was, in 1765, elected a delegate to the Intercolonial Convention held in New York City to protest against the Stamp Act. In 1774 he was a member of the first Continental Congress in Philadelphia. After the outbreak of the Revolution he was commissioned colonel, and took part in the campaigns in the South and in the defense of Charleston in 1776, being promoted brigadier-general in the fall of that year. In 1778 he was a member of the State Constitutional Convention of South Carolina. Elected Lieutenant-Governor of the State, he signed the capitulation of Charleston when that city fell into the hands of Sir Henry Clinton, in May, 1780. He himself was released on parole, but a few weeks later was arrested by order of Lord Cornwallis and conveyed to Fort Augustine, where he remained a prisoner for ten months, refusing to accept freedom on parole. He was finally exchanged, before the close of hostilities, in 1781. In 1782 he was elected Governor of South Carolina, but refused to accept the office, pleading that he was too old.

GADSDEN, JAMES (1788-1858). An American soldier and diplomatist, born in Charleston, S. C. He graduated at Yale in 1806, and entered the United States Army soon afterwards. He served with marked efficiency in the War of 1812, was appointed aide-de-camp to General Jackson in 1818, participated in the Seminole War, was appointed military inspector of the Southern Division in 1820, and subsequently conducted the removal of the Seminole Indians to the southern part of Florida. In 1853 he was sent to Mexico as United States Minister, and in December of that year concluded the treaty which provided

for the readjustment of the boundary between the two countries, and the acquisition by the United States of the tract of land subsequently known as the 'Gadsden Purchase' (q.v.).

GADSDEN PURCHASE, THE. A tract of land lying partly within the present New Mexico and partly within the present Arizona, purchased from Mexico by the United States in 1854. It embraces 45,535 square miles, is bounded on the north by the Gila River, on the east by the Rio Grande, and on the west by the Colorado, and has an extreme breadth from north to south of 120 miles. For this the United States gave the sum of \$10,000,000, while Mexico, besides making the cession, agreed (1) to the abrogation of the eleventh article of the Treaty of Guadalupe Hidalgo (q.v.), and (2) to the abandonment of all damage claims arising from Indian incursions between 1848 and 1853. The land was regarded as of little use for agricultural purposes, and was purchased largely with a view to settling boundary disputes in that quarter between the two governments and to securing a desirable route for the projected Southern Pacific Railroad. The treaty of sale was negotiated with Santa Anna by James Gadsden (q.v.), then Minister to Mexico, in December, 1853, and, after undergoing modifications in the United States Senate, was finally ratified and proclaimed on June 30, 1854, Congress passing the necessary legislation on August 5th. The sale met with much opposition in Mexico, and caused the banishment of Santa Anna in 1855. For the text of the treaty, consult Haswell, *Treaties and Conventions* (Washington, 1889). See the map in the article UNITED STATES, EXTENSION OF THE TERRITORY OF THE.

GADS'HILL. A hill, 256 feet high, in the county of Kent, England, 2½ miles northwest of Rochester, on the London Road, celebrated by Chaucer, famous as the scene of Falstaff's encounter with Prince Henry, and noted as the home of Charles Dickens.

GADSKI, gäd'ské (TAUSCHER), JOHANNA (1871—). A German prima donna, born at Anclam, Prussia. She was educated at Stettin, but made her operatic debut in New York, as Brünhilde, and subsequently appeared in many Wagnerian rôles. In England she sang at Worcester Festivals and at Covent Garden, meeting with the same success that characterized her extended American tour of 1898-99. In the latter year she also sang in Bayreuth.

GADWALL (of doubtful etymology; hardly from *gad*, to run about + *well*, as the variant

BILL OF GADWALL.

spelling *gadwell*, influenced by popular etymology, implies), or GRAY DUCK. A fresh-water duck (*Chauleasmus streperus*), not quite so large as

the mallard, nor often seen in the Eastern United States, but common in the interior and in Florida. It breeds from Kansas northward, and during the summer is circumpolar in its distribution. In the winter it migrates as far south as the Gulf of Mexico, Southern Asia, and the north of Africa. In color the gadwall is chiefly black and white, with some brown, buff, and chestnut. This duck breeds in marshes, and lays from seven to nine cream-white eggs. Except at the breeding season, it is usually seen in small flocks, and an individual is sometimes to be found in a flock of other ducks. It is a favorite game duck, and highly esteemed for the table.

GÆ'A (Lat., from Gk. *Γαῖα*, *Gaia*), or **GE**. The earth, honored among the Greeks as a goddess, though her personality is never very sharply defined. The theogonies of the mythologists, though differing in details, represent her as the first-born of Chaos, and by Uranus (q.v.) the mother of the Titans (q.v.), Cyclopes (q.v.), and the hundred-handed monsters. Angered at Uranus's treatment of his children, she helped Cronus mutilate his father. When Cronus in his turn was deposed by Zeus, Gæa, angry at the fate of her children, the Titans, produced the Giants, who warred against the gods, and, after their overthrow, the monster Typhoeus. When he was conquered by Zeus, Gæa became reconciled to the new dynasty. In accordance with the varying points of view from which the earth was regarded, we find Gæa revered not merely as the universal mother, but as a goddess of death and the shades, and as an oracular divinity, though *Ægæ*, in Achæa, seems to have been the only place where an oracle of Gæa existed in historic times. In art, Gæa appears chiefly in connection with the birth of Erichthonius (see **ERECITHEUS**) and the Gigantomachia; in both scenes she appears as rising out of the earth, only the upper part of the body being visible.

GAEDERTZ, géd'erts, **KARL THEODOR** (1855—). A German dialect poet and historian of literature. He was born at Lübeck, and was educated at Leipzig and Berlin. His extensive knowledge of cameralistics, law, philology, and of various other sciences, as well as his wide acquaintance with Germanic literature, secured for him an appointment, in 1891, as custodian of the Royal Library in Berlin, of which he became chief librarian in 1900. His publications include a number of valuable monographs on German poets and on the history of the German drama, among his best productions in this field being the following: *Goethes München* (2d ed. 1888); *Aus Fritz Reuters jungen und alten Tagen* (vol. i., 3d ed. 1899); *Emanuel Geibel. Ein deutsches Dichterleben* (1897); *Bismarck und Reuter* (1898); *Bei Goethe zu Gaste* (1900). His original productions in Plattdeutsch comprise a comedy, *Eine Komödie* (2d ed. 1881), and a collection of poems, *Julkapp! Leeder un Läschen* (3d ed. 1899).

GAEKWAR, gā'kwār (Marathi, herdsman), or **GUIKOWAR**, gē'kō-wār. The designation of the Mahratta ruler of Baroda (q.v.), one of the native States in India. The Gaekwar originally was an officer in the establishment of the rajahs of Satara, who were nominally the supreme rulers of the Mahrattas (q.v.). The Gaekwar finally became hereditary second in command of

the Mahratta armies. Pelaji, who became Gaekwar in 1721, by predatory excursions, gradually acquired authority over Gujarat, and his son, Damaji, who succeeded in 1732, still further extended the bounds of his ample dominions. The latter threw off his allegiance to the Peishwa; but, being taken prisoner by treachery, was compelled to yield one-half of his dominions and do homage for the other half. Annund Rao, who ascended the throne in 1800, was the first prince of the line who had intercourse with the British. The throne of the Gaekwar being contested by an illegitimate brother, Annund Rao secured the aid of the British Government at Bombay, and agreed by treaty, March 15, 1802, to receive a British subsidiary force. Suaji Rao, who became Gaekwar in 1819, was frequently on hostile terms with the British Government, and in 1838 part of his State was sequestered. In 1840 he made his submission, and, among other concessions, abolished suttee. His successor, Mulhar Rao, inherited the family vices, and in 1873 a commission inquired into his conduct. He was subsequently accused of attempting to poison the British Resident, and tried before a commission, which disagreed about his guilt; but he was deposed on account of his general misrule, and Gopal Rao, a prince of the Khandesh line, was appointed his successor.

GAELIC (gā'lik) **LANGUAGE AND LITERATURE**. See **CELTIC LANGUAGES**; **IRISH GAELIC LITERATURE**; **SCOTTISH GAELIC LITERATURE**.

GAELIC LEAGUE. An organization devoted to the preservation, cultivation, and extension of the Gaelic language, particularly in Ireland. From the time of the Statute of Kilkeny in 1367, when laws were enacted forbidding the use of the Irish language, dress, or surnames within the limits of the Pale, on penalty of death or confiscation, every effort had been made by the English Government to crush out or discourage the native language; and on the establishment of the so-called National Schools in 1833, the instruction in which was in the English language, the Gaelic language, even then spoken by a majority of the Irish peasantry, received its most decisive blow. Through the efforts of the 'Society for the Preservation of the Irish Language,' about twenty-five years ago, some partial concessions were obtained for the language in the schools, but with little practical result, owing to the indifference of the local authorities. Matters were apparently at their lowest mark in all things national when, in 1893, the Gaelic League was organized, chiefly through the effort of Douglas Hyde (q.v.) and Father O'Growney (q.v.), the two most accomplished Gaelic scholars in Ireland. An active educational campaign was at once begun throughout the country, resulting in the establishment of branches of the League in every important centre. In 1898 the movement spread to America. Gaelic is now taught in a large number of National schools, and in nearly all the Catholic Church parish schools in Ireland, the last report showing about 3500 students of Gaelic in Dublin alone. Trinity College, Dublin, and the Roman Catholic Seminary of Maynooth, maintain Gaelic chairs, and a revival in Gaelic literature has since developed, including a revival of Gaelic music and the drama. In the United States and Canada there were in 1902

about forty branches of the League, each of which conducted classes for the study of the language, besides rendering efficient help to the Irish organization. Gaelic or Celtic chairs are also established at Harvard University, the Catholic University of America, Washington, and at Notre Dame University, Indiana. Substantial aid has been rendered by the Hibernian Order, which endowed the Washington chair, and has regularly contributed to the work in Ireland. A similar movement has been inaugurated for Scotland and the Isle of Man by a Pan-Celtic organization which includes Wales, Brittany, and Cornwall in its scope of operations.

GAETA, gá-á'tá. A city and seaport, and one of the strongest fortresses in Italy, on the Gulf of Gaeta, 74 miles by a winding railway northwest of Naples (Map: Italy, H 6). The promontory of Gaeta, on which it is situated, looks from the distance like a tumulus, and according to tradition was the tomb of Caieta, the nurse of Æneas; hence the ancient name of the city, *Portus Caieta*. The promontory is crowned by the Torre d'Orlando, the tomb of Munatius Plancus, the friend of Augustus. It is 160 feet in height and 160 feet in diameter, and resembles the much smaller tomb of Cæcilia Metella at Rome. On the rocks below is the town in a beautiful setting of country houses and orange groves, while the Torre Angiovinina in the citadel affords a splendid prospect of coast and sea. Objects of antiquarian interest are the campanile of the Cathedral of Saint Erasmus, and the remains of a Roman amphitheatre and a Roman theatre. Gaeta is a centre of the coasting trade, and markets fish, oil, wine, and fruit. It was originally a Greek colony, and in ancient times was crowded with magnificent public buildings. Like Amalfi and Naples, it resisted the barbarian invaders, and becoming part of the Byzantine Empire—and later independent—was also a stronghold of civilization against the Lombards and Saracens. In 1134, however, it fell before Roger II., and was annexed to the Norman Kingdom of Sicily. During the centuries that followed it was the sport of various masters, and in 1808 was gloriously defended for six months against Masséna by Prince Ludwig von Hessen-Philippsthal, who is buried in the citadel. It was the refuge of Pius IX. (q.v.) from 1848, when he fled from Rome, until 1850. From November, 1860, until February 13, 1861, Francis II. of Naples, the last of the Bourbon kings, was besieged here by the forces of Victor Emmanuel, and compelled to surrender. Population, in 1881, 6429; in 1901, 5528.

GÆTULIA (Lat., from Gk. Γαιουλλία, *Gaitoulia*). In ancient times, the name given to a region in Northern Africa lying south of Mauritania and Numidia, and embracing the western part of the Desert of Sahara. Its inhabitants belonged to the great aboriginal Berber family of North and Northwestern Africa. They were not in general black, though a portion of them dwelling in the extreme south toward the Niger had approximated to this color through intermixture with the natives and climatic causes. The Gætulians were savage and warlike. They came into collision with the Romans for the first time during the Jugurthine War, when they served as light horse in the army of the Numidian King. Cornelius Cossus Lentulus led a force

against them, and for his success received a triumph and the surname of Gætulicus (A.D. 6). They have been identified with the Tuaregs, the Gutzula of Southern Morocco, the Godola of the Coast, the Ghedala of Northwestern Sudan, and the Gæstulas in Algeria.

GAFF (from OF. *gaffe*, hook, from Ir. *gaf*, hook). A spar, to which the head, or upper edge, of a fore and aft sail is bent. The end next the mast is called the *jaws*; to form them two pieces of wood are bolted to the end of the gaff and the forward side of them cut out in the form of a semicircle so as to fit against the mast, to which it is held by a rope extending around it from jaw to jaw. The after end of the gaff is called the *peak*, because it usually stands much higher than the jaws when the sail is set. On board sloops and schooners gaffs are hoisted and lowered by ropes called *halyards*—those near the peak being the *peak-halyards*, and those at the *throat*, near the jaws, being the *throat-halyards*. In square-rigged ships, the *spanker* and *trysails* are the only ones having gaffs. These gaffs do not ordinarily hoist or lower, and, instead of jaws, have eyebolts holding the forward end to the mast or to a traveler working on a batten on the mast; the latter method is best, as it permits the gaff to be lowered when the sail is reefed. In furling, these sails are drawn in to the mast and up to the gaff by ropes called *brails*.

GAFFAREL, gá'fá'rél', PAUL LOUIS JACQUES (1843—). A French historian, born at Moulins, and educated at the Superior Normal School. He held the chair of history at Besançon, and afterwards became professor of history and geography and dean in the faculty of letters at Dijon. His contributions to colonial history are particularly valuable. His more important works include: *Etude sur les rapports de l'Amérique et de l'ancien continent avant Christophe Colomb* (1869); *Les colonies françaises* (1880); *L'Algérie: histoire, conquête et colonisation* (1882); *Les explorations françaises de 1870 à 1881* (1882); *Les campagnes de la première République* (1883); *La conquête de l'Algérie jusqu'à la prise de Constantine* (1887); *Les Français au delà des mers: Les découvreurs français du XIVème au XVIème siècle; Côtes de Guinée, du Brésil et de l'Amérique du Nord* (1888); *Campagnes du Consulat et de l'Empire* (1888); *Campagnes du premier Empire* (1890); and *Le Sénégal et le Soudan français* (1890).

GAFFKY, gáf'kè, GEORG THEODOR AUGUST (1850—). A German physician, born at Hanover and educated at Berlin. In 1888 he was appointed professor of hygiene at the University of Geissen. As a member of the Imperial Bureau of Sanitation in 1883-84 he accompanied the expedition sent out, under the auspices of Robert Koch, the celebrated bacteriologist, to investigate the conditions attending the epidemics of cholera in Egypt and India. In this capacity he was enabled to accumulate the valuable material embodied in the report subsequently published in collaboration with Dr. Koch, and entitled *Bericht über die Thätigkeit der zur Erforschung der Cholera 1883 nach Aegypten und Indien entsandten Kommission* (1887). His other publications include: *Experimentell erzeugte Septicæmie* (1881); *Zur Aetiologie des Abdominaltyphus* (1884). These and other important treatises by Gaffky have appeared principally in the

Mitteilungen issued by the Imperial Bureau of Public Sanitation.

GAFF-TOPSAIL CAT. A sea catfish (*Felichthys marinus*), common along the eastern coast of the United States and frequently ascending streams. It reaches a length of 30 inches, is not valued as food, and takes its name from the shape of its large dorsal fin, frequently exposed above the surface. See *PLATE OF CATFISH*.

GAG (corrupted from the Spanish name *aguaji*). A large grouper (*Mycteroperca microlepis*), of a variable bluish color, of the South Atlantic and Gulf coast of the United States, called by Spanish fishermen 'aguaji.' It frequents reefs and banks, reaches a weight of 50 pounds, and is an important food-fish. See *GROUPEE*.

GAGALI. See *PODOCARPUS*.

GAGARIN, gá-gá-rén. A princely family of Russia. Some of its most prominent members were Matvei Petrovitch, Governor of Siberia, who suffered death in 1721 by order of Peter the Great on suspicion of aspiring to an independent sovereignty. Alexander Ivanovitch (died 1857) was a distinguished soldier of the Crimean War, and was assassinated by the Prince of Suanethi, whose province he was about to annex to Russia. Pavel Pavlovitch (1789-1872) was a member of the council of emancipation of the serfs, and in 1864 and 1865 president of the Council of Ministers. Ivan Sergejevitch (1814-82) was secretary to the Russian Embassy at Paris, turned Catholic in 1843, and became a Jesuit missionary. He was the author of many ecclesiastical books and pamphlets, among them *Les starovères*, *l'église russe et le pape* (1857); *Les hymnes de l'église russe* (1868).

GAGE (Fr. *gager*, from Lat. *vadium*, a pawn or pledge). An old term of English law, signifying a pledge or pawn of property as security for the performance of a legal obligation. It has lost its independent position in our legal system, and is now found only in the combination mortgage (*mort gage*, dead pledge).

Estates in gage were of two kinds—*vivum vadium*, and *mortuum vadium*, the live pledge and the dead pledge. *Vivum vadium* was where an estate in lands was given in security for a debt, on condition that the estate should remain with the lender until he had made good the sum lent out of the profits of the land. *Mortuum vadium* was a pledge of land or goods to be held by the pledgee until the debt be paid or the obligation performed by the pledgor. See *MORTGAGE*; *PLEDGE*.

GAGE, FRANCES DANA BARKER (1808-84). An American reformer and writer, the daughter of Col. Joseph Barker. She was born in Marietta, Ohio, and early distinguished herself by lecturing on total abstinence, woman's rights, and anti-slavery. She removed to Saint Louis in 1853, and suffered the usual persecutions to which all prominent abolitionists were subjected. Returning to Ohio, she devoted herself largely to editorial work. During the Civil War she gave her services in caring for the sick and wounded. Under the pen-name of 'Aunt Fanny,' she became widely known as a writer of stories for the young.

GAGE, LYMAN JUDSON (1836—). An American financier. He was born in De Ruyter, Madison County, N. Y., and was educated at an

academy at Rome, N. Y., where in 1859 he became a clerk in a bank. In the following year he removed to Chicago, where, after working for three years in various capacities, he obtained a clerkship in the Merchants' Loan and Trust Company, of which in 1860 he became cashier. In 1868 he left this position to become assistant cashier of the First National Bank, one of the leading banks in the West. In 1882 he was promoted to the position of vice-president and general manager, and in 1891 became its president. In 1892 he first became a figure of national prominence from his election as president of the board of directors of the World's Columbian Exposition, the success of which was probably due more to him than to any other one man. He had never taken an active part in politics or held political office, although he had been a delegate to the Republican National Convention of 1880, and the chairman of its committee on finance, but he actively supported Cleveland in the campaign of 1884. In 1892 the Treasury portfolio was offered him by President Cleveland, but declined. In 1897 he was appointed by President McKinley Secretary of the Treasury, which office he continued to hold in McKinley's second administration, and in that of President Roosevelt up to January, 1902, when he resigned and was succeeded by Leslie M. Shaw. Consult *Handy*, "Lyman J. Gage: A Character Sketch," in the *American Review of Reviews* (New York, 1897).

GAGE, SIMON HENRY (1851—). An American scientist, born in Maryland, Otsego County, N. Y. He graduated in 1877 at Cornell University, and was appointed associate professor of physiology there in 1889. In addition to many contributions to scientific periodicals, his publications include: *The Microscope and Histology* (1881, 4th ed. 1892); *Anatomical Technology* (with Professor Wilder, 1882); the vocabulary and definitions in animal histology for Foster's *Encyclopædic Medical Dictionary*, and several articles for Wood's *Reference Handbook on the Medical Sciences*.

GAGE, THOMAS (1721-87). An English soldier and Colonial Governor of Massachusetts, born at Firle, Sussex. He received a lieutenant's commission in the English Army in January, 1741, participated in the battle of Culloden, served as aide-de-camp to Lord Albemarle in Flanders, and in 1751 became lieutenant-colonel of the Forty-fourth Foot, with which in 1754 he came to America under General Braddock. In the latter part of the march against Fort Duquesne, he commanded the advance guard of Braddock's army. Subsequently he was stationed for a time at Oswego, raised a regiment of Provincial troops in 1758, and commanded it on Abercromby's disastrous expedition against Ticonderoga; and in 1759, after the death of Colonel Prideaux, was sent as brigadier-general to replace Sir William Johnson at Niagara. He then served in the last campaign under General Amherst, was made Governor of Montreal in 1760, was promoted to be major-general in 1761, and was commander-in-chief of the English forces in America from 1763 to 1772, when he returned to England. In 1765, while stationed at New York, he was called upon by Governor Colden to enforce the Stamp Act (q.v.), but refused on the ground that a fire from the fort would be 'the commencement of a civil war.' Three years later he was ordered to Boston

to assist the civil magistrates and revenue officers there in carrying out the measures of the British Ministry. Early in 1774 he succeeded Hutchinson as Governor of Massachusetts, and again became commander-in-chief of the British Army in America. He was warmly welcomed on his arrival in Boston in May, but soon antagonized the popular party by his enforcement of the Ministerial measures, especially of the Boston Port Bill (q.v.) and the regulation acts. On June 30, 1774, he issued a proclamation against the 'solemn league and covenant' not to purchase articles imported from Great Britain. On September 1st he seized the powder stored at Cambridge, and soon afterwards began to fortify Boston. On the night of April 18, 1775, he sent an expedition to Concord to destroy the Provincial stores there and to capture Samuel Adams and John Hancock. This led to the battle of Lexington on the following day. (See LEXINGTON.) He ordered the assault upon Bunker (Breed's) Hill on June 17th, and as soon as the news of the action reached England was recalled, sailing from Boston on October 10, 1775. In April, 1782, he was promoted to the rank of general.

GAGERN, gá'gèrn, HEINRICH WILHELM AUGUST, Baron von (1799-1880). A German statesman. He was the second son of the well-known politician Hans Christopher Gagern (1766-1852), and was born at Bayreuth, August 20, 1799. He was educated at the military school of Munich, and on Napoleon's return from Elba entered the army of Nassau, serving as lieutenant at Waterloo. He afterwards devoted himself to the study of law at the universities of Heidelberg, Göttingen, Jena, and Geneva. While at Heidelberg he aided in founding the liberal society of the Burschenschaft (q.v.). On returning home in 1821, he entered political life, and after passing through several public offices, in the Grand Duchy of Hesse, he was elected a member of the Lower Chamber in 1832, in which position he vigorously opposed the reactionary policy of the State governments and of the Federal Diet. In 1836 he retired to his father's estates, but reappeared ten years later and helped bring on the revolutionary movement of 1848 in Germany. In common with some of the greatest men of the time Gagern cherished the hope of a new Germany, organized upon a constitutional basis and under the leadership of a powerful prince who should win for the nation a place among the Powers of Europe. In the National Assembly which met at Frankfurt on May 18, 1848, Gagern, as the recognized leader of those who favored unity and constitutionalism, was elected president, and for a long time succeeded, by the force of his enthusiasm and his magnificent personality, in guiding the action of the Assembly. In the strife over the question of admitting Austria as a Germanic power into the new Empire, Gagern sided with those who opposed Austrian pretensions, and on December 18, 1848, as head of the Imperial Ministry, submitted his 'programme' to the Parliament providing for a Federal State without Austria. Though the plan was accepted by the Parliament, it failed on account of the lukewarmness of the Prussian King, to whom all looked as the head of the new State, and the general reaction which followed in Germany during the early days of 1849. On May 20th Gagern withdrew from the Parliament, convinced that the cause of German

unity, for the time, was a hopeless one. He still took an active interest in politics, however, and in 1850-52 served as a major in the army of the duchies of Schleswig-Holstein. On the conclusion of the struggle he retired to his estate at Monheim, and only reappeared as the representative of the Grand Duchy of Hesse-Darmstadt at Vienna from 1864 to 1872. He was granted a pension in 1872 and took up his residence at Darmstadt, where he died May 22, 1880. Besides several pamphlets and speeches, he was the author of a life of his brother, *Das Leben des Generals Friedrich von Gagern* (1856-57). His younger brother Maximilian was prominent in the service of the Duchy of Nassau and of Austria. Consult: Heimenz, *Heinrich von Gagern in seinen politischen Grundanschauungen* (Tübingen, 1899); Biedermann, *Deutsche Geschichte, 1815-79* (Breslau, 1883-89); von Sybel, *The Founding of the German Empire*, translated (New York, 1890-98).

GAGNON, gá'nyón', LUCIAN (?-1842). A Canadian political agitator, born at Pointe-à-la-Mule, Canada. He was a member of the Assembly of the Counties at Saint Charles, October 23, 1837, and subsequently carried on a campaign of agitation against British rule. He was instrumental in mustering a force of rebels, who were defeated at Moore's Corner and compelled to take refuge in the United States. Another attempt at insurrection also proved unsuccessful, and Gagnon was arrested by United States troops on the charge of having violated the neutrality laws. After the engagement at Odelltown, November 10, 1838, he gave up the struggle and settled in the United States.

GAG RULES. In American history, the name applied to certain rules passed by the National Congress in disregard of the First Amendment to the Federal Constitution, for the abridgment of the right of petition with reference to the abolition or restriction of slavery. After the beginning of the earnest agitation of the Northern abolitionists against the institution of slavery about 1831, petitions of various kinds poured into the House and the Senate, praying for the abolition or the restriction of that institution. These were generally presented by John Quincy Adams, who as a member of Congress identified himself particularly with the struggle against any Congressional abridgment of the right of petition. In May, 1835, the House passed the so-called 'Pinckney Resolutions,' substantially renewed in January, 1837, which provided that all petitions relating to slavery should virtually be disregarded, should not be printed or referred, and should be laid on the table without action. The resolutions also asserted that Congress should not interfere with slavery in the District of Columbia, and that that body had no power, according to the Constitution, to take action with regard to slavery in the individual States. Adams's attempts to introduce petitions in disregard of these resolutions provoked animated debates, in which, on some occasions, considerable feeling was aroused between Northern and Southern members. In December, 1837, the House passed the so-called 'Patton Resolutions,' introduced by J. M. Patton, of Virginia, which declared against the reading, referring, debating, or printing of any petition praying for the interference of the National Government with the

institution of slavery in any part of the United States, including the Territories and the District of Columbia. In December of the following year the House passed the so-called 'Atherton Gag,' covering much the same ground as the 'Patton Resolutions,' and in January, 1840, passed the famous Twenty-first Rule to the same general effect. Adams continued to offer petitions, however, and at the opening of each new Congress endeavored to have the objectionable rule omitted. The majority against him progressively decreased, and in December, 1844, the rule was rescinded. Consult: Adams's *Memoirs* (12 vols., Philadelphia, 1874-77); Benton's *Abridgment of the Debates of Congress, 1789-1856* (16 vols., New York, 1857-61); id., *Thirty Years' View* (2 vols., New York, 1854-56); and Wilson, *Rise and Fall of the Slave Power in America*, vol. i. (3 vols., Boston, 1872-77).

GAGUIN, gā'gān', ROBERT (c.1425-1502). A French chronicler and diplomat, born at Calonne-sur-la-Lys. He studied at the University of Paris under Fichet, and was made professor of canon law there (1463) and dean of the faculty. He was intrusted with various diplomatic missions by Louis XI. and Charles VIII., and traveled in Germany, Italy, England, and Spain. He is said to have had the care of the libraries of both these kings. His Chronicle went through many editions under the title *Compendium super Origine et Gestis Francorum a Pharamundo usque ad Annum 1491* (1497). He also left some letters and discoveries, *Epistolæ et Orationes* (1498).

GA'HERIS. The Orestes of Arthurian legend. He was the son of Arthur's sister, Morgause. He found his mother in adultery with Sir Lamahake and cut off her head.

GAIDOZ, gā'dōz', HENRI (1842-). A French scholar, born in Paris. He has published many learned articles in scientific periodicals on archaeology and mythology, and is the author of a number of books on the same subjects, notably *Equisse de la religion des Gaulois* (1879); *La religion gauloise et le gui de chêne* (1881); *Les religions de la Grande Bretagne* (1885); *Le blason populaire de la France* (with Sébillot, 1884); *Bibliographie des traditions et de la littérature des Francs d'outre mer* (with Sébillot, 1886); *Etude de la mythologie gauloise* (1886); and *Les Roumains en Hongrie* (1894). He founded the *Revue Celtique* in 1870, and in 1877 was associated with Eugène Rolland in the establishment of *La Mélusine* for the study of folklore.

GAITY THEATRE, THE. A London theatre situated on the Strand, and opened in 1868. It is the original home in England of opera bouffe.

GAIL, gāl, JEAN FRANÇOIS (1795-1845). A French Hellenist, son of Jean Baptiste Gail (1755-1829). He was born in Paris, and in 1829 became a professor at the Military Academy of Saint Cyr. His chief works were: *Recherches sur la nature du culte de Bacchus en Grèce* (1821); and the *Geographi Græci Minores* (1826-31), containing, besides other extracts, the *Periplus* of Hanno, that of Scylax, and fragments of Scymnos.

GAIL, gāl, WILHELM (1804-90). A German architectural and landscape painter, born in Munich, where he studied at the Academy and under

Peter Hess, his brother-in-law. After traveling in Italy (1825-27), France (1830), and Spain (1832), he settled in his native city. His paintings in public galleries include: "Hall in Doge's Palace," "San Lazzaro in Venice" (1832), and "Sanctuary of Mosque at Cordova" (1836), in the New Pinakothek, Munich; "Interior of Cloister" and "Spanish Cloister with Procession of Monks," in the Kunsthalle at Karlsruhe; and "Convent of San Martino in Piedmont" (1857), in the National Gallery, Berlin.

GAIL HAMILTON. See DODGE, MARY A.

GAILLARD, gā'yār', CLAUDE FERDINAND (1834-87). A French engraver, born in Paris. He was a pupil of Léon Cogniet, and took the Prix de Rome for engraving in 1856. Among his most remarkable plates are those after Van Eyck, Botticelli, Donatello, Michelangelo, Raphael, and Rembrandt. He also engraved from his own designs portraits of the Count de Chambord, Pius IX., Leo XIII., Monseigneur Pie, and Sœur Rosalie. There are two portraits by him in the Luxembourg, "Monseigneur de Ségur" and an old woman. These especially show his particular faculty, an almost clairvoyant grasp of personality.

GAILLARD, EDWIN SAMUEL (1827-85). An American physician. He was born in Charleston District, S. C., graduated at the University of South Carolina in 1845, and at the State Medical College in 1854. During the Civil War he served in the Confederate Army, holding various positions in the medical department, and subsequently was editor, successively, of the *Richmond and Louisville Medical Journal* and of the *American Medical Weekly*.

GAILLARD, gā'yār', GABRIEL HENRI (1726-1806). A French historian and academician. He was born at Ostel, near Soissons; took up the study of law, but abandoned his legal pursuits for history, and published a large number of works, characterized more by elegance of style than by strict adherence to facts. Among these are: *Histoire de Marie de Bourgogne* (1757); *Histoire de François I.* (1766-69); *Histoire de la rivalité de la France et de l'Angleterre* (1771-77); *Histoire de Charlemagne* (1782). Gaillard also wrote *Eloges* on Descartes, Corneille, Molière, Charles V., Henry IV., and his intimate friend, Mallesherbes.

GAILLARDET, gā'yār'dā', THÉODORE FRÉDÉRIC (1808-82). A French dramatist and author, born at Auxerre. He achieved much notoriety through his duel with Alexandre Dumas, père, and his subsequent lawsuit over the rights to the play *La tour de Nesle*, which Dumas had placed upon the stage as his own (1832). He wrote two other dramas, *Struensee, ou le médecin de la reine* (1832), and *Georges, ou le criminel par amour* (1833), and also *Mémoires du chevalier d'Eon* (1836). While in America he founded in New York City (1827) the *Courrier des Etats-Unis*, which he directed until 1848.

GAINAS (died 401). A Visigoth, commander-in-chief of the Roman Army. He was an Arian, and caused the downfall and execution of the eunuch Eutropius. He used his position for treasonable purposes, which he cloaked successfully for some years. At length he became openly hostile, and attempted to seize Constantinople. His attempt was foiled and his army of Goths destroyed. He fled, but was captured by the

King of the Huns, who sent his head to Constantinople. Consult Bury, *History of the Later Roman Empire*, vol. i. (London, 1889).

GAINES, EDMUND PENDLETON (1777-1849). An American soldier. He was born in Culpeper County, Va., but was early taken by his father to North Carolina. He studied law for a time, but in 1799 entered the United States Army as an ensign, and from 1801 to 1803 was employed in the making of a topographical survey from Nashville to Natchez for the location of a military road. In 1802 he became a first lieutenant, and two years later was appointed military collector of customs for the district of Mobile, in which capacity he arrested Aaron Burr (q.v.) on February 19, 1807. In the War of 1812 he served as captain in the battle of the Thames, participated in the engagement at Chrystler's Field, was commander at Fort Erie (q.v.) in August, 1814, until wounded by the bursting of a shell, and gradually rose to the regular rank of brigadier-general and the brevet rank of major-general. He was one of the commissioners appointed in 1816 to treat with the Creek Indians; was in command of the Southern Military District at the outbreak of the first Seminole War in 1817; was retained as brigadier-general and placed in command of the Western District when the army was reduced in 1821; took an active part in the second Seminole War of 1837, being severely wounded at Outhlacoohie; and at the outbreak of the Mexican War was in command of the Department of the Southwest, with headquarters at New Orleans, in which capacity he was actively engaged in raising volunteers for the army.

GAINES, JOHN P. (1795-1858). An American soldier and legislator, the third Territorial Governor of Oregon. He was born at Augusta, Va. (now West Virginia), but when very young removed to Boone County, Ky. He served as a volunteer in the War of 1812, subsequently was a member for several years of the Kentucky Legislature, and in the Mexican War served first as a major of Kentucky volunteers and afterwards as an aide to General Scott. He was then, from 1847 to 1849, a Whig member of Congress, and from 1850 to 1853, on President Fillmore's appointment, was Governor of the Territory of Oregon, in which capacity he came into serious conflict with the Territorial Legislature, notably over the location of the capital.

GAINES'S MILL, BATTLE OF. A battle fought on June 27, 1862, during the Civil War, between a Federal force of about 30,000 under General Fitz John Porter and a Confederate force of about 65,000 under General Lee, on the left or north bank of the Chickahominy River, eight miles northeast of Richmond, Va. It was the second of the famous Seven Days' Battles (q.v.) which marked the close of McClellan's Peninsular campaign. On the 27th of June, General Lee, having crossed the Chickahominy with the greater part of the army of Northern Virginia, attacked Porter's position at 2 p.m., the Confederate right, centre, and left being commanded by Longstreet, A. P. Hill, and Jackson respectively. Porter, though inadequately reinforced by McClellan, offered a magnificent resistance, and stubbornly held his position in face of repeated assaults until 7 p.m., when his left centre at

last gave way, and compelled a reformation at some distance to the rear of the whole line, under cover of two fresh brigades from the left wing, commanded by French and Meagher. The main battle had been preceded by a sharp contest between the Confederate A. P. Hill, advancing from Mechanicsville, and the Ninth Massachusetts Volunteers at Gaines's Mill, slightly in advance of the main Federal position, and from this the whole battle takes its name. During the night of the 27th Porter joined the left wing south of the Chickahominy, and McClellan, compelled to abandon his old base at White House on the Pamunkey River, hastily made arrangements to transfer his army to the James. During the progress of the battle McClellan, with the left wing, numbering fully 55,000 men, had been held in check by 25,000 Confederates under Magruder, and had been deceived into believing that a Confederate army, numbering over 100,000, lay between him and Richmond. Had he known the real state of affairs it seems probable that he could easily have overwhelmed Magruder and captured the city while Lee was occupied north of the river. On the other hand, Porter's stubborn resistance gave Lee an erroneous impression of the Federal strength at this point. The total Federal loss in the battle of Gaines's Mill was 6387 men, besides 22 guns; while the Confederate loss, though never accurately determined, was probably as much as 1000 more. Two years later the battle of Cold Harbor (q.v.) was fought in this vicinity. Consult: *Official Records*, vol. xi. (Washington, 1885); Johnson and Buel (editors), *The Battles and Leaders of the Civil War*, vol. ii. (New York, 1887); Ropes, *The Story of the Civil War*, vol. ii. (New York, 1894-98); Webb, *The Peninsula* (New York, 1881); and Nicolay and Hay, *Abraham Lincoln: A History*, vol. v. (New York, 1890).

GAINESVILLE. A city and the county-seat of Alachua County, Fla., 57 miles northeast of Cedar Keys; on the Plant System and the Florida Central and Peninsular Railroad (Map: Florida, F 2). It is a popular winter resort, and has the East Florida Seminary. In the vicinity are several points of natural interest, notably Alachua Sink, which alternately is prairie and lake. The principal industries are farming and orange-growing. Population, in 1890, 2790; in 1900, 3633.

GAINESVILLE. A city and the county-seat of Hall County, Ga., 52 miles northeast of Atlanta; on the Southern Railway (Map: Georgia, C 1). It is an attractive health resort, having several mineral springs, and is the seat of Brenau College and Conservatory of Music for young ladies, founded in 1878. There is a public park. The manufactures include cotton goods, cotton yarns, cottonseed oil, shoes, buggies, wagons, brick, lime, leather, tombstones, doors, sash, blinds, meal, and flour. Settled in 1821, Gainesville was incorporated in 1870. It is governed, under a revised charter of 1885, by a mayor elected every two years, and a council. The city owns and operates the water-works and electric-light plant. Population, in 1890, 3202; in 1900, 4382.

GAINESVILLE. A city and the county-seat of Cooke County, Tex., 65 miles north of Fort Worth; on the Missouri, Kansas and Texas, and

the Gulf, Colorado and Santa Fé railroads (Map: Texas, F 3). It is the centre of an agricultural and stock-raising district, and has packing houses and manufactures of cottonseed oil, flour and foodstuffs, pressed brick, etc. Gainesville was settled in 1851, incorporated in 1873, and is governed under a charter of 1879, which provides for a mayor, chosen biennially, and a municipal council, elected on a general ticket. Population, in 1890, 6594; in 1900, 7874.

GAINSBOROUGH. An ancient market-town and port on the Trent, in Lincolnshire, England, 16 miles northwest of Lincoln (Map: England, F 3). It is at the junction of the Great Northern, Great Eastern, and Midland, South and London railways. It was constituted a port in 1841, the canals connecting with the Trent making Gainsborough the eastern outlet for the Midland counties. It has important manufactures of linseed oil, ropes, malt, and tobacco, engineering and ship-building works. The town consists mainly of one long street running parallel with the river, which is spanned here by a fine stone bridge. The Old Hall, or Manor House, restored in 1884, a baronial residence with a tower 75 feet high, is said to have been built by John of Gaunt, and is now used as a corn exchange and assembly rooms. The John Robinson (1575-1625) Memorial Church, inaugurated in 1897, is dedicated to the pastor of the Pilgrim Fathers at Leyden, a reputed native of Gainsborough. The town owns its water-supply and maintains markets. Population, in 1891, 14,000; in 1901, 17,100. Consult Stark, *History of Gainsborough* (London, 1843).

GAINSBOROUGH, THOMAS (1727-88). An English portrait and landscape painter, born at Sudbury, in Suffolk. He was the youngest of nine children, and self-supporting at eighteen years of age. His parents sent him to London, at the age of fifteen, to study painting; he stayed with a goldsmith who introduced him to Gravelot, an engraver, from whom he gained his chief instruction. Later he was associated for three years with Frank Hayman, an historical painter of some reputation. After an unsuccessful attempt to have a studio in London, he returned to Sudbury in 1745, and continued his landscape studies. Soon after his return he married, and six months afterwards went to Ipswich, where for fifteen years he lived quietly and worked earnestly. In 1759 he sent eighteen of his pictures to the exhibition of the Society of Arts; in 1760 he removed to Bath, remaining until 1774, when he returned to London. In 1768 he was elected one of the original members of the Royal Academy. His stay at Bath was marked by success, and he painted many portraits of fashionable beauties and the brightest spirits of the day. George III., on hearing of Gainsborough's return to London, invited him to court, and gave him orders for portraits of himself and Queen. This seemed a signal for the fashionable world, which resulted in prosperity which lasted until Gainsborough's death. He died in London, August 2, 1788, and was buried at his request in Kew Churchyard, without name or inscription on the stone that marked his grave. Gainsborough painted that which charmed him in nature; he was the first impressionist in landscape art, somewhat like Corot, interpreting her poetic

qualities. The "Watering Place," painted between 1768 and 1775, is considered one of his best landscapes.

Gainsborough's portraits are distinguished for their noble and refined grace; they express almost invariably the moment of unconscious rest. They interpret the winning personality of the individual rather than such intellectual qualities as those suggested by Reynolds. Often faulty in drawing, the artist charms us by his color, which is cool, fresh, and transparent; the tones seem to follow each other like the chords of an instrument, without the slightest intimation of separation, always fading away into a background of dreamy atmosphere. His canvas was thinly painted with a smooth and swift technique.

The "Boy Blue," considered his greatest work, was the portrait of a son of Jonathan Buttall, a wealthy ironmonger of London. There are three existing versions of the same subject: one in the collection of the Duke of Devonshire, supposed to be the original; one owned by Mr. George Hearn, of New York; and a third, owned by Count de Castellane. The portrait of Mrs. Siddons, the actress, was painted in 1784, when she was at the height of her fame and but twenty-nine. It is a conception of her beauty distinctly opposed to Reynolds's portrait of the same time, known as the "Tragic Muse." Of Gainsborough's 300 paintings, 220 are portraits; there are also a few etchings and a collection of his drawings in the British Museum. The most important paintings comprise, besides those already mentioned: "Rustic Children"; "Portrait of Örpin, Parish Clerk of Bradford, Wilts"; landscape, "Gainsborough Forest," all in the National Gallery, London. In Buckingham Palace, "Duke and Duchess of Cumberland." In Stratford-on-Avon Museum, "David Garrick." In Windsor Castle, "George III., full length, and a portrait of the "Royal Family." At Dulwich, "Mrs. Moody and Her Children," "Mrs. Sheridan," and "Miss Tichell." In the National Portrait Gallery are several portraits. A number of important works by Gainsborough are in the United States. The Chicago Art Institute has one, a "Landscape with Figures." In the New York Metropolitan Museum are two "Landscapes," "Mr. Burroughs," and a "Child with Cat." In the collection of J. Pierpont Morgan is the "Duchess of Devonshire."

The portrait of the Duchess of Devonshire, known as the "Lost Duchess," was exhibited in 1793, and although a good example of the artist's work, it is more famous for its history than for its value as a work of art. It was bought by the art dealers Thomas Agnew and Sons, of London, for £10,065—the highest sum ever paid at a London art sale for a portrait. The canvas was cut from the frame in their galleries by a thief, and all efforts to recover it proved unavailing, until in April, 1901, it was turned over by the parties holding it to the Pinkerton detective agency in Chicago. Mr. Agnew came to America to identify the picture, which was afterwards sold by his firm to J. Pierpont Morgan, in whose collection it now remains.

• **GAINSBOROUGH**

"THE BLUE BOY," FROM THE ORIGINAL IN THE GROSVENOR GALLERY, LONDON

1878); and Armstrong, *Gainsborough and His Place in English Art* (ib., 1898).

GAIRDNER, JAMES (1828—). An English historical writer and editor. He was born and educated at Edinburgh, and in 1846 was appointed a clerk in the Public Record Office. As his peculiar adaptability for the work became evident he was rapidly promoted, and he was made assistant keeper of the public records in 1859. He edited *Memorials of Henry VII.* (Rolls Series, 1858); *Letters and Papers Illustrative of the Reigns of Richard III. and Henry VII.* (Rolls Series, 1861-63); *Historical Collections of a London Citizen* (Camden Society Publications, 1876); *Letters and Papers of Henry VIII.* (Rolls Series, vols. v. to xv. in continuation of the work of Professor Brewer, 1880-96); *Three English Chronicles* (1880); and *The Paston Letters* (Arber reprints, 3 vols., 1872-75). In addition to numerous contributions to the *Dictionary of National Biography*, he published *The Houses of Lancaster and York* (Epoch Series, 1874); *Life and Reign of Richard III.* (1878); "Henry VII." (*Twelve English Statesmen*, 1889), and *Studies in English History*, with James Spedding (1881).

GAIRDNER, WILLIAM (1793-1867). A Scotch physician. He was born at Mount Charles, Ayrshire, graduated at the University of Edinburgh in 1813, and in 1822 settled in London, where he practiced his profession almost continuously until his death. He published an *Essay on the Effects of Iodine on the Human Constitution* (1834), and an excellent treatise *On Gout: Its History, Its Causes, and Its Cure* (1849).

GAIRDNER, Sir WILLIAM TENNANT (1824—). An English physician, born and educated at Edinburgh. In 1862 he was appointed professor of medicine at the university in that city. He took an active interest in securing reforms in municipal sanitation; and the enactment of the Glasgow Improvement Act in 1867 was due chiefly to his initiative. His publications include: *On the Pathology of Bronchitis, and the Diseases Connected with Bronchial Obstruction* (1850); *Clinical Medicine, Observations Recorded at the Bedside*, with Commentaries (1862); *On the Function of Articulate Speech, and Its Connection with the Hand and the Bodily Organs* (1866); *The Physician as Naturalist* (with Dr. Coats, 1889).

GAIS, gis. A neat Swiss village in the midst of green meadows, in the Canton of Appenzell. It has been in vogue as a 'whey resort' since 1749.

GAISFORD, THOMAS (1779-1855). A distinguished English scholar, born at Ilford. After studying at Christ Church, Oxford, he was appointed regius professor of Greek at the university (1812) and Dean of Christ Church (1831). From 1815 to 1847 he was rector of the parish of Westwell. In addition to his elaborate edition of the *Enchiridion* of Hephæstion (1810), with which he first won recognition as a critic, the most valuable of his classical publications include an edition of the *Poetæ Græci Minores* (1814-20), of Stobæus (1822), of Herodotus (1824), of Sophocles (1826), of the lexicon of Suidas (Oxford, 1834), of the *Paræmigraphi Græci* (1838), of the *Scriptores Latini*

Rei Metricæ (1837), of the *Etymologicum Magnum* (1844), and of Eusebius (1842-52).

GAISSIN, gi'sin. The capital of a district in the Russian Government of Podolia, situated on the Sobi, a tributary of the Bug, 180 miles east of Kamenetz-Podolsk (Map: Russia, C 5). The chief occupation of the inhabitants is agriculture, the manufacturing industries of the town being insignificant. Population, in 1897, 9393.

GAÎTÉ, gâ'tâ', THÉÂTRE DE LA (Fr., Gaiety Theatre). One of the oldest theatres of Paris, originating in marionette shows instituted by Nicolet in 1753. A theatre was established in 1759 on the Boulevard du Temple, and in 1807, when the number of Paris theatres was restricted to eight by Napoleon, the Gâté was among those retained, presenting vaudeville, drama, and spectacular pieces. On the destruction of part of the boulevard in 1862, a new house was built in the Place des Arts et Métiers, and is the present home of the theatre. Among the many directors was Offenbach, under whom the operetta came into special prominence, but at the present time performances of all kinds are given.

GAÛS. A Roman jurist of the age of the Antonines, and the chief source of our knowledge of Roman law prior to Justinian. His personal history is almost entirely unknown, and almost every subject connected with him a subject of controversy. It is not known whether he was a Roman citizen, a foreigner, or a freedman. As to the precise age of Gaius this much is certain, that before the revision of the Roman laws and the reform of legal education by Justinian, the *Institutes* of Gaius, as well as four others of his treatises, were the received text-books of the schools of law. His *Institutes*, moreover, formed the groundwork of the *Institutes* of Justinian. From his being thus preferred to Ulpian or Papinian, it is not to be inferred that he lived after them, but only that his work was more popular. The latest jurist whom he cites is Salvius Julianus, who lived under Hadrian, and the latest Imperial edict is one of Antoninus Pius; whence it may fairly be concluded that he survived Antoninus and probably wrote under his successor.

The works of Gaius were largely used in the compilation of the *Digest* of Justinian, which contains no fewer than 535 extracts from his writings. The principal are: The *Edictum Provinciale*, in thirty-two books; the *Aurea*, in seven; the *Edictum Urbicum*; *On Trusts*; *On Mortgages*; and, above all, the *Institutes*, in four books. The last-named work is that by which Gaius is chiefly known, and it was probably the earliest complete and systematic text-book of Roman law. Although it was the basis of Justinian's *Institutes*, both as to its matter and its division, yet it was completely superseded by that work, and after a time was entirely lost, the only knowledge of it which remained being that which was gathered from the detached extracts in the *Digest*, and from the Breviary of Alaric (q.v.), or code of the Visigoths, which was known to be derived from it. In 1816 Niebuhr, while on his way to Rome, discovered, in a palimpsest manuscript in the library of the Chapel of Verona, portions of the work of some ancient jurisconsult, which was soon afterwards pronounced by Savigny to be a portion of the

Institutes of Gaius. On the publication of his report, the Berlin Academy of Sciences commissioned two German scholars, Göschen and Hollweg, in 1817, to make a copy of the entire palimpsest, which consists of 127 sheets. Nineteenth of the entire work was recovered, and was published in 1821 by Göschen, and again, after a fresh collation of the manuscript, by Blume, in 1824. A third and much-improved edition by Lachmann appeared in 1842. A comparative edition of the *Institutes of Gaius and Justinian*, by Klenze and Böcking, appeared at Berlin in 1829.

The first book was translated into German in 1824 by Von Brockdorff, and the entire work has been translated into French three several times—by Baulet, in 1826; by Domenget, in 1843; and by Pellat, in 1844. In England, it has been translated, with notes, by Post (1885), and by Abdy and Walker (1886), the latter work containing also the text and translation of Ulpian's *Fragments*. Consult: Huschke, "Zur Kritik und Interpretation von Gaius Institutionen," in his *Studien des römischen Rechts* (Breslau, 1830); also Mackeldey's *Handbook of the Roman Law*, translation (Philadelphia, 1883); Ortolan, *The History of the Roman Law*, translation (London, 1896); and Savigny, *System des heutigen römischen Rechts* (Berlin, 1840-49).

GAJ, gā, LJUDEWIT (1809-72). A Slavic writer, born at Krapina, Croatia, and educated at Vienna, Gratz, Leipzig, and Pesth. In 1835 he founded the *Novine Hrvatske* (Croatian News)—a title afterwards changed to *Hirske Narodne Novine* (Illyrian National News)—which rapidly became popular, and was followed by similar publications and by the establishment of patriotic societies of every description. The movement thus organized, which was largely instrumental in uniting the Croats and Serbs in their antagonism to the Magyars, excited considerable opposition in Hungary, and in 1844 the word 'Illyrian' was prohibited. Nevertheless, through the efforts of Gaj, a literary bond had been established among the Southern Slavs of the Hungarian crown. One of his patriotic songs, entitled "Još Hrvatska nij' propala," was extremely popular in its day.

GALABAT, gā'lā-būtt', or **KALABAT**. A small district in the northwest part of Abyssinia, adjoining Egyptian Sudan. Area, about 1540 square miles; population, 20,000. It was formerly an Egyptian province, and is settled by Tokruris from Darfur. Prior to the Italian-Abyssinian War it was in the Italian sphere of influence, but at present it forms an integral part of Abyssinia. Metamneh (Matama), the chief town, is situated close to the Egyptian frontier, and was commercially important prior to the Mahdi uprising in 1883. The population of the town is estimated at 8000.

GALACTIC CIRCLE. A great circle of the celestial sphere passing approximately through the centre of the Galaxy or Milky Way. According to Herschel, the northern pole of this circle lies in declination +27° and right ascension 12 hours 47 minutes. See GALAXY.

GALACTODENDRON (Neo-Lat., from Gk. γάλα, *gala*, milk + δένδρον, *dendron*, tree), or COW-TREE. A tree of the order Urticaceæ, indigenous to tropical South America, variously called *Brosimum galactodendron* (Don), *Galactodendron utile* (Kunth), *palo de vaca*, and *palo de*

leche. When tapped it yields a milky juice which, in its native countries, is used in tea and coffee, turns sour on exposure to the air, and deposits a caseic substance. It is closely related to the breadfruit (*Artocarpus incisa*), the breadnut (*Brosimum alicastrum*, Swartz), and to the fig (*Ficus carica*).

GALACZ, gā'lāts. See GALATZ.

GALAGO, gā-lā'gō. A genus of lemurs, native to the continent of Africa, where various species are scattered from Senegal (whence the name is said to have come) to Natal, none, however, being found in Madagascar, where other lemurs abound. They vary in size from the bigness of a cat to that of a mouse, and are some shade of gray or brown in color. They differ from the other lemurs in dentition, and conspicuously in the power of folding lengthwise, and laying close to the head, their unusually large and naked ears; their tails are long and bushy, and their hind legs of great length proportionately, due to the elongation of the bones of the ankle and foot. They are confined to forested regions, dwell in the trees, about which they leap with extraordinary agility, and where the smaller species are said to make nests resembling those of the mouse-lemurs; but frequently go upon the ground, where their customary attitude is sitting upright on their haunches. They feed upon insects, birds' eggs, fruit, etc., searching for these things mainly at night, and spending the day curled up asleep in some tree-crotch or within the clustered fronds of a palm. They thrive well in captivity and are active and interesting when wakeful. The species longest known is that from Senegal (*Galago senegalensis*), one of the smaller ones, also found throughout equatorial Africa; a closely allied species (*Galago maholi*) ranges from the lower Zambesi to Natal. The largest species are those of the West Coast (*Galago crassicaudata* and *Monteiri*); the least, Demidoff's galago, is only five inches long.

GAI'AHAD, SIB. The son of Launcelot and Elaine, and the purest knight of the Round Table, who alone was able to sit in the Siege Perilous and to recover the Holy Grail. He saw and touched the Lord's body and died. He is the hero of Walter Map's *Quest of the Holy Grail*. Consult Morley, *English Writers*, vol. iii. (London, 1887-90). See GRAIL, THE HOLY.

GA'LAM BUTTER TREE. See BUTTER TREE.

GALANGALE (AS. *gallengar*, from OF. *galingal*, *garingal*, from *galange*, *galangue*, *galangale*, from ML. *galanga*, from Ar. *khalanjān*, *khōlinjān*, from Pers. *khūlinjān*, *khavalinjān*, *galangale*, from Chin. *Ko-liang-kiang*, mild ginger of Ko, or Kao-chow-fu. in the Province of Canton, from *Ko*, or *Kao*, name of a province + *liang*, mild + *kiang*, ginger), *Alpinia*. A genus of plants embracing 30 or 40 species of the order Zingiberaceæ, with perennial stems, terminal inflorescence, succulent fruit, and rootstocks which when full-grown possess aromatic stimulating properties similar to those of ginger, for which it is much used in the East. The pure galangale is the product of *Alpinia galanga*, a native of and cultivated in the Eastern Archipelago. It has a stem six or seven feet high, broad leaves, and a branched panicle of greenish-white flowers.

The rootstock, when young, yields a kind of arrowroot, and is used as an article of food.

GALANTHUS. A genus of spring-blooming bulbs of the order Amaryllidaceæ, popularly known as snowdrops. The flowers, which appear often before the snow has melted, are normally solitary, pendulous, on scapes a few inches long, and with few exceptions white and green. The leaves, which appear with the flowers, but develop more slowly, are grass-like, and last usually until midsummer. Due to their easy culture, cheapness, extreme hardiness, and early blooming habit, snowdrops are general favorites. The bulbs are planted a few inches deep in good soil, frequently on the borders of lawns, in mid-autumn, and allowed to shift for themselves, which they often do to the great satisfaction of the grower where conditions are specially congenial. These conditions are partial shade, cool soil, and moisture.

GAL'AOB. Son of Pelion, King of Gaul, and brother of Amadis of Gaul. He is described as of a much more worldly temperament than his brother.

GALAPAGOS ISLANDS (*Sp. pron. gá-li'pá-gòs*), (*Sp., tortoise*). A group of small volcanic islands in the Pacific Ocean, crossed by the equator and extending from about longitude 89° to 92° W., about 600 miles west of Ecuador, to which it belongs (Map: Ecuador, A 8). It consists of the larger islands of Albemarle, Indefatigable, Chatham, James, and Charles, and a number of smaller islands. The total area of the group is estimated at 2400 square miles, of which Albemarle occupies over one-half. The islands are volcanic in origin and mountainous. There are supposed to exist a number of more or less active volcanoes. The climate is less hot than is usual in regions of that latitude, and the flora, though not rich, is interesting, including species peculiar only to the group or even to separate islands. Turtles are very numerous and form the chief product of the islands. There is some sugar-growing on the island of Chatham, and cattle are raised to some extent. The population is about 400. The Galapagos group was known as early as the sixteenth century, and was afterwards frequently visited by buccaneers, to whom the islands are probably indebted for their English names. They were annexed to Ecuador in 1832, and explored by Darwin in 1858.

The Galapagos Islands are of extreme interest to zoölogists, in view of the peculiarities of their fauna, and the bearing the facts have upon the evolutionary history of animals. It was the observation of them, during the voyage of the *Beagle*, which more than any other set of facts, perhaps, led Darwin to his subsequent speculations; and they figure largely in the reasonings of himself, Wallace, and all other evolutionists. While in general the fauna resembles that of South America (see NEOTROPICAL REGION), it is remarkable for having almost no species in common with the continent, and a great paucity of all forms of life except birds. The flora of the group is scanty, and more than half of its species are found nowhere else; so that it is natural to find that the land-shells, insects (mainly beetles), etc., are few and peculiar. Reptiles are represented by the famous giant tortoises, two species of snake, and four of lizards. Of the last, two are of genera confined to the

islands. One is a large burrowing iguanid, and the other 'an aquatic modification' of the same, having a semi-marine life and subsisting on seaweeds. The giant tortoises, now greatly decreased in numbers, were formerly extremely numerous and tame, and reached a huge size. (See TORTOISE.) The islands were named after them, and there were several species, each inhabiting a separate part of the archipelago. The only mammals were a mouse and a rat, which there is much reason to believe escaped from some early ship, and had time to become modified by the time they were discovered by naturalists. Birds abound, and present many interesting facts. While their resemblance on the whole is to the avifauna of Central and South America, some extraordinary relationships to the Hawaiian fauna are apparent. Forty-six genera, according to Ridgway (1896), are represented on the islands, twenty-eight of which are water-birds wandering throughout the American tropics. One rail (*Nesofelia*) is peculiar, and a sandpiper is known elsewhere only in the Sandwich Islands. Of the thirteen genera of land-birds, six are also represented in South and Central America, one (the bobolink) in North America, and four genera are peculiar: two of them are thrush-like birds, and two are ground sparrows. These genera include a large number of species not known outside of the archipelago. A striking feature in all branches of the local zoölogy is the specific disparity between animals peculiar to the different islands, each of which has its own kind. The various facts lead to the belief that an immense period of time has elapsed since the islands were colonized; that this must have gone on very slowly and accidentally (except in the case of most birds), and at long intervals; and that to a great extent there has been no intercommunication of animal life between the various islands. The archipelago is also a most fruitful illustration of insular influences on animal life and of the effects of isolation (q.v.). Consult: Darwin, *A Naturalist's Voyage* (London, 1866); Wallace, *Geographical Distribution of Animals* (New York, 1876); Salvin, *Transactions of the Zoölogical Society*, vol. ix. (London, 1876); Ridgway, "Birds of the Galapagos," in *Proceedings of the United States National Museum*, vol. xix. (Washington, 1896), and its bibliography.

GAL'APAS. A great giant, in Malory's *Morte d'Arthur*, with whom King Arthur fights, and whom he slays, by first cutting off his legs and then his head.

GALASHIELS, gál'a-shé'z'. A Parliamentary burgh and manufacturing town in the shires of Roxburgh and Selkirk, Scotland (Map: Scotland, F 4). It extends for two miles on both sides of the river Gala, above its confluence with the Tweed, 3½ miles west-northwest of Melrose. It is the chief seat of the Scotch tweed, tartan, and leather manufactures. The annual value of its products is over \$5,000,000. The United States is represented by a consular agent. In 1599 Galashiels was created a burgh of barony, and its woolen trade dates beyond 1778, when it possessed thirty looms and three 'waulk' or fulling mills. The erection of handsome public buildings, shops, and dwelling-houses has greatly improved its general aspect in recent years. Population, in 1891, 17,249; in 1901, 13,598. Consult: Craig-

Brown, *History of Selkirkshire* (Edinburgh, 1886); Douglas, *History of the Border Counties* (Edinburgh, 1899).

GALATA, gá-lá'tá. A suburb of Constantinople (q.v.).

GAL'ATE'A (Lat., from Gk. Γαλάτεια, *Galateia*). (1) In Greek mythology, a Nereid, loved by Polyphemus. She was surprised by the latter in a grotto with her preferred lover Acis, whom Polyphemus, in a fit of jealousy, crushed with a rock. Acis was turned into a stream. In other legends Galatea becomes by Polyphemus the mother of Galas. The myth has been a favorite subject for poets and sculptors of ancient and modern times. In English literature it is used in Gay's *Acis and Galatea*, Proctor's *Death of Acis*, Buchanan's *Polypheme's Passion*, and Austin Dobson's *Tale of Polypheme*. (2) A statue miraculously endowed with life by Venus at the prayer of the sculptor Pygmalion. (q.v.). (3) In Vergil's Third Eclogue, a shepherdess who throws an apple to her lover, Dámœtas, and flees to the shelter of the willows, taking care, however, to be seen; hence a type of the coquette.

GALATEA. (1) A pastoral, in prose form interspersed with lyrics, written by Cervantes in honor of his future wife, in 1583. (2) A play (originally spelled *Gallathea*), produced before Queen Elizabeth at Greenwich, London, on January 1, 1582. The scene is laid in North Lincolnshire, but the piece is directly taken from Ovid's *Metamorphoses*, book ix.

GALATEA. The challenger in the races for the America's cup in 1886, when she was twice beaten by the *Mayflower*. She was a steel cutter, built at Port Glasgow in 1885, from designs by Beavor-Webb. Her length was 102 feet, with a displacement of 157 tons and a draught of 13½ feet.

GALATEA, TRIUMPH OF. A beautiful fresco in the Villa Farnesina at Rome, designed and executed by Raphael in 1514. It represents the sea-nymph drawn in a shell by dolphins over a calm sea, and accompanied by nereids and cupids.

GALATÉE, gá-lá'tá'. (1) A pastoral romance by Florian (1783), the most successful of his works. It is drawn largely from a pastoral of Cervantes, which Florian supplemented with an additional book. (2) A two-act comic opera, based on the story of Pygmalion and Galatea, with music by Massé and words by Carré and Barbier, presented at the Opéra Comique in 1852.

GALATIA, gá-lá'shí-á (Lat., from Gk. Γαλατία). The ancient name of a portion of Asia Minor; so called from the Gauls (Gk. Γαλάται) who settled there. Early in the third century B.C. Celtic armies appeared in the Balkan Peninsula, and though driven from Greece by their defeat at Delphi, about B.C. 278, continued to terrify Thrace. About B.C. 277 the first bands entered Asia Minor on the invitation of Nicomedes, King of Bithynia, whose service they at first entered. They were from three tribes—Tolistobogi, Tectosages, and Trocmi. Of these, the first invaded Æolia and Ionia; the Tectosages, the interior; and the Trocmi, the coast lands of the Hellespont. Northern Phrygia and the border regions of Cappadocia were later conquered as a permanent home. Each of the three tribes was divided into four tetrarchies, and the twelve

tetrarchs formed the supreme government, with a council of 400 as advisers. The Gauls did not settle in the cities, where the native population continued with but little change, but, serving as mercenaries in the armies of the Greek kings of the East, made the neighboring territories pay tribute to escape their ravages. A succession of defeats at the hands of Attalus I. of Pergamum, about B.C. 235, seems to have checked their incursions and confined them to their later boundaries between Bithynia and Paphlagonia on the north, Pontus on the east, Cappadocia, Lycaonia on the south, and Phrygia on the west. Having sided with Antiochus against the Romans, the Galatians were severely punished by the Consul Manlius, B.C. 189. They sided with Pompeius against Mithridates, and the Romans gave one of the tetrarchs, Deiotarus, the title of king. After the death of his successor, Amyntas, Augustus made the country a Roman province, divided under Theodosius into *Galatia prima*, with the capital Ancyra, and *Galatia secunda*, with the capital Pessinus. The majority of the Gauls of Galatia—probably those of the country districts—retained their old Celtic language as late as the time of Jerome (fourth century), who says that they spoke the same dialect as the people about Treves; it is certain, however, that the ruling classes, like the original inhabitants, used Greek. Galatia was twice visited by the Apostle Paul (Acts xvi. 6; xviii. 23). Just what part of the province was visited is not clear. In the latter passage what is meant is evidently the Lycaonian part of the Roman province Galatia, in which were the cities Derbe, Lystra, and Iconium, and also, probably, the Pisidian part, in which Antioch belonged. In xvi. 6 the meaning is more uncertain, since we do not know just where the missionaries turned northward; but here also it is impossible that old Galatia proper is meant. Probably the churches of Antioch in Pisidia, Iconium, Lystra, and Derbe, founded by Paul on his first missionary tour (Acts xiii. xiv.), were among the churches to which the Epistle to the Galatians was addressed. In so addressing his letter, Paul evidently had in mind the relation of his readers to the Empire, not their various ethnic affinities.

GALATIANS, gá-lá'shanz. EPISTLE TO THE. One of the letters of Paul in the New Testament. It is addressed, most probably, to the churches visited by himself and Barnabas on the first mission tour (spring A.D. 47-fall 48), which were situated in the southern part of the large Roman province of Galatia (q.v.) and were composed predominantly of Gentiles, though evidently containing a considerable element of Jews. The letter was occasioned by efforts which were

being made within the membership of the churches by outside agitators to bring about an observance of the ceremonialism of the Mosaic law—especially the rite of circumcision—as essential to salvation, and is consequently marked by a vigorous presentation on the Apostle's part of his fundamental doctrine of justification by faith and not by works.

The main problem in the criticism of the letter is its date, which has been variously conjectured from early to late in Paul's ministry, and perhaps is impossible of absolute settlement. In view, however, of the close resemblance in thought which the letter has to the letter to the Romans and its lack of similar resemblance to the Corinthian letters, especially in view of the fact that, though the situation in Corinth was one which promised to become identical with that in Galatia, there is a striking absence in the Corinthian correspondence of all warning against the serious dangers ahead, which the Apostle could scarcely have refrained from giving had he already passed through the Galatian experience, it would seem probable that its writing occurred between that of II. Corinthians and Romans—in other words, toward the latter part of the Apostle's lengthened journey from Ephesus to Corinth (spring-fall A.D. 55), possibly while he was engaged in mission work in the Province of Epirus (see Rom. xv. 18, 19).

In objection to this argument it is urged that Paul wrote his letters to meet the particular needs of individual churches, which needs might be similar in widely separate fields and at widely different times; so that similarity of thought between Romans and Galatians does not necessarily imply sequence in time of composition. This objection, however, lacks all force from the fact that the significant thing here is not so much the similarity between Romans and Galatians as the dissimilarity between Galatians and Corinthians in spite of the acknowledged similarity in the situations to which they were addressed. Compare the indifferent way in which circumcision is treated in I. Cor. vii. 18, 19, and the general lack of reference in I. and II. Corinthians to the vital difference between salvation by faith and by works, with the serious treatment of circumcision in Gal. v. 2, 3, 6; vi. 12-15, and the absorbing discussion in the letter of the grounds of justification. And yet notice how similar to the situation in Galatia the Corinthian situation had become by the time II. Cor. chs. x.-xiii. were written (II. Cor. xi. 4, 5, 12-15, 21-23; xii. 11, 12). Equally lacking in force is the objection that, according to iv. 13, "Ye know that because of an infirmity of the flesh I preached the Gospel unto you at the former time" [τὸ ἡσθένειν], Paul had visited these churches but twice prior to his writing, which would make it impossible for the letter to have been written as late as the end of his third mission tour; since the New Testament usage of the comparative degree in general, and of the phrase τὸ ἡσθένειν, in particular, makes it perfectly possible to render it here 'formerly,' or even 'at the first.' In positive agreement with this dating is the peculiar phrase in the address of the letter (i. 1, 2, "Paul . . . and all the brethren that are with me unto the churches of Galatia"), which, with the absence of all local color in the surroundings of the Apostle, points rather to the situation of a journey than of a

city residence. Further is the statement of iv. 20 ("But I could wish to be present with you now, and to change my tone; for I am perplexed about you"), which would seem to show the writer as far removed from the readers and beyond the likelihood of a near visit to them. Finally, Rom. xv. 26 gives the list of churches contributing to the collection which was being gathered by the Apostle for the Jerusalem church, and which he took with him on his last visit to that city. This list is evidently the final one, since it was directly after this that the Apostle began his voyage to the Holy City; but it contains no mention of the Galatian churches, though the fact of such a collection among them, evidently in process of being gathered, is referred to in I. Cor. xvi. 1. Evidently some time between I. Corinthians and Romans had come the rupture between the Apostle and those churches which stopped the collection.

The letter is one of the group of four (I. II. Corinthians, Galatians, Romans) which have been almost universally attributed to a Pauline authorship. Bruno Bauer's rejection of all the letters of Paul (1850-52) as unapostolic products of the second century, made no impression as far as this group was concerned—the Tübingen School constituting them, in fact, the standard of genuineness for all their New Testament criticism; while the recent attempt by the Dutch School of documentary critics to make the letter a composite writing by a post-apostolic author, compiled largely from Romans, Corinthians, and the Book of Acts, has been generally considered by the critical world as not proven.

Weiss, in *Die Paulinischen Briefe* (Berlin, 1896); Ramsay (New York, 1900). *Introductions:* Holtzmann (Freiburg, 1892); Godet (English translation, Edinburgh, 1894); Salmon (London, 1894); B. Weiss, English translation (Edinburgh, 1888); Zahn (Leipzig, 1900); Bacon (New York, 1900); Jülicher (Leipzig, 1901); Moffatt, *Historical New Testament* (New York, 1901). *Discussions:* Baur, *Paulus*, English translation (London, 1873-75); Holsten, *Das Evangelium des Paulus* (Berlin, 1880); Ramsay, *The Church in the Roman Empire* (New York, 1893); Saint Paul the Traveler and Roman Citizen (New York, 1896). Bauer's attack is represented in his *Apostelgeschichte* (Berlin, 1850) and his *Kritik der Paulinischen Briefe* (Berlin, 1850-52). The Dutch School is best represented by Steck, *Der Galaterbrief* (Berlin, 1888); the best reply is given by Gloß, *Die jüngste Kritik des Galaterbriefes* (Erlangen, 1890). For general discussion of the school, consult Knowling, *The Witness of the Epistles* (London, 1892).

GALATINA, gá'la-tě'ná. A city in South Italy, 45 miles southeast of Brindisi (Map: Italy, N 7). It has a church dating from 1384, which contains the grave of Balzo Orsini. It markets oil, wine, and cotton. Population of commune, in 1881, 11,000; in 1901, 14,000.

GALATZ, gá'láts, or **GALACZ** (Rum. *Galati*). A city of Rumania, in Moldavia, situated

on the left bank of the Danube, between the mouths of the Pruth and the Sereth (Map: Balkan Peninsula, F 2). It is divided into the old and the new town. The latter is well built, and is the seat of a bishop and of the European commission for the control of navigation on the Danube. There are numerous extensive storehouses, grain elevators, a shipyard, and a large bazaar. Galatz is one of the leading ports on the Danube. The imports, for the most part, consist of textiles and metal goods; the exports are mainly cereals, cattle, and lumber. The annual shipping amounts to about 1,000,000 tons. There are numerous foreign consular agents. Population, in 1890, 59,143; in 1899, 62,678. Galatz has figured prominently in the wars between Russia and Turkey. It was a free port previous to 1883.

GAL'AXY (from Lat. *galaxias*, Gk. γαλαξίας, *galaxias*, milky way, from γάλα, *gala*, milk), or **MILKY WAY**. The luminous band, seen at night, which forms a zone encircling the sphere almost in a great circle. At one part of its course it opens up into two branches, one faint and interrupted, the other bright and continuous, which do not reunite till after remaining distinct for about 150°. This great zone has occupied the same position in the heavens since the earliest ages. Its course, as traced by the naked eye, following the line of its greatest brightness, conforms nearly to that of a great circle, called the 'galactic circle,' inclined at an angle of about 62° 30' to the equinoctial, and cutting that circle in 0 h. 49.1 m. and 12 h. 49.1 m. right ascension. Throughout the space where, as above stated, it is divided into two branches, this great circle is intermediate to those branches lying nearer that which is the brighter and more continuous. The Galaxy is wanting in regularity of outline. Besides the two great branches into which it divides, it has many smaller ones which spring out from it. At one point it diffuses itself very broadly, and opens out into a fan-like expanse of interlacing branches nearly 20° in breadth. At the same point, the branches terminating abruptly, a wide gap presents itself in the zone, on the opposite side of which it recommences its course with a similar assemblage of branches. At other points its course is irregular, patchy, and winding; while at more than one point, in the midst of its brightest parts, broad dark spaces occur. One of these, known from early times among navigators as the 'coal-sack,' is a singular pear-shaped vacancy about 8° long and 5° broad, occurring in the centre of a bright area overlying portions of the constellations of the Cross and Centaur. The 'coal-sack' occupies about half the breadth of this bright space, and presents only one star visible to the naked eye, though it contains many telescopic stars. Its blackness, which attracts the most superficial observer, is thus due to the contrast with the brilliant ground by which it is surrounded. The Galaxy was examined by Sir William Herschel with his powerful telescope, and found to be composed entirely of stars. Modern photographic researches have added but little to Herschel's observations as to the structure of the Galaxy; but some of his conclusions concerning the form of the sidereal universe are no longer tenable. See **STAR**.

GAL'BA, **SERVIUS Sulpicius** (B.C. 3-A.D. 69). Roman Emperor from June, A.D. 68, to January

15, 69. Born December 24, B.C. 3, of a respectable family, he was raised to the consulship in A.D. 33, and in the administration of the Province of Aquitania under Tiberius, of Germany under Caligula, of Africa under Claudius, and of Hispania Tarraconensis under Nero, he distinguished himself for bravery, strictness, and justice. His friends had urged him, on the death of Caligula, to take possession of the throne, but he continued faithful to Claudius, and therefore stood high in his favor. In 68 Julius Vindex rose with the Gallic legions against Nero, and called on Galba to assume the Imperial dignity and thus rid the earth of its oppressor. Galba, who had been informed that Nero was contriving his death, came forward against him at first as the legate of the Roman people, and it was only when he heard of Nero's death that he proceeded to Rome to take possession of the throne offered him by the Prætorians. Galba was now upward of seventy years old, and it soon appeared that his character had deteriorated, as, indeed, had already been manifested in his later administrations. Indulgence to greedy favorites, ill-timed severity, above all, avarice, which led him to withhold the usual donatives to the troops, made him unpopular. The legions in upper Germany called on the Prætorians to choose another emperor; Galba thought to soothe them by adopting Piso as his coadjutor and successor; but he thus offended Otho, who, as administrator of Lusitania, had supported Galba, and looked to be rewarded. The Prætorians, who had received no donative on the occasion of Piso's adoption, were easily excited to insurrection by Otho, and the Emperor, having gone out to quell the rebellion, was cut down by the soldiers as he crossed the Forum.

GAL'BANUM (Lat., from Gk. χαλβάνη, *chalbanē*, from Heb. *khebenah*, galbanum, from *khā-lab*, to be fat). A soft, ductile, white gum resin used in medicine like asafetida, principally in cases of chronic catarrh, and, especially by the Germans, in amenorrhœa and chronic rheumatism. Though sometimes applied externally in plasters as a mild stimulant in indolent swellings, it is generally administered in the form of the compound galbanum pill, which contains galbanum, sagapenum, asafetida, myrrh, and soft soap. It is brought from the Levant in tears or in large masses, which become yellowish with age and which have a peculiar balsamic odor and acrid, bitter taste. Although it is mentioned in Ex. xxx. 34, the plant from which it is derived has not been definitely determined. Since *Polypodium orientale*, *Ferula galbaniflua*, and *Ferula rubricaulis*, all of the order Umbellifera, have been supposed to be the source of galbanum, it is highly probable that it is the product of an umbelliferous plant. But the confidence with which the species have been so represented has perhaps prevented travelers from making that inquiry into the subject which otherwise they might have made. *Peucedanum Galbanum*, a plant of this order found at the Cape of Good Hope, yields a gum resin very similar to galbanum.

GALCHAS, *gāl'chaz*. The designation of a number of tribes in the plateaus and valleys of the Pamir and Hindu Kush, in Ferghana, the basins of the Zerafshan, Amu Darya, etc., who physically belong to the white race, and linguistically to the Aryan stock. They are generally

thick-set, brachycephalic, and in some other respects resemble what Ripley (1899) calls "the ideal Alpine or Celtic European race"—a relationship recognized by Topinard in 1878, and since then by Ujfalvy, etc. They are thus one of the farthest Aryan outliers in Central Asia. In religion they profess, mostly, Islam of the Sunnite creed. Since their residence in this region their physical characteristics have been somewhat modified by intermixture with other peoples of the environment. Keane (1896) ranks the language of the Galchas as an independent branch of the Aryan family; some other authorities make it more nearly akin to the Iranian tongues. The anthropology of the Galchas has been discussed by Ujfalvy in the *Revue d'Anthropologie* for 1879, and the *Bulletins de la Société d'Anthropologie de Paris* for 1887, and more briefly by Ripley in his *Races of Europe* (New York, 1899).

GALDÓS, gál-dós', BENITO PEREZ. See PEREZ-GALDÓS, BENITO.

GALE (probably connected with Dan. *gal*, Icel. *galinn*, furious, from *gala*, to chant). A strong wind varying in velocity (according to the technical classification) from 18.5 to 32 miles per hour; the corresponding wind pressures are 1.5 and 4.5 pounds per square foot. Gales are described as moderate, fresh, and strong, or whole gales. On sailing ships, ordinarily, very little sail is carried in gales; when they are very strong, only close-reefed topsails, staysail and spanker. If running with the wind free, a close-reefed foresail may also be set. In fresh or moderate gales more sail is carried. See WIND; BEAUFORT SCALE.

GALE (in botany). See CANDLEBERRY.

GALE, NORMAN ROWLAND (1862—). An English poet. He was born at Kew, in Surrey, March 4, 1862; was educated at Exeter College, Oxford, graduating B.A. in 1884, and subsequently took pupils, as described in the poem "June in London." Between 1888 and 1891 he published privately at Rugby several verse pamphlets, including: *Anemones*; *Cricket Songs and Other Trifling Verses*; *Meadowsweet*; *Violets*. In 1892 appeared *A Country Muse*, which was followed later in the same year by a new series under the same title. These collections consist mainly of lyrics, in which the two motives of love and nature are united with great charm, recalling, indeed, the manner of Herrick. As representative of their scope may be cited from the second series: "A Thief;" "The Shaded Pool;" "A Pastoral;" and "Leafy Warwickshire." He has since published: *Orchard Songs* (1893), concluding with "A Defense," written in reply to the charge of undue frankness in depicting country manners; *Cricket Songs*, a reissue (1894); *A June Pastoral* (1894), which is an idyl in prose, with scattered verse; and *Songs for Little People* (1896).

GALE, THEOPHILUS (1628-78). An English Nonconformist divine. He was born at Kingsteignton, Devonshire, and was educated at Oxford. After preaching at Winchester Cathedral for three years, he was dismissed because of his Nonconformist views, and devoted himself to teaching. Shortly before his death he was appointed to the pastorate of an independent congregation at Holborn. His fame rests chiefly upon the erudite work to the preparation of

which he devoted the greater part of his life, and which is entitled *The Court of the Gentiles; or, A Discourse Touching the Original of Humane Literature from the Scriptures and Jewish Churches* (1669-78), in which he expresses the view that all theology, philology, and philosophy may be traced to Jewish sources.

GALE, THOMAS (c.1635-1702). An English author. He was born at Scruton, Yorkshire, and was educated at Cambridge. Here he occupied the chair of Greek from 1666 to 1672, when he was appointed high master of Saint Paul's School, where he remained for twenty-five years. He was Dean of York during the last five years of his life. He was widely celebrated for his scholarship, and published the following works: *Opuscula Mythologica, Ethica et Physica* (10 parts, 1671); *Historiæ Poeticæ Scriptores Antiqui* (1675); *Historiæ Britannicæ, Saxonicæ, Anglo-Danicæ Scriptores* (1691); *Rhetores Selecti. Demetrius Phalereus, Tiberius Rhetor, Anonymus Sophista, Severus Alexandrinus, Græce et Latine* (1676).

GALEAZZO, gā'lā-āt'sō, GIAN. See VISCONTI.

GALEN (Gk. Γαληνός, *galēnos*), or CLAUDIUS GALENUS (130-201?). A celebrated physician, born at Pergamus, in Mysia. He first studied medicine at Pergamus, afterwards at Smyrna, Corinth, and Alexandria. He returned to his native city in his twenty-ninth year, and was at once appointed physician to the school of gladiators. In his thirty-fourth year he went to Rome, where he stayed about four years, and was offered, but declined, the post of physician to the Emperor. He returned to his native country in his thirty-eighth year, and had scarcely resumed his ordinary course of life when he received a summons from the emperors M. Aurelius and L. Verus to attend them on the northeastern frontiers of Italy, whither they had gone to make preparations for a war with the northern tribes. He joined the camp toward the end of the year 169; but a pestilence breaking out, the emperors and their court set off for Rome, whither Galen accompanied or followed them. The place and date of his death are not known with certainty, but it is believed that he died in Sicily.

The works that are still extant under the name of Galen consist of 83 treatises acknowledged to be genuine, 19 whose genuineness has been questioned, 45 undoubtedly spurious, 19 fragments, and 15 commentaries on different works of Hippocrates. Besides these, he wrote a great number of works whose titles only are preserved, and altogether it is believed that the number of his distinct treatises cannot have been less than 500. We may divide his works into: (1) Those on anatomy and physiology; (2) those on dietetics and hygiene; (3) those on pathology; (4) those on diagnosis and semeiology; (5) those on pharmacy and materia medica; (6) those on therapeutics, including surgery; (7) his commentaries on Hippocrates; and (8) his philosophical and miscellaneous works. We have most of these works in Greek, the language in which they were originally written; some are, however, preserved in Latin translations, and a few only in Arabic. His most important anatomical and physiological works are: *De Anatomicis Administrationibus* and *De Usu Partium Corporis Humani*. His anatomical and physiological writings are by far the most valu-

able of his works. They contain undoubted evidence of his familiarity with practical anatomy; but whether he derived his knowledge from dissections of human bodies or those of the lower animals is uncertain. The latter is the most probable view, (1) because he frequently recommends the dissection of apes, bears, goats, etc., and (2) because he mentions, as something extraordinary, that those physicians who attended the Emperor M. Aurelius in his wars against the Germans had an opportunity of dissecting the bodies of the barbarians. His pathology was very speculative and imperfect. In his diagnosis and prognosis he laid great stress on the pulse, on which subject he may be considered as the first and greatest authority, for all subsequent writers adopted his system without alteration. He likewise placed great confidence in the doctrine of critical days, which he believed to be influenced by the moon. In *materia medica* his authority was not so high as that of Dioscorides. Numerous ingredients, many of which were probably inert, enter into most of his prescriptions, and he seems to place a more implicit faith in amulets than in medicine. His practice is based on two fundamental principles: (1) that disease is something contrary to nature, and is to be overcome by that which is contrary to the disease itself; and (2) that nature is to be preserved by that which has relation to nature. Judged by modern standards, his ideas and practice were of course childish.

Before Galen's time the medical profession was divided into several antagonistic sects, including the Dogmatici, Empirici, Eclectic, Pneumatici, and Episynthetic. After his time all these sects merged into one, the Galenici. The subsequent Greek and Roman medical writers were mere compilers from his writings, and as soon as his works were translated (in the ninth century) into Arabic, they were at once adopted throughout the East, to the exclusion of all others. The Greek text has been published four times. The first edition was the Aldine, printed in 1525, in five folio volumes; the most complete edition is that of Kühn, in twenty octavo volumes, the publication of which extended from 1821 to 1833. Galen's minor works were edited by Müller and Helmrich, and published in three volumes at Leipzig (1884-93). Several of Galen's works have been translated into French or German. Kidd, in the *Transactions of the Provincial Medical and Surgical Association*, vol. vi. (London, 1837), gives a good account of Galen's anatomical and physiological knowledge. Consult Daremberg, *Exposition des connaissances de Galien sur l'anatomie* (Paris, 1841), an epitome of which in English has been published, from the pen of Coxie (Philadelphia, 1846). Consult also Ilberg, "Die Schriftsteller des Klaudios Galenos," in the *Rhenisches Museum für Philologie* for 1889, 1892, and 1896.

GALEN, gä'len. CHRISTOPH BERNHARD VON (1606-78). A German prelate and soldier. He was born in Westphalia, and was educated at the universities of Cologne, Mainz, Louvain, and Bordeaux. After being coincidentally Canon of Münster and commander of a regiment on the Rhine, he was made Prince Bishop of Münster in 1650. He was exceedingly ambitious, and strove to increase his power, both by reducing his subjects to complete submission and by extending his

possessions without. By 1661 he had made himself master of the city, and he turned at once to foreign alliances to carry out his designs. With a well-trained army he joined England against the Netherlands in 1665, but was forced to make peace in 1666. He joined Louis XIV. against the Dutch (1672), and waged war successfully against them, and then turned his arms against the Elector of Brandenburg and the Emperor. In 1675 he joined the Emperor against France; he next helped the Danes against Sweden, and secured the Duchy of Verden and part of the Duchy of Bremen; in 1677 he helped the Spaniards against the French; in 1678 he invaded East Friesland and extorted a large war indemnity. He died September 19, 1678, during the negotiations leading to the Peace of Nimeguen. In spite of his military activity he found time to introduce many meritorious ecclesiastical reforms. Consult: Tücking, *Geschichte des Stifts Münster unter Christoph Bernhard von Galen* (Münster, 1865); Hüsing, *Fürstbischof Christoph Bernhard von Galen, ein katholischer Reformator* (Münster, 1887).

GALEN, PHILIPP. See LANGE, ERNST P. K.

GALENA. A city, port of entry, and the county-seat of Jo Daviess County, Ill., 17 miles southeast of Dubuque, Iowa; on the Galena River, which affords good water-power, and on the Illinois Central, the Chicago and Northwestern, and the Chicago, Burlington and Quincy railroads (Map: Illinois, B 1). It has a public library, a fine United States Government custom-house, and Grant Park, in which is a statue of General Grant. Galena carries on an important trade by river and rail, and has smelting-works, shoe-factories, etc.; but the city is noted primarily as the centre of extensive lead and zinc mining interests. Under a charter of 1852, the government is vested in a mayor, biennially elected, and a city council. The electric-light plant is owned and operated by the municipality. Population, in 1890, 5635; in 1900, 5005. Galena (named from the abundance of lead sulphide or galena ore in the vicinity) was settled in 1827 and was incorporated as a city in 1839. Gen. U. S. Grant lived here from May, 1860, until the opening of the Civil War, and the Grant homestead still remains as one of the features of the city.

GALENA. A city of remarkable growth during the last ten years, in Cherokee County, Kan., seven miles west of Joplin, Mo.; on the Saint Louis and San Francisco and the Kansas City, Fort Scott and Memphis railroads (Map: Kansas, H 4). It is engaged chiefly in mining, being the centre of an important lead and zinc region. The mining district, about four miles square, has 200 concentrating mills, and employs 3000 men. Over \$4,300,000 worth of ore was mined in the year 1900, and conditions are favorable to an increase in the output. Among the industrial establishments of the city are lead-smelters, a large foundry, and a planing-mill. The government is administered by a mayor, who holds office for two years, and a unicameral council, which elects the deputy marshals and police. The mayor nominates the collector, sexton, and engineer; other officials are chosen by the people. Galena was settled and incorporated in 1877, and its population increased from 1463 in 1880, and 2496 in 1890, to 10,155 in 1900.

GALENA (Lat., from Gk. γαλῆνη, *galênê*, lead ore), or **LEAD GLANCE**. A lead sulphide that crystallizes in the isometric system. It occurs crystallized, fibrous, granular, or cryptocrystalline, and has a pure lead-gray color and a metallic lustre. Galena occurs in beds and veins, both in crystalline and amorphous rocks, and is one of the most widely distributed of the metallic sulphides. It is found in Freiberg, Saxony; in Pibram, Bohemia; in Spain; in Cornwall, Derbyshire, and Cumberland, England; in New South Wales, Mexico, and at various other localities throughout the world. In the United States it occurs in caves or gash veins in stratified limestone, especially at various localities in Illinois, Iowa, Missouri, and Wisconsin. When pure it contains 86.6 per cent. of metallic lead; but it is usually accompanied by other metals, such as antimony, bismuth, cadmium, zinc, and especially silver. It is an important ore of lead, and is often worked also for silver, especially in Colorado, Idaho, Montana, and other Rocky Mountain States, and in British Columbia. A coarse-grained variety of galena is used to glaze pottery, and is sometimes called *potters' ore*. See **LEAD**.

GALENIC, GALENIST. Words having reference to the controversies of the period of the revival of letters, when the authority of Galen was strongly asserted against all innovations, and particularly against the introduction of chemical methods of treatment into medicine. The Galenists adhered to the ancient formulas, in which drugs were prescribed either in substance or in the form of tinctures and extracts, etc., while the chemists professed to extract from them the essences, or quintessences—i.e. substances in small bulk, presumed to contain the whole virtues of the original drugs in a state of extreme concentration, or purified from all gross and pernicious or superfluous matter. Medicines prepared by decoction or infusion, as distinguished from those prepared by chemical processes, are still termed *galenic* medicines.

GALEOMYOMACHIA, gá'lê-ô-mí'ô-má'kl-â (Lat., from Gk. γαλεομιομαχία, Battle of the Cats and Mice). A Greek mock-heroic poem by Theodorus Prodromus, a twelfth-century monk. In its general features it is only an imitation of the *Batrachomyomachia* (q.v.).

GA'LEOPITHE'CUS. See **COBEGO**.

GALEOTTO, gá'lâ-ô'tt'ô, **PRINCIPE**. Another title of Boccaccio's *Decameron* (q.v.), suggested by the name of the book, to the reading of which Dante makes Francesca attribute her sin with Paolo.

GALERIE DES GLACES, gá'le-rê' dâ glâs (Fr., gallery of mirrors). A famous gallery in the Palace of Versailles, France, one of the most magnificent rooms in the world. It is nearly 250 feet long, 40 feet wide, and over 20 feet high, and is profusely adorned with paintings, etc., of the time of Louis XIV. It was designed for balls and fêtes, and on particularly grand occasions was also used as the throne-room. In it William I. was crowned German Emperor in 1871, during the siege of Paris.

GALE'RIUS, VALERIUS MAXIMIANUS (?-A.D. 311). A Roman Emperor (A.D. 305-11). He was born, of humble parentage, near Serdica, in Dacia; entered the Imperial army, and rose from one grade of military rank to another until

Diocletian conferred on him, along with Constantius Chlorus, the title of Cæsar (A.D. 292), and gave him his daughter in marriage. On the abdication of Diocletian (A.D. 305), he and Constantius became *Augusti*, or joint rulers, of the Roman Empire. On the death of Constantius at York (A.D. 306), the troops in Britain and Gaul immediately declared their allegiance to his son Constantine (afterwards Constantine the Great), much to the chagrin of Galerius, who expected the entire sovereignty of Rome to fall into his hands. He died in A.D. 311. Galerius was a brave soldier and a skillful commander, but appears to possess no other claims to the respect of posterity. He hated the Christians, and it is believed that it was he who forced Diocletian to issue his famous edict against them, which caused the last of the Imperial persecutions. It is highly probable that his treatment of the adherents to the Christian faith was determined in great part by a politic opposition to Constantius and his son, who tolerated, and even respected, the new opinions and practices.

GALES, JOSEPH (1786-1860). An American journalist, born in Eckington, Yorkshire, England. His father, Joseph Gales, the elder, was a printer in Sheffield, who was compelled to emigrate to America in 1793 because of his republican principles. The son was educated at the University of North Carolina, followed the trade of his father, and in 1807 settled in Washington, where he became the assistant and partner of Samuel Harrison Smith in the publication of the *National Intelligencer*. In 1810 Gales became sole proprietor of the journal, and made it a tri-weekly publication, and in 1813, he having previously formed a partnership with his brother-in-law, William Winston Seaton, the paper was issued daily, and so continued until 1867, after the death of both publishers. For many years Gales and Seaton were the official printers to Congress, and the files of the *National Intelligencer*, containing a running account of the debates in both Houses, are one of the most valuable sources of United States Congressional history for more than a quarter of a century. Under the title of *Annals of Congress*, Gales and Seaton published (1834-56), in forty-two volumes, the debates in Congress from 1798 to 1824, together with the more important documents and laws, and under the title of *Register of Debates in Congress* (29 vols.), continued the publication in similar form to cover the years 1824-37.

GALESBURG. A city and the county-seat of Knox County, Ill., 43 miles east by north of Burlington, Iowa; on the Atchison, Topeka and Santa Fé, the Chicago, Burlington and Quincy, and other railroads (Map: Illinois, B 3). It is the seat of Knox College (non-sectarian), founded in 1837; the scene of a famous Lincoln-Douglas debate of 1859; Lombard University (Universalist), established in 1852; and the Ryder Divinity School and Saint Joseph's Academy (Roman Catholic). The city has an attractive situation, and is widely known for its educational facilities. There is a public library of about 25,400 volumes. Among the industrial establishments are the Burlington Railroad shops and stock-yards, brick-making plants, boiler and engine works, iron-foundries, farming-implement works, and carriage and wagon factories. The government is administered under a general State

law of 1872, by a mayor, elected every two years, and a unicameral council. The majority of subordinate administrative officials are appointed by the executive, subject to the consent of the council. The city owns and operates its water-works and electric-light plant. Population, in 1890, 15,264; in 1900, 18,607. Galesburg was settled in 1837 by a company from New York State, and was named in honor of the Rev. George W. Gale, who had planned the town as a site for a theological seminary, and as a rallying-place for 'free-soilers,' since the pro-slavery immigration was then threatening to make Illinois a slave State. The city was chartered in 1857. Consult *History of Knox County* (Chicago, 1878).

GALI, gá'lé, FRANCISCO (1539-91). A Spanish navigator, born in Seville. The Viceroy of Mexico engaged him to find a harbor on the western coast of America for Spanish vessels returning from the East Indies, and he set out from Acapulco with that object in view. He visited the Philippines and other neighboring islands, and Japan, and on his way home (1584) discovered the present Bay of San Francisco. Linschot translated into Dutch Gali's account of his expedition, and included it in his work *Track Charts of the Indies* (1596), and Wolf made an English translation in 1598. From a French version of the same narrative a Spanish translation was also made (1802), and there are in the National Library of Mexico fragments of an account of the expedition written by Gali, under the title *Viaje, descubrimientos y observaciones de Acapulco á Filipinas*.

GALIANI, gá-lyá'né, FERDINANDO (1728-87). An Italian savant, born in Chieti, in the Abruzzi. Philosophy, archaeology, history, and more especially the science of political economy, were his favorite studies; but he first attracted notice by a clever squib on the death of the public executioner. This consisted of a collection of essays eulogistic of the deceased, in which the style of the president and leading members of the Neapolitan Academy was admirably imitated. His next publication, *Della Moneta*, written when he was barely twenty, evinced his great learning and powers of reflection, and must be regarded as a valuable contribution to the science of political economy. In 1751 he visited the chief cities of Italy, and was everywhere honorably received. On his return to Naples he collected a rich assortment of stones and volcanic matter of Vesuvius, which, accompanied by a thesis, he subsequently presented to the Pope. On one of the stone specimens he engraved the following suggestive inscription: "Beatissime pater, fac ut lapides isti panes fiant," and received, by way of answer, the rich prebend of Amalfi, for which he had previously qualified himself by entering into orders. In 1759 he became secretary to the Neapolitan embassy at Paris. From his sojourn at Paris dates a voluminous correspondence with political, scientific, and literary personages of the day, an edition of which has appeared by Percy and Maugras (Paris, 1881). In 1767 he visited England, whose social and political institutions he studied deeply. On his return to Paris, he wrote another treatise on political economy, entitled *Dialoghi sul commercio del grano*, in which he argues against both the extreme protectionists and the

pure free-traders. Being recalled to Naples, he was successively appointed to various posts of trust and importance. He died at Naples in 1787, leaving behind him rare collections of music manuscripts, cameos, etc. Consult: Diodati, *Vita dell' abate Ferdinando Galiani* (Naples, 1878); Mattei, *Galiani ed i suoi tempi* (Naples, 1879); Contes, *lettres et pensées de l'abbé Galiani* (Paris, 1866); Du Bois-Reymond, *Darwin versus Galiani* (Berlin, 1876). Consult also, Brunetiere in *Etudes critiques*, vol. ii. (Paris, 1889).

GALICIA, gá-lish'á (Ger. *Galizien*). The largest of the Austrian crownlands, situated in the northeastern part of Austria-Hungary, bounded by Russia on the north and east, Bukowina on the southeast, Hungary on the south and southwest, and Austrian and Prussian Silesia on the west (Map: Austria, H 2). Its area is over 30,300 square miles. Separated from Hungary by the Carpathians, the surface of Galicia inclines toward the north, while the interior consists mostly of hills and elevated plateaus. The northern part is a gently rolling plain. Galicia is abundantly watered by the Vistula and its affluents, and also by the Dniester, which drains the southern part of the province. The latter flows southeast, and is navigable from Sambor. The Pruth also flows through the southern part of Galicia. The Vistula is navigable at Cracow, and, flowing northeast, forms part of the boundary of Russian Poland. Among its tributaries in Galicia are the San and Dunajec, both navigable, and the Bug. There are no lakes of consequence, but mineral springs abound, some of them of more than provincial repute. The climate, owing to the exposed northern position of the crownland, is colder than that of any other part of Austria-Hungary. The winters are generally long and severe, while the summers are hot.

Galicia is more purely agricultural than any other of the crownlands of Austria, no less than 77 per cent. of its population depending for a living directly on the soil. The soil, with the exception of some sandy and marshy districts, is fertile, and produces wheat, barley, rye, oats, maize, etc. Flax, hemp, tobacco, hops, beets, etc., are likewise cultivated. The production of cereals is generally more than sufficient to meet the domestic demand, considerable quantities being in fact exported. Horses, cattle, and sheep are raised in large numbers. The unequal distribution of the land is shown by the fact that while one-third of the cultivable area is in the hands of large landholders owning estates of over 1400 acres each, about one-half consists of holdings of less than 14 acres in extent. This state of affairs, together with the industrial backwardness of the country, is chiefly responsible for the wretched condition of the agricultural classes. Most of the peasants are unable to make a living from their small farms, and are consequently obliged to emigrate in large numbers for a part of the year to Russia, Russian Poland, and Germany, where they work for low wages, while their families attend to the farms at home.

The forests of Galicia occupy about 25 per cent. of the total area of the country, and yield large quantities of timber for export to foreign countries, chiefly to Germany. The mineral industries are insignificant, with the exception of rock salt, of which there are extensive deposits, those of Wieliczka being famous. Petroleum is obtained

in large quantities, and the refining industry is assuming very great importance. The manufactured articles of Galicia are mainly the output of house industries. Weaving, brewing, and distilling, and the production of small wooden articles are the leading industries. There is, however, an improvement in some branches of manufacture, notably in that of textiles. The trade is almost exclusively in the hands of the Jews, and is hindered by the Russian trade policy. The transit business, nevertheless, is somewhat important. The leading exports are petroleum, salt, ozocerite, lumber, grain, cattle, and linens. In 1898 there were in Galicia 2000 miles of railway.

The Constitution of Galicia dates from 1861. The Diet is composed of 154 members, consisting of three archbishops, five bishops, two rectors of universities, 44 representatives of the landed aristocracy, 20 representatives of towns and industrial centres, three from the chambers of commerce and industries, and 77 from the rural communities. In the Austrian Lower House Galicia is represented by 78 delegates, of whom 15 are elected by all voters, while of the remaining 63, 20 are sent by the large landholders, 13 by the towns, 3 by the chambers of commerce and industry, and 27 by the rural communities. For the purpose of administration Galicia is divided into 78 counties, and the two cities of Lemberg and Cracow. The population of Galicia in 1900 was 7,295,538, showing an increase of 10.4 per cent. for the period 1890-1900. According to nationality, as determined by the language spoken, the population is composed as follows: Poles, 53 per cent.; Ruthenians, 43 per cent.; the remainder mainly German. As to religion, over 45 per cent. are Roman Catholic, 42 per cent. Greek, and about 11 per cent. Jews. In 1890 over 73 per cent. of the population could neither read nor write. Higher education is afforded by universities at Cracow and Lemberg. The important cities are Lemberg, the capital; Cracow, Tarnow, Brody, Tarnopol, Przemyśl, and Kolomea.

The original Germanic population of what is now Galicia was replaced at the beginning of the Middle Ages, at the time of the great migration of nations by the Slavic Poles and Ruthenians, who settled to the west and the east, respectively, of the River San. In the twelfth century the principalities of Halicz (Galicia) and Vladimir (Lodomeria) rose to prominence from among a host of petty States. Galicia in general acknowledged the suzerainty of the dukes of Cracow, while Lodomeria was under the control of the ruler of Kiev. The dissensions between the two principalities afforded an opportunity for the intervention of the Hungarians, the Russians, and the Poles, but such periods of foreign rule were brief. In 1198 Roman, Prince of Lodomeria, succeeded in annexing Galicia to his dominions, and made himself virtually independent of Poland and Hungary; the two duchies were separated in 1215, but were once more united by Daniel Romanovitch (1222-66), who by his skillful diplomacy in his relations with Hungary and the Pope entrenched himself firmly in power. During his reign and those of his immediate successors the country enjoyed remarkable prosperity, and attained to a high degree of civilization. In 1340 the House of Roman died out, and soon after Galicia and Lodomeria came under

the sway of Casimir the Great of Poland, and except for an interval of a decade and a half (1370-86) formed a part of Poland till the first partition of that country in 1772. In that year the territory of Galicia, under the title of the Kingdom of Galicia and Lodomeria, was annexed by Austria, whose portion was increased in 1795 by the addition of West or New Galicia. Austria was forced in 1809 to cede West Galicia to the Grand Duchy of Warsaw, and in 1810 a portion of East Galicia to Russia, but it recovered possession of the latter in 1814, while the former remained in the hands of Russia, with the exception of a fragment which was erected into the Republic of Cracow. In 1846 the Republic of Cracow, which had become the centre of the Polish revolutionary movement, was suppressed and handed over to Austria, which incorporated it with the crownland of Galicia. The period since 1848 has been marked by a fierce struggle between the Polish and Ruthenian nationalities, the former seeming to retain their almost absolute ascendancy, and the latter striving to win their share of political rights, and a voice in the government. Consult Jandaurek, *Das Königreich Galizien* (Vienna, 1884).

GALICIA, *Span. pron. gá-lê-thé-à*. A political division of Spain, bounded on the north by the Atlantic, on the east by the provinces of Asturias and León, on the south by Portugal, and on the west by the Atlantic (Map: Spain, A 1). Area, 11,254 square miles. The surface is generally composed of numerous isolated mountains and hills intermingled with valleys and elevated plains, but there are few connected mountain chains. The chief river is the Minho. The climate is moist but not unhealthful. In some districts the soil is fertile and well cultivated. Agriculture and stock-raising are the leading industries. Minerals are found in the mountains, and the waters along the coasts abound in fish. The unequal distribution of land and the backwardness of the manufacturing industries are responsible for the impoverished state of the masses, and the constant stream of emigration to Portugal and the more progressive parts of Spain, as well as to North and South America. Population, in 1887, 1,894,558; in 1900, 1,980,515. The inhabitants are called *Gallegos*, and resemble the Portuguese rather than the Spaniards, speaking a distinct dialect. Administratively, Galicia is divided into the four provinces of Corunna, Lugo, Orense, and Pontevedra. The seat of the Captain-General is Corunna.

Galicia was originally occupied by a tribe known as the Callaici or Gallaici, whence the name of the region. It was first subjugated by the Romans in the time of Augustus. Early in the fifth century, when the torrent of Suevi and Vandals swept across the Pyrenees, Galicia, which then included old Castile, was occupied by the former. After remaining independent for almost two centuries, it became part of the Visigothic kingdom under Leogovild in the latter part of the sixth century. At the time of the Saracen invasion, great numbers of the Visigoths fled thither. The Saracens were driven out in 734 by Alfonso the Catholic of Asturias. Galicia shared the fortunes of Asturias and of León, and finally became part of the Kingdom of Castile. On the death of Ferdinand the Great of Castile and León, in 1065, it formed for a few years an independent kingdom under his son Garcia.

GALIGNANI, gǎ'lě-nyǎ'né. A family of European publishers, of whom the most prominent were GIOVANNI ANTONIO (1752-1821) and his sons JOHN ANTHONY (1790-1873) and WILLIAM (1798-1882). For a time the father, a native of Brescia, lived in London, where his sons were born, but, removing to Paris, founded there an English library, an English *Monthly Repository*, and began in 1814 the publication of *Galignani's Messenger*. This paper, continued by the sons, was published under the old title till a few years ago, but is now known as simply the *Messenger*. At Corbeil the brothers set up a hospital for needy Englishmen, and in 1889, at Neuilly, the Galignani Home for distressed printers.

GALILEE. See PALESTINE.

GALILEE. The name applied in England to a porch or chapel placed near the entrance to a church, beyond which women were not permitted to pass. In abbeys, for example, the monks came to the Galilee to see their female relatives. The term Galilee Porch was also used. The name is supposed to have been suggested by Mark xvi. 7: "He goeth before you into Galilee: there shall ye see him," said to have been quoted by the monks in ushering into the Galilee the women who thus visited the abbey. A portion of the nave was sometimes marked off by a step, or, as at Durham, by a line of blue marble to mark the boundary within which women were not permitted to pass. There are fine specimens of galilees at the cathedrals of Lincoln, Ely, and Durham, and the name is also applied to the little library in the central arch of the west end of Peterborough Cathedral.

GALILEE, SEA OF. See GENNESARET, LAKE OF.

GALILEI, gǎ'lě-lá'è, VINCENZO (c.1533-c.1600). An Italian musician and mathematician. He was born at Florence, and was the father of Galileo Galilei, the astronomer. As a composer, he is chiefly important for his songs with lute accompaniment, which are generally regarded as introducing the monody subsequently adopted by Peri, Caccini, etc., the accredited founders of the *opera in musica*. More valuable are his writings, the most important of which are a polemical discourse on the works of Zarlino of Chioggia (1589), and the treatise *Il Fronimo, dialogo sopra l'arte del bene intavolare e rettamente suonare la musica* (1583). He was an accomplished lute-player and violinist, and a prominent member of the historic coterie of artists whose rendezvous was the house of Count Bardi. His death occurred at Florence.

GALILEO, gǎ'lě-lá'ò, **GALILEO GALILEI**, gǎ'lě-lá'è (1564-1642). An Italian physicist and astronomer, one of the founders of modern experimental science. He was born in Pisa, in February, 1564, of a Florentine family more ancient than opulent. By desire of his father, a mathematician of considerable ability, he directed his early studies to medicine and the prevailing Aristotelian philosophy, the dogmas of which he soon came to disbelieve. Later, however, while still at the University of Pisa, he devoted himself to the study of mathematics and physical science. At the age of eighteen he made one of his most important discoveries. Happening on one occasion to observe, in the Cathedral of Pisa, the oscillation of a lamp casually set in motion, he was struck with

the apparent measured regularity of its vibrations; and having tested the correctness of this observation by comparing the beat of his own pulse with the action of the pendulum, he concluded that by means of this equality of oscillation a simple pendulum might become an agent in the exact measurement of time. This discovery he subsequently utilized by the successful application of the pendulum in constructing a clock for astronomical purposes. His bias toward mechanical construction and experimental science received a new impulse from his intercourse with a friend of his father's, Ostilio Riccio, who consented to give him systematic instruction in pure mathematics. Such was Galileo's absorption and delight in his new studies that his father at length sanctioned his abandonment of the art of medicine, in order that he might concentrate his powers on his chosen sciences. The first fruit of his geometrical investigations was the invention of a hydrostatic balance, by which the specific gravity of solid bodies might be ascertained with great accuracy. In 1589, the fame of Galileo's extraordinary learning having reached the Grand Duke of Tuscany, he was appointed professor of mathematics in the University of Pisa. About this period he turned his attention to the then very imperfectly comprehended laws of bodies in motion; and in opposition to accepted notions, he propounded the theorem that all falling bodies, great or small, descend with equal velocity. This soon led him to the discovery of the law regulating the motion of falling bodies, which was proved correct by experiments made from the summit of the leaning tower of Pisa, greatly to the chagrin of the Aristotelians, whose enmity to Galileo had now grown more decided. In consequence, he relinquished his chair at Pisa, and retired to Padua, where, in 1592, he accepted the invitation of the Venetian Senate to lecture on mathematics in the university for the space of six years. It is also said, however, that Galileo lost his chair at Pisa, from having ridiculed the mechanical pretensions of Giovanni de' Medici, son of Cosimo I. Galileo's engagement at Padua was eventually prolonged to the term of eighteen years; but so urgent was his desire to return to his birthplace, that he sought a restoration to his former post at Pisa, and was gratified by an assent being accorded by Cosimo II., with exemption from any but a voluntary exercise of the duties of professorship. During his sojourn at Padua, his course of lectures enjoyed extraordinary popularity; crowds of pupils flocked to hear him from all parts of Europe; and he was the first to adapt the Italian idiom to philosophical instruction. Among his various discoveries may be noticed a species of thermometer, a proportional compass or sector, and, more important than all, the construction of the refracting telescope for astronomical investigation. In 1609 he offered his first complete telescope to the Doge of Venice, Leonardi Deodati, by whom it was tested from the tower of Saint Mark. In the same year he constructed a microscope; and then commenced his astronomical researches by means of his own telescope. He speedily concluded that the moon, instead of being a self-luminous and perfectly smooth sphere, owed her illumination to reflection, and presented an unequal surface deeply furrowed by valleys and mountains of great extent. The Milky Way he pronounced a

tract of countless separate stars; and these discoveries were crowned by a still more important series of observations, which led to the discovery of the four satellites of Jupiter on the night of January 7, 1610 (though it was not till the 13th of the same month that he came to the conclusion that they were satellites, and not fixed stars), which he named the Medicean stars. He also was the first to note movable spots on the disk of the sun, from which he inferred the rotation of that orb. He returned to Tuscany in 1610, where renewed quarrels with the Aristotelians disquieted and embittered his existence. In 1611 he visited Rome and was received with great distinction, being enrolled a member of the Lincei Academy; but four years later, on a second visit, his reception was widely different, as by that time, in his work on the solar spots, he had openly advocated the Copernican system, and was in consequence denounced as a propounder of heretical views. He repaired again to Rome, to demand an experimental inquiry into the soundness of his views; but the Grand Duke, apprehending Inquisitorial dangers for his favorite, summoned him back to Tuscany; at the same time the Pope, through the famous Cardinal Bellarmine (a sincere friend of Galileo's), commanded him to abstain from all future advocacy of heretical doctrines. Some time after, Galileo wrote his most famous work in the form of a dialogue between three fictitious interlocutors, the one in favor of the Copernican system, the second an advocate of the Ptolemaic, and the third a satirical personage who begins by agreeing with the Ptolemaic arguer, but usually ends by being convinced by the Copernican, and then assists in belaboring poor Simplicio, the supporter of Ptolemaic motion. In 1630 Galileo contrived to obtain the Papal *imprimatur*, which was subsequently revoked; but having got a similar authorization at Florence, he published, in 1632, this exposition of his opinions under the title of *Un dialogo intorno i due massimi sistemi del mondo*. Hardly had the work been issued, when it was given over to the jurisdiction of the Inquisition. Pope Urban VIII., previously Cardinal Barberini, and until now a friend and eulogist of Galileo, was led to believe that Galileo had satirized him in this work under the name of Simplicio, as one who is careless about scientific truth, and who timidly adheres to the saws of antiquity. On September 23, 1632, Galileo was cited to appear for the second time before the Inquisition. During his protracted trial he was allowed to reside as a prisoner in the house of the Tuscan ambassador. His judges condemned him to abjure his scientific theory. This he did. That he was actually put to the torture is now no longer a question open to dispute, though it is true he was threatened with it. His famous whisper, *E pur si muove* ("But nevertheless it does move"), is a fiction. Galileo was sentenced to an indefinite term of imprisonment by the Inquisition, which was soon commuted by Pope Urban, at the request of Ferdinand, the Grand Duke of Tuscany, into permission to reside at Siena, and finally at Florence, should the prisoner's health require the change. In his retreat at Arcetri he continued his researches, even when hearing grew enfeebled and sight was extinguished. He died on January 8, 1642, at the age of seventy-eight, and was interred by ducal

orders in the Cathedral of Santa Croce, where a majestic monument symbolizes his great achievements.

Galileo's disposition was truly genial; he enjoyed with keenness the social wit and banter of his friends, and the pleasures of the banquet; and the readiness with which he offered or accepted atonement modified a somewhat irascible disposition. The great deficiencies in his character were a want of tact to keep out of difficulties, and a want of moral courage to defend himself when involved in them. His biting, satirical turn, more than his scientific tenets, was the cause of his misfortunes. Galileo was of small stature, but of a robust and healthy frame; his countenance was attractive, and his conversation cheerful. He loved art, and cultivated especially music and poetry. His style is nervous, flowing, and elegant.

We may briefly recapitulate Galileo's most important contributions to physical science under the following heads: (1) The relation between space and time in the case of falling bodies; (2) the path of projectiles is a parabola; (3) the isochronism of the pendulum; (4) the partial discovery that suction is owing to the pressure of the atmosphere; (5) the re-invention of Aristotle's theory respecting sound; (6) the invention of the telescope; (7) the discovery of the satellites of Jupiter, phases of Venus, and spots on the sun. For the nature of these discoveries, see PENDULUM; FALLING BODIES; PROJECTILES; etc.

The best edition of Galileo's collected works is that by Alberi (16 vols., Florence, 1842-56). Consult: Viviani, *Life of Galileo* (Lausanne, 1793); Brewster, *The Martyrs of Science, or the Lives of Galileo, Tycho Brahe, and Kepler* (London, 1846); Chasles, *Galileo Galilei* (Paris, 1862); Cebler, *Galileo und die römische Curie* (Stuttgart, 1876); Berti, *Copernico e il vicende del sistema Copernicano, and Il processo originale di Galileo* (Rome, 1876); Rossi, *Del metodo Galileiano* (Bologna, 1817); Favaro, *Galileo Galilei* (Florence, 1882); Scartazzini, *Galileo Galilei* (Milan, 1883); Wegg-Prosser, *Galileo and His Judges* (Eng. trans. London, 1889); Günther, *Geisteshelden*, vol. xxii. (Berlin, 1896).

GALIMBERTI, gä'läm-bär'tè, LUIGI (1836-96). A Roman Catholic ecclesiastic and diplomat, born in Rome, where he was educated in both law and theology. He taught theology in the College of the Propaganda, and at the University of Rome, and in 1868 was appointed Canon of the Lateran. By Leo XIII. he was made secretary of the congregation of extraordinary ecclesiastical affairs, Canon of Saint Peter's at Rome, and Archbishop of Nicæa. He was sent on various embassies, and was the author of the award which the Pope as arbitrator made in favor of Spain, in her contention with Germany for the sovereignty over the Caroline Islands. When, as a result of the struggle of Bismarck against the power of the Catholic Church in Germany (Kulturkampf), the relations between the Papacy and the German Empire were broken off, it was Galimberti who was sent in 1880 on a mission to Germany, with the result that the oppressive 'May Laws' of 1872 were abrogated. In 1887 he represented the Papacy at Vienna, and here also was fortunate in securing a satisfactory settlement of long-standing differences between the Vatican and Austria-Hungary. In 1893 he

returned to Rome, and was made a cardinal and precept of the Papal Archives.

GAL/INGALE (*Cyperus longus*). See **CYPERUS**.

GAL/ION. A city in Crawford County, Ohio, 80 miles southwest of Cleveland; on the Cleveland, Cincinnati, Chicago and Saint Louis and the Erie railroads (Map: Ohio, E 4). It is primarily a manufacturing and railroad town, with railroad-shops, several carriage-factories, brick and tile plants, wheel, wagon, and gear works, lumber-mills, and a foundry. Galion was laid out in 1831, and was chartered as a city in 1878. Its government is administered by a mayor, elected biennially, and a unicameral council. The city owns and operates the electric-light plant. Population, in 1890, 6326; in 1900, 7282.

GALITZIN. See **GOLITZIN**.

GAL/UM. See **BEDSTRAW**.

GALL, gäl, FRANZ JOSEPH (1758-1828). The founder of phrenology, born at Tiefenbronn, Baden. He studied medicine at Strassburg and Vienna, and settled in the latter place as a practicing physician. He became known by the publication of his *Philosophisch-medizinische Untersuchungen über Natur und Kunst im gesunden und kranken Zustande des Menschen* (1791). But he acquired a much more extensive reputation by his lectures on the structure and functions of the brain, which he began to deliver in 1796. His views were so subversive of received doctrines on the subject of mind that the lectures were prohibited in 1802 by the Austrian Government. Along with his pupil, Spurzheim (q.v.), who became his associate in 1804, Gall quitted Vienna in 1805, and during his travels through Germany, Holland, Sweden, and Switzerland, expounded his views in many of the universities and principal cities. In 1807 he settled as a physician in Paris, and there began lecturing and writing for the propagation of his opinions. On March 14, 1808, he and Spurzheim presented to the Institute of France a memoir of their discoveries, on which a committee of the members of that body (including Pinel, Portal, and Cuvier) drew up an unfavorable report. Gall and Spurzheim thereupon published their memoir, with a reply to the report, in a volume entitled *Recherches sur le système nerveux en général et sur celui du cerveau en particulier* (1809). This was followed by their larger work, *Anatomie et physiologie du système nerveux* (1810-19), with an atlas of 100 plates; but the two phrenologists having parted in 1813, the name of Gall alone is prefixed to volumes iii. and iv., and it alone is borne by a reprint of the physiological portion of the work, entitled *Sur les fonctions du cerveau, et sur celles de chacune de ses parties* (1825). In answer to accusations of materialism and fatalism brought against his system, Gall had early published a part of the work under the title *Des dispositions innées de l'âme et de l'esprit* (1812). He continued to practice medicine and pursue his researches at Montrouge till his death. For a discussion of his ideas, see **PHRENOLOGY**.

GALL, LUISE VON. See **SCHÜCKING**, **LEVIN**.

GALL, SAINT. See **SAINT GALL**.

GAL/LAGHER, WILLIAM DAVIS (1808-94). An American journalist and poet, born in Philadelphia, Pa. He was the son of an Irish patriot

implicated in the Rebellion of 1798. While he was still a child his family removed to Ohio, where he learned the printer's trade, and later contributed to country newspapers. In 1828 he settled in Cincinnati, and this city, with brief changes of residence, was his home for many years. He edited several journals, particularly the *Mirror* and the *Hesperian*. Much of the verse and prose which appeared in these publications was contributed by the best American writers of the day, and he constantly wrote for them himself. He next became connected with the Cincinnati *Gazette*. Upon his removal to Louisville, Ky., in 1852, he began another paper, the *Courier*, which failed. During the Civil War he was in the employ of the Treasury Department, and subsequently was a pension agent and farmer in Kentucky. Gallagher was most influential in promoting literary interests in the West. His poetical works include *Errato* (3 vols., 1835-37), containing "The Wreck of the Hornet," and *Miami Woods* (1881).

GALLAIT, ga'lä', LOUIS (1810-87). A Belgian historical painter. He was born at Tournai, studied there under the classicist Hennequin and, afterwards, under van Brée at Antwerp. His "Tribute to Cæsar" (1830) and "Christ Healing the Blind" (1833) were purchased by subscription for the Cathedral of Tournai. At Paris he came under the influence of Delaroche and produced many works such as "Montaigne Visiting Tasso in Prison" (1836) for the Belgian King, the "Capture of Antioch by Godfrey de Bouillon" (Versailles), and other historical subjects for the French Government, and, finally, his "Abdication of Charles V." (1841, Brussels Museum). Exhibited in Germany, where it profoundly influenced native art, this last work brought him the highest honors. He was called by the Government to Brussels, where he founded an influential school of historical painting. His work shows taste and judgment, but the technique is eclectic and his presentation theatrical. Other celebrated subjects are: "Last Honors to Egmont and Hoorne" (1851, Tournai), "Last Moments of Egmont" (1858, Berlin), and the "Plague at Tournai" (1882, Brussels). His once famous portraits and genre subjects are less important. Consult Henne, in *Annales de l'académie de Belgique* (Brussels, 1890), and Dujardin, *L'art flamand* (ib., 1899).

GALLAND, ga'län', ANTOINE (1646-1715). A French Orientalist and numismatist, born at Rollot, near Montdidier, in Picardy. After finishing his course at the Lycée, he studied Oriental languages at the Collège de France. In 1670 he accompanied the French Ambassador De Nointel to Constantinople, and made two subsequent trips to the East in the interest of science, collecting a large number of inscriptions, etc. In 1701 he was made a member of the Académie des Inscriptions, and in 1709 professor of Arabic in the Collège de France. The greater part of Galland's writings relate to numismatics and the East; but what secured for him a lasting reputation was his translation of the *Arabian Nights*, in twelve volumes (*Mille et une nuits; contes arabes*, 1704-17). This was the first translation of these stories ever made into any European language, and so little was known about them in Europe that Galland got the credit

of being himself the author as well as the translator. The translation led not only to the popularity, but also to critical investigations, of the remarkable collection. (See ARABIAN NIGHTS.) Among his other writings may be mentioned: *Paroles remarquables, bons mots, et maximes des Orientaux* (1694), and *Les contes et fables indiennes de Bidpai et de Lokman* (1724). His numismatic and archaeological writings will be found chiefly in the *Journal des Savants*, and the *Mémoires* of the Académie des Inscriptions et Belles-Lettres.

GALLA OX, or **SUNGA**. See **HUMPED CATTLE**.

GALLARATE, gäl'là-rä'tà. A city in North Italy, 25 miles northwest of Milan, with a technical school and important cotton factories (Map: Italy, C 2). Population of commune, in 1881, 8400; in 1901, 12,000.

GALLAS, or **OROMA** (*Gallas*, Conquerors; *Ilm'-orma*, Sons of the Brave). An Ethiopian people in Eastern Africa, south of the Abyssinian plateau, numbering 6,000,000, and occupying 400,000 square miles of territory. They represent the purest type of the Ethiopian branch of the Hamitic race, called Kushito-Hamites. Keane divides these Ethiopian peoples into Somali Hamites, Galla Hamites, Afar (Domakil) Hamites, Abyssinian (Agao) Hamites, Semitized and mixed Hamites, Himyaritic (Abyssinian) Semites, Arab (nomad) Semites, Negroes, and Bantus. He pronounces the Gallas to be the finest people in all Africa—tall, shapely, with high, broad foreheads and handsome faces. Their color is chocolate, the hair black and kinky. They are a pastoral and agricultural people; but their common dangers and mutual jealousies have made them warlike. They are divided into tribes and petty kingdoms, having two social classes—the aristocratic *prutuma* ('herdsmen') and the plebeian *argatta* or *kutto* ('tillers'). They are all more or less subject to the Negus Negusti of Abyssinia. In religion they are pagans, Mohammedans, and Sidamas—that is, members of the Abyssinian Christian Church. Consult A. H. Keane, in Stanford's *Africa*, vol. i. (London, 1895), where all the tribal subdivisions are given, with their exact locations.

GALLAS, gäl'làs, Count **MATHIAS**, Duke of Lucera (1584-1647). A German general in the Thirty Years' War, born in Trent. After serving as a mercenary in the armies of Spain and Savoy, he became colonel of an infantry regiment in the army of the Catholic League, and afterwards became one of Wallenstein's most trusted officers. For his services at the taking of Mantua (1630), in the War of the Mantuary Succession, he was created a count. He commanded the right wing of Wallenstein's army at the battles of Nuremberg and Lützen. From selfish motives he opposed Wallenstein, intrigued against him at Vienna, and after his assassination, in accordance with promises made him, he succeeded to his command. He won the decisive battle of Nördlingen over Bernhard of Weimar, in 1634; but after varying successes and failures in the four following years he was succeeded as commander-in-chief, in 1638, by the Archduke Leopold. After Leopold's defeat by Torstenson and the Swedes at the second battle of Breitenfeld, in 1642, Gallas was again placed in command, but was defeated in Holstein and again superseded. He succeeded

Hatzfeld as commander-in-chief after the latter's defeat at Jankau, but soon fell ill and was compelled to retire.

GALLATIN. A city and the county-seat of Daviess County, Mo., 75 miles northeast of Kansas City, on the Grand River, and on the Wabash and the Chicago, Rock Island and Pacific railroads (Map: Missouri, C 2). It has a trade in lumber, grain, live stock, etc., and is the centre of an agricultural district, with valuable timberlands. Population, in 1890, 1489; in 1900, 1780.

GALLATIN. A town and the county-seat of Sumner County, Tenn., 26 miles northeast of Nashville; on the Louisville and Nashville and the Chesapeake and Nashville railroads (Map: Tennessee, E 4). It is the seat of the Howard Female College, opened in 1836. The town is surrounded by a fertile agricultural region, and manufactures flour, spokes, etc. The water-works and electric-light plant are owned by the municipality. Population, in 1890, 2078; in 1900, 2409.

GALLATIN, ALBERT (1761-1849). One of the most distinguished of American public financiers. He was born in Geneva, Switzerland, January 29, 1761, and graduated at the Academy of Geneva in 1779. In 1780 he and a friend, Henri Serre, came to the United States, and spent a year at Machias, Me., in trade pursuits, with little success. Gallatin then moved to Boston, where he supported himself by teaching French, and in July, 1782, received permission to give instruction at Harvard College. In the following year he explored, and invested in, lands on the western frontier, and in 1784 established a country store in Fayette County, Pa., near the Virginian boundary. He was in 1789 a delegate to the State Constitutional Convention, and in 1790, as also in the two following years, he was sent to the Legislature by Fayette County, where he was conspicuously active in opposition to the Federal excise law, and where, also, the basis of his reputation was made by his report of the Committee of Ways and Means in the session of 1790-91. In February, 1793, he was elected to the United States Senate, and took his seat on December 2d; but in the following February the Senate decided, by a party vote of 14 to 12, that he did not possess the proper qualifications as to citizenship, it having been less than nine years, the time prescribed by the Constitution, since he had taken the oath of citizenship and allegiance to the State of Virginia. Gallatin was active at the time of the Whisky Insurrection (q.v.), and although he urged submission to law and the refraining from all improper and illegal acts, nevertheless he went so far in his relations with the insurrectionists as to give himself, both then and later, considerable political embarrassment. He was, at the end of the trouble, elected to the Pennsylvania Assembly, and from 1795 to 1801 was a member of Congress, where he allied himself with those Republicans who, under the leadership of Madison, were opposing the administration of the Federalists. "In his first term," says his biographer, Stevens, "he asserted his point and took his place in the councils of the party. In his second, he became its acknowledged chief. In the third, he led its forces to final victory."

He served on important committees, and stead-

fastly opposed the administration, especially in the matter of the Jay Treaty, the increase of the army and navy, and the relations with France. Particularly did he attack the administration of the finances, a field with which his pamphlets showed him to be familiar, and his services and abilities in this direction were recognized by Jefferson, who in 1801 made him Secretary of the Treasury, a post which he held until 1813. During these years a marked reduction was effected in the national debt, the practice as to appropriations was made more systematic, the sinking-fund system was improved, and the preparations were made which rendered a war and an increase of the national debt possible without a disorganization of the public financial system. Gallatin also rendered important service in the negotiations which were concluded by the Treaty of Ghent (q.v.). Of his services in this connection, one of his biographers, Henry Adams, has said: "Far more than contemporaries ever supposed or than is now imagined, the Treaty of Ghent was the especial work and the peculiar triumph of Mr. Gallatin." Thereafter, declining both a nomination to Congress and an opportunity to resume charge of the Treasury Department, he became Minister to France, filling the post from 1816 to 1823. Three years later he went to London as Minister, remaining one year, and concluding two important conventions. He had been nominated for the Vice-Presidency by the Crawford Republicans in May, 1824, but withdrew in October to make room for Clay, and in 1843 he declined to enter Tyler's Cabinet as Secretary of the Treasury.

After the conclusion of his diplomatic service he removed to New York (in 1828), and that city remained his permanent residence until his death. He was president of the National Bank there for some years; but the duties were light, and he had ample time for study and public service. He was much interested in the problems of public education and of finance, and took an active part in the movement which resulted in the founding of New York University; but his chief interest appears to have been in the study of ethnology, especially of American ethnology. He founded the American Ethnological Society in 1842, which for a brief period was a very serviceable agency for the promotion of such studies, and he wrote several valuable essays and monographs on ethnological subjects. He did not lose his interest in finance and in history, however, and in every way gave an example of scholarship and of public spirit rarely surpassed by any one in this country.

He was twice married, first, in 1789, to Sophie Allègre, who died within a few months, and then, in 1793, to Hannah Nicholson, daughter of Commodore James Nicholson, whose death shortly preceded his own. He died August 12, 1849, at Astoria, L. I. He published in 1796 a *Sketch of the Finances of the United States*, and in 1843 memoirs on the *American Rights to the North-eastern Frontier*, and many minor essays on finance, history, and ethnology, his *Synopsis of the Indian Tribes Within the United States, East of the Rocky Mountains, and in the British and Russian Possessions in North America* (1836), and his *Notes on the Semi-Civilized Nations of Mexico, Yucatan, and Central America, with Conjectures on the Origin of Semi-*

Civilization in America (1845), being especially noteworthy. His *Writings*, which are of great value in the study of the political history of the United States in the first part of the nineteenth century, have been edited by Henry Adams (3 vols., Philadelphia, 1879). Consult: Adams, *Life of Albert Gallatin* (Philadelphia, 1879), and Stevens, *Albert Gallatin*, "American Statesmen Series" (Boston, 1884).

GALLAUDET, gál'la-dét', EDWARD MINER (1837—). An American educator of the deaf and dumb, son of Thomas Hopkins Gallaudet. He was born in Hartford, Conn., and was educated at Trinity College in that place. In 1856 he became a teacher in the institution for the deaf and dumb which his father had founded at Hartford, and the year following, at the instance of Amos Kendall, removed with his mother, Sophia Fowler Gallaudet, to Washington, where they organized and took charge of an institution similar to that at Hartford, known as the Columbian Institution. In 1864 he was one of the founders of the National Deaf-Mute College at Washington, of which he became president. In 1867-68 he made an extended tour of Europe, visiting the principal institutions for the deaf and dumb, and publishing on his return the results of his investigations in a full and extremely valuable report. In 1880 he was a delegate to the international congress of instructors of deaf mutes, held in Milan, Italy, and in 1883 was president of the convention of American instructors of deaf-mutes at Jacksonville, Ill. At the request of the British Government, he went to England in 1886 and gave information on American methods of teaching the blind, deaf, and dumb, before a royal commission appointed to investigate and reorganize the system in England. His publications include: *A Popular Manual of International Law* (1879), and *Life of Thomas Hopkins Gallaudet* (1888), his father.

GALLAUDET, THOMAS (1822-1902). An American clergyman and educator of the deaf and dumb, a son of Thomas Hopkins Gallaudet (q.v.). He was born in Hartford, Conn., and graduated at Trinity College (Hartford) in 1842. In the following year he became a teacher in the Institution for the Deaf and Dumb in New York City, which position he held for fifteen years. Meanwhile he was ordained a deacon and priest in the Protestant Episcopal Church, and in 1852 he organized Saint Anne's Episcopal Church in New York, in which service was provided for deaf mutes. In 1872 he organized and became general manager of the Church Mission for the Deaf and Dumb, and in 1885 founded the Gallaudet Home for Deaf Mutes at Poughkeepsie. He was chosen rector emeritus of Saint Matthew's Episcopal Church and vicar of Saint Anne's, which since 1897 has been associated with Saint Matthew's Parish, and is used exclusively as a place of worship for deaf mutes.

GALLAUDET, THOMAS HOPKINS (1787-1851). An American educator of the deaf and dumb, born in Philadelphia, Pa., of French Huguenot ancestry. He graduated at Yale in 1805, and after pursuing theological studies at the Andover Theological Seminary, was licensed to preach in 1814. Instead of preaching, however, he went to Europe in 1815, to study the existing methods of caring for the deaf and

dumb, familiarizing himself with the systems of the Abbé Sicard in Paris, and of Braidwood and Watson in London. In 1817, with Laurent Clerc, a deaf-mute assistant of Sicard, he opened a school of instruction at Hartford, Conn., of which he continued to act as principal until 1830. He published, in addition to numerous pamphlets: *Sermons Preached to an English Congregation in Paris* (1818); *Bible Stories for the Young* (1838); *The Child's Book of the Soul* (1850). Consult: Humphrey, *Life* (New York, 1858), and E. M. Gallaudet (his son), *Life* (New York, 1888).

GALL-BLADDER. See LIVER.

GALLE, gál. See POINT DE GALLE.

GALLE, ANDRÉ (1761-1844). A French engraver and medalist, born at Saint-Etienne. His most famous medals commemorate the conquest of Upper Egypt, the capitulation of Vienna, the battle of Friedland (1807), the battle of Wagram (1809), and the marriage of the Duke de Berry. He also engraved vignettes for banknotes, and the plates for a series of stamps for Government use.

GALLE, gál'le, JOHANN GOTTFRIED (1812-). A German astronomer, born at Pabsthaus, near Gräfenhainichen. He studied the mathematical sciences at Berlin, taught for a time in a gymnasium, and was subsequently made assistant observer in the Berlin Observatory, of which Encke was then director. He discovered three unexpected comets, and was awarded the prize of the French Academy. But his principal achievement was the finding of the planet Neptune. It was to the Berlin Observatory that Leverrier addressed his request that a search be made for the hypothetical planet, whose place in the sky he had computed from the observed disturbances in the motion of Uranus. Galle made the search requested by Leverrier, and was the first to see the new planet, September 23, 1846. Galle was also perhaps the first astronomer to advocate (1875) the use of planetoid observations for the determination of the solar parallax (see PARALLAX)—a method now considered the best known. His researches on this subject were published at Breslau, where he had been made director of the observatory and professor of astronomy in 1851. Galle's published works include: *Grundzüge der schlesischen Klimatologie* (1857); *Ueber die Verbesserung der Planetenelemente* (1858); *Ueber die Bestimmung der Sonnenparallaxe* (1875); *Mitteilungen der Breslauer Sternwarte* (1879); *Verzeichnis der bisher berechneten Kometenbahnen* (1894). His original contributions were published, for the most part, in scientific periodicals.

GALL/LEOT. See GALLIOT.

GALLEGO, gá-lyá'gó, JUAN NICASIO (1777-1853). A Spanish poet, born at Zamora. He took orders in 1800, and became court chaplain in 1805. On the uprising of 1808 he wrote what is probably his best-known poem, "Al dos de Mayo," a stirring patriotic ode. After the restoration of Ferdinand VII. he was imprisoned for three years, but the Revolution of 1820 set him at liberty. He became the perpetual secretary of the Spanish Academy. His works are few, but hold a high place in the literature of his country, on account of their excellent style

and intense patriotism. A posthumous edition of his *Obras poeticas* was published in 1856.

GALLENGA, gál-lép'gá, ANTONIO (1810-95). An Italian historian and publicist, born at Parma. He began the study of medicine at the University of Parma, but soon abandoned it for a literary career. After the insurrection of 1831, in which he played a part, he had to go into exile, and visited France and the United States. Returning to Italy, he became prominent in the councils of Mazzini's party, and was chosen as the agent to assassinate the King of Sardinia, Charles Albert. He could not bring himself to the performance of this cowardly deed, and in 1838 withdrew to London. In 1843 he was given the chair of Italian literature in University College, and three years later he became a naturalized British citizen. In Italy again on the uprising of 1848, he left it when the fortunes of the revolutionists sank, only to return in 1854, when he was elected a Deputy to the Sardinian Parliament. The following year he had his *History of Piedmont* published at London, and aroused such dissensions in Mazzini's party by his frank statement of facts as to the intended assassination of Charles Albert that he had to resign his place in the Parliament. He returned to Italy in 1858, reentered the Parliament at Turin as a Deputy, and in 1874 he accompanied King Victor Emmanuel to Berlin and Vienna. He was long a correspondent of the *London Times* both in Italy and in other countries, including America, Denmark, and Spain. In addition to the *History of Piedmont*, he wrote, among other works: *Oltremonte ed oltremare, canti di un pellegrino* (1844); *Italy, Past and Present* (1846); *Scenes of Italian Life* (1850); *Italy in 1848* (1851); *Two Years of the Eastern Question* (1877); *The Pope and the King* (1878); *L'Italia presente e futura* (1886). His *Practical Grammar of Italian* for the use of English-speaking students has passed through many editions since 1851. He contributed many articles to English reviews.

GAL/LEON (from Sp. *galcón*, It. *galeone*, augmentative of *galea*, galley). A name formerly applied to ships of war of three or four gun-decks, but subsequently transferred to the large merchant vessels which every year brought to Spain the gold, silver, and other wealth contributed by its Mexican and South American colonies. They were armed, but being heavy, unmanageable vessels, and containing cargoes of immense value, were eagerly sought after as prizes whenever a war broke out.

GALLERY (OF. *gallerie*, *galerie*, Fr. *galerie*; probably a special use of OF. *gallerie*, *galeric*, mirth, from *gale*, festivity, from AS. *gal*, OHG., Ger. *geil*, wanton). A word with several applications in architecture. (1) A long open structure in the upper part of a building, whether projecting or not, inside or outside; (2) a long passage, a corridor or narrow hall connecting other apartments; (3) a large, well-lighted, long hall for exhibiting collections of paintings, sculptures, and other works of art; (4) a large structure, usually of glass, used for public purposes, shops, etc. Of class (1) interesting examples are, for outside galleries, the famous outside façade galleries on French Gothic cathedrals, such as the *galerie des rois* at Rheims, Amiens,

and Paris, usually serving as a practical passage-way; for inside galleries, the second-story galleries in so many mediæval churches, often termed triforium galleries, the projecting roof-lofts, or singing galleries, extending across the inside façade, and the projecting galleries in many modern churches, theatres, opera-houses, etc. The arrangement of galleries in tiers one over the other, now so much used in churches, theatres, etc., is entirely modern, dating from the seventeenth century. Of class (2) early and most interesting instances are the low and richly paneled gallery-halls of the old châteaux and manor houses, especially in English mansions of the sixteenth and seventeenth centuries, where family portraits and collections of arms, armor, furniture, and bric-à-brac were kept; but even more strictly to it belong such galleries as the Bridge of Sighs, in Venice, or the gallery of the Sainte Chapelle and of the Palais de Justice in Paris, connecting two buildings together. Here should be mentioned such long galleries as those connecting the Pitti Palace and the Palazzo Vecchio. Class (3) is related to the *château* gallery, being a hall largely for public instead of private exhibition, but differs fundamentally in having the name applied to the entire building containing the several exhibition galleries. We are familiar with the Uffizi, Borghese, Louvre, National, and other such galleries. Finally, to class (4) belong the very modern and colossal glass galleries at Naples and Milan and those of the Palais Royal and some of the German cities, which are in reality streets roofed with glass. Some galleries can hardly be classified, such as the famous Gallery of Mirrors at Versailles.

GALLERY. In military fortifications, a covered passage, cut through the earth or masonry in the defenses, whereby effective musketry fire can be directed through loopholes. Galleries have been occasionally used in the counterscarps of dry ditches, enabling the defenders to maintain a flanking fire upon the ditch. They are also used in the construction of military mines, and form an important part of fortresses like Gibraltar, where there are galleries of communication and connection. See FORTIFICATION; MINES AND MINING, MILITARY.

GALLEY (OF. *galce*, *galie*, It. *galea*, from ML. *galea*, *galcia*, Grk. *γαλέα*, *galca*, *γαλαῖα*, *galaia*, galley). The name generally applied to vessels using sails and oars. The ships of the ancients were practically all of this character, hence they are generally spoken of as galleys. A bas-relief at Thebes represents a naval victory gained by the Egyptians over the East Indians about B.C. 1400. The vessels shown have oars and sails, and the Egyptians had figureheads of metal in the shape of a lion's head. Herodotus says that the Egyptian war galleys had soldiers on board as the fighting force, archers and sling-men being stationed on the raised platforms at bow and stern, while pikes, spears, javelins, battle-axes, falchions, swords, and other weapons were kept in convenient places for use in boarding or repelling boarders. The sail was square and carried on a yard on the single mast. The Egyptians never were such bold navigators as the Phœnicians, and their vessels were probably inferior in sea-going qualities to the Phœnician ships. After having been for centuries masters of the seas, the Phœni-

cians became subject to Egypt, and in B.C. 610, by order of the Egyptian King, Necho, a Phœnician expedition is said to have circumnavigated Africa. The advantages possessed by a war vessel propelled by oars over one at the mercy of the winds was early realized, and to attain the greatest possible speed the number of banks of oars was increased to two, three, four, and five. The increase beyond three seems to have resulted in very little gain, and the *trireme* remained for many centuries the standard type of war galley of the first class. In merchant galleys sails formed the principal motive device, and oars were auxiliary; in war galleys the reverse was the case.

The more modern galley appeared after sail-power had begun to assert its supremacy as the propelling force of sea-going vessels. Its development reached its highest point at the end of the sixteenth century, Lepanto being the last great sea fight in which the galley appeared as the most powerful type of war-ship. These vessels carried firearms, guns, and small arms, and had fairly good sail-power as well as oars. During the Middle Ages the oars of galleys were largely manned by infidel prisoners and criminals, and in France convicts were used in the large boats working about the arsenals until recent times. Row-galleys, fitted as gunboats, were extensively used during the Napoleonic wars in operations, and caused much trouble to the British fleet. Like all galleys designed especially for oar-propulsion, they were long and narrow, the length being seven or eight times the beam, and they were, therefore, very fast. In the British Navy the term galley is applied to the captain's boat, or gig, and other similar boats built for speed under oars. For further information, consult: Duemichen, *Die Flotte einer ägyptischen Koenigin*, etc. (Leipzig, 1868), Eng. trans., *Fleet of an Egyptian Queen*; Rawlinson, *Ancient Monarchies* (London, 1862-76); Parker, *Fleets of the World: The Galley Period* (New York, 1877); Chabas, *Etudes sur l'antiquité historique* (Paris, 1873); Jal, *Archéologie navale* (Paris, 1840); Bouet-Willamez, *Batailles de terre et de mer* (Paris, 1855). See SHIPS.

GALLEY SLAVE. See BAGNES.

GALL-GNAT. A minute fly of the family Cecidomyiidae, which makes galls (q.v.) on plants.

GALLIARD, gá'yär' (Fr., merry). An old French dance for two dancers. It was of a stately character, written in three-quarter time, and was one of the precursors of the minuet.

GALLIC ACID (from Lat. *galla*, gall-nut), $C_6H_7(OH)_2COOH$. An organic acid that exists ready-formed in small quantity in gall-nuts, in tea, in valonia (the acorn-cup of *Quercus agilops*), in divi-divi (the pod of *Casalpina coriaria*), in sumac, and in other vegetable products. It is formed from tannin when the latter is boiled with dilute sulphuric or hydrochloric acid, or, much more slowly, when gall-nuts, reduced to a thin paste with water, are exposed to the air. Gallic acid has also been prepared artificially by chemical methods. It may be purified by dissolving in hot water, decolorizing the solution with animal charcoal, and setting it away to crystallize. Pure gallic acid is a colorless substance, crystallizing in the form of silky needles that are slightly soluble in cold water, but require

only three parts of hot water for their solution, and are also freely soluble in alcohol and in ether. When heated to the temperature of 220° C., gallic acid melts and decomposes into pyrogallic and carbonic acids, the reaction taking place according to the following chemical equation:

Solutions of gallic acid have an acid reaction and a sour, astringent taste; iron salts impart to them a blue-black color, and, therefore, gallic acid has been employed in the manufacture of ink. Further, as the acid possesses the property of reducing the salts of gold, silver, and platinum, it has been extensively employed in developing photographs. Gallic acid is also sometimes used in medicine; and finally, since solutions of its alkali salts rapidly absorb oxygen, the acid may be usefully employed in the chemical laboratory.

GALLICAN CHURCH. The National Church of France. The term is frequently used, however, not so much in its historical or geographical sense as in the narrower signification attached to the word Gallicanism—a school of thought which asserts certain principles of more or less independent Church government and prerogatives in administration claimed by the National Church as opposed to certain rights of the Pope. The fact that France was the 'eldest daughter of the Church,' one of the countries in which the Christian faith became widely diffused even in the lifetime of the Apostles, gave the adherents of this view a powerful tradition of Church privileges to which they might appeal. Christianity flourished very early among the Greek colonies in the south of Gaul, as the old tradition of the visit of Lazarus to this region attests. In the numerous and populous towns along the Rhone and its tributaries, there arose important congregations professing Christianity. When persecution came, the Gallic Christians had their full share of hardships. They were closely in touch with those who shared the same faith in other parts of the world, and one of the most touching monuments of early Christian literature is the letter of the churches of Lyons and Vienne to the brethren in Asia concerning the martyrs of these churches, which Eusebius has preserved in his *Ecclesiastical History*. The works of Irenæus, Bishop of Lyons (died c.202), are important contributions to the history of Christian doctrine. In the next two centuries Sulpicius Severus, Hilary of Poitiers, Hilary of Arles, Vincent of Lérins, Prosper, Victor, Eucherius, Salvian, and Gregory of Tours continued a tradition of great churchmen, of which Gaul was not without reason proud. The hierarchical organization of the Church of Gaul was, from the earliest times, the most complete and regular of all Western Christendom. As a result of this tradition of zeal and faith, many privileges were granted to it, and later on, the kings of France began to make themselves more and more felt in ecclesiastical affairs. This was an almost inevitable consequence of the close relations between the Crown and the Church dignitaries, most of whom held the temporalities of their benefices by the ordinary feudal tenure; the royal authority soon came to assert a correlative claim to certain privileges in ecclesiastical matters.

VOL. VIII.—26.

There were not wanting ecclesiastics who would compound with their consciences in order to uphold the claims of their sovereign, and for several centuries after the death of Charlemagne, kings and bishops at times played into each other's hands.

In order to secure subservient ecclesiastics, monarchs insisted on the privilege of nominating to bishoprics. The wealth of the more prominent sees was very great, and rulers contrived at times to have their brothers, or even illegitimate relatives, nominated to them. Where such unworthy prelates ruled their flocks without due regard to Church principles, the only resort was an appeal to Rome; and that usually took a considerable time, during which abuses seemed to acquire the force of right. As the result of these appeals and their not infrequent decision against the wish of the King, there came a protest against having such causes decided outside the realm. More than one of the French sovereigns engaged in a conflict with the Roman See; and these conflicts naturally called out a division of opinion among the members of the Church of France, one party supporting the Papal claims, while the other maintained the alleged prerogatives of the French Crown and privileges of the National Church. The great contest between Philip the Fair and Boniface VIII. was a turning-point in the constitutional history of Europe—the beginning of a reaction on the part of the laity against ecclesiastical predominance, which, like most reactions, went further in the opposite direction; and the State succeeded in transferring to itself the greater part of the external dominion enjoyed previously by the hierarchy.

Gradually the principles of what is known as Gallicanism took definite shape, even thus early. Throughout its long career, while recognizing in theory the primacy by divine right of the Roman pontiff over the whole Church, it yet asserted the independence of national churches, and especially that of France, in many details of local government, and held the exercise of Papal prerogative to be limited by the canons and decrees of general councils. It must be added that while the Gallican theory to this extent claims an exemption from dependence upon the authority of the Pope, it acquiesces, on the other hand, to an almost proportionate degree in the assumption of ecclesiastical authority by the civil government; indeed, in many of the details of its later development it falls into the extremest form of Erastianism, the doctrine of State supremacy in matters spiritual as well as temporal. The conflicting claims of the rival popes in the Western schism (see **SCHISM, WESTERN**) tended to weaken the Papal authority, especially in France. The expedient adopted of calling a general council to pronounce upon the respective claims of the rival popes gave prominence to what became one of the leading tenets of Gallicanism, the superiority in point of authority of the general council to the Pope.

Some of the disciplinary enactments of the councils of Constance (1414-18) and Basel (1431-45) were mainly directed toward the limitation of the Papal authority in the exercise of Church patronage within the limits of the National Church. These claims of privilege culminated in the Pragmatic Sanction (q.v.), passed at

Bourges in 1438 by a national council of the French Church in union with the King, Charles VII. This abolished Papal reservations, and restricted appeals to Rome to *causæ maiores*. Though Louis XI. attempted to repeal it, it was maintained in spite of Papal protests until 1516, when it was superseded by the Concordat of Bologna (see CONCORDAT) between Leo X. and Francis I. The most conspicuous alteration effected by the new compromise was the transfer of the right of nomination to bishoprics and other *benefices consistoriaux* from the capitular bodies to the Crown, with a provision for Papal veto upon any choice which did not satisfy canonical requirements. It was substantially a triumph of the absolutist principle, as represented by the King and the Pope, over the constitutional, as embodied in the 'Gallican liberties'; the upholders of the latter quoted it complacently as establishing them, whereas it was the most formidable blow which had been dealt at them.

Soon, however, new and more far-reaching complications arose with the introduction of the principles of the Reformation into France. The first Protestant place of worship in Paris was opened in 1555, at which time the adherents of the Reformation in the kingdom probably numbered about a million and a half. Beginning as dissenters on spiritual grounds, the Huguenots were soon driven by the force of circumstances into the position of a seditious faction whose activity threatened the peace and stability of the State. Their history cannot be properly understood unless this fact is borne in mind. The story of the wars of religion is strangely complicated by its bearing upon their progress. Thus the League, which took its rise from the strangely indulgent terms granted to the Huguenots by the 'Peace of Monsieur' in April, 1576, four years after the massacre of Saint Bartholomew (see BARTHOLOMEW'S, MASSACRE OF SAINT), was founded upon peculiarly assorted principles; politically it was democratic, while its religious views were the most ultramontane. At the time of its predominance, after the 'day of the barricades' (May 12, 1588), the Huguenots became for a time the champions of order and constitutional authority; but the situation changed again with the conversion of Henry IV. That sovereign, when he issued the Edict of Nantes in 1598, was actuated not only by a general belief in toleration, but by his knowledge that French Protestantism was a struggle even more for political than for religious predominance, and his desire to bring that conflict to an end, in the interests of statesmanship, by depriving his Protestant subjects of any reasonable pretext for disaffection.

With the cessation of civil strife, a remarkable outburst of religious life manifested itself. There was need for it; three-fourths of the parochial churches and a third of the episcopal sees were without pastors, and miserable disorder was to be seen everywhere. Now, in all directions, new undertakings multiplied—colleges, schools, hospitals, congregations for the systematic training of the clergy, seminaries, and new monastic orders or reforms within the old ones. The names of Saint Vincent de Paul, of Saint Francis de Sales, and his devoted associate, Saint Jane Frances de Chantal, of Cardinal de Bérulle, and M. Olier—of La Trappe and Saint-Maur and Port Royal—speak eloquently of the great wave of

zeal which passed over the land in the first half of the seventeenth century. When, however, the death of Richelieu removed the great personality which had stood for order and unity, this fair picture was marred by a new ebullition of strife, which proved full of peril and disaster, in the rise of Jansenism and Quietism (qq.v.). Toward the close of the century, moreover, with the attempt of Louis XIV. to enlarge the ecclesiastical prerogative of the Crown as he had increased its political authority, the principles of Gallicanism assumed an importance which may fitly be treated here at length. Controversy arose over his attempt to enforce the so-called *droit de régale*, based upon his claim to receive the revenues of bishoprics during vacancies, and to appoint to all benefices in the bishop's patronage, not involving the cure of souls, which might fall vacant during the interval. An effort to exercise this power brought on a collision between the Crown and certain bishops. Their metropolitan decided against them, and they appealed to Rome, where Innocent XI. upheld them, much to the displeasure of Louis and the courtier ecclesiastics. An assembly of the higher French clergy was convened to find a way out of the difficulty. At its opening Bossuet, just chosen Bishop of Meaux, delivered his celebrated discourse on the unity of the Church. It was clear that his intention was not to deny the headship of Rome in any sense, but merely to reassert what were considered prescriptive privileges; yet it is difficult to understand how the prelate who pronounced so eloquent a defense of the rights of the Pope could, before the end of the assembly, have signed the Gallican articles.

These articles, four in number, are considered the charter of Gallicanism. The first declares that "the jurisdiction of Saint Peter and his successors in the Roman see as vicars of Christ on earth, although divinely bestowed, is confined to things spiritual, and does not extend to civil or temporal affairs." The second renews the declaration of the Council of Constance as to the superiority of a general council to the Pope, and declares that the articles passed in the third and fourth sessions of the council are not to be restricted in their application to a period of schism such as existed at the time of the council. The third asserts that the authority of the Pope is to be restricted by the canons of the universal Church, and that "the laws, customs, and constitutions of the realm and of the Gallican Church remain in full force." The fourth declares that "the Pope has the principal share in the decision of questions of faith; his decrees regard all the churches and each church in particular; nevertheless, his judgment is not irrevocable unless the consent of the entire Church be added to it." It has been pointed out that since the Vatican Council, adherence to this last proposition would amount, for Roman Catholics, to formal heresy. The chief laws and customs referred to in the third article are that the National Church of France is not bound to receive all the decrees of councils and of popes in matters of discipline, and that only such decrees as are formally received are in force in France; that the Gallican Church holds itself free to receive or reject the rules of the Roman Chancery; that the Roman Pontiff cannot levy any impost upon the French clergy without their consent;

that he cannot bestow of his own motion on a foreigner any benefice properly belonging to the Gallican Church; that neither the Pope himself, nor his legates, can hear French causes 'in the first instance,' and that even in cases of appeal he is bound to assign French judges to hear the cause, even should the appellant be a metropolitan or primate; finally, it is asserted that the French bishops shall not be required to attend any general council, unless with the permission of the Crown. The last of these customs, as also those which make the reception of the general canons of discipline optional in France, and which practically throw the decision into the hands of the civil power, have been not unreasonably called the 'slaveries' rather than the 'liberties' of the Gallican Church. It was not long before Bossuet declared that "the liberties of the Church are constantly appealed to against the Church and to her detriment." Fénelon wrote: "In practice the King of France is now more the head of the Church than the Pope. Liberty toward the Pope; servitude toward the King. The King's power over the Church has fallen into the hands of the civil tribunal. Laymen lord it over the bishops. Secular judges go so far as to examine even those Papal bulls which relate only to matters of faith."

Louis was resolved, nevertheless, to enforce the declarations strenuously. By royal edict he commanded the acceptance of the four articles and their incorporation into the acts of parliaments and universities. Professors were required to teach them and bishops to swear to them. The Sorbonne objected, but was compelled to submit. Outside of France, distinct disapproval marked the declaration; Pope Innocent XI. received it in silence, but refused to raise to the episcopate any members of the assembly who were subsequently nominated. His successor, Alexander VIII., condemned the declaration in 1690. Two years later Louis wrote to Innocent XII. that his edict concerning the Declaration of Rights no longer held, and that he wished all the world to recognize his veneration for the Pope. The declaration was not, however, formally withdrawn, and was subsequently condemned by Clement XI. in 1706, and again by Pius VI. in 1794.

The revocation of the Edict of Nantes scarcely belongs in strictness to an ecclesiastical survey, since, like the original promulgation, it was supposed to be an act of political wisdom. The Huguenots, as Lavalée remarks, preserved toward the Government the attitude of children in disgrace, and toward the Catholics that of disdainful enemies; they persisted in their isolation; they kept up a continual correspondence with their friends in England and Holland, even when those countries were hostile to their own. "France," says Michelet, "found a Holland in its own bosom which was rejoicing at the success of the other." On the eve of the formation of the League of Augsburg against him, Louis XIV. could hardly have been expected to leave such a stronghold of anarchy within his kingdom as the privileges of the Edict of Nantes had come to constitute. The act of revocation was received with a chorus of enthusiastic applause from all sorts of people in France. Bossuet burst forth into a joyful panegyric: Fénelon, who has been represented as the apostle of toleration, laid it down clearly that "though no sovereign may re-

quire interior belief in religious matters from his subjects, he may prevent the public exercise, or the profession, of opinions or ceremonies which disturb the peace of the commonwealth, by the diversity and multiplicity of sects." The laity applauded the King not less than the clergy; the great Chancellor, Le Tellier, after a life of noble and high-minded service to his country, died with the *Nunc dimittis* upon his lips, saying that he had nothing left to wish for after this final act of his long ministry. The consequences to religion were not, however, altogether happy; and the gentle methods of persuasion employed by the Lazarists, Sulpicians, Doctrinaires, and Theatines, who went as missionaries among the Huguenots, were probably far more efficacious in producing real conversions than were the *dragonnades*.

The general tone of laxity which characterized the eighteenth century did not fail to have its effect upon the Church, infecting at least the higher clergy with a spirit of worldliness and selfish devotion to ease and pleasure. A terrible punishment came upon them in the Revolution. The Constituent Assembly first laid hands upon the property of the Church to meet its financial needs, and then assumed to tamper with her organic structure. The 'Civil Constitution of the Clergy,' decreed on July 12, 1790, was but a natural outcome of Gallican principles; yet its arbitrary suppression of dioceses and establishment of others, its provision for the election of bishops and *curés* by the people and their payment by the State, whose stipendiaries they were to become, raised the weightier question as to whether, after all, the civil power was to impose laws upon the spiritual without the concurrence of its legitimate rulers. From this time Gallicanism, as a system, has steadily declined; and while it is true that French bishops in the nineteenth century have been, as a rule, less ultramontane than others, they seem to have learned the necessity for the supremacy of the head of their Church in religious matters. In fact, since the Vatican Council, it may be said that Gallicanism as a factor in French Church history has almost entirely disappeared.

The attempt just mentioned of the Constituent Assembly to separate the French Church from Rome, and to make it a mere department of the newly organized State, brought about a condition of affairs very like a schism. Those who submitted to take the oath to support the new order of things, the Constitutional clergy as they were called, were regarded by the stricter Catholics as having forfeited their rights, and in the more conservative provinces, like Brittany, the people refused to attend their ministrations. On the other hand, those who refused the oath were subjected to increasingly heavy penalties by the Revolutionary Government, and either exiled as a last resort to the pestilential swamps of Guiana or executed. Their faithfulness, however, had its reward; when religion once more held up its head after the excesses of the Terror, the Constitutional organization gradually disappeared; and a *modus vivendi* was reached in the Concordat of 1801 by Napoleon, who was acute enough to see the advantage to his newly founded dynasty of the support of the Church. This, having proved not entirely satisfactory, was reviewed after the Restoration, in 1817; but the

new instrument, which was in many particulars a return to that of 1516, was not approved by the Chambers, and the Church remained for several years uneasily fluctuating between two concordats, neither of which was fully executed, until in 1822 an arrangement was concluded by which thirty prelates were added to the existing hierarchy, its total number being thus fixed at eighty.

Among questions or movements of general significance which have agitated the French Church since that date must be mentioned the stir caused about 1830 by the body of enthusiastic visionaries, of whom Lamennais, Lacordaire, and Montalembert are the best known, starting from a pure devotion to the cause of liberty and a conviction that the Church would gain by its fullest exercise, but ending in dangerous errors which received the condemnation of the Holy See, and in more modern times the very serious aggressions made upon the Church with increasing bitterness by the Government of the Third Republic. Though Pope Leo XIII. has repeatedly laid down the principle that there is no reason why, theoretically, a good Catholic should not be a good republican, it is undeniable that the bulk of the monarchist parties is composed of members of the Church; and it is, therefore, not altogether to be wondered at that the Government has felt justified in taking a position of antagonism to the Church as a whole. The extreme lengths, however, to which this antagonism has been carried within the last few years are difficult to reconcile with the principles of a democracy, and afford scope for many doubts as to the outcome of a policy so hostile to the religious instincts which are at least latent in the great majority of the French population.

GALLICAN CONFESSION. See GALLICAN CHURCH.

GALLIEN, gāl'lén, JOHANNA. See WYTTEBACH, DANIEL ALBERT.

GALLIENUS, gāl'lī-ē'nūs, ARCH OF. An arch at Rome in honor of Gallienus and his wife Salonina. It represents the old Esquiline gate of the Servian city, converted into a travertine arch by Aurelius Victor.

GALLIENUS, PUBLIUS LICINIUS (? A.D. 268). Roman Emperor, A.D. 253-268. The son of the Emperor Valerianus, he was made joint

ruler on his father's accession in August, 253. In 256 he took the field against the Alemanni, who were making incursions into the Roman provinces along the Danube. After several campaigns they were subdued in 258, but they rose again soon after and forced their way into Italy, where Gallienus gained a victory over them near Milan. (See ALEMANNI.) Meanwhile Valerianus had been engaged in wars with Sapor, the Persian King, by whom he was taken prisoner in 260. Gallienus now became sole Emperor, but only in name; for self-appointed rulers arose in all parts of the Empire, this period being for that reason known in history as the 'Reign of the Thirty Tyrants.' Gaul became practically a separate kingdom under Postumus (258-267). With civil war within and constant incursions of the barbarians from without, the reign of Gallienus was a period of incessant turmoil until, in an attack on Milan, where he was besieging the usurper Aureolus, he was killed in a plot formed by some of his own officers (March 4, 268).

GALLIETFET, gā'l'ē'fā, GASTON ALEXANDRE AUGUSTE, Marquis de (1830—). A French soldier, born in Paris. He fought in the Crimean War on the staff of General Bosquet, and was commended for his bravery at Sebastopol. He was subsequently engaged in Mexico, and was dangerously wounded at the battle of Puebla (May 15, 1863). In recognition of his bravery he was selected upon his return to France to deliver the captured Mexican battle-flags to Napoleon III. During the Franco-German War he led the memorable cavalry charge at the battle of Sedan, and afterwards became conspicuous in the suppression of the Commune. In 1872-73 he was in Algeria, where he suppressed the revolt among the natives. In 1875 he became general of division, and in spite of his Bonapartist and clerical proclivities, avowed himself a loyal republican, and won the favor of Gambetta. In 1879 he was appointed commander of the Ninth Army Corps, and did much to improve the French cavalry. In 1899 he was appointed Minister of War, which position he resigned in 1900, after having by his rigorous discipline done much to carry the Government safely through the crisis of the Dreyfus agitation. He is considered one of the leading authorities in Europe on cavalry tactics.

GALLINÆ (Lat. nom. pl. hens), or RASORES. An order of birds, more generally valuable to man than any other order, containing at once the most important species domesticated as poultry, and those most sought after as game. The common domestic fowl may be regarded as the type of the order. Like it, the Gallinæ in general have a small head; a rather short bill, with the upper mandible a little arched; nostrils placed on the sides of the bill, and usually in a soft membranous space at its base; the figure bulky; the wings short, and not governed by powerful muscles, or adapted for long or rapid flight; the feet with three toes before, and one behind—which is articulated higher than the others, and is sometimes wanting—adapted for walking on the ground and for scraping, which is much resorted to, in order to procure food and for other purposes; the digestive organs are complex, the crop is large, the gizzard very muscular, the intestine long, with two very large cæca. The sternum is deeply double-notched; there are two carotids; the oil-gland is tufted; the plumage

has aftershafts and there are usually more than twelve tail-feathers. The head, at least of the males, is often furnished with appendages, as a crest, comb, wattles, etc. The feet of the males are also often furnished with *spurs*, and at least during the breeding season the males are very quarrelsome. The males of many species (e.g. pheasants) are birds of splendid plumage; that of the females is sober, but females of very advanced age often assume a plumage similar to that of the males. Some of the Gallinæ are polygamous, some pair at the breeding season; the nest of all of them is artless, and the males take no part in incubation, or in the rearing of the young. The young are precocial, that is, they are comparatively feathered when hatched, and are immediately able to run about and pick up food for themselves, but are for some time tended and protected by the mother, and by her the proper food is sought for them and pointed out to them, or broken into sufficiently small pieces, and laid before them. The Gallinæ have unmelodious voices. Except the curassows, they make their nests on the ground. Some of them are found in almost all parts of the world. Besides those already named; guans, pheasants, grouse, partridges, quails, ptarmigans, peacocks, turkeys, guinea-fowls, and tragopans may be mentioned as examples of this order. See ORNITHOLOGY; FOWL; GROUSE; PARTRIDGE; PEACOCK; EGGS OF AMERICAN WATER AND GAME BIRDS, for colored plates and further description.

GALLINETA (Sp., sandpiper). A remarkable rail (*Aramides ypecaha*) of the La Plata Valley, South America, called 'ypecaha' by the native Indians, which is noted for its shrieking cries, and for its gathering into companies which join in dances, the performers becoming almost frenzied with excitement, and with loud cries and outstretched wings rushing from side to side for several minutes. These performances seem to be unconnected with the nuptial season or sexual excitement, and are indulged in by jacanas, the Cayenne lapwing, and various birds in other parts of the world. For a detailed description and consideration of this and other habits, consult Hudson, *Naturalist on the La Plata* (London, 1892).

GALLINGER, JACOB H. (1837—). An American physician and politician, born at Cornwall, Ontario, Canada. He graduated at the medical school of Dartmouth College in 1858, practiced medicine and surgery at Concord, N. H., from 1862 until his appearance in public life, and contributed much to medical literature. In 1879-80 he was Surgeon-General of New Hampshire, with rank of brigadier-general. He was a member of the New Hampshire House of Representatives in 1872-73, of the State Senate in 1878, 1879, and 1880, and again of the House in 1891. From 1882 until his resignation in 1890 he was chairman of the Republican State Committee, and in 1898 and 1900 was reelected to the post. He was chairman of the New Hampshire delegation to the Republican National Convention of 1888, in which he seconded the nomination of Benjamin Harrison for the Presidency, and also to that of 1900. In 1885 he was elected to the Federal House in the Forty-ninth Congress. He was reelected in the Fiftieth, declined renomination for the Fifty-first, took his seat in the Senate in 1891, and was reelected in 1897.

GALL-INSECTS (from Lat. *galla*, gall-nut). Until about two hundred years ago galls were supposed to be purely of vegetable origin, and the maggots that grow within them were supposed to arise by spontaneous generation in the organic substances in the galls. Pliny knew that a fly came from galls, and thought they grew like fungi in the night. Malpighi, in the second half of the seventeenth century, was the first to record the fact that the production of galls followed puncture of vegetable tissue by insects, and he came to the conclusion that the insects inject a substance, which he called ichor, into the plant-tissue, and this substance produced a swelling similar to that which the sting of a bee causes in animal tissue. Réaumur held the theory that the gall is not the product of some specific irritating fluid, but is due to the irritation caused by the prick, and to the presence of the egg and developing larvæ in the tissue. Some galls begin to develop as soon as the eggs are laid, but, unfortunately for the universal application of Réaumur's theory, others do not begin to develop until after the eggs hatch, which may be months after they are deposited in the tissue.

Galls occur on a great many kinds of plants and are produced by a variety of insects, by mites, and by at least one nematode worm. Each species of insect confines its activities to one or, at the very most, to a very limited number of species of plants. The same kind of insect will produce different kinds of galls on different kinds of plants, and different kinds of insects will produce different kinds of galls on the same plant. Each species of gall-insect, however, infests different parts of the plant, such as the leaf, flower, stem, or root, and that part alone; and it produces there galls with such precise qualities that it can be definitely stated, from the appearance of the gall, what sort of an insect has caused its development. In rearing galls, one cannot be certain from merely observing the emerging insects what species are the producers of the gall, for a number of different kinds of insects may develop within the same gall, some as guests, feeding on the tissue of the gall, and others as parasites on the larvæ of the true gall-insect.

Nearly all the orders of insects have gall-making representatives. In addition there are the galls of mites and nematodes. The galls made by mites, like those produced by plant-lice, have open mouths for the escape of the matured mites. An example of a gall produced by mites is the pear-leaf blister made by *Phytoptus pyri*. Nematodes of the genus *Anguillula*, which is allied to the vinegar-worm, are the cause of smut in growing grain, particularly in wheat. The larvæ of these insects have the most extraordinary capacity of withstanding desiccation. The egg is laid by the parent in the growing ear, where the larvæ develop and are set free by the dying grain. They then live in the moist earth until the young wheat begins to grow. They creep up the stem of the wheat, and when once lodged within the head they soon gain sexual maturity. In their wanderings in search of new, growing grain, the larvæ undergo great vicissitudes. They may be compelled by drought to encyst a number of times, even on the very stem of the plant, and await moisture before they are able to reach their final destination. Accord-

ing to Spallanzani, they may retain their vitality for twenty years while awaiting their food-plant.

The family Cynipidæ, of the order Hymenoptera, furnishes the greatest number of species of gall-producing insects. The majority of its species (called gall-flies) infest some part of the oak, making closed galls. They are the best studied of all the galls, and a large amount of information concerning their life history has been gained by the painstaking studies of Adler, Riley, and others. Adler kept oak saplings until from four to six years old, and on these he isolated certain insects, and observed the resulting galls. Some of the species that Adler bred were so nearly alike that he could determine them with certainty only by their galls. Moreover, certain species that had been given different specific or even generic names he found to be the alternating generations of other described species. Some winged generations he found to be composed entirely of females, and the next generation of both males and females. Thus the individuals of one generation do not resemble their parents, but their grandparents. (See ALTERNATION OF GENERATIONS.) Not only are the insects of these two generations very different, but the galls that they produce are likewise different. Other forms are believed to reproduce entirely parthenogenetically without males ever appearing. Adler studied galls of the bud, leaf, bark, and root, and found that all of them are developed by abnormal activities of the cambium ring. The potentialities of the tissue-growth are always present at the spot pricked, and are merely called into activity by the prick or by the larvæ. He found that some of the galls are protected from attack by sweet juices, which attract guarding ants, and it is interesting to note that the honey-making ants (q.v.) of the Southeastern United States gather honey from oak-galls. Other galls are provided with a sticky secretion on long hairs which entraps marauders; the spongy parenchyma of some galls is so very thick that it acts as an effectual barrier against intruders. Other galls have an inner stony layer for the protection of the larvæ; others, a large, hollow chamber in which it is difficult for the enemy from without to locate the larvæ. The pine-cone-like arrangement of scales in certain galls is a sufficient protection to the larvæ. Other galls are exempt from attack by virtue of their bitter tannin or by their protective coloration. Insects, titmice, pheasants, and squirrels are the chief enemies of gall-insects, the birds and squirrels tearing them open in winter to get the larvæ within them.

Three classes of hymenopterous insects may be reared from one and the same gall. (1) Psenids, or true gall-flies, which lay their eggs in the tissue of the plant; many of these species cause those subsequent modifications in the development of the plant-tissue that we call galls. (2) Inquilines, or guests, which lay their eggs and develop in the galls caused by the true gall-makers. (3) Parasites, which prey on the larvæ of the true gall-makers or their guests. According to Adler, Riley, and others, the growth of the gall probably depends upon the activity of the larvæ, and is the result of some secretion or excretion thrown out by the larvæ.

The rate of growth of the gall will depend on that of the meristem, those that are formed on

catkins and young leaves growing rapidly, while those on roots and bark require perhaps months to gain full size.

Some of the gall larvæ of the Diptera (especially the minute flies of the family Cecidomyiidae) transform in the plant tissue and others in the ground. The larvæ are maggot-like and without anal opening. The goldenrod gall, a round ball produced in the stem of the plant by a fly (*Trypeta solidaginis*), and the pine-cone galls on the heart-leaved willow (*Salix cordata*) are formed by dipterous insects. The Hessian fly of wheat, which stings the base of the leaf, and the wheat-midge, which stings the flower, are also classed as gall-insects. The Hemiptera have gall-producing representatives among the plant-lice (aphids) of the Coccidæ and of Phylloxera. The galls produced by plant-lice have open mouths for the escape of the developed lice. Reproduction may take place within the gall. The cockscomb elm-galls, on the upper side of elm-leaves, are produced by a plant-louse (*Colopha ulmicola*). The destructive grape-vine phylloxera makes galls on the under side of the grape-leaf and on the roots of the vine. The elongated galls on the goldenrod stems are produced by a tineid moth (*Gelechia gallæsolidaginis*). In Australia several plants are infested by gall-producing thrips, and galls are also said to be caused by beetles.

Consult: Osten Sacken, "On the Cynipidæ of North American Oaks and Their Galls," in *Proceedings of the Entomological Society of Philadelphia*, vol. i., pp. 47 to 72, 241 to 259; and vol. ii., pp. 33 to 49; vol. iv., pp. 331 to 380 (Philadelphia, 1861-64); Cameron, *Monograph of the British Phytophagous Hymenoptera* (London, 1882-93); Rothman, "On the Ætiology and Life History of Some Vegetal Galls," in *Natural Science*, vol. iii. (London, 1893). Beutenmüller, "Catalogue of Gall-Producing Insects Found Within Fifty Miles of New York," in *Bulletin of the American Museum of Natural History*, vol. iv. (New York, 1892—). See PHYLLOXERA; APHID.

GALLINULE (Lat. *gallinula*, diminutive of *gallina*, hen). A bird of one or other of the genera *Gallinula*, *Iornis*, etc., of the family Rallidæ, closely allied to the coots, and having the upper mandible similarly extending up on the

HEAD AND FOOT OF GALLINULE.

a, foot of purple gallinule (*Iornis Martinica*); b, profile of head of the same; c, top of head of Florida gallinule (*Gallinula galeata*), showing shape and extent of frontal shield.

forehead in a naked soft plate, but the toes usually furnished with an undivided narrow marginal membrane. This membrane and the great length of the toes enable the gallinules to swim well, and all of them are aquatic. The species are about 30 in number, some of them confined to tropical regions. Two occur in the United States. The Florida gallinule (*Gallinula galeata*) is brownish olive above, grayish black beneath, and

the bill is red. It is a little more than a foot in length, and is found from New York State, Minnesota, and California southward through Central and Northern South America, though only a summer visitor in the most of the United States. Its nesting habits are like those of the coot (q.v.). The purple gallinule (*Tornis Martinica*) is a trifle smaller, and a handsome olive green above, the head and under parts being a beautiful purplish blue. It is a South and Central American species, common to the West Indies and the South Atlantic States, where it is resident. (See Plate of RAILS, ETC.) All these birds are commonly known as 'mud-hens,' and are shot for sport, but the flesh is not good.

The common gallinule (*Gallinula chloropus*) of Europe is more usually styled in Great Britain 'water-hen,' or 'moor-hen.' It is widely diffused in the Old World, and abundant in suitable situations, such as river marshes and the artificial ponds of parks, where these birds may often be seen in considerable numbers, swimming together, with a peculiar nodding motion of the head. They seek their food both on the surface of the water and by diving, partly also among the grass of meadows and river-banks. A frequent jerking of the tail is very characteristic of them. When alarmed, they sometimes seek safety by flight, but more frequently by hiding among rushes or reeds. They make their nests near the water which they frequent, and usually on the ground, and lay from seven to ten brown and speckled eggs. The flesh is well flavored. See COOT and RAIL.

GALLIO, LUCIUS JUNIUS. A Roman rhetorician of the first century, a member of the senatorial order, who gained the ill will of Tiberius by proposing that retired members of the Prætorian Guard should have seats with the *equites* in the first fourteen rows of the theatre. He was banished from Rome, then recalled and kept under surveillance, and finally put to death by Nero. His text-book on rhetoric has not survived.

GALLIO, LUCIUS JUNIUS ANNÆUS. The name assumed by Marcus Annæus Novatus from that of Lucius Junius Gallio, the rhetorician, by whom, as a friend of his father, Marcus Annæus Seneca, he had been adopted. He was an older brother of the philosopher Lucius Annæus Seneca, and of the geographer Lucius Annæus Mela, father of the poet Lucan. It was quite probably through the influence of the former that, in the latter part of the reign of Claudius, Gallio was appointed Proconsul of Achaia, though his Hellenic culture was not an unlikely factor in the case. The exact date of this appointment is uncertain. It could not have been earlier than A.D. 44, in which year Achaia was raised to a senatorial province, and may have been as late as 54, the last year of Claudius's rule. If the office was in any way due to his brother's influence it must have been after 49, when Seneca, who had been in exile since 41, was recalled by Agrippina to become the tutor of Nero. We know definitely that Gallio was in office when Paul was at Corinth on his first visit to that city, but the exact date of this visit is debated, and varies between fall 49-spring 51 and fall 53-spring 55. See NEW TESTAMENT CHRONOLOGY.

It was during this visit that the Jews, angered evidently by the defection of leading members of the Synagogue to the Apostle's following, brought

Paul before the proconsul on the charge that he was acting contrary to the [Roman] law. Gallio dismissed their case, however, with the statement that he was not minded to be a judge of these matters. And when Sosthenes, probably the leader of the accusing party, was taken by the [Greek] bystanders, with whom the Jews were generally unpopular, and beaten before the judgment seat, Gallio refrained from interposing, the narrative stating that he cared for none of these things (Acts xviii. 14-17). From this last statement it has been inferred that Gallio was indifferent to Christianity. The words of his reply, however, while betraying an ignorance of the distinctive features of Christianity, disclose simply the usual attitude of Roman officials to the religions of the people of the provinces in accordance with Roman law. Its meaning is that, inasmuch as the controversy was practically a matter of religious dispute among the Jews, it should be adjudged by themselves, the Roman law taking no cognizance of such things. In accord with this it is clear that the statement referred to had reference merely to Gallio's indifference to the controversy in general and to the beating of Sosthenes in particular as matters of his judicial concern. Consult, besides the usual lives of Paul and commentaries on Acts, Ramsay, *Saint Paul the Traveler and Roman Citizen* (New York, 1896). See PAUL.

GALLIOT (from OF. *galiote*, from ML. *galeota*, diminutive of *galea*, galley). A galley of medium size having one mast and 16 to 20 oars, and very generally used in the sixteenth, seventeenth, and eighteenth centuries as a cargo vessel and gunboat by the maritime nations of Europe. Also a Dutch or Flemish vessel with very full lines, an easy bilge (q.v.), and a flat bottom. It is rigged like a ketch with a high mast stepped in the centre of the ship and a much lower one farther aft. The head-stays lead from the main (or higher) mast, and the head sails are large and numerous; both masts are square-rigged. Galliot are usually of 400 to 500 tons measurement. They were formerly much used as bomb vessels, the absence of a mast forward giving ample space for the operation of bombards, mortars, or howitzers.

GALLIPOLI, gál-lé'pó-lè. A city and seaport in the Province of Lecce, in South Italy, 55 miles south of Brindisi, the Greek name of which, Calipolis (beautiful city), was derived from its picturesque situation in the Gulf of Taranto, on a rocky island which a bridge having 12 spans now connects with the suburb of Lizza on the mainland (Map: Italy, M 7). Gallipoli has a cathedral dating from 1629, a castle, a seminary, a gymnasium, and a technical school. There is regular steamship communication with Brindisi and Taranto. It exports oil, wine, and fruit, and has long been famous for its oil-cisterns cut in the solid limestone. Population of commune, in 1881, 11,000; in 1901, 13,552.

GALLIPOLI (anc. *Callipolis*). A seaport of European Turkey, capital of a sanjak in the Vilayet of Adrianople, situated on the eastern coast of the peninsula of Gallipoli, at the north-eastern end of the Dardanelles (Map: Turkey in Europe, F 4). It has crooked, ill-paved streets, and is built mostly of wood. There are manufactures of leather, silk, and cotton, but the commercial importance of the town is on the decline, and

the well-fortified harbor has more strategical than commercial value. Gallipoli is a Turkish naval station, and the seat of a captain pasha and a Greek bishop. The population, largely Greek, is estimated at from 20,000 to 30,000. The town was of great commercial importance during the Middle Ages, and at one time had a population of 100,000. It suffered terribly at the hands of the Catalans early in the fourteenth century, and fell into the hands of the Turks in 1354, being the first Turkish possession in Europe.

GALLIPOLI, PENINSULA OF (the ancient Thracian Chersonesus). A portion of the Vilayet of Adrianople, European Turkey, separating the Strait of Dardanelles on the east from the Gulf of Saros on the west. It extends in a southwest direction for about 55 miles, and varies from 4 to 13 miles in breadth. The principal town on the peninsula is Gallipoli (q.v.).

GALLIPOLIS, gál'li-pó-lés'. A city and the county-seat of Gallia County, Ohio, 56 miles southeast of Chillicothe; on the Ohio River, and on the Toledo and Ohio Central, the Columbus, Hocking Valley and Toledo, and other railroads (Map: Ohio, F 8). It has a public library, a public park, and Gallia Academy. The city is surrounded by undeveloped coal-fields, and is a distributing centre of some importance. There are iron and wood-working industries, and manufactures of furniture, stoves, woollens, lumber, leather, etc. The government is administered by a mayor, elected every two years, and a city council. The water-works are owned and operated by the municipality. Population, in 1890, 4498; in 1900, 5432. Gallipolis was first settled in 1790 under the auspices of the Scioto Company, by a party of five hundred Frenchmen, who named it Gallipolis—the City of the Gauls. It was incorporated as a village in 1842, and in 1865 was chartered as a city. Consult *Centennial Anniversary of Gallipolis* (Columbus, 1891).

GALLISSONNIÈRE, gál'sò'nyâr', AUGUSTIN FÉLIX ELISABETH BARRIN, Comte de la (1742-1828). A French soldier. He was a nephew of Roland Michel Barrin, Marquis de la Gallissonnière, and was born at Anjou. He entered the navy while he was a boy, and served under his uncle in Canada; then he fought in the Hanoverian campaigns. In 1788 he was appointed field-marshal, and, just before the Revolution, was invested with the grand sword of Anjou, and was made president of the nobility in the States-General. When the Revolution came he was a Deputy to the Constituent Assembly, and on its dissolution refused to leave the country, but later became an *émigré* and fought under Condé. But in 1801 he returned to France and was elected Deputy in 1809. After the Restoration he fared equally well, being promoted to the rank of lieutenant-general, but soon retired. He wrote on the establishment of the National Guard, on the Constitution of 1789, on the freedom of the press, and many other contemporaneous topics.

GALLISSONNIÈRE, ROLAND MICHEL BARRIN, Marquis de la (1693-1756). A French naval officer and Governor-General of Canada, 1747-49. He was born at Rochefort, and at the age of seventeen entered the Royal Navy. In 1745, although only a captain in rank, he was appointed to the position of Governor-General of Canada to succeed Beauharnois. He reached Quebec in

1747, and during the two years he remained in Canada displayed not only great energy, but broad statesmanship. His plan for advancement of the French possessions in America provided for building a chain of forts in the Mississippi Valley to connect Louisiana and Canada, for settling ten thousand French peasants in the Ohio Valley to check the migration that was beginning to pour over the Alleghanies from the English colonies, and for winning the friendship and alliance of the Iroquois tribes. He succeeded in establishing some forts, and supported Abbé Piquet in his mission to the Iroquois country, but his request for new settlers remained unheeded. In 1749 he was recalled to France to act on the commission to fix the boundaries to be established under the Treaty of Aix-la-Chapelle, and was succeeded by the Marquis de la Jonquière. On his return to France he was made chief of the naval Bureau of Charts and Plans, in which position he organized several important scientific expeditions. In May, 1756, he defeated the English fleet under Admiral Byng off Minorca, a result which led to the court-martial and execution of the latter. Gallissonnière died the same year.

GALLITZIN, gál-lét'sén, DMITRI AUGUSTIN, Prince (1770-1841). An American Catholic priest, of Russian family. Born at The Hague, he received a Spartan training from his mother, who sent him to North America in 1792. The ostensible purpose of his journey was to study American life, and his observations led him to believe that the Catholic Church in the United States needed men, and to volunteer. He became a priest in 1795; was settled at Port Tobacco, Md., and then at Taneytown, Md.; but in 1799 he was transferred to Cambria County, Pa. He was dissatisfied with the American system of trustee control and limitation of the priestly power, and founded the Catholic town of Loretto, Cambria County, Pa., from which colonies went out to Saint Joseph, Saint Augustine, Pa., and Carrolltown, Pa. In his work Father Smith (as Gallitzin called himself until 1809, when he resumed his family name) spent much effort and a large fortune. In 1809, when Philadelphia was made a bishopric, Gallitzin was appointed Vicar-General of the outlying districts. His writings were mainly controversial. Consult Brownson, *Life of D. A. Gallitzin, Prince and Priest* (New York, 1873).

GALLIUM (Neo-Lat., from Lat. *Gallia*, Gaul, France). A metallic chemical element, discovered by Lecoq de Boisbaudran in 1875, by means of the spectroscope. Its properties had been previously (1870) predicted, from the periodic law (q.v.), by the Russian chemist Mendelëff, who gave it the provisional name of *eka-aluminum*. It is found in minute quantities in various zinc ores, and was originally discovered in the sphalerite of Pierrefitte, from which it may be obtained by dissolving the ore and decomposing the resulting solution by metallic zinc. The precipitate thus obtained contains gallium as a hydrated oxide, which is then further purified by repeated solution and precipitation, and the gallium finally thrown down in its metallic condition by zinc.

Gallium (symbol Ga; atomic weight, 69.9) is a fairly hard gray metal that may be hammered into thin plates which can be bent without break-

ing. It melts at 30.15° C. (about 86° F.), and has a specific gravity of 5.9 when solid. Its general properties are similar to those of the metal aluminum. Gallium combines with oxygen, forming a monoxide and a sesquioxide, and with chlorine to form a dichloride and a trichloride.

GALLIVATS (East Indian). Large row-boats, sometimes having as many as fifty oars, formerly and still to some extent used in Eastern waters. They rarely exceed seventy tons, carry two masts with high, triangular sails, and are generally armed with a few small swivel guns, fastened on the bulwarks. The Malay pirates, now nearly exterminated, employ these swift but somewhat fragile vessels.

GALLIWASP (probably of West Indian origin). (1) A lizard of Jamaica and Eastern Central America (*Diploglossus monotropis*), which is greatly feared by the people, though perfectly harmless. (2) A small species of lizard-fish (*Synodus fætens*), common from South Carolina to Brazil. See Plate of LANTERN-FISHES.

GALL-MITE. See MITE.

GALLON. See WEIGHTS AND MEASURES.

GALLOON' (Fr. *galon*, from Sp. *galon*, augmentative of *gala*, finery; probably from OHG., Ger. *geil*, AS. *gāl*, wanton). A narrow, tape-like fabric composed of silk or worsted, or of both. It is usually employed for binding garments, curtains, etc. The small band worn round gentlemen's hats is an example. It is also used as a trimming material, and sometimes has a scalloped edge. When woven in gold or silver tinsel it is used as a trimming for uniforms.

GALLOTANNIC ACID. See TANNIN.

GALLOWAY. An ancient province in the southwest of Scotland, now merged in the county of Wigtown and the stewartry of Kirkcudbright. The designation, though still in use, has no political significance. The district, about 70 miles long by 40 miles broad, is famed for its mountain, lake, stream, and moorland scenery, and forms the peninsula terminating in Scotland's southernmost point, the Rhynns of Galloway, projecting into the Irish Sea. It is purely a pastoral country, remarkable for its mild climate. The simple inhabitants, honest and hospitable, but of lax morality, engage in agriculture and fishing. Its breeds of small horses and large, hornless black cattle have been known for centuries.

The name Galloway is derived from *Gall-Gael*—foreign Gaels, so called because, topographically separated from their northern brethren, they preserved their identity as a distinct race down to the twelfth century, and their language beyond the fifteenth. Ptolemy styled the inhabitants *Novantæ* and *Selgovæ*, and described their towns *Lucophibia*, *Reigionium*, *Uxellum*, *Carbantorigum*, etc., the sites of which have been identified. After the Roman evacuation Galloway came under the power of the Anglians, and later of the Norsemen. Under the Anglians they acquired the name of the Picts of Galloway. In the twelfth century they were conquered by Malcolm Canmore, who made his son David Earl of Galloway. When David ascended the throne of Scotland Galloway was united to the kingdom. The Lords of Galloway, however, frequently revolted against Scotch rule, and the periodical

troubles did not cease until the Lordship of Galloway was attached to the Crown in 1455. Consult: Skene, *Celtic Scotland* (Edinburgh, 1876); M'Kerlie, *History of the Lands and Their Owners in Galloway* (5 vols., Edinburgh, 1870-78); and *Galloway in Ancient and Modern Times* (Edinburgh, 1891).

GALLOWAY, BEVERLY THOMAS (1863—). An American botanist. He was born at Millersburg, Mo., and was educated at the University of Missouri, where he was appointed assistant in the department of horticulture in 1884. After being associated with the division of vegetable physiology and pathology of the United States Department of Agriculture for one year, he was appointed director of the entire department in 1888, and in 1900 he took charge of the office of plant industry.

GALLOWAY, CHARLES BETTS (1840—). An American bishop of the Methodist Episcopal Church, South. He was born at Kosciusko, Miss., and graduated at the University of Mississippi. He entered the ministry in 1868, and was pastor of several churches in his native State. An earnest advocate of the prohibition of the liquor traffic, he was long president of the Prohibition Executive Committee of Mississippi, carried on a spirited controversy with Jefferson Davis on that subject, and wrote a *Handbook* and *Open Letters on Prohibition*. His publications include *A Circuit of the Globe*, and *Modern Missions, Their Evidential Value*. He was for some time president of the Board of Education of his Church, a trustee of the John F. Slater Fund, and president of the Board of Trustees of Millsaps College.

GALLOWAY, JOSEPH (1731-1803). An American lawyer and pamphleteer, prominent as a Loyalist during the Revolutionary War. He was born in Kent County, Md., but early removed to Philadelphia. Almost continuously from 1757 to 1774 he was a member of the Pennsylvania Assembly, and for twelve years was Speaker of the House. In 1764 he was associated with Franklin in the contest with the Proprietary Government, and, in opposition to Dickinson, advocated the erection of Pennsylvania into a royal province. On the approach of the Revolution he was a vigorous opponent of war and of independence. In 1774 he was chosen by the Assembly to be one of the Pennsylvania delegates to the first Continental Congress, and here signed the Association, and attracted general attention by introducing (on September 28th) his celebrated 'Plan of a proposed Union' between Great Britain and her colonies. This plan provided for a federation under British supervision of the American colonies, each colony to "retain its present constitution and powers of regulating and governing its own internal police in all cases whatsoever;" for a President-General, "to be appointed by the King," and for a Grand Council, "to be chosen by the representatives of the people of the several colonies in their respective assemblies, once in every three years," and to meet once a year or oftener if necessary—the President-General and Grand Council to constitute "an inferior distinct branch of the British Legislature, united and incorporated with it," for certain specific purposes. This scheme was supported in Congress by John Jay and James

Duane, and was rejected by a vote of only six colonies to five. In December, 1776, Galloway joined the English army under Sir William Howe, and, on the capture of Philadelphia, became superintendent of the port, of prohibited articles, and of the police of the city and suburbs. After the evacuation of Philadelphia he accompanied the British army to New York, and in 1778 went to England, where he passed the rest of his life. Soon after his departure his life was attainted, and his property, valued at about £40,000, was confiscated by the Continental Congress. He was one of the ablest of the Loyalist pamphleteers. Among his best-known pamphlets are: *A Candid Examination of the Mutual Claims of Great Britain and the Colonies* (1775); *Letters to a Nobleman on the Conduct of the War in the Middle Colonies* (1779); *Historical and Political Reflections on the Rise and Progress of the American Rebellion* (1780); *Cool Thoughts on the Consequences to Great Britain of American Independence* (1780); *Political Reflections on the Late Colonial Governments* (1782); and *The Claim of the American Loyalists Reviewed and Maintained upon Incontrovertible Principles of Law and Justice* (1788). Galloway also wrote *Brief Commentaries upon such Parts of the Revelations and Other Prophecies as Immediately Refer to the Present Times* (1802), and *The Prophetic or Anticipated History of the Church of Rome, Written and Published more than Six Hundred Years Before the Rise of that Church* (1803). Consult: Balch (ed.), *The Examination of Joseph Galloway by a Committee of the House of Commons* (Philadelphia, 1855); Tyler, *Literary History of the American Revolution* (New York, 1897); and Baldwin, "Galloway, the Loyalist Politician," in the *Pennsylvania Magazine of History and Biography*, vol. xxvi. (Philadelphia, 1902).

GALLOWAY, MULL OF. A rocky headland terminating the Rhynns of Galloway, in Wigtownshire, the southernmost point of Scotland (Map: Scotland, D 5). It is one and a half miles long, a quarter of a mile broad, rises to a height of 210 feet, and is crowned by a lighthouse 325 feet above the level of the sea, visible 25 miles.

GALLOWS HILL. The name given to a hill in the neighborhood of Salem, Mass. On it during the witchcraft mania of 1692 a number of victims were hanged as witches. It is also called Witch Hill.

GALLS. In plants, deformities caused by the presence of foreign living organisms in the tissues, by substances which these organisms have produced, or by both causes combined. The technical term 'cecidium' has been proposed as a substitute for 'gall,' with the purpose of using it with prefixes to indicate origin, e.g. myco-cecidium for gall produced by fungi; diptero-cecidium for gall due to gnats, etc. The organism producing the gall is usually either an insect or a fungus, although some galls are due to the attack of slime-molds (Myxomycetes), algæ, bacteria, or worms. Galls show a great diversity of form. The deformity is due primarily to an exaggerated growth of the tissues normally present in the plant organ affected, although the tissues frequently have their cells much altered in form and size; secondarily the gall is due to the

development of special tissues peculiar to galls. The development of the gall is sometimes due to the substance injected by the insect at the time of biting or egg-laying, but more commonly

FIG. 1. FLOWER OF RADISH, greatly enlarged and deformed by a fungus, *Albugo candida*.

it depends upon the presence of the egg or larva, whose excreta or movements supply the necessary stimulus. Attempts to produce galls artificially by injuries or injections have failed.

Galls produced by parasitic plants are usually due to the presence of the organism, and since these are immobile the initial cause must be looked for in the excreta of the attacking plant (Fig. 1). Examples of galls produced by plants are the wens and tumors of various sizes and forms common upon leaves and stems infested by parasitic fungi (Fig. 2). They are not easily

FIG. 2. SHOOT OF JUNIPER, enlarged and deformed by the presence of a fungus, *Gymnosporangium claviforme*.

distinguished in form from similar galls produced by insects. The club-root (q.v.) of cabbage and turnips, due to the attack of slime-molds, and the tubercles upon the roots of Leguminosæ, due to

bacteria-like parasites, are examples of root-galls (Fig. 3). See GALL-INSECTS.

FIG. 3. ROOT-TUBERCLES OF A LEGUMINOUS PLANT, THE PEA, produced by the infection of the roots with *Bacillus radicicola*.

GALL-STONE. See CALCULUS.

GALLUPPI, gá-loop'pè, PASQUALE (1770-1846). An Italian philosopher. He was born in Calabria of a noble family, and educated in the University of Naples. He entered the Government service, and for the greater part of his life he had a position in the Finance Department. Though apart from academic influences, he pursued his favorite studies; and it was not till he had reached the age of sixty and had become widely known by his philosophical writings that he was called to a chair in the University of Naples, which he held till his death. Galluppi's first work was an essay on analysis and synthesis (1807). This was followed by the important *Saggio filosofico sulla critica della conoscenza* (6 vols., 1819-32). Among his other works is to be mentioned *Elementi di filosofia* (1820-27). Galluppi was a thorough-going opponent of the sensationalistic philosophy prevalent in Italy at the beginning of the nineteenth century. He founds his system upon the "original fact of the ego, which perceives something existing outside of itself," thus closely affiliating himself with the Scottish School, by which he was greatly influenced. But in the spirit of Kant he failed to see how experience can give a knowledge of relations, because he regarded relations as the result of conscious activity. His ethics was distinctively Kantian. Consult Lastrucci, *Pasquale Galluppi, studio critico* (Florence, 1890).

GALLUS. A famous story of Roman life by W. A. Becker (1838). The work is important for its faithful reproductions of Roman customs under Augustus, and for the great amount of archaeological information contained in it. It has been translated into various languages and still serves as a handbook for students.

GALLUS, GAIUS CORNELIUS (B.C. 66-26). A Roman poet, orator, and general, born of a humble family at Forum Iulii (now Fréjus) in South-eastern Gaul. At an early age, like many provincials, he went to Rome for an education, and attended the lectures of the Epicurean philosopher Syron. Vergil and Varus were his fellow pupils, and the three became firm friends. He had the fortune, also, to gain the good will and friendship of Asinius Pollio, one of the greatest Romans of the time; and when Octavius (afterwards Augustus) returned to Italy from the East after the assassination of Julius Cæsar, Gallus heartily joined his party, and was given the important charge of assigning lands in North Italy to the veterans of Octavius's army. On this occasion he was able materially to help his friend Vergil, who was a native of Mantua. At the battle of Actium, Gallus commanded a division of Octavius's forces, and afterwards was sent, as general, into Egypt, where he defeated the armies of Antonius, and captured Cleopatra, whom he kept as a prisoner in her palace. Upon her death in B.C. 30, Egypt was turned into a Roman province, with Gallus as its first Governor. He ruled in Egypt for four years, largely with success, but not without making enemies; and an unfortunate remark about Augustus was brought to the Emperor's notice, with many other charges. Gallus was accordingly deprived of his rank and estates, and ordered into exile; but he preferred death, and committed suicide by falling upon his sword in B.C. 26. Gallus attained great renown among his contemporaries as a poet and an orator. He was the author of four books of elegies, and Ovid claimed for him the first place among the Roman elegiac poets; but none of his writings has survived. It was at the request of Gallus that Vergil wrote his tenth Eclogue. In modern times he has been made the hero of a well-known antiquarian story, *Gallus*, by Becker, which was translated into English by Metcalf (London, 1886).

GALLUS, GAIUS VIBIUS TREBONIANUS (c.205-c.254). Roman Emperor from 251 to 254. He served under Decius in the campaign against the Goths, in 251, and is said to have contributed by his perfidy to the disastrous battle in which Decius was killed. Thereupon he was elected Emperor, and shortly afterwards purchased peace with the Goths by permitting them to retain their plunder and their captives and promising them a fixed annual tribute. In 253 the Empire was again invaded by the Goths, but they were defeated in Mœsia by Emilianus, whose troops proclaimed him Emperor. Gallus marched forth to suppress the rebellion, but was killed by his own soldiers before there had been any collision between the opposing armies.

GALLY, MERRITT (1838—). An American inventor, born near Rochester, N. Y. He learned the printing trade, graduated at Rochester University in 1863, studied at the Auburn Theological Seminary, and in 1866 was ordained to the ministry of the Presbyterian Church. After three years of pastoral work, however, he was compelled by the loss of his voice to withdraw from the pulpit, and turned his attention to mechanics. He invented the Universal printing-press, built an establishment for the manufacture of presses, and obtained many patents on appliances connected with printing machinery. His

experiments in regard to automatic musical instruments resulted in the invention of the 'orchestron,' and of the so-called counterpoise pneumatic system employed in similar contrivances. His patents, more than four hundred in number, also include a machine for the manufacture of printer's types from cold metal by a process of swaging.

GALOIS, gá'lwá', EVARISTE (1811-32). A French mathematician, born at Bourg-la-Reine, near Paris, and killed in a duel at Paris at the age of twenty and a half years. While yet a pupil in the Collège de Louis-le-Grand he published in Gergonne's *Annales*, vol. xix. (1828), a memoir entitled *Démonstration d'un théorème sur les fractions continuées périodiques*. Entering the Ecole Normale in 1830, he wrote in the next two years six memoirs on the theory of equations and the theory of numbers. Galois may justly be said to be the founder of the theory of groups (see SUBSTITUTION), and, with Abel and Cauchy, to have been one of the founders of the theory of functions. A well-known theorem on the solubility by radicals of irreducible equations of prime degree bear his name. His works attracted little attention when they first appeared, but their value became recognized when Liouville collected them in his *Journal*, vol. ii. His works were published under the auspices of the Société Mathématique de France, with an introduction by Picard (Paris, 1897).

GALOP, gá'lô' (Fr., gallop). A very lively German round dance in two-four time. It was introduced into France early in the nineteenth century, but its popularity is now confined chiefly to Germany. It is similar to the waltz (q.v.), but is less graceful and more animated.

GALT, gált. A town in Waterloo County, Ontario, Can., on both sides of the Grand River, about 55 miles from its entrance into Lake Erie (Map: Ontario, C 4). Among its industrial establishments are woolen-factories, iron-foundries, and extensive flour-mills. The manufacture of edge tools is carried on to a large extent, and the trade is greatly promoted by the Great Western Railway. The eastern and western parts of the town are connected by bridges. There are a collegiate institute and an extensive library and public reading-room in connection with a mechanics' institute. The town is principally built of stone, and has gas, electric lighting, and water-works. The United States is represented by a consular agent. The environs of the town are noted for their beauty. The inhabitants numbered, in 1891, 7535; in 1901, 7866, the majority being of Scotch descent. The town was named after John Galt, the Scotch author.

GALT, Sir ALEXANDER TILLOCH (1817-93). A Canadian financier and statesman. He was born in Chelsea, London, was educated privately, and in 1835 removed to Sherbrooke, Lower Canada, where he had been appointed to a clerkship in a colonization society. He remained in the service of this company until 1856, and during the latter half of the period was its manager. He began his public career as a Liberal member of the Provincial Parliament in 1849, but opposed the Liberal Government. He resigned in the same year, and did not enter Parliament again until 1853, after which he served continuously until 1872. Such was the reputation he established

that on the fall of the Brown-Dorion Cabinet in 1858 he was called upon to form an administration, but declined. Subsequently he joined the Cartier-Macdonald Cabinet as Inspector-General of the Finances, demanding as a condition of his taking office that the administration should pledge itself to further a federation of the British colonies in North America. He went out of office with the fall of the Ministry in 1862, but held the Finance portfolio in the Tache-Macdonald Administration from 1864 to 1866. He was active in the promotion of the plan for federation, was a delegate at the Charlottetown and Quebec conference in 1864, and in 1865 was one of the delegates to England to urge Imperial support of the plan for union. After the inauguration of the Federal Government he became first Finance Minister of the Dominion of Canada, and secured the issue of legal-tender notes which form the basis of the present currency of the Dominion. He resigned in 1868, and after 1872 his public services were for the most part of a diplomatic nature. He served twice as Commissioner to negotiate with the United States, and from 1880 to 1883 was High Commissioner of the Dominion in England. He was the author of a number of important pamphlets of a political nature, including *Church and State in Canada* (1876); *Civil Liberty in Lower Canada* (1876); *Future of the Dominion of Canada* (1881); and *Relations of the Colonies to the Empire: Present and Future* (1883).

GALT, JOHN (1779-1839). A Scotch novelist. He was born in Irvine, Ayrshire, May 2, 1779. The family removing to Greenock, Galt was educated there, and then placed in the custom-house. He wrote poems and contributed to the newspapers. In 1804 he migrated to London. As a commercial agent, he traveled on the Continent, going as far east as Constantinople. On a part of the voyage he was associated with Lord Byron, whose life he afterwards wrote. As secretary of the Canada Company, he was in Canada for three years (1826-29). Returning to England and then to Scotland, he devoted the rest of his life to miscellaneous literary work. He died at Greenock, April 11, 1839. Galt's poetry, plays, and biographies have little interest. But he holds a secure place in the progress of English fiction by his sketches of Scotch life, among which are *Ayrshire Legatees* (1820); *The Annals of the Parish* (1821); and *Last of the Lairds* (1826). *The Omen* (1825) was praised by Scott; and *Laurie Todd* (1830) has especial interest, as it contains admirable sketches of frontier life in America. Galt undertook to rival Scott in historical fiction, and failed miserably. Consult his *Autobiography* (London, 1833). His novels were edited by Meldrum (8 vols., London, 1895-96).

GALT, Sir THOMAS (1815-1901). A Canadian jurist, son of John Galt (q.v.), born in London, England. He was educated there and in Scotland, but emigrated to Canada in 1832. He found employment for six years with the Canada Land Company, of which his father was superintendent, but afterwards studied law, and began to practice in Toronto (1845). He was made Queen's Counsel (1858), Chief Justice of the Court of Common Pleas (1887), was knighted (1888), and retired in 1894.

GALTON, gal'ton, Sir DOUGLAS STUART (1822-99). An English scientist and engineer, born at Spring Hill, near Birmingham. He was educated chiefly at Rugby and the Royal Military Academy (Woolwich); was appointed second lieutenant of engineers in 1840, and rose to be captain in 1855. In 1847 he was appointed secretary to the Railway Commission, and in 1854 secretary to the Railway Department of the Board of Trade, in which capacity he visited the United States in 1856 to inspect railways there. He became a member of the commission on sanitary conditions in military hospitals and barracks in 1858, and in 1859 chairman of the Government committee for the investigation of submarine cables. From 1860 to 1862 he was assistant inspector-general of fortifications, in 1862-70 assistant Under-Secretary of State for War, and from 1869 until his retirement in 1875 director of public works and buildings in the Office of Works. He was general secretary of the British Association for the Advancement of Science from 1871 to 1895, and a member of the council of the Institution of Electrical Engineers in 1888-90. He was best known for his studies in connection with army sanitation, and his improvements in the construction of hospitals and barracks won for him a high reputation both in England and on the Continent. A ventilating grate for fireplaces, invented by him and known under his name, was at one time widely used. His publications include: *Sanitary Engineering* (1877); *The Construction of Healthy Dwellings* (1880); *Ventilating, Warming, and Lighting* (1884); *Army Sanitation* (1887); and *Healthy Hospitals* (1893).

GALTON, FRANCIS (1822-). An English man of science, born at Birmingham, England, the third son of S. T. Galton and Violetta, eldest daughter of Erasmus Darwin. He was educated at King Edward's School, Birmingham, at the Birmingham General Hospital, at King's College, London, and at Trinity College, Cambridge, where he was graduated B.A. in 1844. During 1846-47 he traveled in Egypt far beyond the temples and cataracts of the Nile to the Sudan, at that time almost unexplored. As a result of the stimulus given by this expedition he started in 1850 to explore in South Africa. In company with J. C. Andersson, he landed his expedition at Walfish Bay, and from August, 1850, to January, 1852, he was engaged in the exploration of Damaraland (German Southwest Africa). In these travels he discovered the *Ovanipo* race, a partly civilized, agricultural people. As a result of this exploration the whole country from Lake Ngami to the seacoast, between 18° and 23° S. latitude, became known for the first time. The scientific results of the expedition were published in the *Royal Geographical Society's Journal* for 1852, and in his book, *Narrative of an Explorer in Tropical South Africa*. Galton also published *Art of Travel, or Shifts and Contrivances in Wild Countries* (1855), which has gone through several editions, has won well-merited appreciation, and exhibits Galton's characteristic ingenuity. About this time Galton turned his attention especially to meteorology, the result of which was his *Meteorographica, or Methods of Mapping the Weather* (1863), which is the basis of our present familiar weather maps. The theory of anticyclones, which

is at the foundation of our weather forecasts, was also proposed by him, and various inventions relating to meteorologic and geographic affairs were given out by him from this period to 1881. This interest in the statistical science of meteorology had an importance in Galton's future work. In 1869 was published his *Hereditary Genius*, and from that time on his anthropological and biological interests, first awakened in Africa, became uppermost. In 1873 he first began to apply statistics to anthropology, especially those of children. In 1874 appeared his *English Men of Science*, and in 1883 his *Inquiries into Human Faculty*. Meanwhile, he invented the method of composite portraiture and various measuring apparatuses in psychology. In 1883 he sought for quantitative data on inheritance, and issued his blank *Record of Family Faculties*, of which 150 were filled out and sent to him for study. The results of these studies appeared in his *Natural Inheritance* (1889), in which the quantitative method of studying variation is developed. In 1892 was published his *Finger Prints*, and shortly after his *Idea of Finger Prints*. In his paper published in the *Proceedings of the Royal Society* on "The Law of Ancestral Inheritance," he put the study of heredity on a quantitative basis.

GALTON WHISTLE. See PSYCHOLOGICAL APPARATUS.

GALUPPI, gá-lóop'pé, BALDASSARE (1706-85). An Italian composer. He was surnamed IL BURANELLO, from the island of Burano, near Venice, the place of his birth. He was the pupil of his father, a barber, who was a good violinist. Although the composer of many operas and smaller works, all are now forgotten except a sonata for the harpsichord, which is included in the *Alte Klaviermusik* of Pauer. His principal success was in comic opera, by which he gained the title of 'father of Italian comic opera.' Apart from this, he is of some importance historically, owing to his connection with the growth of music in Russia. His principal appointments and tours were: 1741, tour to England; 1762-64, master of music at San Marco, Venice, and director of the Conservatorio degli Incurabili; 1765-68, maestro to Catharine II. of Russia; and afterwards, up to the end of his career, director again of the Incurabili in Venice. He died in Venice.

GALVANI, gál-vá'né, LUIGI (1737-98). A famous Italian physician and anatomist, and the discoverer of current or 'galvanic' electricity. He was born at Bologna, and at an early age relinquished an intention of entering the Church, to follow the profession of medicine, devoting himself to the study of physiology and comparative anatomy. He married the daughter of Galeazzi, a distinguished member of the medical faculty of Bologna, whom he succeeded in 1762 as professor of anatomy. His writings, though not numerous, contain valuable scientific matter, and are characterized by a rare precision and minuteness of detail. Two treatises which added considerably to his reputation are: *Considerations on the Urinary Organs of Birds*, and *On the Organs of Hearing of Birds*. It is to a purely casual discovery, however, that Galvani owes the wide celebrity attached to his name. It is related that Galvani's wife happened one day

to notice the convulsive muscular movements produced in a skinned frog when the nerve of the leg was accidentally touched by a scalpel which lay on the table, and had become charged by contact with an adjoining electric machine. She communicated the phenomenon to her husband, who instituted a prolonged series of experiments (1790). He came to the conclusion that the source of electricity lay in the nerve, and that the metals which are necessary served merely as conductors. (See ELECTRICITY; and ELECTRICITY, ANIMAL.) In consequence of his refusal to take the oaths prescribed in 1797 by the Cisalpine Republic, of which Bologna formed a part, he was deprived of his position and income, but was subsequently restored. A statue of Galvani was unveiled at Bologna in 1879. His writings have been chiefly published in the memoirs of the Bologna Institute of Sciences, including the treatise entitled *De Viribus Electricitatis in Motu Musculari Commentarius* (1792), which contained an account of his discovery and experiments, and translated into German is to be found in Ostwald's *Klassiker der Exakten Wissenschaften*, No. 52 (Leipzig, 1894). A complete set of his works was published at Bologna in 1841. See GALVANIC BATTERY; VOLTAIC CELL OR BATTERY.

GALVANIC BATTERY. The names of Galvani and Volta have both become inseparably associated with the earliest device to produce a continuous current of electricity—a device now commonly known as a *voltaic cell*. In its simplest form it consisted of a strip of zinc and one of copper immersed in a solution of salt, or of an alkali.

Galvani, in 1786, made the capital discovery that freshly prepared frogs' legs, hung by a copper wire on an iron balcony, twitched convulsively whenever the flesh touched the iron. He rightly ascribed this effect to electricity, but erroneously supposed that it proved the existence of animal electricity generated by nerves and muscles. Volta showed by experiment that Galvani was wrong, but he made the equally erroneous assumption that the electricity was due to the contact of the two dissimilar metals. His experiments led, however, to the invention of the celebrated 'crown of cups' about 1800, consisting of a number of simple elements or cells joined in series, the copper strip of one being connected with the zinc of the next. Such cells and their less simple successors are therefore properly called voltaic cells, though the word 'galvanism' is still retained in medical literature to denote the current obtained from them.

When Davy, in 1801, substituted dilute acid for Volta's salt or alkaline solution, it was found that there was local action which caused the zinc to waste away. Kemp and Sturgeon, in 1830, drew attention to the fact that a diminution of this local action was brought about by the amalgamation of the zinc plate. The amalgamation consists in forming a mercury-zinc alloy on the surface of the zinc. This is best done by first cleaning the zinc by rubbing it with dilute sulphuric acid, and then applying a small quantity of mercury. The amalgamated zinc plate acts like pure zinc, and wasteful local action is largely prevented. See VOLTAIC CELL OR BATTERY for a full discussion of primary cells and batteries.

GALVANISM. See ELECTRICITY.

GALVANIZED IRON. Iron which has been coated with zinc, to prevent it from rusting. The iron is simply dipped or immersed in melted zinc, not coated by any galvanic process, as its name would imply. The process of galvanizing iron is now practiced on a most extensive scale. The French chemist Dumas states that so long ago as 1742 Malouin knew of a plan for coating iron with zinc. At all events, it is stated in Bishop Watson's *Chemical Essays*, issued in 1786, that a method (essentially the same as that now in use for zincing iron) was then practiced at Rouen for coating hammered iron saucepans with zinc, and some details of the operation are given. The first English patent for galvanizing iron was granted to H. W. Craufurd in 1837, and another for the zincing of iron which had been previously tinned was taken out by E. Morewood in 1821. The process as employed by Craufurd, which is still essentially unchanged, was first to remove the rust and scale from the iron by *pickling*—that is, immersing it in dilute sulphuric or hydrochloric acid, either hot or cold, although the former state was preferred; and for this purpose the acid was kept warm in a large leaden bath, sunk in the ground for easier access. After the sheets or other articles of iron had been acted upon by the acid for a few minutes more or less, according to their requirements, they were plunged into cold water, to remove the acid, and afterwards scoured with sand, and again washed clean with water. The iron being now ready to receive its coating of zinc, it is plunged into a bath of that metal, which, previous to its being melted, is coated with a thick layer of dry sal ammoniac (chloride of ammonium); this melts also, and forms a viscid coating over the metal, which prevents that rapid oxidation to which the molten metal is otherwise liable.

For inferior material the scouring with sand is usually dispensed with. The sheets of iron are then made to pass between two iron rollers in the zinc bath, and are thus more easily drawn through and kept perfectly smooth. Ships' bolts, nails, screws, chains, etc., are dipped in, in bundles, or in the case of nails, etc., in iron strainers; when removed, the zinc makes them adhere together; and to effect their separation, they have to be placed in a crucible with powdered charcoal, in which they are heated to redness, and repeatedly shaken as they cool; by this means they are easily separated.

Galvanized iron is largely used in the form of sheets, both plain and corrugated, for roofs, sheds, and cisterns; in the state of wire, besides that used in telegraphs, a large quantity is employed for wire ropes, netting, and the like; and it has innumerable minor applications, such as for water-vessels, ship-fittings, and many other articles formerly made of wood, copper, brass, slate, etc. For most of these purposes the zinc coating is much more lasting and less troublesome than they would be; but still in certain situations, as where it is exposed to the action of sulphurous compounds in smoke, and where its surface is brought directly into contact with other deleterious chemical substances, its use cannot be recommended; and in these circumstances other plans should be resorted to for the protection of the iron.

The plan adopted for making the variety of galvanized iron called *galvanized tinware* is as follows: The sheets or other articles, after being pickled, and scoured, and washed, as in the usual process, are transferred to a large wooden bath. On the bottom of the bath is first placed a layer of finely granulated zinc, then a sheet of iron, then another layer of granulated zinc, and so on as far as convenient; and the bath is filled up with a diluted solution of chloride of tin, so that by means of the galvanic action produced the tin becomes deposited thinly over the sheets of iron. The plates are then taken to the zinc bath, prepared exactly as in the ordinary process, where they are dipped or passed through the rollers. By this process a very even deposit of zinc is produced, and the material so made is preferred for some purposes to ordinary galvanized iron, although its properties are much the same.

GALVANOMETER (from *galvanic* + *Gk. μέτρον*, *metron*, measure). An instrument for detecting the presence of an electric current and measuring its magnitude. It consists of a coil of insulated wire surrounding a magnet, freely hung or pivoted so as to be easily deflected by the passage of a current through the coil. The wire forming the coil is so wound that each turn lies in a plane approximately parallel to the axis of the needle or magnet when at rest. The current in passing through the coil or bobbin of insulated wire produces a magnetic field in the space in which the needle hangs and tends to swing the needle around, until it hangs crosswise in the coil. The force tending to deflect the needle is proportionate to the strength of this field, or, what is the same thing, the strength of the current producing it, and to the length and strength of the needle, while the magnetic force of the earth acts to keep the needle in the direction of the magnetic meridian. Under the influence of these two forces the needle will come to rest in a position where they are in equilibrium. As the shape and strength of the magnetic needle, speaking broadly, remain the same in a given galvanometer, the instrument affords a means of measuring the strength of any current passed through it, by the amount of motion imparted to the needle.

These conditions can be reversed and the coil suspended and the magnetic field produced by a permanently mounted magnet, as in the case of the D'Arsonval galvanometer described below. Galvanometers are constructed in a great variety of forms, specially suited to various uses, from simple instruments for merely indicating the presence of a current to extremely elaborate apparatus for making measurements of great accuracy. The action of the galvanometer depends upon the following principle discovered by Oersted in 1820: When a magnetic needle is placed under a straight wire, through which a current passes, it is deflected to a certain extent, and when the wire is bent, so as also to pass below the needle, it is deflected still more. The north pole of the needle is deflected to the left if the current is flowing from south to north in a conductor which is placed above the needle, and vice versa when the conditions are reversed. The direction of the deflection can be remembered by *Ampère's rule* which states that supposing a man swimming along the conductor in the direction of the flow of the current and always facing the needle, the latter will be deflected toward his

left hand. The current in the upper and the lower wire moves in opposite directions, but as they are on opposite sides of the needle, the deflection caused by both wires is in the same direction. By thus doubling the wire, we double the deflecting force. Schweigger and Poggendorf soon ascertained that if the wire, instead of making only one circuit round the needle, were to make two, the force would be again double, and if several, the force (leaving out of account the weakening of the current caused by the additional wire) would be increased in proportion. If the circuits of the wire are so multiplied as to form a coil, this force would be enormously increased, and the galvanometer rendered more sensitive. These early galvanometers were called

FIG. 1. ASTATIC NEEDLE AND COIL.

multipliers, and have been much used. The next improvement in the instrument was due to Nobili, who employed two needles, placed parallel to each other as nearly as possible, with their poles turned opposite ways and suspended by a thread without twist. These needles have little tendency to place themselves in the magnetic meridian, for one tends to move in a contrary direction to the other. If they were exactly equivalent, they would remain indifferently in any position; but they cannot be so accurately paired as this, for they almost always take up a fixed position, arising from the one being somewhat stronger than the other. Such a compound needle is called *astatic*, as the magnetic influence of the earth does not determine the direction in which it will point. If an astatic needle be placed in a coil, so that the lower needle be with-

FIG. 2. ASTATIC GALVANOMETER.

in the coil, and the upper one above it, its deflections will be greater than those of a simple needle, for two reasons. In the first place, the power which keeps the needle in its fixed position is small, and the needle is consequently more easily influenced; in the second place, the force of the coil is exerted in the same direction on two needles instead of one, for the upper needle, being much nearer the upper part of the coil than the lower, is deflected alone by it, and the deflection is in the same direction as that of the lower needle. An astatic needle so placed in a coil constitutes an astatic galvanometer. The coil is formed of fine copper wire, insulated with silk, and wound on a frame or bobbin. The as-

tatic needle is placed in this bobbin, which is provided with a vertical slit, to admit the lower needle, and a lateral slit, to allow of its oscillations, and is suspended by a cocoon fibre from a hook supported by a brass frame. The upper needle moves over a graduated circle, and the entire system hangs freely, without touching the bobbin. The instrument is inclosed in a glass case, and rests on a stand, supported by three leveling screws. When used, the bobbin carrying the divided circle with it is turned until the needle stands at the zero point of the scale, and

FIG. 3. THOMSON REFLECTING GALVANOMETER (SINGLE COIL).

the wires through which the current is sent are joined to the bending posts, which connect with the terminals of the coil. The number of degrees that the needles are deflected under the action of the current may then be read off, showing the strength of the current.

For most kinds of testing and measurement extremely sensitive galvanometers are required. Of these, the reflecting galvanometer, designed by Sir William Thomson, is one of the standard types. It is shown in the illustration. In this instrument a reading is made by the use of a ray of light reflected upon a screen from a mirror attached to the needle so that even the smallest motion is shown. The Thomson galvanometer consists of a pair of astatic needles attached by shellac or other adhesive material to a mirror made of very thin microscope glass. This is superseded by a single fibre of raw silk in the centre of a coil containing many thousand turns of fine wire. The whole is suitably protected from currents of air by a glass case, and the base is mounted upon leveling screws, so that the hanging needle may be adjusted to swing freely in the centre of the coil. The needle is caused to point to zero of the scale by a powerful magnet outside of the case which is adjustable as to direction by a tangent screw, and may be removed to any distance to weaken its effect upon the needle or increase its sensitive-

FIG. 4. THOMSON DOUBLE COIL GALVANOMETER.

ness. This galvanometer is much used in all kinds of testing work and for reading the delicate signals in ocean telegraphy. Increased sensitiveness may be obtained by using two sets of coils and needles, while there have been Thomson galvanometers constructed in which there were four such sets of coils.

For experimental work and laboratory demonstrations the tangent galvanometer is used. This instrument is shown in the illustration. It con-

FIG. 5. TANGENT GALVANOMETER.

sists essentially of a thick strip or wire of copper bent into the form of a circle, from one to two feet in diameter, with a small magnetic needle with pointers of thin glass fibres moving on a graduated circle, at its centre, supplied with a mirror. When the needle is small compared with the ring, it may be assumed that the needle, in whatever direction it lies, holds the same relative position to the disturbing power of the ring. This being the case, it is easy to prove that the strengths of currents circulating in the rings are *proportional to the tangents of the angles of deviation of the needles*. Thus, if the deflection caused by one voltaic cell was 45° , and of another 60° , the relative strengths of the currents sent by each would be as the tangent of 45° to the tangent of 60° , viz., as 1 to 1.73. The needle can never be deflected 90° , for as the tangent of 90° is infinitely large, the strength of the deviating current must be infinitely great, a strength manifestly unattainable. The tangent galvanometer can consequently be used to measure very strong currents.

A common or detector galvanometer is an instrument used in ordinary shop work, and for outdoor testing, where a portable instrument is required, and the other forms are too delicate. It contains a large magnetic needle or compass swinging upon a pivot. A small cavity formed in an agate let into the centre of the needle is usually employed to prevent friction in swinging upon the pivot. The coils of wire are placed underneath the dial bearing the graduations over which the needle swings, and the whole is inclosed in a round brass box, with a glass cover over the needle. For convenience, a circuit-closing key for admitting current to the coil is often

built into the case and permanently connected with the coils. Such a galvanometer is often used in connection with a set of resistances for making measurements of resistance by the Wheatstone bridge (q.v.), and in that case the apparatus is known as a combination or portable testing set.

THE D'ARSONVAL GALVANOMETER is quite different in its underlying principle from the instruments already described, for instead of having the magnet suspended and deflected under the influence of the current in a surrounding coil of wire, the coil itself is suspended between the poles of a compound horseshoe magnet. This coil is made of fine copper wire, wound on a rectangular frame of thin copper, and suspended by a fine wire of silver or copper, through which the current flows to the coil. The other end of the coil is connected to a similar wire, which leads to one of the binding posts, the supporting wire being connected with the other. The coil can thus oscillate freely in the space between the two magnets, and is in a strong magnetic field.

FIG. 6. D'ARSONVAL GALVANOMETER.

When a current flows through the coil an opposing field is set up, and the coil, being free to move, is deflected. The motion of the coil can be determined either by a light pointer or by means of a mirror and a reflected beam, as in the case of the Thomson galvanometer. The D'Arsonval galvanometer is, perhaps, at the present time the most used of any form of galvanometer, since it is not affected by any external magnetic influences, and is easily adjusted. It is also aperiodic, or 'dead beat,' the coil coming to rest almost instantly and thus saving much time to the observer. For these and other reasons this galvanometer is extensively used for making tests and measurements, and certain modifications have been introduced, so as to render the apparatus portable and indicate current and electromotive force directly by means of a pointer and scale. These instruments form the most accurate ammeters and voltmeters.

THE BALLISTIC GALVANOMETER is intended to measure currents of extremely brief duration, such as those produced by the discharge of a condenser or by induction, and a magnetic needle is employed that has a period of vibration amounting often to several seconds. Instead of coming to rest after its deflection by the current, the needle will continue to oscillate, as there are no damping devices, and as the needle itself has considerable mass. When used to measure a momentary current, the deflection does not begin to move practically until the current has passed, and then the throw of the needle is noted. This instrument is used to determine the capacity of a condenser and to measure self-induction. Consult Kempe, *Handbook of Electrical Testing* (6th ed., London, 1900); Thompson, *Elementary Lessons in Electricity and Magnetism* (New York, Vol. VIII.—97.

1901), contains a full elementary description of galvanometers and the theory of their action.

GALVESTON. A city, port of entry, and the county-seat of Galveston County, Tex., on Galveston Island, at the mouth of Galveston Bay, 50 miles southeast of Houston; on the Southern Pacific, the International and Great Northern, the Missouri, Kansas and Texas, the Gulf, Colorado and Santa Fé, and other railroads (Map: Texas, G 5). Regular steamship communication is maintained with important European, Mexican, and Cuban ports, and there are also lines to China, Japan, and South America, as well as several coastwise lines. The street-railway system comprises 35 miles of track.

The city, including Pelican Island, has a total area of nearly 13 square miles, and is built toward the inland side of the island, while along the outer side extends, for a distance of 30 miles, a hard and level beach. Galveston is the seat of Saint Mary's University (Roman Catholic), opened in 1854, and of the medical department of the State University. It has two Roman Catholic academies, the Ball High School (one of the city's principal buildings), and a fine library in course of erection, which is to be endowed with \$400,000. There are two orphan asylums, a home for friendless children, and an old women's home, and two well-equipped hospitals, Saint Mary's and the John Sealy, the latter used in connection with the State Medical College. Other notable structures are the county court-house, custom-house and post-office, city hall, railroad depot, Young Men's Christian Association Building, Masonic Temple, and several of the business buildings. There are here three forts, a life-saving station, a State quarantine station, an office of the United States Marine Hospital Service, and the State branch of the United States Weather Bureau. A railroad bridge, two miles long, connects with the mainland.

Galveston, with an admirable location for a commercial centre, has also improved means for handling its important commerce. Both by rail and water transportation facilities are excellent. By means of rock jetties, 12 miles long, completed by the Federal Government in 1896 at a cost of \$8,000,000, the channel between the island and the mainland has been deepened to afford an average of 27 feet. Terminal tracks, aggregating 50 miles, extend to the wharves, of which there are now 6 miles. There are four export grain elevators, with a total storage capacity of 3,750,000 bushels, and one clearing and conditioning elevator, a coal elevator, marine works, creosoting works, etc.

Galveston in 1901 ranked third among ports of the United States in exports (value, \$106,526,508), a gain of \$14,000,000 over 1900; and thirty-sixth in imports (value, \$1,048,866). Since the improvements in the harbor, the export trade has substantially increased, though, on the contrary, imports have decreased. The city alternates with New Orleans as the largest cotton-exporting centre in the United States, is the first in the amount of cottonseed products, and eighth in wheat. In value the leading exports for 1901 were: Cotton, \$85,857,145; oil cake and meal, \$5,568,449; cottonseed oil, \$1,502,307; wheat, \$1,476,205; flour, \$462,607; lumber, \$479,457. The live-stock trade is now compara-

tively unimportant; the lumber exports have fallen off because of the unusual demand at home; and imports of coal have suffered considerably, owing to the discovery of Beaumont oil, which is being used largely for fuel. Galveston is the centre of an extensive wholesale and jobbing trade. The manufacturing interests are important and varied; the products include rope, bagging, beer, cement, pipe, ice, iron, sash, doors, blinds, cotton oil, flour and meal, etc.

The government, under a charter of 1876 (last revised in 1893), is vested in a mayor, chosen biennially, and a city council, the members of which, though elected one from each ward, are voted for by the entire city. The executive appoints the recorder and the city clerk, and nominates, subject to the consent of the council, a number of other municipal officials. The boards of water commissioners, health, public works, and school trustees, the hospital board, and police and fire commissioners, are chosen by popular vote. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 29,084; in 1900, 37,789.

Early in the nineteenth century the site of Galveston was a favorite resort for pirates, who established themselves here under the leadership of the notorious Jean Lafitte (q.v.). They were driven from the locality in 1820, but soon reestablished themselves, and in 1827 were again driven away by the United States authorities. A permanent settlement was made in 1837, and two years later the first charter of incorporation was obtained. On October 8, 1862, during the Civil War, a Federal force took possession without opposition; but on January 1, 1863, the Confederates under Magruder captured the city and secured 350 prisoners. In November, 1885, there was a destructive fire, and on September 8, 1900, occurred the most terrible disaster resulting from purely natural causes in the history of the North American continent. A West Indian hurricane, lasting eighteen hours—the wind veering in every direction and reaching a maximum velocity estimated at 135 miles an hour—swept over the city, and the streets were flooded to a maximum depth of 16 feet above mean low tide. Within a period of five hours, but chiefly between 7 and 9 o'clock p.m., 6000 lives were lost, and property, including 7000 buildings, valued at \$18,000,000, was destroyed. Help poured in from all parts of the country, and much of the suffering was thus alleviated, though a large part of the city had been totally destroyed. The municipal government was placed in the hands of five commissioners, two elected and the others appointed by the State Governor, and the work practically of creating a new city was begun, with the present results as detailed above. During 1901 nearly \$4,000,000 was expended for permanent improvements. A committee of eminent engineers in 1901 made plans and specifications for a breakwater, estimating the cost of a sea-wall at \$1,250,000, and attendant filling in of the city to a commensurate grade at \$2,250,000. In the same year the city received from the Federal Government an appropriation of about \$1,000,000, 90 per cent. of which went for reconstruction of the fortifications. Other improvements projected for the immediate future

are the repair of the jetties and the widening and deepening of the channel.

GALVEZ, gal'vath, BERNARDO, Count de (1755-86). A Spanish administrator, Governor of Louisiana and Viceroy of Mexico. He was born near Malaga, a member of a powerful Spanish family; entered the army in 1771; studied military science in France in 1772-75; served under O'Reilly against the Algerians in the latter year, rising to the rank of brigadier; and in 1776 was sent to Louisiana as Lieutenant-Governor under Luis de Unzaga, whom he succeeded in the same year. During the Revolutionary War his sympathies were largely with the Americans, whom he assisted in various ways, even before Spain's declaration of war against England in June, 1779, after which he prosecuted hostilities with considerable energy against the English possessions in this part of the country, and succeeded in capturing Fort Manchac, Baton Rouge, and Fort Panmure (1779), Mobile (1780), and Pensacola (1781). For these successes, and as a reward for his general administrative efficiency, he was raised in 1783 to the rank of count, was promoted to be lieutenant-general, and was appointed Captain-General of Cuba. This position, however, he relinquished two years later, to succeed his father as Viceroy of Mexico, where he lived with much ostentation, and for this, and for his construction of a fortified palace at Chapultepec, was accused by many of planning to create an independent Mexican kingdom, with himself as king. Both in Mexico and in Louisiana he introduced numerous and important reforms, and he has been regarded as one of the ablest Spanish administrators ever sent to America. Consult: Gayarré, *History of Louisiana*, vol. iii. (last ed., New Orleans, 1885); and Bancroft, *History of Mexico, 1516-1887* (San Francisco, 1883-88).

GALWAY. A maritime county of Connaught, Ireland, and, after Cork, the largest of the Irish counties (Map: Ireland, B 3). It is bounded on the east by the Shannon and its affluent the Suck, and on the west by the Atlantic Ocean. Area, 2452 square miles, of which bog and marsh make up about 15 per cent. The coast-line is about 400 miles in length, and the shore, much broken, is fringed with numerous islands. Copper is the only mineral of importance that is found. Agriculture and fishing are the leading pursuits; the production of kelp is large; and woollens, linens, friezes, and felt hats are manufactured. Chief towns, Galway, the capital, and Tuam. Population, in 1841, 440,700; in 1851, 322,430; in 1891, 211,227; in 1901, 192,150.

GALWAY. The capital of Galway County, Ireland, a municipal and Parliamentary borough, seaport, and civic county at the mouth of the Corrib on the north shore of Galway Bay. 50 miles north-northwest of Limerick, and 130 miles west of Dublin (Map: Ireland, B 3). It is built on both sides of the river, and on two islands in its channel, its parts being united by two bridges. It is connected with Lough Corrib by a canal, and forms the terminus of the Midland Great Western Railway. Galway has numerous flour and other mills, brush factories and breweries, distilleries, foundries, etc., salmon and sea fishing, a good harbor, with docks and a lighthouse. It exports agricultural produce, wool, bacon, fish, kelp, and a fine black marble, and im-

ports grain, timber, petroleum, and manure. The old town of Galway is poorly built and irregular, and some of its older houses have a somewhat Spanish appearance. One of these houses, marked with a skull and cross-bones, was the residence of James Lynch Fitzstephen, a mayor of Galway, who, in 1493, condemned his son to death for murder, and to prevent his rescue, caused him to be hanged from his own window. The new town consists of well-planned and spacious streets, built on rising ground, which slopes gradually toward the sea and the river. Claddagh, a suburb, is inhabited by fishermen, who exclude all strangers from their society, and marry within their own circle. These fishermen still speak the Irish language, and the Irish costume is still worn by the women. They annually elect a 'mayor,' whose function it is to administer the laws of their fishery, and to superintend all internal regulations. Attached to the Anglican diocese of Tuam, Galway is also a Catholic episcopal see. The principal buildings are the parish Church of Saint Nicholas, founded in 1320, Saint Augustine's Catholic Church, three monasteries, and five nunneries, Queen's College, the county court-house, barracks, etc. The town returns one member to Parliament.

Galway was taken by Richard de Burgo in 1232, and the ancestors of many of the leading families resident in this quarter settled here about that time. Galway rose in commercial importance chiefly through its Spanish trade, from the thirteenth to the middle of the seventeenth century. During the seventeenth century it suffered for its adherence to the Royalist cause. In 1652 it was taken by Sir Charles Coot after a blockade of several months; and in July, 1691, it was compelled to surrender to General Ginckell. Population, in 1851, 20,686; in 1891, 13,800; in 1901, 13,414. Consult Hardiman, *History of the Town and County of Galway* (Dublin, 1820).

GALWAY BAY. An inlet of the Atlantic Ocean, on the west coast of Ireland, between the counties of Galway and Clare (Map: Ireland, B 3). It is 30 miles long from west to east, with an average breadth of about 10 miles. The islands of Aran form a natural breakwater at its entrance between the north and south sounds. There are lighthouses on Inisheen, Mutton, Eeragh, and Straw Islands, and at the entrance to Galway docks.

GALYZIN, gá-lét'sén. See GOLITZIN.

GAMA, gá'má, JOSÉ BASILIO DA (1740-95). A Brazilian poet, born at São José (Minas Geraes). He became a novice in the Jesuit College at Rio de Janeiro. Upon the expulsion of the Order in 1759, he continued his studies at the seminary of São José, and subsequently went to Portugal and then to Rome, where in 1763 he was admitted as a member of the literary circle known as the *Arcadia*. Having returned by way of Portugal to Rio de Janeiro, he was there denounced as a Jesuit, and was sent to Lisbon on a ship of war. Here he openly declared against the Jesuit Order, found a patron in Pombal, the Portuguese statesman, wrote an ode celebrating the dedication of an equestrian statue of José I, was elevated to the nobility in 1771, and in 1774 received an official post in the Ministry of Foreign Affairs. When his protector was dismissed from office in 1777, he proceeded to Rio de Janeiro, where he

organized an *Arcadia Ultramarina*, in imitation of that at Rome. This society having been dissolved in 1790 by the new Viceroy, the Count of Rasende, who suspected plots, and its members having been threatened with imprisonment, Da Gama returned to Lisbon and there lived in retirement until his death. His chief work is the epic *Uruguay* (1769), in which he endeavors to show that the Jesuits of the Seven Missions sought to found in Uruguay an independent theocratic State. Besides *Uruguay*, which enjoyed a high popularity in Brazil, he also wrote shorter poems entitled "Quitubia" and "Cantico aos Campos Elysios."

GAMA, gá'má, VASCO DA (c.1469-1524). A Portuguese navigator and the first European to reach India by the maritime route round Africa. He was descended from a noble family, and was born at Sines, a small seaport of Portugal. After some years at Court he was chosen to command the expedition dispatched by King Emmanuel to India by the all-sea route, the possibility of which had been revealed by the rounding of the Cape of Good Hope by Bartholomeu Dias in 1488, and confirmed by the explorations of Covilhão, who had reached India by way of the Red Sea, and had crossed the Indian Ocean from Goa to Sofala. Vasco da Gama sailed from Lisbon July 8, 1497, and, doubling the Cape of Good Hope in November, reached in December the Rio do Infante, the farthest point attained by Dias. There he had to suppress a mutiny of his sailors, who shrank from facing the unknown dangers that awaited them. They breasted the strong Agulhas current, and on Christmas Day, 1497, sighted the coast, which da Gama, in honor of the day, named Natal (*dies Natalis*). Past Delagoa Bay, Quillimane, and Mozambique they sailed, until, on April 15, they anchored off Melinde, where they took on board an Indian pilot, a native of Gujarat. A voyage of twenty-three days across the Indian Ocean brought the vessels to the coast of Malabar, which was sighted on May 17, 1498. The ruler of Calicut did not receive the Portuguese very favorably, and da Gama was forced to fight his way out of the harbor when he started homeward. He rounded the Cape once more in March, 1499, and on September 8 reached Lisbon. A fleet was immediately dispatched for India under Pedro Alvarez Cabral, whose ships were driven out of their course westward, the discovery of Brazil being the result. In 1502 da Gama sailed again for India, planting Portuguese colonies on the way at Mozambique and Sofala. On reaching Calicut he bombarded the place, destroyed the fleet of the Rajah and forced him to conclude peace. In December, 1503, he was back in Portugal with a fleet bearing rich cargoes, and was received with great honor and given the titles of Count Vidigueira and Admiral of the Indian Ocean. For twenty years da Gama saw no active service. Then in 1524, he was dispatched with a fleet to India as the sixth Viceroy of Portuguese Asia, but soon after his arrival he died at Cochin on Christmas Day, 1524. The fame of da Gama is due, perhaps, less to the merit of his exploits than to the place assigned him by Camões in his epic, "Os Lusíadas." Consult: Correa, *The Three Voyages of Vasco da Gama and His Viceroyalty*, Hakluyt Society Publications (London, 1869); Alvaro Bel-

ho, *Roterio da viagem que em descobrimento da India pelo cabo da Boa Esperança fez Dom Vasco da Gama em 1479*, trans. by Ravenstein, Hakluyt Society Publications (London, 1898).

GAMA GRASS, or **SESAME GRASS** (*Tripsacum*). A genus of grasses indigenous to America, said to be named from the Spanish gentleman who first attempted its cultivation in Mexico. Only two or three species are known, of which the gama grass (*Tripsacum dactyloides*) of Mexico is distinguished by usually having three spikes together. It produces a large quantity of coarse fodder, for which it is cultivated, not only in Mexico, but in the United States, and to some extent in Europe. In favorable circumstances it yields a very abundant crop, and attains a height of nine or ten feet, its root-leaves measuring six feet in length. It possesses what for some climates is an almost invaluable property of enduring excessive drought without injury, but suffers from frost. It seems eminently adapted to the climate of Australia. *Tripsacum fasciculatum*, a native of Mexico, attains a height of fifteen to twenty feet.

GAM'ALA. An ancient fortress of Palestine, situated on the Lake of Tiberias and supposed to be either the modern *El-Hussu* or *Khan-el-akbah*. In the Jewish war of 66-70, Gamala, which had been fortified by Josephus, was vainly besieged by Agrippa, but finally taken by Vespasian, who slaughtered 9000 of the defenders.

GAMALIEL, gā-mā'li-ēl (Heb., 'God is a reward'). A noted Pharisee, twice referred to in the Book of Acts: (1) In v. 34-39, where, as a member of the Sanhedrin, he counseled, from the point of caution, moderate measures regarding Peter and the other Apostles; and (2) in xxii. 3, where Paul speaks of him as his instructor in the law. Jewish tradition identifies him with the famous Rabbi Gamaliel, the elder, the son of Simon and the grandson of Hillel, the founder of the more liberal of the two Pharisaic schools. This Gamaliel was the first of the seven Jewish doctors who received the honored title of Rabban, and was held in such reputation that when he died, according to Mishna (*Sota* ix. 15), "reverence for the law ceased, and purity and abstinence died away." At the same time, in Gamaliel's day, instruction in the law was much more in sympathy with the spirit of practical life than was the case in the time of the later law schools of Palestine and Babylon. In fact, Gamaliel himself at several points modified the restrictive customs of Jewish exclusivism and Jewish Sabbatism, while he protected the interests of wives in the matter of divorce, and the interests of fatherless children in the matter of inheritance. He was even liberal enough to be a student of Greek literature, which was held in abhorrence by narrow-minded rabbis. In view of these facts it is not difficult to understand his tolerant position in the Sanhedrin council of Acts v., though it is to be doubted whether any appreciation of Christianity entered into his motives, the legend of his subsequent conversion to the Christian faith being worthless. It is also not difficult to understand the attraction to him of Saul of Tarsus: though the fact that Saul afterwards became a persecutor has been made a ground for denying the historicity of the narrative in Acts v., or the actuality of any

relations between him and Saul. The development of one of his pupils in fanatical directions, however, may after all be due more to the pupil's unique surroundings and their influence upon his growing conviction that salvation was by works, rather than to any inherent bigotry of spirit within the pupil that would make unlikely instruction at such a teacher's feet. Gamaliel died evidently some time before 70, since his son Simon was then in public life, while he himself seems to have been forgotten. Many traditions are ascribed to him which belong to his grandson, Gamaliel II., with whom he is constantly confused.

GAMARRA, gā-mār'rá, AGUSTÍN (1785-1841). A Peruvian soldier and politician, born at Cuzco. He studied there at the College San Buenaventura, and rose to be a lieutenant-colonel in the Spanish Army, but in 1821 entered the Patriot service, and became successively general and grand-marshal. In 1829, after the deposition of General Lamar, he was inaugurated as President of Peru. His administration, not wholly a successful one, closed in 1833. In 1834 he became a leader in the insurrection against his successor, Orbegoso, but afterwards escaped to Bolivia. He subsequently fought under Santa Cruz (q.v.) and Salaverry, and in 1835 was banished by the latter to Costa Rica for an attempt to incite revolt. When war was declared between Chile and the Peru-Bolivian Confederation formed by Santa Cruz, he commanded the reserve of the Chilean army sent to invade Peru, and after the defeat of the troops of the Confederation in 1839, near Yagay, was declared Provisional President. He was elected Constitutional President by Congress with the title of 'Restorer,' and obtained the abolition of the liberal Constitution of 1834. In 1841 he declared war against Bolivia, commanded the army of invasion, and was killed at the defeat of Yngavi (November 20). Despite frequent tyrannical acts, he appears to have sought the progress of his country. In 1849 a mausoleum was erected in his honor in the Pantheon of Lima.

GAMBA, gām'bā, BARTOLOMEO (1776-1841). An Italian bibliographer, born at Bassano. He gave himself entirely to the study of the literature of Italy, and for many years was vice-librarian of Saint Mark's, Venice. His works include: *Serie dei testi di lingua* (1808, 4th enlarged edition, 1839); *Galleria dei letterati ed artisti delle provincie venete nel secolo XVIII* (1824); *Vita di Dante* (1825); *Catalogo delle più importanti edizioni della Divina Commedia* (1832); and *Bibliografia delle novelle italiane in prosa* (1833).

GAMBARELLI, gām'bā-rē'lē. The family name of five brothers, who were architects and sculptors in Rome during the early Renaissance. The two foremost, Antonio and Bernardo, are best known by their surname, Rossellino (q.v.).

GAM'BESON, or **WAMBAIS** (AS. *wamb*, from OF. *gambeson*, *wambaison*, from ML. *gambeso*, *wambasium*, from OHG., Goth. *wamba*, stomach, Eng. *womb*). In mediæval armor, a protection for the body, composed of layers of cloth, tow, or similar material, quilted on a lining canvas or leather. It was worn by the infantry as their only defense, and by knights under their mail shirts.

GAMBETTA, *Fr. pron. gǎn'bǎ'tǎ'*, LÉON (1838-82). A French statesman. He was born April 3, 1838, at Cahors, of a family which had come originally from Genoa, and which is said to have been of Jewish origin. In 1859 he began the practice of law at Paris, and soon made his mark as counsel for defendants in political prosecutions, showing himself an able and determined opponent of the Second Empire. He was returned to the Chamber of Deputies from Paris and Marseilles in the elections of 1869, and on May 5, 1870, he delivered a speech containing a panegyric of the republican form of government, which attracted great attention. After the disaster of Sedan and the fall of the Empire he became Minister of the Interior in the Provisional Government, and remained for some time in Paris after it was invested by the Germans. In order to arouse the provinces, he escaped from the city in a balloon, October 7, proceeded to Tours, and established a virtual dictatorship. With untiring energy he organized resistance to the invader, putting three great armies into the field for the relief of the capital, and calling upon the nation to rise *en masse*. He urged his countrymen to fight to the bitter end, and denounced the capitulation of Metz as an act of treason on the part of Marshal Bazaine. When a National Assembly was resolved upon in 1871 Gambetta sought to give it an exclusively republican character by a decree directing that no official of the Second Empire should take part in the election. The decree was canceled at the instigation of Prince Bismarck, and Gambetta resigned office, February 6, 1871. He subsequently entered the Assembly as a member for Paris, and became the leader of the Extreme Left, violently attacking the monarchical parties. After the retirement of M. Thiers his political action became more moderate. The Republicans owed to his leadership their success in the elections of 1877, and their defeat of the attempts of the Conservatives to deprive them of its results. In the same year he was twice prosecuted for violence of speech, and once condemned to imprisonment. On the election of Jules Grévy to the Presidency of the Republic in 1879, Gambetta became president of the Chamber of Deputies, January 31.

Upon the fall of the Ferry Ministry in November, 1881, Gambetta was asked to form a new Cabinet. Prevented by Léon Say and others from bringing the various factions of the Republic together by giving the representatives of each a place in the Ministry, he startled the nation by a selection which it could not but regard with apprehension and alarm. The Roman Catholics were directly insulted by the choice of Paul Bert, an open skeptic, as Minister of Public Worship. The Conservatives, agitated by his proposed curtailment of the powers of the Senate, joined with the Church in opposing his policy. The Extreme Left also had reasons for opposition. At an early date Gambetta reintroduced his favorite schemes of *scrutin de liste* (q.v.) and Senatorial abridgment. The Lower Chamber was to share in the election of Senators, and the vote of the latter upon financial measures was to be taken away. The *scrutin de liste* was defeated and Gambetta immediately resigned (January 14, 1882). Although his influence over national affairs was

still felt through his newspaper, the *République Française*, he seldom appeared in public after his resignation. The Republicans, who had not wholly trusted him while in power, were thrown into confusion by the news of his death, as it deprived them of the one man whose strong opposition the Royalist and Bonapartist factions especially feared. A pistol wound in the hand aggravated a malady from which he had long suffered, and he died December 31, 1882. Gambetta's *Discours et plaidoyers* have been edited in 11 volumes by Reinach (Paris, 1881-85). Consult: Reinach, *Léon Gambetta* (Paris, 1884); Tournier, *Gambetta* (Paris, 1893); Harrison, *Léon Gambetta, a Positivist* (London, 1892); Coubertin, *The Evolution of France Under the Third Republic*, translated by Hapgood (New York, 1897). See FRANCO-GERMAN WAR.

GAMBIA. A British colony in Northwestern Africa, at the mouth of the river of the same name (Map: Africa, C 3). Its area is only 69 square miles, but it lies adjacent to territory under British protection, with an area of 4500 square miles. The principal exports are ground-nuts, hides, beeswax, rice, cotton, and india-rubber. The trade of the colony shows a rapid growth for the last few years, the exports having increased from £93,500 in 1895 to £281,970 in 1900, while the imports had risen from £97,700 to £277,659 during the same period. The population in 1901 was 13,500, while that of the adjacent protected territory is estimated at 77,000. Of the population of the colony only 193 are whites. There are 7700 Mohammedans and 3540 Christians. The principal town is Bathurst (q.v.). Gambia was included in the British West African Settlements from 1866 until it was constituted a separate colony in 1888.

GAMBIA (African *Ba-diman, Fourci*). A river of West Africa, rising in the mountains of Futa-Jallon, Senegal, and flowing through the British colony of Gambia (q.v.) (Map: Africa, C 3). It falls into the Atlantic at Bathurst by a wide estuary. There is a bar a short distance from its mouth, which obstructs navigation at low tide. The total length of the river is estimated at over 700 miles. The lower part of the river flows through a swampy region. Sea-going steamers ascend as far as Fort George, about 170 miles, while lighter vessels reach the Barraconda Rapids, about 220 miles from its mouth. The river incloses a number of islets.

GAMBIER'. A village in Knox County, Ohio, 50 miles northeast of Columbus; on the Cleveland, Akron and Columbus Railroad (Map: Ohio, F 5). It is the seat of Kenyon College (q.v.), Kenyon Military Academy, Harcourt Female Seminary, and Bexley Theological Seminary. Population, in 1890, 660; in 1900, 751.

GAMBIER, JAMES, Lord (1756-1833). An English admiral. He was born at New Providence, Bahamas, October 13, 1756, while his father was lieutenant-governor of the islands. He entered the navy in 1767, was post-captain in 1778, and in 1780 took part in the capture of Charleston, S. C. He commanded the *Defence* in the battle off Ushant in June, 1794, and was the first to break through the French line. He received a gold medal for his services, and was made colonel of the marines. The following year he be-

came rear-admiral and a Lord of the Admiralty. In 1799 he was made vice-admiral. In 1802 he was appointed Governor of Newfoundland and commander-in-chief of the naval station. In 1804 he returned to the Admiralty, and in 1805 attained the rank of admiral. For his share in the bombardment of Copenhagen and the capture of the Danish navy in 1807 he was raised to the peerage as Lord Gambier. In command of the Channel fleet he blockaded the French fleet in Aix Roads, but did not support Cochrane. Lord Dundonald, whom the Admiralty had deputed to destroy it. When Cochrane complained, Gambier demanded a trial, and received a qualified acquittal by a friendly court-martial. As a chief commissioner he took part in the peace negotiations of the United States at Ghent in 1814, and for this service was nominated G. C. B. In 1830 he was promoted to be Admiral of the Fleet. He died April 19, 1833.

GAMBIER ISLANDS. A small group of islands in the Pacific, situated in latitude 23° 8' S., and longitude 134° 55' W. (Map: Australia, F 6). They number seven, all of coral formation, and cover an area of about twelve square miles. They are all elevated, well wooded, and have a good supply of fresh water. The chief products are sugar, bananas, coconuts, etc. The largest island of the group is Mangareva, with a good harbor. The group is under French protection, and has a population of nearly 600 inhabitants, who are of Raratongan origin, and Roman Catholics.

GAM'BIR (Malay), *Terra japonica*. A crystalline plant extract similar to catechu (q.v.). Like catechu, it is largely used in tanning and dyeing, and it is used medicinally as an astringent. It is obtained from the leaves and young twigs of *Uncaria gambir*, which is extensively cultivated at Singapore. To prepare it, the leaves and twigs are extracted by boiling, the solution evaporated to sufficient thickness, cast into small cubes, and allowed to harden. Gambir is mainly used in England.

GAM'BLE, HAMILTON ROWAN (1798-1864). An American statesman, 'War' Governor of Missouri. He was born at Winchester, Va., studied at Hampden-Sidney College (Farmville, Va.), was admitted to the Virginia bar, and from 1818 resided in Missouri. In 1823 he was elected Secretary of State of Missouri. Subsequently he acquired an extensive legal practice at Saint Louis, and rose to be presiding Judge of the State Supreme Court. He was elected in 1861 to the Missouri Constitutional Convention, and when on July 31st that body established a Provisional Government, he was appointed Governor to replace Claiborne F. Jackson, who had joined the Secessionists. In 1862 he issued an order commanding the enrollment of the total fighting population, and giving authority to General Schofield to place in active service a force adequate to the maintenance of peace. This order occasioned an uprising among the partisans of the South, who looked upon it as a draft measure, and believed that in having given oath not to take up arms against the State or Federal Government they had become non-combatants. On June 15, 1863, at the summons of the Governor, a convention assembled which adopted an ordinance providing for a method of gradual emancipation of slaves. This did not satisfy the ultra-Republicans, who

demanding an immediate emancipation, and thereby gained the election of November, 1864.

GAMBLING, or **GAMING** (from AS. *game-nian*, *gamen*, *gomen*, game, sport, joy). The art or practice of playing a game of hazard, or one depending partly on skill and partly on hazard, with a view to pecuniary gain. Games of this nature were forbidden by the Romans, both under the Republic and the Empire. The ground on which this was done was not the tendency of such practices to demoralize the populace, but to render them effeminate and unmanly. It belonged to the *adiles* to attend to the public interest by punishing violations of the gaming laws. During the Saturnalia, which was a period of general license, these games were permitted, and a like indulgence at other seasons was extended to old men both among the Greeks and the Romans. Nor has this vice been confined to civilized nations, either in the ancient or the modern world; Tacitus mentions its existence among the ancient Germans, and it is known to prevail among many half-civilized and even savage tribes at the present day.

It is remarkable that in England, as in Rome, the ground on which gambling was first prohibited was not its demoralizing, but its effeminating, influence on the community. The act 33 Henry VIII., ch. 9 (1541) had in view the double object of "maintaining artillery and debarring unlawful games." On that act followed 16 Charles II., ch. 7, and 9 Anne, ch. 14, the latter of which declared that all bonds or other securities given for money won at play, or money lent at the time to play with, should be utterly void, and all mortgages or incumbrances of lands made on the same consideration should be made over to the use of the mortgagor. Such continued to be the statute law till 1845, when there was passed the act 8 and 9 Vict., ch. 109, which, though it repealed the obsolete provisions of 33 Henry VIII., and 16 Charles II., and 9 Anne, reenacted the former prohibitions against card-playing and other games, and was followed up (in 1853 and 1854) by the acts for suppressing betting houses (16 and 17 Vict., ch. 119) and gaming houses (17 and 18 Vict., ch. 38). By 8 and 9 Vict., ch. 109, the common law of England was altered, and wagers, which, with some exceptions, had hitherto been considered legal contracts, were declared to be no longer enforceable in a court of law. This prohibition does not affect contributing to prizes for lawful games. In Scotland an opposite rule had been followed, the judges having held, irrespective of the character of the game, or of any statutory prohibition regarding it, that "their proper functions were to enforce the rights of parties arising out of serious transactions, and not to pay regard to *sponsions ludicras*." But partial assimilation has now been effected in this respect between the laws of the two countries by a statute, which also provides that cheating at play shall be punished as obtaining money under false pretenses. The mode of enforcing the act 8 and 9 Vict., ch. 109, was defective, and the act 17 and 18 Vict., ch. 38, put heavy penalties on those who obstructed the police by putting chains or bolts against the doors of gaming houses or otherwise delaying the entry into such houses, and any apparatus or arrangement for giving alarm to the persons inside was declared to be evidence that the house was a gaming house. The Sum-

mary Jurisdiction acts of 1879 and 1884 have provided summary remedies against the violators of gaming laws. The Betting-Houses Act (16 and 17 Vict., ch. 119) was passed to put down another kind of gaming—namely, in houses where money is received as or for the consideration for any undertaking to pay money in the event of any horse race, or other race, fight, game, sport, or exercise. All such betting houses are declared to be gaming houses within the statute 8 and 9 Vict., ch. 109, and similar powers of search may be resorted to. But nothing in the act extends to a person holding stakes to be paid to the winner of any race or lawful sport, game, or exercise. Besides these statutes, the Intoxicating Liquors Licensing Act of 1872 puts a penalty on the keeper of any house for the sale of liquors allowing any gaming for money or money's worth on the premises. By the vagrant acts all persons are liable to penalties for playing at games on a public highway or public place. These enactments do not interfere with gaming in private houses.

In most of the States of Germany gaming was allowed, and the extent to which it was practiced at the German watering places is well known. The princes of the petty States often derived a large portion of their revenue from the tenants of their gaming establishments, whose exclusive privileges they guaranteed. Recently these German gaming tables have all been closed. Monaco has now the chief public gaming tables of Europe.

In the United States, as in England, one who keeps a gambling house is indictable at common law for maintaining a nuisance; and one who wins another's money with false dice, or the like, is punishable as a common-law cheat. Legislation in our States against gambling has taken a course similar to that above described in Britain. The tendency has been toward greater precision in defining the offenses of gambling and of keeping gambling houses and implements, toward more summary methods of dealing with the violators of these statutes, and toward severer punishment of violators. Such legislation is so diverse in matters of detail as to render even an outline of it impracticable. There has been difficulty in arriving at a correct definition of gambling. It cannot be said that a mere contest of skill or strength, however great may be the prize, is indictable at common law, for in England and the United States such contests have at all times been sanctioned by public policy and protected by the courts. Of course there may be contests not objectionable upon this ground which may be prohibited for other reasons, as, e.g. cock-fighting, which is properly regarded as a cruel and wanton sport. But it is 'gaming' for persons to stake money on chance. The chance must be the controlling factor in the game. It is not enough that chance should enter into a contest to make it gambling, for it cannot be denied that there is a certain element of fortune in almost any contest or undertaking. But this does not make such contest gambling. All competitive examinations are affected somewhat by chance, yet no competitive examination is gambling. So in games of skill, as chess and billiards. In such games chance may have very little part. If so, playing these games, even for a prize or reward, is not gambling. It is otherwise when the game depends more largely on chance than on skill; so that it may be said that gambling as a penal

offense, under the statutes making it such, may be defined as a staking on chance. Consult: *Encyclopædia of the Laws of England* (London, 1897-98); Bishop, *On Statutory Crimes* (3d ed., Chicago, 1901).

GAMBOGE, gām-bōōj', or -bōj', or **CAMBOGE** (from *Camboja*, *Cambodia*, Skt. *Kambōja*, where the tree abounds). A gum resin brought from the East Indies, and believed to be the produce chiefly of *Garcinia Cambogia*, also known as *Garcinia cambogioides*, a tree of the natural order Guttiferae, a native of Ceylon, Siam, Cambodia, etc. The gamboge-tree attains a height of forty feet, has smooth oval leaves, small polygamous flowers, and clustered succulent fruit. When the bark of a tree is wounded, gamboge exudes as a thick, viscid, yellow juice, which hardens by exposure to the air. The finest gamboge comes from Siam. *American gamboge*, which is very similar, and used for the same purposes, is obtained from *Vismia Guianensis* (natural order Hypericinea), a native of Mexico and Surinam. Gamboge occurs in commerce in three forms: (1) In rolls or solid cylinders; (2) in pipes or hollow cylinders; and (3) in cakes or amorphous masses. The first two kinds are the purest. Good gamboge contains about 70 per cent. of resin and 20 per cent. of gum, the remainder being made up of woody fibre, fecula, and moisture. The resin of gamboge, known as gambogic acid, is a bright yellow substance soluble in alcohol and in ether. Its composition is represented by the formula $C_{40}H_{20}O$. It is much used by painters to produce a beautiful yellow color. It is also employed for staining wood, and for making a gold-colored lacquer for brass. It has a shelly fracture, is destitute of smell, and has an acrid taste. If taken internally, it acts as a cathartic, producing a large amount of secretion. It is but rarely used in medicine, and never alone, as it causes griping and irritation of the alimentary canal. See MANGOSTEEN.

GAMBRI'NUS. A mythical king of Flanders, to whom is ascribed the invention of beer. His figure is familiar in German beer-cellars and elsewhere, seated astride a cask with a tankard in his hand. The name is said to have arisen out of that of Jan Primus, Duke of Brabant (1251-94). He obtained the presidency of the Brussels guild of brewers, and his portrait, with a foaming glass of beer in his hand, was hung up in the hall of the guild. The name was presumably converted into German, the prince of the story made a king, and the invention of beer ascribed to him. But this explanation is probably itself a fiction.

GAME. See HUNTING.

GAME FOWL. See FOWL; COCK-FIGHTING.

GAME LAWS. Statutes enacted either for the purpose of protecting persons in the enjoyment of certain sporting rights, or of protecting game from improper destruction.

Previous to the Norman Conquest of England there were no restrictions against the hunting of game, except a general law prohibiting the hunting of game on Sundays; so far as is known this was the earliest game law. A subsequent law prohibited monks hunting in the woods with dogs. All other classes of society were at liberty to hunt over the country at large, except that the King's hunting was not to be interfered with;

that is, wherever the King elected to hunt, all others had to vacate until the King and his followers had passed. With the advent of the Normans in 1066, hunting became the sole privilege of the nobles, and the common people were prohibited, under severe penalties, from the hunting of game. They enacted stringent game laws, which became known as the Forest Laws, and which frequently drove the Saxons, and common people generally, into rebellion. Many of them, as in the case of the historic Robin Hood, became outlaws. During the Middle Ages the game laws of England were framed so as to secure to the landed aristocracy the exclusive right of taking game. Under their provisions, according to Blackstone, "All persons of what property or distinction soever, that kill game out of their own territories, or even upon their own estates, without the King's license expressed by grant or franchise, are guilty of the offense of encroaching on the royal prerogative. And those indigent persons who do so without having such rank or fortune, as is generally called a qualification, are guilty not only of this offense, but of the aggravations also created by the statutes for preserving game." One of the 'qualifications' for killing game in Blackstone's time was the ownership of a freehold estate of £100 per annum, "there being fifty times the property required to enable a man to kill a partridge," remarks the great commentator, "as to vote for a Knight of the Shire." Early in the last century all the old statutes on the subject were repealed, and the Night Poaching Act, 1828 (9 Geo. IV., ch. 69), and the Game Act, 1831 (2 Wm. IV., ch. 32), were substituted for these. These laws define game as hares, pheasants, partridges, grouse, heath or moor game, blackgame, and bustards." Later statutes have added to the list "landrails, quail, snipe, woodcock, rabbits, and deer." These enactments give to the occupier of land the civil remedies of trespass and injunction against persons entering his land to kill game, or shooting into it for such purpose. They also impose criminal punishment for various violations of their provisions, such as deer-stealing, taking of game at night, poisoning game, and the like.

In the United States game laws have been framed on different lines from those of England. Their primary object has been the protection of game itself, not the grant of exclusive rights to persons possessed of large property qualifications. In 1623 Plymouth Colony declared fowling, fishing, and hunting to be free, except on certain private property. In 1682, in this same colony, "the law prohibiting the catching of fish before they have spawned is to be revived by the commissioners at their next session." In 1709 it was enacted that "no weirs, hedges, fish-garths, stakes, kiddles, or disturbance or incumbrance, shall be set, erected, or made on or across any river, to the stopping, obstructing, or straitening of the natural or usual course and passage of fish in their seasons or spring of the year." In these laws are embodied the principles which are the basis of all just and reasonable game laws, and they are the corner-stones and foundations of all the statutes for the protection of fish and game that are in force in the States and Territories today. Class legislation is dead; all wild game and fishes are the property of him that reduces them to possession by killing or catching, with due regard to the law of trespass on private prop-

erty, be it land or water; wild game and fishes must not be molested during the season of reproduction, and they must be allowed free and unobstructed passage to their breeding grounds or waters.

The rule governing the acquisition of property in game in this country differs in some respects from those in England. There, if a hunter captures game upon the land of another, it belongs to the landowner, while here it belongs to the captor, although he may be liable to an action for trespass, and in some States to a criminal prosecution, for entering upon the premises of another without permission. By the common law the right of fishing in the sea and in tide-waters generally is public and common to every person; but the owners of lands on the banks of fresh-water rivers above the tide line have the exclusive right of fishing to the middle of the stream. If the same person owns lands on both sides of the river, he has the sole right of fishing in the river as far as his lands extend. So the sole right of fishing in ponds or lakes belongs to him who owns the fee of the soil beneath the water. Moreover, a person rightfully navigating a river becomes a trespasser when he shoots at or kills wild ducks thereon, in case the bed of the river is the property of adjacent land-owners.

This right of fishery, however, is not an absolute or unqualified right of property. It is subject to the police power of the State. Persons may be prohibited by legislation from fishing or hunting even upon their own lands, during certain seasons, and their sale of game which has been killed during the open season may be regulated. This rule rests upon the doctrine that the wild game within a State belongs to the people in their collective sovereign capacity. It is the subject of private ownership only so far as the people may elect to make it so; and they may absolutely prohibit the taking of it, or traffic and commerce in it, if this is deemed necessary for the protection or preservation of the public good. Hence State laws prohibiting the citizens of other States from planting oysters within the tide-waters of the enacting State are constitutional. So are laws regulating the catching of fish within the bays of the enacting State, or prohibiting the catching of fish or the killing of game for the purpose of carrying the same beyond the limits of the State. All State laws having for their object the protection of game from unnecessary slaughter, and the propagation of game, have been treated with favor by both State and Federal courts, and have received a liberal construction. Indeed, the Supreme Court of the United States has not hesitated to declare that it is the duty of the Legislature to enact such laws as will best preserve game of every kind and secure it as a valuable food-supply for the future use of the people of the State. Even the sale of fish propagated in private ponds may lawfully be restricted during the close season. Such restriction, the Supreme Court of Massachusetts has decided, does not differ in principle from forbidding persons from catching fish in streams running through their own lands. In short, the right to take game is a boon or privilege rather than a vested legal right.

Modern game laws do not stop with prohibitions against killing game out of season. They extend to the sale of such game, and even to its

possession, during the period of prohibition. They have become more stringent and minute in their restrictions. The machinery for the enforcement of this provision is far more effective than formerly, and civil suits for heavy fines are more frequently resorted to than criminal prosecutions under indictments.

The lack of uniformity of the various State laws dictating the seasons during which birds and animals shall be protected frequently defeats the very purpose for which the laws were framed, and, moreover, makes compliance with the provisions of the Federal law difficult for both shippers and game dealers, who have to consider the open seasons in the State in which the game was killed, and that to which it is their purpose to ship it. Still more confusion is caused by the general diversity in defining the seasons. In some States the open seasons are given, and in others the closed; while in all their statements is to be found every possible variety of inclusion and exclusion of the dates named. In some States the regular killing season is checked by the prohibition of shooting or killing on certain days of the week.

SHIPMENT OF GAME. This also is an important subject of game legislation, for one of the greatest factors in the rapid destruction of game in recent years has undoubtedly been the illegal shipment of game from one State to another. It has also been an exceedingly difficult problem to cope with, largely because interstate commerce is outside the jurisdiction of the several States. There was passed by Congress on May 25, 1900, an act, popularly termed the Lacey Act, which gave to the Secretary of Agriculture all duties and responsibilities connected with the preservation of game, and at the same time prohibited interstate commerce in game killed in violation of local laws. The Lacey Act is based, to a modified degree, on State laws, so that its proper enforcement requires a knowledge of certain local provisions which are subject to periodical change. Section 4 of this act ordains that every package containing game animals or birds, when shipped by interstate commerce, must be clearly marked, so as to show the name and address of the shipper, as well as the nature of the contents. In addition to this the laws of Colorado, Connecticut, Michigan, Nebraska, Ohio, Oregon, Wisconsin, New Brunswick, and Ontario require packages of fish or game to bear a statement clearly indicating the nature of the contents, which must cover the *kind* of game and the *amount* in the package. The majority of the States prohibiting exports place no restrictions on shipments within the State; six States, however, absolutely prohibit all shipment, as Tennessee, quail; Texas, domestic game; Minnesota, most game birds; Kansas, all protected game; Nevada, big game; and New Hampshire, moose, caribou, and elk; other States impose various limitations ranging anywhere between the two extremes. An important event in the development of modern State laws was the establishing by the Supreme Court of the constitutionality of the Connecticut statute prohibiting export of certain game. (*Geer vs. Connecticut*, 161 U. S. 519.) As a result, non-export laws have been generally adopted throughout all the States, nearly every State prohibiting the export of certain kinds of game. Kentucky, Mississippi, and Virginia are the only exceptions.

In some States the sportsman may carry a limited amount of game out of the State, but only under special restrictions. Deer may not be lawfully exported from Alabama, Florida, or any of the States or Territories west of the Mississippi, except Montana, Kansas, and Iowa; any of the States north of the Ohio and Potomac rivers, except Illinois, Ohio, Delaware, New Jersey, Connecticut, Rhode Island, and Massachusetts; while in Montana they cannot be sold, and in Illinois, Iowa, New Jersey, Connecticut, Rhode Island, and Massachusetts they are protected indefinitely at all seasons, or else for a definite term of years. The most general prohibition among game birds is that against the export of quail, which, with six exceptions, is in force in every State and Territory of the Union.

Across the border, Canada has a general law, covering and prohibiting the export of wild turkeys, partridge, prairie-fowl, quail, woodcock, and deer, except in the case of deer raised on private reserves; and an exception which provides that non-resident sportsmen may export two deer each in a calendar year at certain ports of export within fifteen days after the close of the open season. Such ports are Halifax and Yarmouth, in Nova Scotia; MacAdam Junction, New Brunswick; Quebec and Montreal, in Quebec; Ottawa, Kingston, Niagara Falls, Fort Erie, Windsor, Sault Ste. Marie, and Port Arthur in Ontario; and such other ports as the Minister of Customs may, from time to time, designate.

LICENSES FOR HUNTING AND SHIPPING GAME. In some sections of the United States, as Louisiana and Missouri, non-residents are denied the privilege of hunting, while the same class is denied the right to kill game in certain parts of the State of Virginia. Throughout Canada, and in twenty-five of the States of the Union, non-residents may hunt certain game providing they have secured a license. In nine States a similar restriction is imposed on residents, but the fee is usually nominal, and in all cases considerably less than that imposed on non-residents.

With regard to *fishing*, both for food and game fishes, all that has been said on the subject of hunting also applies. Most of the States have their own laws regulating the fishing for food and game fish—the open seasons varying according to the State and the species of fish. In some States it is illegal to take fish under a certain size or weight, while in most it is forbidden to take trout, bass, and other fish by netting or spearing, or by any method other than with hook and line. The laws apply to fishing in private waters as well as in those that belong to the State.

TRESPASSING. The same laws govern trespass in fishing as in hunting, although some States have made special laws on the subject. As a rule, however, the general law throughout the States on this subject decides that if the bottom of a lake or stream is subject to private ownership, the owner has the sole right of fishing, even though the water is deep enough to float a boat, and is subject to public use as a highway. In public waters the right belongs to the State, and consequently is usually free to the public, although there are instances where the State grants it to particular persons.

Below will be found tables giving the open and closed seasons for the more important varieties

of game—fish, bird, and animal—and a comprehensive bibliography:

GAME.

Deer.—The month of May is a closed season throughout the country; the regular closed period in each State ranging from the entire year, except December, in Minnesota, to May, June, July, and August, in New Mexico.

Wild Turkey is protected during May, June, July, and August throughout all the States.

Quail is slightly better protected than the wild turkey.

Grouse, including *Prairie Chicken* and *Pheasant*, is generally protected in the Northern and Eastern States, except during the months of November and December. In the Southern and Southwestern States the open season is, as a rule, during December, January, and February.

Wild Water Fowl enjoy a closed period varying from one to three months.

Rail and Woodcock are protected most of the first half of the year, and in New York and New England generally, during the month of December. The following also enjoy periods of immunity, varying according to State legislation: Hares, Rabbits, Plover, Snipe, and Squirrels; also Elk, Moose, Antelope, Buffalo, Mountain Sheep. Among *water animals*, the Beaver, Mink, Otter, Muskrat, Sable, Fisher, and Marten.

See *FERÆ NATURE*; *FISHING LAWS*; etc. Consult: *Geer vs. Connecticut*, 161 United States Reports, 517 (1896); *Commonwealth vs. Gubert*, 160 Massachusetts Reports, 157 (1893); *Year Book of the Department of Agriculture*, 1899, pp. 282-287; id., 1901, pp. 634, 635; Oke, *Handy Book of the Game Laws* (4th ed., London, 1897).

GAMELYN, gām'e-līn. The hero of an English verse tale of the same name written in the fourteenth century. It was formerly ascribed to Chaucer, for the reason that all extant copies of the poem are found in the MSS. of the *Canterbury Tales*. It is interesting as furnishing Thomas Lodge with an outline for the first part of *Rosalind*, upon which Shakespeare afterwards based *As You Like It*. Consult the appendix to the *Variorum* edition of Shakespeare's play by Furness (Philadelphia, 1890).

GAME OF CHESS, A. A political comedy by Thomas Middleton, satirizing Spain and Roman

FISH ARE OUT OF SEASON DURING THE FOLLOWING MONTHS.

Except where there is only one mark, in which case only part of the month is closed, and the part left blank is open.

Catholicism, produced at the Globe Theatre in August, 1624, and published in quarto the same year. It was suggested by the notorious Spanish Match, and drew much of its abundant detail from contemporary tracts which dealt with that fiasco. The Spanish Minister immediately protested to King James concerning it, and the author was temporarily imprisoned. The vogue which the play enjoyed at the time was remarkable, its nine performances netting £1500. Consult Doran, *English Stage*.

GAME PRESERVE. A park stocked with game, or a tract of country, sometimes inclosed, and set apart for the protection of game. At the beginning of the Middle Ages the rulers of European countries maintained their own hunting grounds or forests, a fashion which was soon followed by the landed nobility, and out of which grew up the present system, by which the right of hunting and the ownership of game is vested in the ownership of the land. (See **GAME LAWS**.) Austria-Hungary and Germany contain many 'hunting estates,' as also did France before the Revolution; and game of every description is plentiful. In none of these countries, however, is the preservation of game so much a concern of the National Government as of the individual proprietor. In the British Isles game preserving has attained a high degree of development; but, as in Continental Europe, it is due to the individual land-owner rather than to the Government, and the impelling factor is a selfish rather than a patriotic motive.

In England and Scotland the old method of shooting birds over dogs has been largely superseded by 'driving.' Instead of hunting the game, the sportsmen or 'guns' take up previously appointed positions, and the 'beaters' or game-keepers drive the game in front of the gunners. Vast sums are annually expended in breeding the different varieties of game; but as they are practically raised in captivity, they are as a rule heavy on the wing, and lacking in the characteristics most desired by the keen hunter. Within recent times fresh-water fish have come under Government protection, local as well as national.

In Ireland the impoverished condition of the great majority of the land-owners has prevented the stocking and breeding of game to any great extent; nevertheless there are several estates in the midlands, south, and west, where game is carefully preserved for sporting purposes.

Scotland possesses the largest single areas set apart for shooting and hunting in the United Kingdom, the preserve of the Duke of Sutherland ranking as one of the largest in the world. The vast tracts set apart for these purposes have become a very real grievance to the Scottish people. Grouse, deer, and salmon are especially preserved in Scotland.

In the United States the subject of game preservation in its largest sense has become a matter of national legislation. Every effort is being made to preserve what is left of the bison, the Maine caribou, the bald eagle of the Rockies, and the ibis and the flamingo of the extreme southern forests. Besides the numerous zoölogical gardens throughout the country, and the various Government reservations, there are many estates owned by private individuals or by private clubs. One of the oldest of these latter is that founded by Fayette S. Giles in 1870, which covers 17,000 acres, and is known as the Grove Park Associa-

tion. The first real game preserve in America was that of Judge John Dean Caton, the author of *The Deer and Antelope of America*, who founded his preserve for the purpose of sport as well as for study. The Litchfield tracts at Tupper Lake, N. Y., and the Webb holdings at Nehasane, N. Y., and Shelburne, Vt., are also well-known game preserves. Corbin Park at Newport, N. H., next to the Duke of Sutherland's estate, is the largest inclosed game preserve in the world; the latter, however, exceeds it only in superficial area, and not by any means in scope or importance. The Corbin tract consists of more than 25,000 inclosed acres, with additional land outside, and includes altogether nearly four entire townships. An important game fish preserve is that of E. C. Benedict, in Connecticut, at the east end of Long Island Sound. The most important private game preserve in the United States is that of G. W. Vanderbilt at Biltmore, N. C., which covers 80,000 acres of diversified country, of which 6000 acres are inclosed and the remainder open. The preserve is cared for by an organized system of rangers, keepers, etc. Private game preserves are becoming plentiful in the Adirondacks, but the interests of the general public are being cared for there as in other places throughout the country by the creation of Government reserves, both forest and game. See **FORESTRY**.

Canada has several big preserves, but throughout eastern and central Quebec the best stretches of game country land and water are all owned by private individuals. A famous preserve is the great Caughnawaga tract, which is situated north of Deux Rivières, on the Magnacippi River. The preserve of the Roberval Club, which has a mixed Canadian and United States membership of over 300, is in the heart of the Laurentian Mountains, and is a little over 500 square miles in extent. The most remarkable preserve is that belonging to Henri Ménier, consisting of the whole of Anticosti Island, in the Gulf of Saint Lawrence. See **FISHING; HUNTING**.

GAMES, ANCIENT. The public games of Greece and Rome were athletic contests and spectacles of various kinds, generally connected with religious observances. It is hard to overestimate the influence of the public contests of Greece in developing the extraordinary appreciation of physical beauty among the Greeks, and its reflection in art and literature. They also exercised a powerful influence in promoting a feeling of national unity in opposition to the many rivalries which tended to disrupt the Grecian world. As the contests came to take on more and more of the professional character, the admiration for the athletes decreased, and the games lost much of their early character. In the Homeric poems we find games a part of the funeral of a great chief, but with the fall of the nobility they become associated with some special sanctuary or religious festival. The Romans preferred to play the part of spectators, and their shows were commonly gladiatorial and bloody—things entirely foreign to the feeling of free Greece. See **OLYMPIC GAMES; PYTHIAN GAMES; NEMEA; ISTHMUS; PANATHENÆA; CIRCUS; AMPHITHEATRE; GLADIATOR**.

GAMESTER, THE. (1) A comedy by Shirley (1633). It is founded on a novel by Celio Malespini, and in its turn suggested Johnson's

The Wife's Relief (1711); Garrick's *The Gamesters* (1758); and Poole's *The Wife's Stratagem* (1827). Charles I. approved it highly, and is said to have even assisted in the construction of its plot. (2) A comedy by Mrs. Centlivre (1705). It was taken from Regnard's *Le joueur* (1696), and suggested Destouche's *Le Dissipateur* (1736). (3) A bourgeois tragedy in prose by Edward Moore, produced with success at Drury Lane, February 7, 1753. Garrick wrote the scene between Lewson and Stukely in the fourth act, and played the principal part.

GAM'ETANGIUM (Neo.Lat., from Gk. γαμέτην, *gametē*, wife + ἀγγεῖον, *angeion*, vessel). The organ of plants in which the sex cells (gametes) are developed. In its narrow sense, the name is used only in connection with the lower algæ and fungi, in which the gametes are alike. In the higher plants the gametes are unlike (eggs and sperms), and the organs which produce them are called oogonia or archegonia, and antheridia.

GAMETE, gā-mēt' or gām'ēt (Gk. γαμέτην, *gametē*, wife, from γάμος, *gamos*, marriage, from γαμέειν, *gamein*, to marry). The sexual cell which fuses with another in the process of fertilization. In the lowest plants gametes are similar in appearance, and there is no apparent distinction of sex. In most plants, however, the pairing gametes are strikingly different. One of them is a small and usually ciliated body called the sperm; while the other is a comparatively large and passive body called the egg. In every case the gamete is a naked cell. The organ in which the gametes are formed is called a gametangium; and when the gametes are differentiated, the gametangium which produces the sperms is called an antheridium, while that which produces the egg is called the oogonium in the algæ and fungi (thallophytes) and archegonium in the higher groups. See FERTILIZATION.

GAM'ETOPHYTE (from Gk. γαμέτην, *gametē*, wife + φυτόν, *phyton*, plant). That phase in alternation of generations of plants which bears the sex organs. For example, in mosses the ordinary leafy moss plant is the gametophyte, while in ferns the prothallium is the gametophyte. The alternating asexual phase is called the sporophyte. See ALTERNATION OF GENERATIONS; PROTHALLIUM.

GAM'GEE, ARTHUR (1841—). An English physiologist. He was born in Florence, Italy, was educated at Edinburgh University, was there assistant in medical jurisprudence from 1863 to 1869, and in 1873 was appointed the first Brackenbury professor of physiology in Owens College, Manchester. He was also professor of physiology at the Royal Institution of Great Britain from 1882 to 1885, and became an assistant physician and lecturer on materia medica in Saint George's Hospital, London. After his retirement from Owens College as professor emeritus, he practiced medicine and conducted private investigations. He became particularly known for his researches in physiology and physiological chemistry. His writings include numerous papers on these subjects, especially the latter, a translation and edition (1875; 2d ed. 1878) of Hermann's *Grundriss der Physiologie* (Berlin, 1863), and a *Text-Book of the Physiological Chemistry of the Animal Body* (1880-93).

GAM'MER GURTON'S NEEDLE. The title of an English comedy, performed at Cambridge in 1566, and printed in 1575. It has been ascribed on insufficient grounds to John Still (1543-1607), Bishop of Bath and Wells. In order of time it is the second of the English comedies founded on Latin models, the first being *Ralph Roister Doister*, by Nicholas Udall, printed in 1566. The theme of the play is the loss of a needle by Gammer Gurton, a village housewife, while she is mending her husband's breeches, and the consequent disturbance in the household and the village. The wit is coarse, homely, and boisterous. The play contains the oldest and one of the most famous drinking songs in the English language—"Back and side go bare, go bare." For the comedy, consult Dodsley, *Old Plays*, edited by W. C. Hazlitt, vol. iii. (London, 1874-76).

GAM'MON, OILY. A smooth, swindling solicitor in Warren's *Ten Thousand a Year*.

GAM'OPET'ALÆ. Another name for the Sympetaleæ, one of the divisions of the dicotyledons (q.v.).

GAMP, Mrs. SAIREY. A professional nurse in Dickens's *Martin Chuzzlewit*, husky of voice and moist of eye, and given to stimulants during her night watching. She constantly refers to the opinions of her mythical friend Mrs. Harris in confirmation of her own views, and is noted for her plethoric umbrella, which has given the name 'gamp' to other umbrellas of similar shape.

GAMTOOS (gām'tōs) RIVER. A river of Cape Colony, South Africa, which rises in the plateau of the Great Karoo in a number of wady-like streams (Map: Cape Colony, J 9). At the eastern end of the Zwartte Berge it becomes a permanent watercourse, flowing southeasterly to the Indian Ocean, which it enters through Saint Francis Bay about 50 miles (coastwise) west of Port Elizabeth. A number of tributaries are received by the main stream from both the north and the south; the Konga River from the latter being the chief one.

GAMUNGAN, gā-mōōn'gān. A Malay people in Cagayan Province, Luzon. See PHILIPPINES.

GAM'UT. The name given to a system of musical notation invented by Guido of Arezzo, a Benedictine monk of the tenth century. He called the lowest tone of the musical system gamma (Greek letter g), and then, taking the syllables from an old Latin hymn, called the notes of the hexachord ut, re, mi, fa, sol, la. The scale thus formed, with the later addition of si for the seventh, acquired the name *gamut* (gamma-ut), or French *gamme*.

GANANCIAL SYSTEM (from Sp. *ganancia*, gain, profit). The Spanish law governing the title and disposition of property acquired by husband and wife during the existence of the marriage relation. It is almost identical with the community system of the French law and many of our Western States, the chief point of difference being that under the Spanish rule the conjugal community of ownership cannot be renounced or modified by any stipulation or agreement of the parties except in case of a judicial separation, whereas under the other system they are permitted to regulate the ownership of their separate or jointly acquired property by contract.

Several of the States acquired by the United

States from Spain have retained this system without material modification, and it exists in most of the Spanish-American countries. In Spain it is regulated by the Civil Code. The term is not generally employed in the United States. See **COMMUNITY OF PROPERTY**; **HUSBAND AND WIFE**.

GANANOQUE, gā'ná-nók'. A port of entry of Leeds County, Ontario, Can., on the left bank of the Saint Lawrence, where it issues from Lake Ontario, 18 miles east-northeast of Kingston (Map: Ontario, G 3). It is a favorite summer resort, convenient for the exploration of the Thousand Islands, which lie opposite to it. Gordon Island, just below Gananoque, has been converted into a fine public park. Gananoque has abundance of water-power, and manufactures of agricultural implements and machinery, etc. Population, in 1891, 3669; in 1901, 3526.

GAND, gān. See **GHENT**.

GANDA, **BAGANDA**, bá-gān'dā. Names applied to the Uganda Protectorate.

GANDAK, gūn-dāk', or **SALIGRAMI**, sā'lē-grā'mē. A river of the Northwestern Provinces and Behar, India, a northern tributary of the Ganges. It rises in the Nepal Himalayas and joins the Ganges opposite Patna, after a southeasterly course of about 400 miles. Only a small portion of its course is navigable below Bhelunji, but rafts of timber are floated down from Nepal. It drains an area of about 40,000 square miles.

GANDAMAK, or **GUNDAMUK**, gūn'dā-mūk'. A village in the eastern part of Afghanistan, about 60 miles east-southeast of Kabul. It figures in connection with the fatal retreat from Kabul in 1842, when a body of about 100 British soldiers and 300 camp followers were massacred here, only one man effecting his escape. In 1879 a treaty was concluded at Gandamak between the British and Yakub Khan.

GANDARA, gān'dā-rā. A town of Samar, Philippines, situated 10 miles north of Catbalogan (Map: Philippine Islands, J 8). Population, in 1898, 15,563.

GANDERCLEUGH, gān'dēr-klōōk. The imaginary residence of the imaginary editor of Scott's *Tales of My Landlord*, Jedediah Cleishbotham.

GANDÍA, gān-dē'ā. A town in the Province of Valencia, Spain, 47 miles by rail south-southeast of the city of Valencia, on the Rio Sèrpiá, or Alcoy, about two miles from the sea (Map: Spain, E 3). It is surrounded by walls, and has several buildings of merit, among which are the ducal palace, the hospital, the town hall, the Colegio de Escuela Pia, founded by Saint Francis of Borgia, who was born in Gandía, and the collegiate church, a Gothic structure with fine paintings and sculptures. There are plazas and promenades. The town is situated in an extremely fertile valley which produces grain, rice, oranges, raisins, wine, oil, silk, etc. Through the port at the mouth of the river, Gandía carries on a considerable coastwise and foreign trade; its principal industrial establishments include silk-mills, ribbon and velvet manufactories, and tanneries. Population, in 1900, 9924.

GANDO, gūn'dō, or **GANDU**, gūn'dōō. A former subordinate sultanate of the Sokoto Empire, now merged (since a treaty between France

and England in 1898) in the colonies of Nigeria and in Dahomey and the French Military Territories; reaching along both sides of the Niger from Gomba up to Birni (Map: Africa, E 3). Sokoto is on the east, the region of the Mossi on the west, and the District of Ilorin on the south. Gando is embraced among the Hausa States, being inhabited by the Hausas, Fulbes, and Surhais. The Sultanate of Gando was founded in 1802. The capital, Gando, is situated half way between Sokoto and Gomba, with a population of about 12,000.

GANDOLFO, gān-dōl'fō. See **CASTEL-GANDOLFO**.

GAND'ON, JAMES (1743-1823). An English architect, born in London, of Huguenot descent. He began the study of drawing as a boy, and was the first to receive a gold medal for architecture from the Royal Academy (1769). Two years later he went to Ireland and followed his profession there until his death, with a break of two years spent in London. Some of the most prominent buildings in Dublin were planned by him, such as the Custom House (1791), Carlisle Bridge (1791-94), and the Four Courts (1802).

GANDU, gūn'dōō. See **GANDO**.

GANELON, gā'ne-lon. One of Charlemagne's paladins, who plays an important part in the Carolingian cycle of romance. It is said that his castle was built on the Blocksberg, the loftiest peak of the Harz Mountains. Ganelon was jealous of Roland, and in order to destroy his rival, he treacherously planned with Marsillus, the Moorish King, the attack of Roncesvalles. He is represented as a man of more than ordinary build, fierce in his demeanor, and a lover of solitude. His name became a synonym of treason. He is mentioned in Chaucer's *Nun's Priest's Tale*, and in Dante's *Inferno*.

GANESA, gā-nā'shā, or **GANESH**, gā-nēsh' (Skt., lord of the host, from *gana*, host + *śa*, lord). One of the most popular Hindu minor divinities, the god of wisdom and remover of obstacles. His temples, shrines, or images are to be seen even in the smallest villages in India; and his grotesque figure, with an elephant's head, four arms, and a huge protruding belly, usually painted red, is not only familiar by the wayside, but is employed as a sign over the doors of shops, to bring luck in business. As a remover of difficulties he is invoked at the beginning of Sanskrit literary works, with the formula, *Namō Gaṇeśāya*, 'Homage to Ganesa'; and he is likewise prayed to for success in all sorts of enterprises and undertakings. In Hindu mythology, Ganesa is the son of Siva and Parvati (q.v.), or of Siva alone, and various legendary accounts are given to explain the presence of his elephantine head with its single tusk. His name, which is found also in the form *Gana-pati*, means lord or leader of the company of minor divinities that attend upon Siva. He is often represented as riding upon a rat, a creature symbolic of the god's familiarity with out-of-the-way places and dark or obscure matters. Consult: Wilson, *Hindu Mythology* (London, 1900); Dowson, *Hindu Mythology* (London, 1879).

GAN'GA (Catalan, grouse). A local name for three birds: (1) Any sand-grouse, especially the pin-tailed species (*Pterocleptes alchata*) common in Southwestern Asia, and in winter in Northern

India; (2) a South American carrion-hawk, or caracara, of the genus *Ibycter*; (3) the helmeted cockatoo (*Callocephalus galeatus*), of South-eastern Australia and Tasmania; it is prevalently gray, with a head and crest of flaming red and the feet nearly black.

GAN'GA SAGOR'. See SAUGOR.

GANGES, gān'jēz (Skt. *Gangā*, stream). An important river of Northern India, rising in Garhwal, in latitude 30° 56' 4" N., and longitude 76° 6' 40" E. It drains the southern ranges of the Himalayas, and after a southern and eastern course of 1557 miles flows into the northern section of the Bay of Bengal through a multi-channelled delta 283 miles long (Map: India, D 3). Its basin, one of the finest and most fertile portions of the world, covers an area of over 390,000 square miles, lying between the Himalaya and Vindhya ranges, and extending to the mountains which separate Burma from Bengal. The Ganges is famous as the sacred river of the Hindus. Its main source is in a snow-field imbedded between three Himalayan mountains over 22,000 feet high. It issues as the Bhagirathi from an ice cave, 13,800 feet above sea-level, and with a fall of 350 feet in a mile descends 10 miles to Gangotri, the first temple upon its banks, and a favorite pilgrim resort. Seven miles below Gangotri it is joined from the right by the Jahnvi, and at Deoprayag (q.v.), 133 miles from its source, the Bhagirathi joins the Alaknanda, the united streams being from this point called the Ganges. The Ganges leaves the Himalayas at Sukhi, and reaches the border of the great plain of Hindustan at Hardwar, 157 miles from its source and 1024 feet above the sea, after a descent of 9276 feet, or nearly 60 feet in a mile. From Hardwar it flows past Atrauli and Farukhabad, near which it receives the Ramganga, and continues past Kanauj and Cawnpore to Allahabad after a winding course of 488 miles, beset by shoals and rapids, and with an average fall of 22 inches per mile. The stream is navigable for river craft to Hardwar, for small-draught steamers to within 100 miles of the mountains, and for loaded barges to Cawnpore, 140 miles northwest of Allahabad. At Allahabad the Ganges is joined by the Jumna from the southwest, and thence the increasing river flows east to Mirzapur, Benares, Ghazipur, Patna, Monghyr, and Bhagalpur, receiving from the right the Son, and from the left the Gumti, Gogra, Gandak, and Kusi. This section, which has a fall of about five inches a mile, varies in breadth and in depth according to the season of the year, but notwithstanding many shoals, is navigable even in the dry season for vessels drawing 18 inches of water. Around the Rajmahal Hills, at the head of its delta, 563 miles from Allahabad, the Ganges bends southward and commences a descent of 283 miles to the Bay of Bengal. Near Pakaur (assuming the early name of the river) the Bhagirathi, and 70 miles lower down the Jalangi, branch off, and after individual courses of 120 miles each, unite to form the Hugli, the westernmost and principal channel of navigation, on which Calcutta (q.v.) stands. The main branch, throwing out various minor offsets, continues as the Padma, or Padda, to Goalundo, where it unites with the Jamuna, the main branch of the Brahmaputra, and finally flows through the wide estuary of the Megna into the Bay of Bengal; between this estuary and the

western channel of the Hugli lie the numerous mouths of the deltaic channels. The delta, which in the northern part is fertile and well cultivated, in the south bordering the sea is a dismal network of swampland, known as the Sundarbans (q.v.), infested by crocodiles, tigers, and other wild animals. Three distinct species of crocodiles are found in the Ganges, the fresh-water, long-snouted gavial, the man-eating koomiah, and the muggar.

The Ganges, as a whole, cannot be accurately described. From year to year it exchanges old channels for new ones, more particularly in the alluvial basin of its lower sections. Even as high as Fathipur, above Allahabad, this characteristic is marked. In this part the river bed has an average width of four miles, within the limits of which it changes its course annually, in the lapse of four or five years shifting from the one limit to the other. Between seasons the fluctuations in some places are more conspicuous; at Benares, the stream ranges, according to the time of the year, from 1400 feet to 3000 feet in breadth, and from 35 feet to 78 feet in depth. Lower down these vicissitudes produce more striking results. Toward the end of July a proportion of the delta is inundated over an area of more than 100 miles in diameter, presenting to the eye nothing but villages and trees and craft of every sort. To mitigate this evil, expensive dams have been constructed with a collective length of over 1000 miles. The influence of the tides extends, at the dry season, a distance of 240 miles from the sea. The minimum outflow of water per second has been estimated at 36,000 cubic feet, and its maximum at 494,000 cubic feet. Like all rivers subject to floods, the Ganges holds in suspension a large admixture of mud and sand, depositing in the sea annually millions of tons of solid matter.

The Ganges, or, as it is called, the Ganga (feminine), occupies an important position in Hindu mythology of the classical and the Purānic periods, and is the subject of numerous traditions and legends. In the religion of all classes of Hindus, it is held in particular veneration as the holiest of rivers, the cleanser of sins, and the entrance to Paradise, when death and sepulture occur upon its banks. Temples and shrines with ghats or flights of steps, giving easy access to its waters, stud its banks almost from its source; the most conspicuous examples are the temples and ghats of holy Benares. The junctions of the river's various affluents are especially sanctified spots; that of the Jumna at Allahabad is considered the most sacred and is the most frequented place of ablution, annually visited by thousands of pious pilgrims, who also convey the water to all parts of India for use in their religious rites.

GANGES CANAL, UPPER AND LOWER. A navigable channel of India (Map: India C 3), which obviates the difficulties in the navigation of the Ganges above Allahabad, and with numerous branches irrigates the Doab, or country lying between this river and the Jumna. The Upper Canal, commenced in 1848, and opened in 1854, extends on the right bank of the Ganges from Hardwar to Cawnpore and Etawah. The Lower Canal, commenced in 1873, continues to Allahabad. The total length of the main channel is 700 miles, and its irrigating branches

amount to nearly 3000 miles. A magnificent aqueduct of 15 arches which crosses the Solani, and the weir wall at Narora, 3800 feet long, with 42 sluices, are monumental works upon its course. The entire work cost about \$25,000,000.

GANGHOFER, gāng'hô-fēr, LUDWIG (1855—). A German novelist and playwright, the son of August Ganghofer, a celebrated forester. He was born at Kaufbeuren and studied at the universities of Würzburg, Munich, Berlin, and Leipzig. In 1879 he published his first book, a volume of poetry entitled *Vom Stamme Asra*. In 1880 his first play, *Der Herrgottschnitzer von Ammergau*, achieved success at Munich. Two other dramatic successes, *Wege des Herzens* and *Der Anfang vom Ende*, were followed by his appointment as dramatic author to the Ringtheater at Vienna, for which he wrote a number of comedies. From 1886 to 1892 he was one of the editors of the Vienna *Tageblatt*. Besides his plays and several volumes of verse he published: *Der Jäger von Fall* (1883, dramatized as *Der Zweite Schatz*); *Bergluft* (1883); *Aus Heimat und Fremde* (1884); *Die Sünden der Väter* (1886); *Edelweiskönig* (1886); *Oberland* (1887); *Der Unfried* (1888); *Der Besondere* (1890); *Die Fackeljungfrau* (1893); *Der Klosterjäger* (1894); *Die Martinsklausen* (1895); *Schloss Hubertus* (1895); *Der laufende Berg* (1897); *Das Gotteslehen* (1899); *Rachele Scarpa* (1899); *Der Dorfapostel* (1900).

GANGI, gān'jâ. A city in Sicily, 2800 feet above the sea, on the slope of a steep mountain, 65 miles southeast of Palermo, on the wagon road that leads from Termini Imerese to Leonforte (Map: Italy, J 10). Two miles distant is the Convent of San Benedetto, built on the ruins of the old town that was destroyed in 1299 by Frederick II. In ancient times Gangi was Engium, whose celebrated temple of the Matres Magnæ Cicero tells us that Verres despoiled. Population of commune, in 1881, 12,021; in 1901, 11,376.

GANGLION, gān'glî-on (Lat., from Gk. γάγλιον, tumor). In surgery, a term applied to small, tense, rounded swellings containing fluid that develop in the course of tendon-sheaths and are most often situated on the dorsum of the hand and wrist. See NERVOUS SYSTEM.

GANGOTRI, gān-gō'trê (Hind., Descent of the Ganges). A temple erected on the highest accessible spot on the Ganges (q.v.), about 10,000 feet above the level of the sea, on the right bank of the river (here called the Bhagirathi), some 10 miles from its source. Immediately in front, the stream expands into a small bay, which is subdivided into pools, taking their names respectively from Brahma, Vishnu, and other gods. Though the water is specially sacred, and ablution peculiarly efficacious, yet, from various causes, the pilgrims are by no means numerous. Besides the length and ruggedness of the journey, and the difficulty of procuring subsistence by the way, there is no accommodation for visitors, the only dwelling-house in the locality being occupied by the officiating Brahmans. However, flasks of the holy element, sealed by the attendant priests, are exported.

GANGRA, gān'grâ, COUNCIL OF. A council held at Gangra, in Paphlagonia, about A.D. 370, against Eustathius of Sebaste, who was the first

preacher of the ascetic life in the countries around Pontus, where his disciples became numerous. He taught that it is unlawful to marry and to eat certain meats; separated several married persons; and advised those who disliked the public offices of the Church to communicate at home. He wore, and imposed on his disciples, a distinctive dress, compelled women to cut off their hair, and directed his followers to shun, as profanation, the communion and benediction of a married priest. In opposition to these and similar views, the council published twenty canons condemning those who pronounced marriage unlawful, who forbade the eating of meat, refused to receive the communion at the hands of a married priest, wore a peculiar dress as a mark of unusual strictness, forsook their husbands through a false horror of marriage, and deserted their children or their parents under pretext of leading an ascetic life. Consult Hefele, *History of the Councils*; English translations by Clark, Oxenham, and Buch (Edinburgh, 1876-96).

GANGRENE, gān'grên (OF. *gangrene*, from Lat. *gangræna*, from Gk. γάγγραινα, gangraina, eating sore, from γάγρειν, grainein, to devour, Skt. gar, to swallow). The loss of vitality in a part of the living body, whether external or internal, the part becoming often, in the first instance, more or less red, hot, and painful, then livid, and finally dark and discolored, black, or olive green, according to circumstances, and later putrescent; after which a separation takes place gradually between the living and dead parts; and if the patient survive, the disorganized tissue sloughs off, and the part heals by the formation of a cicatrix. (See CICATRIZATION.) Gangrene is classified into two main varieties by the surgeon—moist and dry—according to the condition found in the part. The first variety is usually characterized by rapid, the second by slow, development. Gangrene may be brought about by local agencies, such as pressure, extreme heat or cold, chemicals, or disease or injury of the blood-vessels; or it may be due to constitutional disturbances such as accompany certain mental and nervous affections, cardiac disease, fevers, exhausting diseases, nephritis, and diabetes mellitus, or follow the administration of certain drugs, as ergot. The treatment requires that the strength of the patient be maintained by a nourishing and stimulating diet, to counteract constitutional causes, and that amputation be done or natural separation favored by the surgeon, according to his judgment. In gangrene from frostbite, or in senile gangrene, to await natural separation is the rule.

GANGS, AGRICULTURAL. A name applied to groups of women, girls, and boys brought together for labor in the fen districts of England, or the low tracts south of the Wash in the counties of Lincoln, Cambridge, Norfolk, Suffolk, and Rutland. Not long ago this part of the country was a marsh; but since dikes and canals have been constructed to drain it, it has become one of the most fertile districts of England. Instead of erecting houses on this land to be used as homes by farming tenants, the landlords escaped the exactions of the poor laws by employing laborers from the villages on the highlands near by. As women, girls, and boys worked cheaper than men, they were exclusively employed to

the number of 27,000. Near the close of the session of 1866-67 an act was passed regulating agricultural gangs. It provided that no woman or child should be employed in the same gang with men or boys, and that no woman or girl was to be employed under a male gang-master, unless a woman licensed to act as superintendent was also present with the gang. The effect of this act was most salutary. A commission was appointed in 1867 to inquire into the employment of women and children in agriculture, to investigate how far the principles of the factory acts could be applied to agriculture, with the special view of securing the better education of the children. On August 5, 1873, was passed the Agricultural Children Bill, which provided that no child should be employed under the age of eight; none between the age of eight and ten who had not a certificate showing 250 days attendance at school the previous year; and none between the ages of ten and thirteen who could not produce a certificate showing 150 days' attendance. .

GANGUE, gāng (Fr., from Ger. *Gang*, vein). The stony matrix in which metallic ores occur. Quartz is the most common gangue mineral, but calcite, barytes, fluor-spar, and other minerals are not uncommon. Portions of the gangue are sometimes worked and submitted to metallurgic processes, since they may contain enough metallic material to be classed as low-grade ore.

GANGWAY. A passageway or thoroughfare in a ship; now generally applied to the opening in the ship's rail leading to the gangway ladder, or gang-plank, and to the part of the deck in this vicinity which is forward of the quarter deck. In old-type ships the term is applied to the passages or parts of the upper deck between the quarter deck and forecastle. In the days when the quarter deck was only a partial deck, the gangway was a raised platform connecting it with the forecastle. When a ship is not lying at a wharf the gangway is reached by means of an *accommodation ladder*, which is a portable flight of steps bolted to a gangway platform (sometimes called the *upper grating*) at the upper end and reaching down nearly to the water. At the lower end it is supported by an iron span and ropes from above, or rests on a lower platform or grating. When at sea the platforms and ladder are unshipped and placed on deck; the side may then be climbed by means of iron brackets or wooden cleats secured to the side of the ship, forming a *sea ladder*.

GANGWAY (in geology). See **LEVEL**.

GAN-HWUY, gōn hwōō'ē. See **NGAN-HWEI**.

GANISTER. A hard, siliceous variety of clay, commonly associated with the coal measures. Owing to its refractory character, it is used as a lining for furnaces, particularly in iron-smelting.

GANNAL, gā'nāl', **JEAN NICOLAS** (1791-1852). A French chemist. He invented the elastic rollers used in printing, and made important improvements in the manufacture of borax and the preparation of tallow. He also discovered the method of preserving anatomical preparations, and of embalming bodies by means of solutions of aluminum salts, etc. He wrote

Histoire des embaumements et de la préparation des pièces d'anatomie normale (1841).

GANNAT, gā'nā'. The capital of an arrondissement in the Department of Allier, France, pleasantly situated on the Andelot, a tributary of the Allier, amid hills covered with vines and timber-trees, 34 miles south-southwest of Moulins (Map: France, K 5). In former times it was fortified by walls and ditches; the ruined castle is utilized as a prison. The Church of Sainte Croix presents interesting architectural features of the eleventh to the fourteenth centuries. Gannat has mineral springs, breweries, tanneries, manufactures of cutlery, and a trade in corn, wine and cattle. Population, in 1901, 5324.

GANNET (AS. *ganot*, *ganet*, OHG. *ganazzo*, MHG. *ganze*, gander; connected ultimately with Lat. *anser*, Gk. χήν, *chên*, Skt. *hainsa*, goose). A large gregarious sea-bird, closely allied to the pelicans. Gannets frequent the coasts of most parts of the world offering rocky cliffs upon which they may breed in fair security, and nine species are known, constituting the genus *Sula* and family Sulidæ. Most of the species inhabit the tropics and the Southern Hemisphere, and are called boobies (see **BOOBY**) by sailors.

The typical and best-known member of the family is the gannet of the North Atlantic (*Sula Bassana*), which derives its specific name from its frequency on Bass Rock, in the English Channel; it is also called solan (i.e. Solent) goose, for the same reason. It is scattered in summer at suitable places all around the British and Scandinavian coasts, about the islands of the North Atlantic, and from southern Greenland down to the Gulf of Saint Lawrence. Nevertheless, their colonies are scattered and steadily diminishing. This gannet has a body much like that of a goose, but weighs less; its total length is about three feet, much of which belongs to the neck, and long, strong, conical beak. Its general color when adult is white, with the head and neck buff, and the primaries of the long wings black and very conspicuous as they lie crossed above the tail when folded. Young specimens are mottled brown until three or four years old. In winter the gannets migrate to the northwest coasts and islands of Africa, or to the Gulf of Mexico; but early in the season they go north again, appearing at their breeding haunts in April, where by May they are collected in thousands about the sea-fronting cliffs. The gannets of Bass Rock were estimated in 1831 at 20,000, and in 1869 at 12,000, and are known to be decreasing there and in the Hebrides, owing to the excessive gathering of their eggs and downy young. On the American coast they nest along the shore of Labrador, and at Percé Rock and Bonaventure Island, off the Gaspé Peninsula, and on Bird Rock, an outlier of the Magdalen group, in company with murre, kittiwakes, etc.; but even in these almost inaccessible places are growing less in numbers, although somewhat protected. Upon the summits and ledges, wherever a square yard of room may be found, a gannet places its shallow nest of seaweed, and lays and incubates its single chalky-white egg. The sitting females crowded along the ledges make them look sometimes as if covered with snow, while the neighborhood will be full of

their mates, roosting, flying about, or darting down into the sea. They sail about at a considerable height, their eyes searching the surface for fish, and when one is seen they turn downward, shut the wings, and seem to drop upon it with amazing velocity, rarely missing a capture. They also make long excursions seaward, and toward the close of the breeding season are of service to the fisherman by finding and disclosing to him shoals of herrings and the like, which they follow and prey upon in great numbers. For the gannets in the Gulf of Saint Lawrence, consult the following richly illustrated books: Chapman, *Bird Studies with a Camera* (New York, 1900); Job, *Among the Waterfowl* (New York, 1902).

GANNETT, EZRA STILES (1801-71). An American Unitarian clergyman, son of Rev. Caleb Gannett, and grandson of Ezra Stiles, President of Yale College. He was born in Cambridge, Mass., and was educated at Harvard. He became assistant to Channing in the Federal Street Church, and later (1842) succeeded him as pastor. His incessant toil as the first secretary of the American Unitarian Association, one of the prime movers in the formation of the Benevolent Fraternity of Churches, founder and editor of the *Scriptural Interpreter*, and in many other interests, resulted in his breaking down in 1836, and soon after he was crippled by a paralytic stroke. But his mental activity was not abated. He edited the *Monthly Miscellany of Religion and Letters* and the *Christian Examiner*, besides attending alone to his large parish. He was an overseer of Harvard College from 1835 to 1858, and received the degree of doctor of divinity from that institution in 1843. He retired from pastoral work in 1869, and was killed in a railroad accident. He was a Unitarian of the more conservative type, an excellent preacher, and an ardent reformer. See the memoir by his son (1875).

GANNETT, HENRY (1846—). An American geographer. He was born in Bath, Maine; graduated at Harvard in 1869 and at the Hooper Mining School in the following year; was an assistant in the Harvard College Observatory in 1870-71; was topographer of the Hayden National Survey, and in 1882 became chief topographer of the United States Geological Survey. He contributed much of the geographical matter to the present edition of the *New International Encyclopædia*. His publications include: *A Manual of Topographic Methods* (1893); *Dictionary of Altitudes* (3d ed. 1899); and *Building of a Nation* (1895).

GANNETT, WILLIAM CHANNING (1840—). An American clergyman of the Unitarian Church, born in Boston, Mass. Having been ordained to the Unitarian ministry, he became pastor at Saint Paul, Minn., and subsequently at Rochester, N. Y. His publications include *A Year of Miracle and The Thought of God in Hymns and Poems* (with F. L. Hosmer).

GANO'DONTA. An order of Tertiary mammals, allied to the Edentata (q.v.), and apparently representing the ancestral forms from which they, or some of them, were derived. The oldest type (*Hemiganus*) is found in the earliest Eocene strata of North America, and is highly generalized, combining in its skeleton characters now

marking the armadillos and ground-sloths. It had a full complement of teeth and powerful jaws. The next representative is *Psittacotherium* (Upper Puerco beds), and is noticeable for its reduced dentition, and the fact that incisors (only one pair in each jaw) have enamel only upon their anterior faces. The foot is decidedly edentate. *Calamodon* is larger and shows progress toward the modern edentate type; and a still later form, *Stylinodon*, advances this progress. A review of the series shows "a gradual diminution of the incisors, a gradual loss of enamel on the teeth generally, and the production of hypselodont teeth growing from persistent pulpae; all of which are features of the later edentates" (Beddard). The order, however, includes another family, *Conoryctidae*, including the genera *Conoryctes* and *Onychodectes*, whose position with reference to the Edentata is more doubtful. Consult: Wortman, "The Ganodonts," etc., in *Bulletin of the American Museum of Natural History*, vol. ix. (New York, 1897); Beddard, *Mammalia* (London, 1902).

GANOIDEI (Neo-Lat. nom. pl., from Gk. γάνος, *ganos*, brightness + εἶδος, *eidos*, appearance), or **GANOIDEA**. One of the four orders of fishes in the classification of Agassiz. They are characterized by ganoid scales, horny plates covered with enamel, and angular (rhomboidal or polygonal) shiny scales. The small number of ganoid fish living at the present time do not form a natural group, for they have been found to be members of the three orders *Crossopterygii*, *Chondrostii*, and *Holostii*, examples of which are, respectively, the bichir (*Polypterus*), the sturgeon (*Acipenser*), and the gar-pike (*Lepidosteus*). In Paleozoic and early Mesozoic times ganoid fish were the prominent types of Teleostomes, and their remains are found in abundance in the Carboniferous, Permian, Triassic, Jurassic, and Cretaceous rocks of Europe and North America. With the close of Cretaceous time the ganoid types began to disappear and to give way to the teleost fishes, which are the predominating types at present. Thus, the ganoid structure is seen to represent an ancient, more primitive stage in the evolution of teleost fishes. Some well-known fossil ganoids are: *Holoptychius*, of the Upper Devonian; *Macropoma*, of the Chalk; *Palæonicus*, of the Permian; *Platysomus*, of the Permian; *Catopterus*, of the Triassic shales of Massachusetts, Connecticut, and New Jersey; and *Chondrosteus*, *Lepidotus*, *Eugnathus*, and *Mesturus*. See BICHIR; GAR; STURGEON; and the generic names mentioned above.

GANS, gäns, EDUARD (1798-1839). A German jurist, leader of the philosophical school of jurisprudence in Germany. He was the son of a Jewish banker, and was born in Berlin, and educated there, at Göttingen, and at Heidelberg. After his conversion to Christianity he was appointed professor at Berlin. He was a philosopher rather than a jurist, a strong Hegelian, and one of the foremost opponents of the historical method in jurisprudence, as represented by Hugo and Savigny. The philosophic theory of jurisprudence is presented by him in: *Ueber römisches Obligationrecht* (1819); *Scholien zum Gaius*; *Das Erbrecht in weltgeschichtlicher Entwicklung* (1824-35); *System des römischen Civilrechts* (1827); and in his edition of Hegel's *Grundlinien der Philosophie des Rechts* (3d ed. 1854). The Prussian Govern-

ment prohibited his lectures on contemporary history, later published as "Vorlesungen über die Geschichte der letzten fünfzig Jahre," in the *Historisches Taschenbuch* (1833-34). His other works include: *Vermischte Schriften* (1834); the personal *Rückblicke* (1836), describing his travels in England and France; and the periodicals *Beiträge zur Revision der preussischen Gesetzgebung* (1830-32) and *Jahrbücher für wissenschaftliche Kritik* (1827).

GANSEVOORT, gän'svöört, PETER (1749-1812). An American soldier, born in Albany, N. Y. On the outbreak of the Revolutionary War he joined the Patriot army, and on June 30, 1775, was appointed major of the Second New York Regiment. He subsequently accompanied Montgomery on his expedition against Canada; was promoted to be lieutenant-colonel in March, 1776; was placed in command of Fort George, on Lake George, in July; became a colonel in November; and from August 2 to August 22, 1777, defended Fort Schuyler (formerly Fort Stanwix) against Saint Leger, with a large force of British Tories and Indians, until the arrival of reinforcements under Gen. Benedict Arnold. (See FORT STANWIX.) He was a brigadier-general in the militia of New York State from March, 1781, until the close of the war, and in February, 1809, received the same rank in the Regular Army of the United States. He also filled successively the offices of commissioner of Indian affairs, commissioner for fortifying the frontiers, and military agent.

GANSFORT. See WESSEL, JOHANNES.

GANTANG (gän'tung) **PASS**. A mountain pass leading eastward from Kunawar, a district of Bashahr, in the Punjab, India, into Tibet. Its height is 18,295 feet above the sea, and it is overhung by a peak of its own name about 3000 feet loftier. The place is unspeakably desolate and rugged. Beset with perpetual snow and devoid of fuel, it is little frequented.

GANTEAUME, gän'töm', HONORÉ JOSEPH ANTOINE, Count (1755-1818). A French naval officer, born at La Ciotat. He entered the navy, in 1771, as a lieutenant, and saw service during the American Revolution. In 1794 he attained the rank of captain, in 1798-99 participated in the expedition to Egypt, and, with the rank of rear-admiral, he commanded the naval forces at the sieges of Jaffa and Acre. In 1799 he was given the title of Councilor of State. In 1804 he became vice-admiral, in 1808 commander of the Mediterranean Squadron, and in 1810 a member of the Council of the Admiralty. He supported the Bourbons, and was elevated to the peerage by Louis XVIII.

GANYMEDE (Lat., from Gk. Γανυμήδης). According to the *Iliad*, the son of Tros; or, according to others, of Laomedon, Ilus, or Erichthonius. The most beautiful of mortals, he was carried to heaven to become the cup-bearer of Zeus. The legend gradually developed, and it was the common belief that he had been borne away by the eagle of Zeus, or by Zeus himself in the form of an eagle. The eagle carrying away the boy was seemingly a favorite subject with later artists. The most celebrated was the work of Leochares, of which some conception may be obtained from a small marble copy in the Vatican. Ganyমেদে was also identified with

the divinity who presided over the sources of the Nile. The Greek astronomers likewise placed him among the stars, under the name of Aquarius (the water-bearer).

GAP, gäp. The capital of the Department of Hautes-Alpes, France, pleasantly situated on the right bank of the Luye, 84½ miles from Grenoble by rail (Map: France, N 7). It is approached through avenues of walnut trees, and is surrounded by vine-clad hills. The chief public buildings are the handsome Gothic cathedral, rebuilt since 1887; the bishop's palace; the prefecture building, containing a museum and the marble mausoleum of the Constable de Lesdiguières; a lyceum, a seminary, a library, and a theatre. The city is the seat of a bishop since the fifth century, has a court of assize, and a commercial tribunal. It has manufactures of hats, cement, leather, etc. Population, in 1901, 11,018. Gap (the ancient *Vapincum*) was formerly capital of a district of Dauphiné to which it gave the name of Gapençais. At the commencement of the seventeenth century it is said to have had about 16,000 inhabitants. Its decay dates from 1692, when it was sacked and almost wholly reduced to ashes by Victor Amadeus of Savoy.

GAPÁN, gä-pän'. The largest town of the Province of Nueva Ecija, Luzon, Philippines (Map: Luzon, E 5). It is situated in a level region four miles east of San Isidro. Population, in 1898, 20,216.

GAPER, gäp'ér. The soft clam (*Mya truncata*) of Great Britain, highly esteemed as food. The name is also occasionally applied to other similar edible bivalves. See CLAM.

GAPES, gäps (from gape, Icel. *gapa*, a yawn). A disease of poultry, due to the presence of a round gapeworm (*Syngamus trachealis*) of nearly universal distribution, found in the trachea of gallinaceous birds. Infested birds assume a characteristic drooping attitude in walking or standing, are attacked by frequent fits of coughing, and rapidly become emaciated. Many experiments seem to show that the earthworm is the intermediate host of the gapeworm, which gains entrance to the fowls when earthworms parasitized by gapeworms are eaten. On the other hand, some investigators deny any such interrelation. A favorite remedy is turpentine applied with a feather inside the windpipe. Internal doses of asafetida, garlic, or turpentine sometimes give good results. The most effective and convenient method is to make the fowls breathe the dust of air-slaked lime. This irritates the mucous membrane of the respiratory passages and produces violent coughing, during which the gapeworms, already affected by the lime, are thrown out. During the operation the fowls should be in a box or coop. Infested soil should be treated with a strong solution of common salt before the fowls are allowed to run upon it. Such treatment would probably kill the gapeworms.

GAR (from AS. *gār*, spear). The name of two different sorts of fishes having an external similarity, namely: (1) the marine garfishes, needle-fishes, etc., of the teleost family Esocidae; and (2) the fresh-water gar-pikes or billfishes of the ganoid family Lepidosteidae.

(1) The gars of the family Esocidae are round

slender fishes, sometimes five feet long, and having the jaws prolonged into a stout bill, and studded with sharp teeth; they are found in all warm seas, and are classified in four genera with about fifty species. They are voracious carnivorous fishes and powerful surface swimmers, pursuing the fleet flying fish and similar small gregarious prey, and often leaping high out of the water in their eagerness. The best-known species is the Old World garfish (*Belone vulgaris*), or greenbone, congeners of which dwell in the South Pacific and along the Asiatic coast; a prominent Oriental species is the great *Belone gigantea*, illustrated on the Colored Plate of PHILIPPINE FISHES. This genus is characterized by the presence of fin-rakers. On the tropical American coasts occur many species of the genus *Tylosurus*, popularly known as needle-fishes, spearfishes, longjaws, agujones, hound-fishes, etc. One of these (*Tylosurus marinus*) is common as far north as Cape Cod, often, like the others, ascending rivers to spawn. They are particularly numerous about the West Indies and in the Gulf of Mexico, and annoy the fishermen by tearing their nets. See AGUJA, and Plate of NEEDLE-FISH.

(2) The fresh-water gars, billfishes, bony pikes, or pikes, form a family of ganoid fishes (Lepidosteidae), the only living representatives of the order Rhomboganoidea, which was rich in forms in earlier geological times. (See GANOIDEI.) They have an elongated nearly cylindrical body, covered with a bony case of rhomboidal scales. The head, whose external bones are very hard and rugose, terminates in a long beak-like snout, with nostrils near the end of the upper jaw; and the jaws are set with several series of sharp recurved teeth. The dorsal fin is set well back, above the anal fin. There is a single genus, *Lepidosteus*, comprising five species, inhabiting the lakes and rivers of North America and China, some of which are very numerous in individuals. The most familiar species is the common billfish or gar-pike of the United States (*Lepidosteus osseus*), which under favorable conditions becomes five feet long, and is numerous found in lakes and rivers from Vermont to Texas. It lives by preying upon other fishes, and is not itself good for food. It is nocturnal in its activities, and in early summer seeks shallow places in which to lay its eggs, which are glutinous and adhere to the first object they come in contact with. When the fry hatches from the egg it has a row of suckers above a very large mouth with which it clings to submerged stones. The short-nosed gar (*Lepidosteus platostomus*) is smaller and has a shorter bill; it has a northerly range. The great or alligator gar, or manjuari (*Lepidosteus tristæchus*), belongs to the Southern States, Cuba, and Mexico, and sometimes reaches sixteen feet in length. A fourth species inhabits the west-coast streams of Central America, and a fifth is found in China. Compare BICHIR.

GARAMANTES, gâr'â-mân'têz. An ancient people of Garama (Jerma), northwest of Murzuk, in the oasis of Fezzan (Phazania), Tripoli, North Africa. This was the southern limit of the Roman Conquest. At the end of the seventh century the Arab Mohammedans swept away the vestiges of the Roman power. With perhaps a strain of negro blood, there are mixed in the veins of the present inhabitants that of Hamite,

Mediterranean, and Semite. They are akin closely with the native population of Ghadames, in common with whom they were conquered by the Quæstor Cornelius Balbus in the reign of Augustus.

GARANCINE (Fr. *garance*, Lat. *garantia*, madder). A red dye-stuff which may be derived from madder, and which was formerly much used on an industrial scale. It was originally obtained by Robiquet and Colin in 1827, who treated the ground madder with an equal weight of concentrated sulphuric acid. This treatment caused the formation of alizarin (q.v.), which was the coloring principle of garancine, and of which the latter contained a higher percentage than madder. Garancine therefore dyed more readily than madder, yielding brilliant reds and pinks with yellow tone, and lilacs with a gray shade.

GARASHANIN, gâr'â-shâ'nên, ILIYA (1812-74). A Servian statesman, born at Garachi. He studied at the Normal School of Semlin, entered the civil service, and in 1844 became Minister of the Interior. From 1852 to 1854 he was president of the Council, and in 1857-58 again Minister of the Interior. In 1862 he was once more at the head of the Cabinet, conducting the department of Foreign Affairs until 1867. As Minister of the Interior he inaugurated many reforms, particularly in connection with the system of public education and the administration of justice.

GARAT, gâr'â', DOMINIQUE JOSEPH (1749-1833). A French statesman and man of letters. He was born at Bayonne, and as a youth came to Paris, where he soon became known as a writer of *éloges* and editor of the *Journal de Paris*. After 1786 he enjoyed immense vogue as a lecturer on history at the Lycée. Going over to the partisans of the Revolution, he became a slavish adulator of Danton, whom he succeeded as Minister of Justice in 1792, becoming Minister of the Interior the following year. He was imprisoned during the Reign of Terror, but was freed after the fall of Robespierre, and became Minister of Public Instruction. He was Ambassador to Naples in 1798, and member of the Ancients in 1799. Made a Senator and a count by Napoleon, he remained faithful to him after the first Restoration, and was consequently ousted by Louis XVIII. from the Institute of France, to which he had been elected in 1795. After 1830 he became a member of the Academy of Morals and Political Science. Garat's character, like his brilliant literary style, was inherently weak, resting on no steadfast principles. Hungry for success and applause, he fawned upon Bourbon and Sans-culotte, Napoleon and Louis Philippe with equal assiduity.

GARAT, JEAN PIERRE (1762-1823). A French singer and composer, born at Ustariz. He began to study law and went to Paris to finish his course; but his great talent for music was almost immediately recognized, and he was patronized by the Count d'Artois, who introduced him to Marie Antoinette. He gave her lessons in singing and became a Court favorite. During the Revolution he went to Germany with Rode, the violinist, where his success was astonishing. He returned to France in 1794, and sang in the concerts at the Théâtre Feydeau (1795). He then went abroad again and sang throughout the

Continent with equal success. About 1796 he was made professor at the Conservatory, and was a popular teacher. He is said to have been the most wonderful singer France ever produced. His voice ranged from tenor to barytone, and suited all styles of music. He was also a composer; but his songs, it is said, owed most of their charm to his manner of singing them. Among these songs are: "Je t'aime tant;" "Bélisaire;" and "Le ménestrel exilé."

GARAY, gör'oi. János (1812-53). An Hungarian poet, born at Szegszárd. He was an ardent patriot, and all his poems deal with national subjects, although they are formed on German models. He held a chair in the University of Pesth for a year (1848), and was librarian there from 1850 until his death. His works include: *Csatár* (1834), an epic, which made him widely known, and the tragedies *Arbocz* (1837), *Ország Ilona* (1837), and *Bátori Erzsébet* (1840). His lyric poems are of a high order. There is an excellent edition of his complete works by Ferenczy (1888), who also wrote his *Life* (Buda-pest, 1883).

GARAY, gá-rí', JUAN DE (1541-84). A Spanish soldier, born in Biscay. He went to Paraguay about 1565, was appointed secretary to the Governor, made a voyage up the Paraná River, and in 1573 founded the city of Santa Fé de Vera Cruz. Subsequently he was appointed a lieutenant-general, and in 1580 he founded on the site of the first settlement the present city of Buenos Ayres. While returning to Asunción, he was massacred by hostile natives. In his dealings with the Indians he was humane and beneficent. His doings are celebrated by Bareo Centenera in the poem *La Argentina* (Lisbon, 1602).

GARB, or **GARBE** (OF. *garbe*, *jarbe*, Fr. *gerbe*, from OHG. *garba*, Ger. *Garbe*, sheaf; ultimately connected with Lith. *grapti*, Skt. *grabh*, to grasp). In heraldry, a sheaf of any kind of grain. If it is blazoned garb simply, wheat is understood; if any other kind of grain is intended, the kind must be mentioned, as a 'garb of oats.' See HERALDRY.

GARBAGE AND REFUSE DISPOSAL (ME. *garbage*, entrails of fowls; probably from OF. *garbage*, tribute paid in sheaves, from *garbe*, sheaf). A term used in the United States to designate kitchen wastes of animal and vegetable origin, incident to the preparation and serving of food. Associated with it there is likely to be more or less inorganic matter, some of which, such as tin cans and bottles, have been in contact with food materials. It is not uncommon to place all household wastes, other than sewage, in the garbage can or box, including ashes. In England all the wastes named are classed under the general head of refuse, and are placed in a common receptacle, or dust-bin. Aside from household wastes there are various classes of trade and manufacturing refuse, such as paper, rags, and shavings; also green stuff from vegetable markets, and the odds and ends from butcher shops, such as bones, scraps of meat, grease, and offal.

Much of the organic matter named, when fresh, is similar to, and generally quite as inoffensive as, the food supplies from which it was rejected, but its unstable character renders it liable to offensive decomposition. Hence it must be re-

moved promptly from dwellings and other buildings, and so transformed or otherwise disposed of as to give rise to no offense. The most primitive means of disposal are dumping on land or in water. A slight improvement on these processes is the burning of a portion of the wastes in the open air, but this rarely affects more than certain light combustibles, like paper and shavings, that have been mixed with the garbage proper. As the population of a city and its suburbs increases land disposal becomes intolerable except by burial, and finally impracticable by that means. The dumping of garbage and refuse at sea is expensive at best, besides being likely to cause the fouling of beaches and harbors.

By keeping organic and inorganic wastes in separate receptacles their final disposal is greatly simplified, but the difficulties incident to their storage and prompt removal from the premises of householders is thereby increased. Ashes, as they come from stoves and furnaces, are composed of inert inorganic matter, with no harmful or objectionable qualities save those due to dust and dirt. In America, town ashes seem to be of little use for any purpose except filling, for which they are most excellent. Paper, like many other classes of light, dry household and industrial wastes, is not necessarily offensive, but its unsightliness and possible association with organic wastes make its speedy and complete disposal highly desirable. Occasionally wastes of this nature are made to yield a revenue sufficient to pay a part of the cost of their collection and disposal.

Considering the vast quantities of material and large number of cities and towns concerned, the problem of the final scientific disposal of the city wastes is still in its infancy. Their collection, however, is on a far better basis, although leaving much to be desired. There do not appear to be more than three hundred cities and towns, in all the countries of the world, that have adopted thoroughly modern sanitary methods of garbage and refuse disposal; and many of the cities falling within this class have made but a beginning as yet. Great Britain and the United States seem to be far in the lead in matters of final disposal. Outside of some of the larger American cities, nearly all the improved processes of disposal employ cremation, or burning, in specially designed furnaces. In Europe the practice is to make the refuse consume itself, without extra fuel. In America large quantities of extra fuel are almost always required, for reasons explained below. In Great Britain many of the destructors, as they are called, are fitted with boilers, which generate steam for use about the plant, or for electric lighting, a number of combined refuse destructors and electric-light plants having been built recently. Besides utilizing the heat, the clinkers from the English furnaces are often put to a variety of uses, being ground up and mixed with cement, for making slabs or tiles for sidewalks, or being used for the foundations of pavements. In the United States nearly all the attempts to recover anything from garbage treatment have aimed to extract grease from the garbage, and to make the tankage, left after separating the grease and water, into a fertilizer base.

Great Britain took the lead in the installation

of garbage furnaces, both in point of time and in superior results attained. From 1870 to 1876 several crude furnaces were tried. In the latter year the city of Manchester put in operation the prototype of the more recent and more successful furnaces, thus antedating by many years the first furnace built for a city in the United States, which was erected at Des Moines, Iowa, in 1887. The common use of soft coal in open fireplaces in England leaves a larger percentage of combustible matter in the ashes from dwellings in that country than in the domestic ashes of American cities, while the people of the United States produce far larger quantities of watery green vegetable wastes, particularly in summer, than is the case abroad. Both of these facts favored the more rapid development of garbage furnaces, or refuse destructors, in England than in America, besides which the need for improved means of disposal was felt sooner in the former country. The tendency in America has been and still is to exclude ashes, and, to a less extent, old or broken crockery and the like, from garbage. This was partly due to the American practice of feeding garbage or swill to hogs, and, in the earlier days, even to cows. Farmers from the surrounding country would gather the swill for their stock, but would refuse that containing foreign matter. These food wastes were, and are yet, sometimes gathered by the municipality, or by a general contractor, and delivered to farmers at the outskirts of the city. Originally householders may have received a small sum for their swill, but latterly they have been fortunate if they can get it taken away without expense. At present, collections by or for American farmers are generally restricted to small towns, or to the hotels and restaurants of the larger places. The feeding of city garbage to either cows or hogs, particularly to milch cows, should be prohibited by State and city legislation. Household wastes in the country, when so fed, are generally fresh and harmless, but in the city they are liable to be in such a state of decomposition as to affect injuriously the milk of cows and the flesh of animals used for food. It may be added that wherever there is any attempt to recover paper, rags, glass, and the like from city wastes those substances should not be mixed with either garbage or ashes, since the sorting made necessary where mixing is allowed is a disgusting if not dangerous task for those engaged in it. The sorting is all the more objectionable because most of the work is done by women and children.

Before describing garbage furnaces and reduction plants a few words regarding the collection of city wastes may be said. Garbage proper should be collected in carts or boxes provided with water-tight, non-absorbent boxes or tanks, with closely fitting covers. Steel is now considered to be the best material for such tanks. Ashes and other dry wastes should be gathered in tight carts, well covered to prevent scattering by jolting or wind. The best material for the ash-wagon boxes, or tanks, is also steel, but this matters comparatively little from a sanitary standpoint, so long as the conditions named are fulfilled. The frequency of collection should vary with the character of the wastes and the population. Market wastes, the garbage of hotels and restaurants, and of houses in crowded districts, often require daily collection, particularly in the sum-

mer. Domestic garbage, under ordinary conditions, requires collection from two to three times a week in warm, and once or twice a week in cool or cold weather. Ashes, paper, and all other inorganic wastes, so long as not mixed with garbage, may be collected to suit the convenience of the householders and the municipality, the tendency being to increase the frequency with the density of population and consequent lack of room for storage. Cleansing or disinfection of garbage cans and wagon boxes or tanks is practiced in the most progressive communities. Whether garbage and refuse collection and disposal should be performed by contract or directly by the municipality is a question for each community to settle for itself. Many sanitarians favor direct municipal performance, as giving better sanitary results. An efficient city government can secure good work under either plan, but perhaps complaints of poor service may receive more prompt attention when the work is done by the municipality. In many American cities the collection, and in still more the final disposal, of garbage and refuse is left entirely to private scavengers, under little or no municipal control. The results are that the people having most need of good service get none whatever, being unwilling or unable to pay for it, while the work as a whole is generally poorly done. The final disposal, under this plan, is almost always a makeshift. Whatever may be done as to ashes and inorganic wastes, good sanitation demands that the collection and disposal of garbage, offal, and dead animals should be attended to by the municipality, either under the contract or day-labor system. As a matter of economy it is probable that all the wastes considered in this article should be handled by or under the direction of the city or town.

Garbage Furnaces, or Refuse Destructors, as they are called in Great Britain, consist of one or more grates upon which the garbage is burned, ash-pits, flues, and chimneys, together with the necessary feeding holes for the garbage, and stoking holes or doors. In America supplementary fuel is almost invariably used, generally on a separate grate. In England, as already explained, special fuel is rarely employed; a boiler for steam-raising is generally used, and it is becoming more and more common to use either steam jets or blowing fans to produce a forced draught. Most of the American furnaces have level grates, the heat from the extra fuel passing horizontally over one and sometimes two garbage grates. The English furnaces generally have one level grate, with an inclined surface leading to it from the feeding hole above, so designed that the refuse is dried and heated before it reaches the main fire. The English furnaces are usually composed of small units, or cells, of uniform size, each having a grate surface of 25 square feet. Any desired capacity is secured by increasing the number of cells, which are commonly placed back to back, with a central flue. In America the cells are larger, and the various manufacturers have not adopted a standard size. A few years ago it was the accepted practice in Great Britain to have a small special fire, generally of coke, in the base of the stack. This was designed to produce a high temperature for the complete combustion of all the gases from the main fires, before they passed

up the chimney and into the atmosphere. These *fume cremators* are being discontinued in England, with the introduction of forced draught and higher temperatures. They were never so generally used in America, but are still employed here and there in forms more or less modified from the English practice. Some form of *dust-arrester* is often used in the later English furnaces to hold back the fine ashes which might otherwise pass up through the chimney and cause a nuisance in the surrounding territory. These are chambers or passages designed to bring the dust to rest and to retain it for future removal. Probably such devices are more essential in England than in America, owing to the large quantities of ashes put through the furnaces and the use of forced draught in the former country. The *temperature* of a garbage furnace should be in the vicinity of 2000° F., in order to insure complete combustion and to prevent odors from the chimney gases. *Boilers* for utilizing heat from garbage furnaces should not be placed directly over the fire, since the water in the boiler will lower the temperature in the furnaces. To avoid this, the boilers are placed between the furnaces and the chimney, or between two furnaces. This causes a loss of heat for steaming, but sanitary considerations should come first. In the later English plants water-tube boilers are being installed.

In America practically nothing has been accomplished in the way of utilizing heat from garbage furnaces. Early in 1900 a single garbage furnace was installed at one of the municipal electric-lighting stations in Chicago, and arrangements were made for a similar installation at Grand Rapids, Mich. The combined refuse destructor and electric-lighting plant at Shoreditch, England (a part of the city of London), has attracted much attention. The destructor was opened on June 28, 1897. There are twelve furnaces, or cells, each having a grate area of 25 square feet; six water-tube boilers, with 1300 square feet of heating surface; and a thermal storage tank 8 feet in diameter and 35 feet long, designed to store water heated by the steam at times of small demand for electric lighting. The thermal storage tank does not seem to have been tried at any other garbage furnace. A forced draught, rated at 8000 cubic feet per minute, is supplied by three fans, driven by electric motors. The chimney is 150 feet high, with a dust-arrester at its base. Each furnace has a capacity of 8 to 12 tons of refuse in 24 hours, or 96 to 144 tons in all. The aggregate horse-power of the connected boilers is about 1200. During the first two years of its operation, the Shoreditch plant consumed about 25,000 short tons of refuse a year. The value of English refuse for steam-raising purposes appears to run from 5 to 15 per cent. that of coal, assuming a coal that will evaporate 10 pounds of water from and at 212° F. per one pound of coal. This is omitting extremes. Probably 10 per cent. is the maximum safe figure upon which to base estimates for continuous work, and even that may be too high.

The following particulars relating to some other European refuse destructors have been taken from Goodrich, *The Economic Disposal of Town's Refuse* (London and New York, 1901). Birmingham has over fifty cells in use, burning

about six long tons per cell per day. In 1897 the total amount of refuse burned was 96,309 long tons, out of a total of 200,703 long tons collected. Leeds also has about fifty cells, with an average capacity of about seven long tons each. Liverpool has some forty-four cells with a capacity of about seven long tons per cell per day. Manchester, although the first city in the world to put in permanent garbage furnaces (in 1876), still sends some 70,000 long tons of refuse to the dumps each year, but has ordered 18 new cells. At Hunstanton 3½ long tons of refuse per day is burned, the heat from which furnishes steam sufficient to drive the pumps supplying the town with water. Berlin and Hamburg, Germany, are the chief examples of Continental cities with garbage furnaces. Over twenty furnaces are said to be in use in Berlin, having an estimated capacity of some 1300 long tons a day. Coal is used as a secondary fuel, and it seems that relatively little steam is utilized. Mr. Goodrich appears to have attempted to secure a complete list of all the cities in the world having garbage furnaces, together with at least a brief description of each. His summary, with figures for the United States and Canada, as collected by the *Engineering News*, is as follows: England, including 18 districts in the metropolitan district of London, 123 cities; Scotland, 6; Ireland, 2; Channel Islands, 1; Continental Europe, 4; South Africa, 2; India, 3; South America, 3; Australia, 4; the East, 3; Canada, 2; United States, 50; total, 203. Outside of Great Britain, Canada, and the United States, quite a number of cities may have been overlooked, and possibly 10 to 15 additional cities in the United States should be included. It should be noted, too, that the garbage of 16 of the largest cities of the United States is treated by the reduction process, as stated in more detail below.

American garbage furnaces, as may be seen from what has preceded, have not been so fully developed as English, such superiority as can be claimed for American sanitary engineers in this respect being for the reduction rather than the cremation of refuse. Just how large a part of the difference between the two countries is due to variations in the character of their respective wastes it is hard to say, since there does not seem to be any thoroughly satisfactory data on this point. In general, it may be noted that some English writers give the average percentage composition of ash-bin refuse as follows: Breeze (or partially burned coal) and cinder, 50; coal and coke, 1; ash, 12; dust and dirt, 20; paper, straw, fibrous material, and vegetable refuse, 13; bones and offal, 0.6; rags, 0.4; bottles, tins, metals, crockery, broken glass, 3; total, 100. After the refuse passes an English furnace there remains 20 to 40 per cent. of the original weight in the form of ashes and cinders. It is believed that American garbage, even when mixed with ashes, contains more organic matter than is shown by the figures just given, and that its percentage of moisture is far higher. The latter must be evaporated before the combustible matter can be burned. To add still further to the difficulty of burning American wastes, the ashes, when mixed with the other refuse, appear to contain less combustible matter than those in England, owing partly to the large quantities of soft coal burned, and that imperfectly, in England. An-

other drawback to the development of American garbage furnaces is the practice of awarding short-term contracts for disposal, or changing the methods in vogue with each change of city administration. Under all these circumstances it is not strange that American garbage furnaces have not been brought to a higher state of perfection, nor that it is hardly known what they might accomplish in long service under favorable conditions. Some of the most successful furnaces in America follow English practice very closely. Of a list of 50 cities with garbage crematories in the United States, all but 15 had populations of 25,000 or more by the census of 1900. The largest city and most capacious plant in the list is San Francisco, Cal., where a private company owns 32 furnaces, or cells, with a rated daily capacity of 600 tons per day. The company has a franchise under which it has thus far succeeded in compelling the private scavengers who collect garbage, ashes, and other refuse in San Francisco to bring their collections to the furnaces and pay the company 20 cents a load for burning it, the loads not to exceed one cubic yard each. The weight of the refuse is estimated at 800 pounds per cubic yard. On this basis, over 61,000 short tons, or 215 tons a day, were burned in 1899. At both Milwaukee, Wis., and Minneapolis, Minn., large furnaces were under construction early in 1901. A small portion of the garbage of Greater New York is burned in a number of furnaces scattered over outlying districts. The one small furnace in Chicago has already been mentioned. Boston has the distinction of being the only city in the United States with a well-equipped refuse-sorting plant. Light refuse from a part of the city is brought to this station, dumped, shoveled onto an inclined conveyor, from which men and boys sort out various grades of paper, rags, and all other merchantable refuse as the particular kinds pass the person to whom the task of removing it is assigned. The residue is dumped automatically into a furnace and readily burned, producing

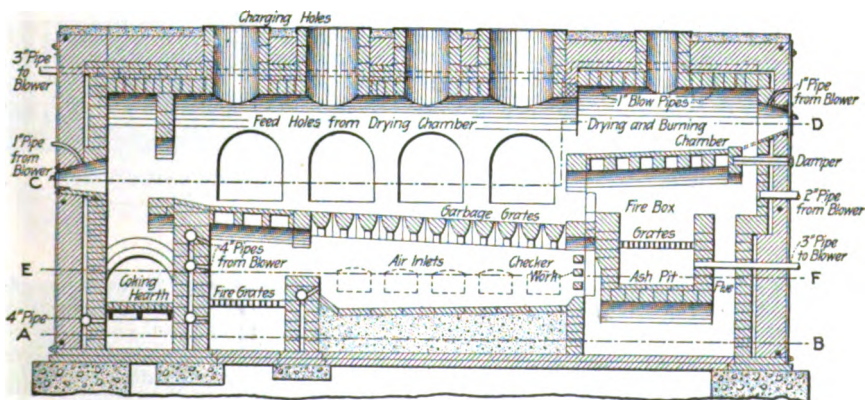

put in use, including the Warner, Horsfall, and Meldrum. The first American garbage furnace, opened at Des Moines, Iowa, about September, 1887, was designed by Andrew Engle. In December of the same year a Rider furnace was

SECTION OF FRYER REFUSE DESTRUCTOR.

fired up at Pittsburg, Pa. At present, the Engle, Dixon, Smith-Siemens, and Thackeray furnaces lead in North America, most of the plants being supplied with either Engle or Dixon apparatus. The Thackeray furnaces at Montreal and San Francisco have inclined drying grates, but larger than those employed in the English furnaces.

Garbage reduction aims to recover grease and fertilizing material from animal and vegetable household and market wastes, while at the same time affording a sanitary means of final disposal. The process requires, for its greatest success, a rigid exclusion of all other wastes from those named, both to reduce the bulk of inert and unprofitable refuse and to prevent damage to the plant. The first step is the extraction of grease. This is effected by melting with steam heat, combined with pressure, or by means of such solvents as naphtha and benzine. Sulphuric acid has been

Longitudinal Section X-Y.

GARBAGE CREMATORY AT MILWAUKEE, WIS., LONGITUDINAL SECTION.

more than enough steam to run the plant. The paper and like salable material is baled ready for shipment.

The first permanent English furnaces, built at Manchester, England, were designed by Alfred Fryer. Since then many other styles have been

tried and found unsatisfactory. In most of the plants, and for the greater part of the garbage now being treated, steam is used. Where a solvent is employed, naphtha is more often chosen than benzine, but the general process is much the same in either case.

In the steam plants the grease is extracted in rendering tanks, after which the residue, or tankage, is pressed and then dried to free it from moisture. Where naphtha is employed, the drying generally takes place before the solvent is applied. The rendering tanks, or digesters, are cylindrical, some 5 feet in diameter and 15 feet high, with tightly fitting covers for the charging holes and a horizontal valve at the foot of the conical bottom, to empty the charge. Pipe connections are provided for admitting steam or chemicals, as the case may be, and pipes or other channels for leading away the various liquids after the garbage has been treated for a sufficient length of time, generally a number of hours. The tankage is sometimes pressed by steam in the rendering tank and sometimes in presses of either the cheese-cake or roller type. The driers are generally steam-jacketed horizontal cylinders, fitted with revolving stirring arms, mounted on a longitudinal axis. Grinding-mills are sometimes provided for such of the tailings from the screens as are of value, chiefly bones. The dried and screened tankage is generally sold to fertilizer manufacturers, but at a few plants phosphates and other rich fertilizers are mixed with it, so as to produce a finished or commercial fertilizer. The grease and water are separated by gravity, in tanks, the grease rising to the top and being skimmed off. In some cases the grease is refined at the reduction works, but usually there is little attempt to do much refining. It may be shipped to buyers in tank cars or in barrels. Where naphtha is used it is recovered by distillation. The water from the digesters is sometimes discharged directly into a sewer, stream, or lake. In other cases it is evaporated to 'stick,' and mixed with the dried tankage, increasing the value of the latter, and at the same time not polluting any body of water. In the best plants

plants require an extensive equipment of boilers, engines, pumps, tanks, driers, and other apparatus, the capital charges on which, together with the expenses for fuel and other supplies, and for labor, make up a large total. On the other hand, there is a considerable revenue from the sale of grease and tankage. All the reduction plants in the United States are owned and operated by private companies, which do not wish to reveal the details of their business to their rivals or to the municipalities with whom they have or from whom they hope to secure contracts. It is, therefore, impossible to give reliable figures as to the cost of constructing and operating reduction plants, or the amount and value of the grease and fertilizer recovered and sold. Obviously, these figures vary widely with the character and amount of garbage handled and with local conditions governing the cost of construction, of fuel, and of labor. Information collected under the direction of the late Col. George E. Waring, Jr., in 1895, showed that 3000 tons of summer garbage, from different cities and treated by various methods, gave the following average composition:

	Per cent.	Pounds per ton
Rubbish.....	7	140
Water.....	71	1,420
Grease.....	2	40
Tankage.....	20	400
	100	2,000

The selling value of the products from a ton of such garbage was given as follows:

Grease, 40 lbs. at 3 cts.....	\$1.20
Tankage { Ammonia, 13 lbs. at 8 cts.....	1.04
Phosphoric acid, 13 lbs. at 1 ct.....	13
Potash, 3 lbs. at 3½ cts.....	10
Total.....	\$2.47

PLAN AND SECTIONS OF GARBAGE CREMATORY AT MILWAUKEE, WIS.

all objectionable vapors are condensed and the gases are purified by scrubbing, or else conveyed to and burned in the boiler furnaces. Reduction

Based on the total weight of tankage, the value of the 400 pounds would be about one-third cent per pound. Winter garbage would contain a

larger percentage of grease and less moisture. The price of both grease and tankage is liable to wide fluctuations.

The sixteen cities in the United States where contractors were treating garbage by reduction early in 1901, with their respective populations by the census of 1900, and the method of grease extraction employed, are as follows:

CITY	Pop'n	Method
Boston.....	560,892	Steam
New Bedford.....	64,442	"
Buffalo.....	352,387	Naphtha
New York.....	3,437,202	Steam
Syracuse.....	108,374	"
Utica.....	56,383	"
Allegheny.....	129,896	Naphtha
Philadelphia.....	1,293,697	Steam
Pittsburg.....	321,616	Naphtha
Washington.....	278,718	Steam
Cincinnati.....	325,902	Benzine
Cleveland.....	381,768	Steam
Columbus, Ohio.....	125,660	"
Indianapolis.....	169,164	"
Detroit.....	245,704	"
Saint Louis.....	575,238	Naphtha
Total.....	8,466,943	

It will be noted that all these cities have populations of over 50,000. The list includes 10 of the 19 cities in the United States having populations of 200,000 or more. Of the other nine cities in that class, San Francisco, Milwaukee, Louisville, and Minneapolis have furnaces; Chicago has one small one, insignificant in comparison with its total garbage output. Baltimore, New Orleans, Newark, and Jersey City

treatment at Detroit and for cremation at Milwaukee.

Prominent because of the size of the cities employing it, and the completeness of the plants in many of their details, is the Arnold system, in use at New York, Philadelphia, and Boston. The New York plant has a contract capacity of 1000 short tons a day, and is said to have been crowded to a rate of 1500 tons. The only garbage-disposal plant approaching it in size is the crematory at Berlin, Germany, with a reported capacity of 1300 long, or about 1450 short, tons. The New York works are located on Barren Island, about 25 miles, by water, from the Battery, or the extreme lower end of old New York. There are really two plants here, one built for New York and one for Brooklyn, before consolidation, but the contractors operate them together. The contractors receive the garbage on scows at the various docks, tow it to the works, and treat it, for \$89,990 a year, under the New York contract, and for an average of \$121,000 a year, under the Brooklyn contract; but the latter includes collection from houses and other buildings, as well as towage and final disposal. For the year 1899 there were treated under the New York contract 151,600 short tons, giving a rate of about 60 cents per ton for transportation and treatment. Under the Brooklyn contract, a total of 104,000 tons was collected, shipped, and treated, at an average cost to the city of \$1.20 per ton. It must be understood that these quantities do not include ashes, street sweepings, and light refuse, most of which are dumped at sea, nor quite all the garbage of Greater New York, a small part of which is burned in furnaces located in outlying districts. At Barren Island the garbage is shoveled from the scows onto conveyors, which deposit it in the digesters, from which it goes to the driers. Early in 1900 there were 96 steam digesters in use, and the addition of 16 more was proposed, which would raise the ordinary working capacity from 1000 to 1200 short tons a day. There were also 17 boilers, of about

SECTIONAL SKETCH OF GARBAGE REDUCTION WORKS AT SYRACUSE, N. Y.

have no improved means of garbage disposal, but something is proposed at Baltimore, and there was once a reduction plant at New Orleans.

The first reduction plant in the United States was put in use at Buffalo, N. Y., in or about the year 1888, under United States patents granted in 1886 to Joseph Merz, of Bruen, Moravia. The Merz system has been modified since by Charles W. Preston and F. G. Wiselogel. Merz patents were taken out abroad as early as 1882. The patents covered the extraction of grease by use of the lighter hydrocarbons. Naphtha is used in the Merz process. At one time the system was in use at Buffalo, Detroit, Milwaukee, and Saint Louis, but it has been abandoned for steam

250 horse-power each, and various engines, pumps, and accessories. An immense fan, some 20 feet in diameter, and with a face of 6 feet, was used to exhaust steam and gases from the digester and press-house, and send it to a large scrubber. The gases from the various inclosed tanks and other vessels are passed through jet condensers.

A small but compact and apparently well-designed plant, built under what is known as the Holthaus system, is in use at Syracuse, N. Y. There are four digesters, in which the garbage is treated with steam under a pressure of about 60 pounds per square inch; a cylindrical press, working under a pressure of 2000 pounds

per square inch; a steam drier, a conveyor, elevator, and screen for the dried tankage; a grease and water separator; and an evaporator for the water, besides means for treating the gases and vapors; boilers with a combined capacity of 180 horse-power, a 100 horse-power engine, an electric-lighting plant, and a fertilizer factory. The daily capacity of the plant is stated as 50 tons. One of its noteworthy features is the arrangement of the digesters over the press and the press over the drier, with proper connections, so the garbage is not exposed to the air from the time it goes into the digesters until it comes out as dried tankage.

For additional information, consult: Goodrich, *The Economic Disposal of Town's Refuse* (New York, 1901); Maxwell, *The Removal and Disposal of Town Refuse* (London, 1898); Waring, *Street Cleaning and the Disposal of a City's Wastes* (New York, 1897). The latter, however, contains but little on garbage furnaces or reduction plants. Goodrich's book has a chapter devoted to American practice. Many descriptions of individual American plants have been given in the *Engineering News* and *Engineering Record* (both of New York) during the past ten or twelve years.

GARBE, gār'be, RICHARD KARL (1857—). A German Orientalist, born at Bredow, Pomerania. He studied at Tübingen, became a lecturer in 1878, and in 1880 professor, at Königsberg. In 1885-87 the Prussian Government defrayed his expenses for travel and residence in India, and the study there of the native philosophy. *Indische Reiseskizzen* (1880) chronicles some of his impressions at that time. His further publications include an edition (1878) and translation (1878) of the *Vaitāna Sūtra*; *The Crauta Sūtra of Apastamba* (1882-85); *The Sāmkhya Sūtra Vritti* (1888; an English translation was published in 1892); and *Die Sāmkhya-Philosophie* (1894).

GARBO, gār'bó, RAFFAELINO DEL. See RAFFAELINO DEL GARBO.

GARBORG, gār'börg, ARNE (1851—). A Norwegian novelist and publicist, born on the island of Time, in the District of Jæderen. In 1877 he founded the *Fædraheimen*, a journal in the popular idiom, and his novels are written in the same language. Among these, nearly all translated into Danish or Swedish, are the following: *A Free Thinker* (1881); *The Students from the Country* (1883); *Stories and Traditions* (1884); *Men* (1886). He also wrote *The New Norwegian Language and the National Movement* (1887) and *Free Discussion* (1889).

GARÇÃO, gār-soun', PEDRO ANTONIO CORREA (1724-72). A Portuguese poet, born in Lisbon. He was one of the members of the celebrated 'Arcadia' of Lisbon, and was the author of some beautiful verse. His "Cantata a Dido" is especially fine. He is called 'the Portuguese Horace.' His *Obras poeticas* have gone through several editions; the latest (1888) contains an excellent biography.

GARCIA, gār-sē'a, DIOGO (1471-1529). A Portuguese navigator, born at Lisbon. Under commission of a mercantile firm at La Coruña, he sailed with three ships for South America in 1526, arrived at São Vicente, Brazil, on January 11, 1527, and explored the Uruguay and

Paraná rivers. He aided the expedition of Sebastian Cabot, which was besieged by natives on the lower Paraná, and in 1528 returned to Spain without having discovered any precious metals. It is said that he afterwards made a voyage to the East Indies, and that the island of Garcia, in the Indian Ocean, is named from him.

GARCIA, gār-thē'a, MANUEL DEL PÓPOLO VICENTE (1775-1832). A famous Spanish tenor singer and teacher of singing, born at Seville. At six years of age he was a chorister in the cathedral there. His teachers were Ripa and Almarcha, whose thorough training, combined with his own great talent, brought him distinction when but seventeen in the triple rôles of singer, composer, and conductor. After winning an established reputation as a singer in Cadiz and Madrid, he went to Paris (1808), and achieved instantaneous success at the Italian opera. In 1811 he proceeded to Italy, meeting with great popular manifestations of public favor. The next five years were spent in study, and on his return to Paris, in 1816, disagreement with Catalani, the manageress of the Théâtre Italien, ended in his going to London (1817), where he was enthusiastically received. Either alone or with a company he visited England, South America, the United States, and Mexico, meeting everywhere with unqualified success. His compositions are now forgotten, although they were successful in their day, and included forty-three operas, written either in Spanish, French, or Italian. His fame as a teacher is enduring, his theories, proven by successful results, forming the groundwork of the best modern teaching. Among his successful pupils were his daughters, Maria Felicitas Malibran and Pauline Viardot Garcia, and the singers Nourrit, Rimbault, and Favelli. He died in Paris.

GARCIA-GUTIERREZ, gār-thē'a-gōō-tyā'-rath, ANTONIO (1812-84). A Spanish dramatist, born at Chiclana. As a youth he studied medicine at Cadiz, but his bent was always toward literature, and in 1836 he produced his play *El trovador*. It was a brilliant success. Verdi afterwards took this drama as a subject for his opera *Il trovatore*. None of Garcia-Gutierrez's other works was well received, although several of them were finer, especially *Juan Lorenzo* (1865). His poetry was published under the title *Luz y tinieblas* (2 vols, 1842, 1861). This volume also includes some pretty comedies. His plays were published by himself, as *Obras escogidas* (1866).

GARCIA HIDALGO, gār-thē'a ē-dāl'gō, JOSÉ (c.1656-c.1712). A Spanish painter, born at Murcia. He studied in that town under Villacis and Gilarte, and then went to Italy, where he received instruction from Pietro da Cortona, Salvator Rosa, and Carlo Maratta. He was made painter to the King in 1703. The works of Garcia belong to the period of decadence. With Carrino he painted some frescoes in the cloister of San Felipe el Real.

GARCIA MORENO, gār-sē'a mó-rā'nó, GABRIEL (1821-75). A politician of Ecuador, born at Guayaquil. He was educated at the University of Quito and in Europe, and became successively professor of chemistry and rector at Quito. In 1859 he was chosen head of the Provisional Government, and in 1861 President. After an administration marked by cruelty and many con-

cessions to the ecclesiastical power, he proclaimed himself Dictator in 1865. In 1869, and again in 1875, he was reelected President, but previous to his inauguration in the latter year was assassinated.

GARCÍAS, gár-thé'ás, PEDRO. A wealthy licentiate, spoken of by Le Sage in the preface to *Gil Blas*. Two journeying scholars came upon a fountain bearing the inscription, "Here is buried the soul of the licentiate Pedro Garcías." On removing a stone they found a leather purse containing 100 ducats.

GARCIA Y INIGUEZ, gár-sé'a é é-ne'gés, CALIXTO (1836-98). A Cuban patriot and soldier, born at Holguin, Santiago Province. He began the practice of law; but in 1868 became associated with Donaté del Mármol as a leader in the Ten Years' War, and soon attained the rank of brigadier-general. Subsequently, upon the removal of Gen. Máximo Gomez by the Provisional Government, he was appointed commander-in-chief of the Cuban forces. At San Antonio del Bahar, with a band of 20, he was surrounded by 500 Spaniards, and to avoid capture shot himself through the breast, but, having recovered, was deported to Spain and there imprisoned. In 1880 he fought with José Maceo in the six months' rebellion known as the 'Little War,' again was captured, and for fifteen years was held in Spain under police surveillance. Upon the outbreak of the final insurrection against Spain, he escaped in 1895 to Paris, and thence went to the United States, where he was active as a filibuster. An expedition fitted out under his direction, and embarked on the *J. W. Hawkins*, failed through the wreck of the vessel, and \$200,000 worth of arms and ammunition was lost. Afterwards he succeeded in reaching Cuba on the *Bermuda*, with six field guns and other supplies. During the insurrection, as commander of the troops in Camaguey and the Oriente, he won several brilliant victories, and in the Spanish-American War led a Cuban force of 4000 at El Caney (July 1, 1898). He died while in Washington as the head of a commission sent by the Assembly of the Provisional Government to discuss Cuban affairs with President McKinley.

GARCILASO DE LA VEGA, gár-thé-lá'sò dà lá vá'gá (1503-36). A Spanish soldier and poet. He was born at Toledo, and early adopted the profession of arms. He gained a distinguished reputation for bravery in the wars carried on by the Emperor Charles V. against the French and Turks, but was mortally wounded while storming a castle near Fréjus, in the south of France, and died at Nice. Garcilaso, though prematurely cut off, lived long enough to win immortality by the part which he played, in conjunction with his friend Boscan, in revolutionizing the national poetic taste of his countrymen. Like Boscan, he imitated the Italian poetical manner, and substituted Italian verse forms for the older national measures, which he used in only very few cases. His eclogues, it should be said, show also a Vergilian influence. His pieces consist of only thirty-seven sonnets, five canzones, two elegies, one epistle, and three pastorals. Singular to say, they do not contain a trace of military ardor, but are inspired by a tender sweetness and melancholy which appear to have deeply affected his countrymen. Garcila-

so's poems were first published in 1543, in an edition of Boscan's works. They are most accessible in the collection of Spanish masterpieces called the *Biblioteca de autores españoles*, vols. xxxii. and xlii. (cf. Wiffen's English translation, published in 1823). For the best account of his life, consult Navarrete, in Salvá y Baranda, *Documentos inéditos para la historia de España*, vol. xvi. (1850).

GARCILASO DE LA VEGA (c.1540-1616). A Peruvian historian, known as 'the Inca.' He was the son of one of the Spanish Conquistadores, and grew up amid the civil turmoil of the early years of Spanish rule in Peru. He became familiar with the men and events of the time, so that his history has all the flavor of actuality. At his home he met relatives of his mother, an Inca princess, who told him much of the history of his family and of the land over which they had ruled. After his father's death, Garcilaso decided to go to Spain. He entered the army as a captain, and served against the Moriscos. Becoming involved in debt, he retired from the military service and entered on a literary career. He translated Abarbanel's *Dialogues of Love* from the Italian, published in 1590, and then turned his attention to history. From an old soldier, a companion of De Soto, he learned the story of the conquest of Florida, which he wrote out in a bombastic literary style. Meanwhile he had gathered from his early schoolmates their recollections of early days in Peru, and by combining these with his own memories, especially of what he had heard from his mother's people, he prepared the *Royal Commentaries of Peru*, a work of prime importance, filled with interesting detail and in the main authoritative. The first part was published in 1609, and the second in 1617, a year after the author's death, which took place at Cordova, where he had passed the latter half of his life. The *Commentaries* have been translated, with notes and an introduction by Markham, and published by the Hakluyt Society (London, 1869).

GARCIN DE TASSY, gár'sân' de tá'sé', JOSEPH HÉLIODORE SAGESSE VERTU (1794-1878). A noted French Orientalist. He was born in Marseilles, studied Oriental languages as a pupil of the distinguished Silvestre de Sacy, and in 1828 was appointed to the chair of Hindustani especially founded for him at the Ecole des Langues Orientales. In 1838 he was elected to succeed Talleyrand in the Académie des Inscriptions et Belles-Lettres. Subsequently he became president of the Société Asiatique and an administrator of the Ecole. Originally known as a student of Mohammedanism and a translator from the Arabic, he was later recognized as the foremost European savant in the undeveloped and difficult field of the Hindustani language and literature. His annual review, *La langue et la littérature hindoustanies* (1872-77), was authoritative, not only throughout Europe, but as well among native Indian scholars. His publications include: *Les oiseaux et les fleurs* (1821), Arabic text, with translation; *Les aventures de Kamrup*, Hindustani text (1835); *Les œuvres de Wali*, with text, translation, and notes (1863); *La poésie philosophique et religieuse chez les Persans* (1864); and his chief work, a *Histoire de la langue et de la littérature hindoues et hindoustanies* (2d ed., 3 vols., 1871). He also

prepared a French edition (1849) of Sir William Jones's *Grammar of the Persian Language* (1771).

GARCIN'IA. See MANGOSTEEN.

GARD, gâr. A department of France, in Languedoc, bounded on the east by the river Rhône, its southern extremity reaching into the Mediterranean, in a headland which has a coast line of about 10 miles (Map: France, L 7). Area, 2253 square miles. Population, in 1890, 416,036; in 1901, 420,836. A considerable part of the surface is occupied by forests, plantations, and vineyards. On the coast there are extensive and unhealthful marshes. It is watered mainly by the Rhône and its tributaries—the Gard, the ancient Vardo (from which the department has its name), and the Cèze. The northwest is occupied by a branch of the Cévennes Mountains; the remainder slopes toward the Rhône and the Mediterranean. The soil is in general dry, the best lands occurring in the river valleys. Coal, iron, lead, and zinc are found in several places, and salt is manufactured in the south. The vine, the olive, and the mulberry are extensively cultivated. The silk industry is important. Lignite is worked in the northeast of the department. Wine is largely exported. The department is divided into the four arrondissements of Nîmes, Alais, Uzès, and Le Vigan. Capital, Nîmes.

GARDA, gâr'dâ (Lat. *Lacus Benacus*). The largest lake in Italy. It is 34 miles long, from 3 to 11 miles broad, 189 square miles in area, and its greatest depth is 1135 feet (Map: Italy, E 2). Its northern extremity is in Tyrol, and Peschiera, at its southern extremity, is 16 miles west of Verona and 77 miles east of Milan. There is communication by steamboat once or twice daily between different points on the lake. The principal fish are salmon trout, trout, pike, and eels. The water is often rough, especially when there is a storm from the north. (Consult Vergil, *Georgics*, II., 160.) The southern shores are low and flat; but as the lake narrows toward the north the spurs of the Alps rise boldly from the water's edge. The chief tributary is the Sarca, and the only outlet is the Mincio, which descends from Peschiera to Mantua, and discharges into the Po.

The most fashionable resort is Gardone-Riviera; but dearest to the poet and to the antiquarian is Sirmione, a narrow promontory that extends 2½ miles out into the lake. The view from it is magnificent, and there are the ruins of Roman baths and of a building said to be the villa of the poet Catullus. Salò, a small town with terraces of lemon groves, has a church containing several interesting paintings; Maderno has a basilica of the eighth century. Malcesine is the place where Goethe was arrested by the Venetian officials. To the beautiful little village of Garda the lake owes its name. Riva, at the north end of the lake, in Austrian territory, is popular with tourists, on account of its hotels, ruins, and climate in summer. It is the starting-point for numerous excursions over the mountains.

GARDAIA, gâr-dî'â, or **GHARDAYA** (locally, *Faghardeit*). An important trading point of the Sahara, and the chief town of the Mزاب District in Algeria, situated on a hill in the oasis of Gardaia, amid rocky mountains, 312

miles in a direct line south-southeast of Algiers (Map: Africa, E 1). It is fortified by a wall surmounted with towers and pierced by gates; possesses several mosques, one remarkable for its size, and has a flourishing caravan trade with Tunis, Algiers, Fez, Morocco, Sudan, and Timbuktù, in slaves, barley, dates, pottery, provisions, oil, wool, cotton, indigo, leather, gold dust, ivory, and all the varied raw products of Central and Northern Africa. Its trade is for the most part in the hands of Jews, who inhabit a separate quarter. The population consists chiefly of the Beni Mزاب, who speak a Berber dialect modified by Arabic. Gardaia is surrounded by extensive date-palm orchards, and is irrigated by artesian wells. In the vicinity are the ruins of a Roman tower. The Mزاب Confederation, formerly independent, has acknowledged the sovereignty of France since 1850. In 1857 Gardaia, its capital, was surrendered to the French and was made a military station. Population, in 1892, 38,967.

GARD'ANT, Fr. pron. gâr'dân' (Fr., gazing, pres. p. of *garder*, to look). In heraldry (q.v.), a term used of an animal which is represented full-faced.

GARDEN, ALEXANDER (c.1730-91). An American physician and naturalist. He was born in Charleston, S. C.; was educated in Scotland, was professor in King's College (now Columbia University) in 1754, and in 1755 settled as a physician in Charleston. At the time of the Revolutionary War he sided with Great Britain, and in 1783 emigrated to London, where he lived until his death. He wrote a number of papers on zoölogical and botanical subjects. The genus *Gardenia* was named in his honor.

GARDEN, ALEXANDER (1757-1829). An American soldier and writer, born in Charleston, S. C., and educated at Glasgow, Scotland. On the outbreak of the Revolutionary War he joined the Patriot party, and from March, 1781, to the close of the war was volunteer aide-de-camp to General Greene. He is known chiefly as the author of *Anecdotes of the Revolutionary War, with Sketches of the Character of Persons Most Distinguished in the Southern States for Civil and Military Services* (1822; last ed., 3 vols., 1868).

GARDE NATIONALE, gürd ná'syó'nál'. See NATIONAL GUARD.

GARDEN CITY. A village in Nassau County, N. Y., about 20 miles from New York, on the Long Island Railroad. It was projected by A. T. Stewart as a model suburban village, and is the seat of the Protestant Episcopal Bishop of Long Island, with the cathedral schools of Saint Paul's and Saint Mary's. The Cathedral of the Incarnation is a fine specimen of Gothic architecture, erected by Mrs. Stewart in honor of her husband. It has a magnificent organ, one of the largest in the world, that cost \$100,000.

GARDEN CITY. A popular name for Chicago, from its numerous parks and gardens.

GARDENER-BIRD. See BOWER-BIRD.

GARDE'NIA (Neo-Lat., from Alexander Garden). A genus of trees and shrubs of the order Rubiaceæ, natives of tropical and subtropical countries, many of which are now favorites in greenhouses and hothouses, on account of their

"THE GARDEN OF THE GODS"
CATHEDRAL SPIRES (UPPER)
THE SEAL AND BEAR (LOWER)

beautiful and fragrant flowers. Some of them are hardy enough to endure the open air in summer. The corolla is funnel-shaped, or approaching to salver-shaped, the tube much longer than the calyx; the fruit, a berry, crowned with the calyx. The name Cape jasmine is given to *Gardenia jasminoides*, popularly known as *Gardenia Florida*; a Japanese species is well known in America. The fruit, which is about the size of a pigeon's egg and orange-colored, is sold in the shops of China and Japan for dyeing silks yellow. A beautiful yellow resin exudes from wounds in the bark of *Gardenia gummifera*, an East Indian species. The wood of *Gardenia Thunbergii* and *Gardenia Rothmannia* is very hard, and is used for agricultural implements, wheel-axes, etc., at the Cape of Good Hope. Both of these species are grown in American hot-houses. See JASMINE.

GARDENING. See HORTICULTURE.

GARDEN OF ENGLAND. Worcestershire: so named because of its fertility.

GARDEN OF EUROPE. A frequent designation for Italy, from its fertility, climate, and scenery.

GARDEN OF FRANCE. A name sometimes used of the ancient Province of Touraine.

GARDEN OF ITALY. A popular designation of Sicily, because of its fertility and scenery.

GARDEN OF THE GODS. The name given to a region in Colorado, near Colorado Springs, covering about 500 acres, and remarkable for the strange forms of the rocks with which it is covered. The red and white sandstone here assumes grotesque shapes to which various names have been given. The Gateway is formed by two huge masses of rock, of a bright red color, and 330 feet high, between which the road passes.

GARDEN OF THE HESPERIDES. See HESPERIDES.

GARDEN SNAIL. The British name of the large, brightly colored land-snail (*Helix aspersa*), common and sometimes troublesome in gardens throughout Europe. It is edible when well cooked, but not so often eaten as another species (*Helix pomatia*), known and cultivated as the 'edible' snail. Some interesting folklore attaches to this species in the rural districts of England and Scotland. See SNAIL, and Colored Plate of NORTH AMERICAN SNAILS.

GARDENS OF CÆSAR. See CÆSAR, GARDENS OF.

GARDENS OF LUCULLUS. See LUCULLUS, GARDENS OF.

GARDENS OF MÆCENAS. See MÆCENAS, GARDENS OF.

GARDENS OF SALLUST'. See SALLUST, GARDENS OF.

GARDEN VEGETABLES. See VEGETABLES.

GARDEN WARBLER. An English name of a small brownish warbler (*Sylvia hortensis*) of Southern Europe, called in England 'greater pettychaps,' familiar about gardens, and noted for its sweet and varied song, whence the Germans call it 'false nightingale.' It is often caged, under the French name *fauvette*, but does not endure captivity well. This is the bird known to the Italians as *beccafico* (q.v.), because it

punctures the ripening figs, as illustrated in the article FIG.

GARDE SUISSE, gärd swés. See SWISS GUARD.

GARDIE, gärdé', MAGNUS GABRIEL DE LA (1622-86). A Swedish statesman, born in Reval. He studied at the University of Upsala, became Ambassador to France, and subsequently commanded the Swedish Army in Livonia. During the minority of Charles XI. he was Lord Chancellor, but later fell into disfavor and was deprived of his estates. He presented to the University of Upsala the famous Codex Argenteus. (See ULFILAS.) His very extensive collection of manuscripts was acquired in 1848 by the library of the University of Lund.

GARDINER, gärd'nér. A city in Kennebec County, Maine, six miles south of Augusta; on the Kennebec River, and on the Maine Central Railroad (Map: Maine, D 7). Naturally endowed with excellent water-power, it has saw, paper, and pulp mills, foundries and machine-shops, a shoe-factory, and manufactures of lumber in various products. Lumber and ice are largely exported. There is a public library with about 6000 volumes. Settled in 1760, Gardiner was part of Pittston until 1803, when it was incorporated as a town. It was chartered as a city in 1849. The government is administered under the charter as revised in 1895, by a mayor elected each year, though custom extends the term to two years, and a bicameral council. Population, in 1890, 5491; in 1900, 5501. Consult Hanson, *History of Gardiner, Pittston, and West Gardiner* (Gardiner, 1882).

GARDINER, FREDERIC (1822-89). An American Episcopalian scholar. He was born at Gardiner, Maine, September 11, 1822; graduated at Bowdoin College, 1842; entered the Protestant Episcopal ministry; was professor in the Berkeley Divinity School at Middletown, Conn., from 1868 to his death, July 17, 1889. He was one of the best Bible students of his day, and his publications include commentaries upon Leviticus, II. Samuel, Ezekiel, and Jude; a harmony of the Gospels in Greek and in English (1871); *The Principles of Textual Criticism* (1876); *The Old and New Testaments in Their Mutual Relation* (1885); *Aids to Scripture Study* (1890).

GARDINER, JAMES (1688-1745). A daring Scottish soldier, famous for his remarkable religious experience. He was born at Carriden, Linlithgowshire, Scotland, in 1688. When only fourteen he obtained a commission in a Scotch regiment in the Dutch service. In 1702 he entered the English Army, and fought with distinction in the campaigns of Marlborough. He was promoted to the rank of major in 1718. Up to this time his life had been extremely dissolute. But in 1719, while bent upon pleasure, he happened to take up a religious book, and while reading it saw what he considered a vision of Jesus Christ. He was immediately 'converted' and thenceforth lived a pious and excellent Christian life. He became colonel in 1743, and two years later was mortally wounded in the battle of Prestonpans. Consult: Doddridge, *Some Remarkable Passages in the Life of Col. J. Gardiner* (London, 1747; many later editions); Carlyle, *Autobiography*, edited by Burton (Edinburgh, 1860).

GARDINER, JOHN (1731-93). An American lawyer, the son of Dr. Sylvester Gardiner. He was born in Boston, studied law, and practiced his profession for a time in London and in Wales. A friend of John Wilkes, he appeared as junior counsel of the latter in 1764. While serving in the Massachusetts Legislature, he procured the abolition of the law of primogeniture in Massachusetts, and the prohibition of special pleading, and strove earnestly for the repeal of the anti-theatrical laws. He was one of the leaders of the original Unitarian movement in Boston.

GARDINER, LION (1599-1663). An English settler in America. He was a military engineer, and had seen service in the English Army in the Netherlands. In 1635 he arrived at Boston under contract to remain for a term of four years in the service of a company which had obtained the patent of a tract of land situated at the mouth of the Connecticut River. He designed and built a fort which he called Saybrook, and remained in command there until 1639. In that year he bought from the Indians the island called by him the Isle of Wight, now known as Gardiner's Island, where he made the first English settlement within the present limits of the State of New York. To his little domain of nine miles in length by a mile and a half in width he gained proprietary rights which enabled him to rule independent of external authority as lord of the manor.

GARDINER, SAMUEL RAWSON (1829-1902). An English historian. He was born at Ropley, Hants, March 4, 1829, and was educated at Winchester, and at Christ Church, Oxford. He subsequently studied at Edinburgh and at Göttingen, taking the degrees of J.U.D. and Ph.D. In 1884 he was elected fellow of All Souls, and in 1892 fellow of Merton. Until 1885 he was professor of modern history at King's College, London, and was examiner in history at Oxford University, 1886-89. On the death of Froude he was offered, but declined, the regius professorship of modern history at Oxford. On August 16, 1882, he was granted a Civil List pension of £150. Gardiner's first important work was his *History of England from the Accession of James I. to the Disgrace of Chief Justice Coke, 1603-1616* (2 vols., 1863). Subsequent installments appeared at various intervals until 1881, when they were reissued in a revised collective edition, the earlier volumes much altered, under the title *History of England from the Accession of James I. to the Outbreak of the Great Civil War, 1603-1642* (10 vols., 1883-84). The *History of the Great Civil War* appeared in 3 vols. (1886-91), and was reissued in a slightly revised form for the collective edition in 4 vols. (1893). The third and last installment of the great combined work, under the title *History of the Commonwealth and Protectorate*, of which three volumes, including the year 1656, appeared in 1894-1901, was arrested by Mr. Gardiner's death. He was the first English writer to treat this controversial period in detail from a non-partisan standpoint. His work rests upon the most laborious and exhaustive study of all the sources of the period which has been attempted. In this his efforts were lightened for the earlier part of the work by the various *Calendars of State Papers* still in process of publication. He was also greatly favored by numerous discoveries

of new material, among which the most important are that of the great collection known as the Clarke MSS. in the library of Worcester College, Oxford, the Verney MSS., the 'Paston Letters' of the seventeenth century, the 'Nicholas Papers,' the 'Hamilton Papers,' and the secret correspondence of the Papal agent Rossetti in England with Cardinal Barberini. In the history of the Long Parliament Mr. Gardiner explains adequately for the first time the rise of the Cavalier party, and the division, growing into the Civil War, which arose from differences of opinion in matters of religion. Besides his great work, Mr. Gardiner edited numerous volumes for the Camden Society, and contributed many articles and reviews to the *English Historical Review*, of which he was editor from 1891 to 1901. He summarized the results of his labors in the following recent works: *Cromwell's Place in History* (1897); *Oliver Cromwell*, a biography first published in an elaborately illustrated volume (1899) and afterwards in a cheaper form without the illustrations (1901). Other works are: *Constitutional Documents of the Puritan Revolution* (1889; 2d ed. 1899); *What the Gunpowder Plot Was* (1897); *The Thirty Years' War, 1618-1648* (1874); *The First Two Stuarts, and the Puritan Revolution, 1603-1660* (1876). Of his works for the use of students, the following deserve special mention: *A Student's History of England* (3 vols., 1890-92); *A School Atlas of English History* (1891); with Mullinger, *Introduction to the Study of English History* (1881; 3d ed. 1894). He died at Seven Oaks, Kent, February 23, 1902.

GARDINER, STEPHEN. An English prelate and statesman, born about 1483. He was the reputed son of John Gardiner, a cloth-worker, at Bury Saint Edmunds, and studied at Trinity Hall, Cambridge, where he distinguished himself in classics. In 1520 he became doctor of civil law, next year of canon law, and in both branches speedily attained eminence. In 1524 he was appointed Rede Lecturer in the University, and the same year became tutor to a son of the Duke of Norfolk. That nobleman introduced him to Cardinal Wolsey, who made him his secretary. In this capacity he gained the confidence of Henry VIII., and, owing to his legal qualifications, was sent to Rome in 1528, to conduct the negotiations with the Pope for the King's divorce from Catharine of Aragon. His arguments were unavailing, but on his return he was made Secretary of State. In 1531 he was appointed Archdeacon of Leicester, and the same year was installed Bishop of Winchester, vacant by Wolsey's death. A determined opponent of the Reformation and a staunch Catholic, he nevertheless wrote *De Vera Obedientia* (1535) in support of the King's supremacy. Various embassies to France and Germany were now intrusted to him, and after the execution of Thomas Cromwell, Earl of Essex, whose downfall was due mainly to him, he acquired great power. The tale of his impeachment of Catharine Parr and subsequent disgrace by Henry VIII. is doubtful, but on the accession of Edward VI. he was imprisoned for his opposition to the Reformation, and deprived of his bishopric. When Mary came to the throne in 1553 she restored him to his see, and made him Lord Chancellor and Prime Minister. He officiated at the Queen's coronation, and at her nuptials with Philip of Spain. How far he was responsible for

the persecution of Protestants during her reign is a debated question. He was a man of great erudition, and a friend of learning in every form. His writings consist of a number of tracts on theological and literary subjects, and include his interesting letters to Sir John Cheke against the Anglicizing of Greek pronunciation. Although a worldly-minded ecclesiast, he was a devoted and zealous worker, and conspicuous for religious consistency. He died in 1555. Consult: Cooper, *Athenæ Cantabrigienses*, vol. ii. (Cambridge, 1858), for his writings; Gairdner, *Letters and Papers . . . of the Reign of Henry VIII.* (15 vols., London, 1862-96); Brewer, *Reign of Henry VIII.* (2 vols., London, 1884); Maitland, *Essays on the Reformation in England* (London, 1849); Dixon, *History of the Church of England* (4 vols., London, 1878-91); Burnet, *History of His Own Time* (6 vols., Oxford, 1833); Lingard, *History of England* (13 vols., London, 1837); Froude, *History of England* (12 vols., New York, 1870).

GARDINER, SYLVESTER (1707-86). An American physician. He was born in South Kingston, R. I., studied medicine in Paris and London, and began practice in Boston. He was instrumental in colonizing that part of the 'Plymouth Purchase' lying along the Kennebec River, and in settling the town of Pittston, Maine, from which the present city of Gardiner, named in his honor, was subsequently set off. He established a church and library there, and was one of the founders of King's Chapel, in Boston. On the outbreak of the Revolutionary War he joined the Loyalist element in Boston, and in 1776 removed to Halifax, N. S., whence he subsequently removed to England, his name having meanwhile been included in the proscription and banishment act of 1778. In 1785 he returned to this country, and settled at Newport, where he died.

GARDINER'S ISLAND. A portion of Suffolk County, N. Y., lying five miles off Long Island on the south side of the east entrance of Long Island Sound, in the bay formed by the two arms of Long Island (Map: New York, H 4). It has an area of 3300 acres. It has been the property of the Gardiner family ever since the white settlement of the country. It was on this island that the noted pirate (or privateer) Captain Kidd secreted much of his treasure, which was afterwards discovered and appropriated. There is a lighthouse on the north side of the island.

GARDNER. A town in Worcester County, Mass. (Map: Massachusetts, D 2), including the villages of Gardner Centre, South Gardner, and West Gardner, 25 miles north of Worcester: on the Fitchburg branch of the Boston and Maine Railroad. It has the Levi Heywood Memorial Library, an almshouse, and a home for the aged, and Dunn and Crystal Lake parks. It is the seat of an extensive chair-manufacturing industry that employs 3000 persons. The government is administered by town meetings, convened whenever necessary. Gardner was incorporated as a town in 1785, its population then being about 375. Population, in 1890, 8424; in 1900, 10,813.

GARDNER, ELIZABETH JANE (1842—). An American artist, born at Exeter, N. H. She studied in Paris under Merle, Lefebvre, and Bouguereau, and her pictures have been exhibited constantly in this country and abroad. Among

her works are: "Cinderella;" "Cornelia and Her Jewels" (1872); "Corinne" (1874); "Fortune Teller" (1876); "Maud Muller" (1879); "Daphne and Chloë" (1882); and some portraits.

GARDNER, ERNEST ARTHUR (1862—). An eminent English archaeologist, born in London. He was educated at the City of London School, and at Gonville and Caius College, Cambridge, of which he was fellow 1885-94. Since 1884 he has devoted himself to archaeological work, and was director of the British School of Archaeology at Athens (1887-95). At present he is Yates professor of archaeology in University College, London. He conducted the excavations at Naukratis in Egypt (1885-86), and has carried on similar explorations in Cyprus, at Megalopolis, and on many other sites in Greece. His numerous publications include a *Handbook of Greek Sculpture* (1896-97); *Catalogue of Vases in the Fitzwilliam Museum* (1897). He has been a frequent contributor to archaeological journals, and since 1897 has been co-editor of the *Journal of Hellenic Studies*.

GARDNER, GEORGE (1812-49). A Scotch botanist, born in Glasgow. He studied at the University of Glasgow, qualified as a surgeon, turned his attention from medicine to botany, and, assisted by subscriptions obtained in great part through the influence of his instructor, Sir W. J. Hooker, explored Brazil from May, 1836, to the close of 1840. During his absence he forwarded to England 60,000 specimens divided among 3000 different species. His total number of specimens represented more than 6000 different species. In 1842 he was elected a member of the Linnæan Society of London, in 1844 was appointed superintendent of the botanical garden of Ceylon, and in 1845 visited India for botanizing purposes, and became an associate editor of the *Calcutta Journal of Natural History*. He aided H. B. Fielding in the writing of *Sertum Plantarum* (1844), and published *Travels in the Interior of Brazil* (1846), and many papers in the *London Journal of Botany* and other periodicals.

GARDNER, HENRY BRAYTON (1863—). An American political economist and educator, born in Providence, R. I. He graduated in 1884 at Brown University, studied at the Johns Hopkins University, and was subsequently appointed professor of political economy at Brown. In 1897-98 he was vice-president of the American Economic Association. His publications include *Statistics of Municipal Finance* (1889; in new series, No. 2, of the American Statistics Association's publications), and a second monograph under the same title in new series, No. 2 (1899), of the publications of the American Economic Association.

GARDNER, PERCY (1846—). An English classical archaeologist, born at Hackney. He received his education at the City of London School and at Christ's College, Cambridge, of which he was made a fellow in 1872; since 1887 he has been professor of classical archaeology in Oxford University. Professor Gardner is best known for his numerous publications dealing with ancient numismatics. Among his other works are: *New Chapters in Greek History* (1892); *Sculptured Tombs of Hellas* (1896), etc. He is corresponding member of archaeological institutes in many foreign countries.

GARDNER GUN. A machine gun consisting of two simple breech-loading rifle-barrels, placed parallel, about 1.4 inches apart, in a case or compartment. The barrels are loaded, fired, and relieved of shells by one revolution of the hand crank. These guns, of .45-inch calibre, are used in the United States service. See MACHINE GUN.

GARDONE-RIVIERA, găr-dô'nă rê-vê-ă'ră. A winter resort on the western shore of Lake Garda (q.v.), in Northern Italy. It is sheltered by the mountains from all raw winds, and, in winter, has little rain, much sunshine, and an even temperature. About 1884 it became popular with Russians and Germans, and is now visited by invalids and tourists from all parts of the world. Population of commune, in 1901, 1987.

GAREFOWL, or **GAIRFOWL** (Icel. *geirfugl*, Swed. *garfögel*, Dan. *geirfugl*; Eng. *gerfalcon*; connected with OHG. *gir*, Ger. *Geier*, vulture, OHG. *ger*, *giri*, greedy + *fugl*, AS. *fugol*, Ger. *Vogel*, fowl). The great auk (*Plautus impennis*) once frequently seen in the Hebrides, but now extinct. It was the largest of its race, standing about 29 inches high, and resembling a big razor-bill. It was black above and white beneath in winter, the head changing to snuff-brown in summer. Its small wings were useless for flying, and it waddled about with great difficulty on land. Its defenselessness and stupidity made it easy to kill, even with clubs, and at first it was slaughtered and its rookeries robbed of eggs for food or amusement. Later the demand for its feathers caused its rapid destruction, and the last bird was killed about 1844. See AUK.

GARETH, SIR. The youngest son of King Lot and Morgaine in the Arthurian legends. He entered the Court of his uncle, King Arthur, concealing his identity at the request of his mother, and received from Sir Kay the nickname Beaumains. At the expiration of a year, he received knighthood and, at the request of Linet, liberated her sister Liones, who was imprisoned in Castle Perilous, and whom he afterwards wedded. Tennyson's "Gareth and Lynette" has some variations.

GARFIELD, JAMES ABRAM (1831-81). Twentieth President of the United States. He was born at Orange, Cuyahoga County, Ohio, November 19, 1831; was early left fatherless, and spent his youth in alternate periods of study at school and hard manual work for his own support. He worked on a farm; is said to have driven horses for a time on the Ohio Canal; learned the carpenter's trade, and worked at it during his school vacation in 1850. He had already entered the Geauga Seminary at Chester, Ohio, where he began the study of Latin, Greek, and algebra. In 1851 he entered the Western Reserve Eclectic Institute (now Hiram College) at Hiram, Ohio, and in 1854 entered Williams College, Mass., where he graduated with distinguished honor in 1856. He then became teacher of Latin and Greek in the institute at Hiram, Ohio, of which he was elected the head one year later. Before entering college, he had united with the Disciples Church, in which he had been brought up, and, according to the usage of that denomination, though never formally ordained to the ministry, he often preached. In 1858 he entered his name as a student with a law firm in Cleveland, Ohio, though his study was carried on by himself at Hiram. Having taken some part as a Republican in the campaign of 1856, he was

in 1859 elected to represent the counties of Portage and Summit in the State Senate. In August, 1861, he was appointed lieutenant-colonel of volunteers, and in September colonel. In December he reported for duty to General Buell at Louisville, Ky., and was ordered in command of a brigade of four regiments of infantry, to repel the Confederates under General Marshall from the valley of the Big Sandy River. He accomplished the task in January, 1862, defeating Marshall in the battle of Middle Creek, and forcing him to retreat from the State. He was commissioned brigadier-general, was placed in command of the Twentieth Brigade, and was ordered to join General Buell. He reached, with his brigade, the field of Shiloh on the second day of the battle, and aided in the final repulse of the enemy; and next day, at the front with Sherman, took part in the attack on the enemy's rear guard. He participated in the siege of Corinth, and, after its evacuation, was detailed to rebuild the railroad to Decatur. In October, 1862, he served on a court of inquiry, and in November on the court-martial which tried General Fitz-John Porter. In February, 1863, he joined the Army of the Cumberland under Rosecrans, just after the battle of Stone River, and was appointed chief of staff. In the discussion with regard to a forward movement, Garfield, as chief of staff, collated the written opinions of the seventeen corps, division, and cavalry generals, and summarized their substance with cogent arguments of his own. This report induced Rosecrans to move forward, contrary to the opinions of most of his generals, in the Tullahoma campaign, opening the way for the advance on Chattanooga. In the battle of Chickamauga, September 19th, Garfield issued the orders, as chief of staff, and after the retreat of the right of the army rode under fire across country, and took word to Thomas, commanding the left wing, of the necessities of the situation, and, under Thomas, assisted in retrieving the disaster. Garfield was sent to Washington with dispatches, and was promoted to be a major-general for his services in the battle.

Having been elected a Representative in Congress, he resigned his commission December 3, 1863, and took his seat in the House of Representatives, where he served as member of the Military Committee until the close of the war. Largely through his efforts and arguments, the commutation clause of the Enrollment Act was repealed, and the draft enforced at a time when otherwise the army would have been fatally depleted. In 1865 he was assigned to the Committee of Ways and Means, and on March 16, 1866, made an elaborate speech on the public debt and specie payments. In 1867-68, as also later, he took strong ground against the improper inflation of the currency. In December, 1867, he returned to the Military Committee as chairman, and held that place during the discussions on the reconstruction of the Southern States, delivering a speech January 17, 1868, on the power of Congress in this relation, in which he severely criticised the action of the President, and the course of Major-General Hancock in his celebrated 'Order No. 40.' He also sustained the motion to impeach the President. Later he was chairman of the Committee on Banking and Currency, and of a special committee to investigate the cause of the gold panic in September, 1869, which cul-

minated in the crisis of 'Black Friday.' He also draughted a bill for the taking of the census of 1870, which was rejected by Congress, but was made the basis of the law passed ten years later for the census of 1880. In 1871-75 he served as chairman of the Committee on Appropriations, and in this capacity introduced many important reforms. In 1873 charges of corruption were made against him in relation to the *Crédit Mobilier* (q.v.). These attracted attention throughout the country, and especially in his own Congressional district. After earnest discussion he was renominated by the three-fourths vote of the convention, and was reelected by a large majority. The charges were renewed two years later, but were met with greater strength. In 1876 there was no opposition in the convention, and in 1878 he was reelected by a large majority. In the Forty-fourth Congress (1875-77) the Democratic Party was in the majority. Garfield became a member of the Committee of Ways and Means. He was a frequent and careful speaker on important measures, and was recognized as one of the leaders of the minority. After the Presidential election of 1876, he was one of the prominent Republicans requested to witness the counting of votes in Louisiana, and one of two Republican members appointed by the House of Representatives to sit in the Electoral Commission (q.v.). In December, 1876, he was nominated by his party for Speaker of the House of Representatives, and received the same nomination on two subsequent occasions. In the Forty-fifth Congress (1877-79) he earnestly advocated the resumption of specie payments, and spoke against the Bland Silver Bill. In 1880 he was elected by the Ohio Legislature United States Senator for six years from March 4, 1881.

In the Republican national convention at Chicago, June, 1880, he was an earnest advocate of the nomination of John Sherman of Ohio. The convention was divided between the advocates of General Grant and the opposition favoring James G. Blaine, John Sherman, and others. Garfield was not at first considered a candidate, but after more than thirty ballots without a choice, and earnest discussion in which, as well as in the advocacy of his favorite candidate, he won the admiration of delegates from all sections, he received the nomination. In November he received 214 electoral votes as against 155 for his opponent on the Democratic ticket, Gen. Winfield S. Hancock, and was inaugurated on March 4, 1881. With the single exception of Robert T. Lincoln, Secretary of War, his Cabinet, headed by James G. Blaine, as Secretary of State, was drawn from that wing of the Republican Party of which Garfield himself was a member, and which antagonized the so-called 'Stalwarts' (q.v.), among whom the Vice-President, Arthur, ranked himself. Both in public and in private, however, Garfield had signified his earnest desire to unite all factions in support of his Administration, and the people in general were disposed to trust in his promises. On March 23d the President sent in the name of William H. Robertson as his appointee to the office of Collector of the Port of New York. As Mr. Robertson was known to be a political enemy of Senator Conkling, the leading spirit among the 'Stalwarts,' Conkling looked upon the nomination as an affront to himself, and when he found that he could not pre-

vent the Senate from confirming it, he and his colleague, Thomas C. Platt, resigned their offices (May 16th) and returned to New York to seek vindication by reelection. The New York Legislature, however, refused to reelect either one, and after a long and tedious struggle Messrs. Lapham and Warner Miller were chosen in their stead. Meanwhile the President's nomination had been confirmed in the Senate, and the breach between the Stalwarts and the Administration was hopelessly widened. On July 2d Charles J. Guiteau, a man whose vanity had been offended by the refusal of an office, and whose unbalanced brain had been excited by the dissensions in the Republican Party, shot Garfield in the railway station at Washington. The crime excited the horror and execration of all parties alike; and foreign nations joined in the universal sorrow and indignation. For eighty days Garfield lingered between life and death. Toward the end of August his medical attendants felt that his last chance of recovery depended on his removal from the malarious climate of Washington, and on September 6th he was taken by train to Elberon, N. J., where he died thirteen days later, on the 19th. His body was taken to Washington, where it lay in state September 22d-23d, and then to Cleveland, Ohio, where it was buried, September 26th. A subscription started in New York for the bereaved family soon reached the sum of \$360,000. The assassin Guiteau was convicted after a protracted trial in which the only defense offered was that of insanity, and was hanged in the jail at Washington on June 30, 1882.

Many of Garfield's speeches were published at the time of their delivery, and after his death B. A. Hinsdale collected his writings and published them in two volumes (Boston, 1882). For his biography, consult: Gilmore (New York, 1880); Coffin (Boston, 1880); Bundy (New York, 1880); Mason (London, 1881); and Stoddard (New York, 1889).

GARFIELD MONUMENT. A monument at Cleveland, Ohio, in memory of the martyred President, dedicated May 30, 1890. Its cost, \$135,000, was defrayed by popular subscription. The monument is a round tower, 50 feet in diameter and 148 feet high, containing a marble statue of Garfield.

GARFISH. See GAR.

GARGAMELLE, găr'gă'měl'. The wife of Grangousier and mother of Gargantua. In Rabelais's romance, *Gargantua et Pantagruel*.

GAR/GANEY. A European teal duck (*Querquedula circia*) resembling the American blue-winged teal (see TEAL), which never ranges far north of Central Europe, but is known eastward to China. It is also called 'summer teal,' and in Italy 'garganello.'

GARGANO, găr-gă'nô (Lat. *Garganus*). A peninsula on the east coast of South Italy, called both Monte Gargano and Monte Sant' Angelo. It is an almost treeless mass of mountains, separated from the rest of the Apennines by the broad valley of the Candelaro, while it is washed on three sides by the Adriatic. It is 54 miles long, 27 miles broad, and in Mount Calvo rises to the height of 3465 feet.

GARGANTUA, Fr. pron. găr'gă'n'tu'ă. A leading character in Rabelais's satire, *The Grand*

and *Inestimable Chronicles of the Grand and Enormous Giant Gargantua* (1531). He appears also in another *Gargantua* (1535), the first part of the work now known as *Gargantua and Pantagruel* (1532-64). See RABELAIS.

GARGAPHIA. The name of a valley near Platæa in Greece, the place where Actæon was torn to pieces by his own hounds. Jonson has also employed it as the scene of his comedy *Cynthia's Revels*.

GAR/GARA, or GAR/GARUS. See IDA.

GAR/GERY, JOE. A simple-minded, open-hearted blacksmith, in Dickens's *Great Expectations*, who suffers much from the shrewish tongue of his virago wife, Pip's sister, and has an innocent desire for 'larks.'

GARGET, gâr'gêt. See MAMMITIS.

GARGET-ROOT. See PHYTOLACCA.

GARGLE, or GAR/GARISM (OF. *gargouille*, throat, from Lat. *gurgulio*, gullet). One of a group of medicines intended not to be swallowed, but to be ejected from the mouth after having been churned about in the mouth and throat, with a view to cleansing the parts when affected with discharges from ulcers, or to acting as astringents (q.v.) or stimulants (q.v.) in sore throat. The best gargles are composed of boric acid solution, or alcohol and water; of chlorine water or solution of permanganate of potash, in putrescent cases; of port wine, alum, and capsicum (cayenne pepper), when a stimulating effect is required; of tannin or oak-bark decoction with alum or borax, in case a pure astringent is needed. Gargles are very useful in the later stages of sore throat, in almost all its varieties.

GARGOYLE (OF. *gargouille*, *gargouille*, Fr. *gargouille*, throat, connected with Lat. *gurgulio*, throat). A projecting spout, discharging the water from the roof-gutters of buildings. Gargoyles of various forms have been used in almost all styles of architecture. Early examples are found in the temples of Edfu and Denderah in

GARGOYLES

decorating the Sacristy of the Cathedral of Notre Dame at Paris.

Egypt. Those of painted terra-cotta and of marble, often in the shape of lions' or boars' heads, were a prominent part of classic and Etruscan temples. But the term is especially

applied to the varied development of the spout in connection with Gothic architecture. The gargoyles of French buildings have usually great prominence, much more than in England. Some gargoyles are small and plain, others large and ornamental, according to their various positions. They are carved into all conceivable forms—angelic, human, bestial, and grotesque; and as in fountains, the water is generally spouted through the mouth. The mediæval love of the grotesque found congenial expression in creating weird and deformed heads and figures for them. Some of them are famous, as at Saint Jacques and Notre Dame in Paris. In late castellated buildings they frequently assume the form of small cannons projecting from the parapet. In modern times the use of metal pipes to convey the water from roofs has almost entirely superseded the use of gargoyles.

GARIBALDI, gû'rê-bâl'dê, GIUSEPPE (1807-82). An Italian patriot and liberator, born at Nice, July 4, 1807. He was a sailor's son, and adopted the sea as his own calling, and as early as 1830 was in command of a brig. It was about this time that he became interested in the Italian national movement, which afterwards became the great passion of his life. He made the acquaintance of Mazzini and other leaders of Young Italy in 1833, and became imbued with an unquenchable hatred of despotism. He was compromised by his participation in the futile outbreak at Genoa in 1834, and fled to French territory, while his condemnation to death was published in Italy. He resumed his sea-faring life, and sailed to South America, where he took an active part in the struggle of the new Republic of Uruguay, against the Argentine dictator, Manuel Rosas. He distinguished himself as an intrepid partisan leader on sea and land, and contracted a romantic marriage with Anita, the remarkable woman who for several years shared his campaigns. Upon receiving news of the rising of Northern Italy against Austria in 1848, Garibaldi hastened to Europe to share in the struggles of his countrymen. He bore an effective part in the whole of the Sardinian campaign as the commander of a volunteer corps. He then joined the Revolutionary Government at Rome, and distinguished himself by his defense of the city against the French forces under Oudinot in June and July, 1849. After a retreat of unparalleled difficulty through districts occupied by Austrian forces, Garibaldi, accompanied by his heroic wife, set sail in a small fishing craft toward Venice; but being pursued by Austrian vessels, they were compelled to land where they could, and, not far from the shore, his wife, exhausted by the dangers and terrible exertions of their flight, expired in the arms of her husband. Garibaldi at length reached Genoa in safety, and thence embarked for Tunis. He afterwards lived in Staten Island, N. Y., supporting himself by making candles in a factory, revisited South America, and commanded an American trading-vessel on the Pacific coast.

Though a republican by conviction, Garibaldi did not follow Mazzini in opposition to the Sardinian monarchy, but accepted it, as the hope of Italy, in the years preceding the war of 1859. As the head of an irregular auxiliary force of the Piedmontese army on the commencement of hostilities in 1859 his services were brilliant and ef-

GIUSEPPE GARIBALDI

fective, notwithstanding the limited scope assigned for his operations. In 1860 he undertook the most momentous enterprise of his career. After the disappointing peace of Villafranca had defeated the hope of liberation from the Austrian yoke just when it seemed to be approaching realization, the Italian people resumed the revolutionary operations which had been temporarily suspended in the hope that Italian unity would be accomplished through the efforts of Sardinia. In Sicily, early in 1860, disturbances broke out and Francesco Crispi (q.v.) obtained from Garibaldi a promise of assistance. In fulfillment of this promise, Garibaldi assembled at Genoa a volunteer force of 1070 patriots, and on May 5th set sail for the island of Sicily. On the 11th his two small transport steamers reached Marsala in safety, and the landing of his followers was successfully effected in sight and partially under the fire of the Neapolitan fleet. On the 15th, in the battle of Calatafimi, 3600 Neapolitan troops were routed by Garibaldi's small force, and this opening victory cleared the way to Palermo. On the 27th of the same month Garibaldi and his little army occupied the heights which commanded Palermo, and after a desperate conflict with the royalist troops fought their way into the city, which for several subsequent days had to sustain a ruthless bombardment from the united fire of the Neapolitan garrison and fleet. The intervention of the British fleet, however, and the isolated and destitute condition of the garrison shut up in the forts, induced the Neapolitan general to capitulate June 6th, and on his departure with his troops Garibaldi remained in undisputed possession of the city and strongholds of Palermo. He issued a proclamation as dictator in the name of Italy and Victor Emmanuel, armed the citizens, and on July 20th, at the head of 2500 men, he gave battle at Milazzo to 7000 Neapolitans, who were completely defeated, and compelled to evacuate that fortress. On the 25th the Neapolitans were driven back into Messina, into which Garibaldi made his triumphal entry on the 27th.

On August 19th Garibaldi crossed over into Calabria, and was immediately joined by large bodies of volunteers from all directions, by whom he was accompanied on his memorable and eventful march to Naples. On September 5th his army, which then amounted to 25,000 or 30,000 men, occupied Salerno on the withdrawal of the royalists, and on the 7th, amid the frenzied enthusiasm of the inhabitants, Garibaldi entered Naples with only one or two friends, to prove to Europe that his advent was that of a welcome liberator, and not of a conqueror. On the previous day the capital had sullenly witnessed the withdrawal of the King, Francis II., to the fortress of Gaeta. On the 1st of October the royalist troops, numbering 15,000 men, advanced from Capua, and attacked the whole line of Garibaldians spread along the Volturno. For some hours the outcome of the battle was in doubt, and more than once it seemed as if success were about to desert the patriots at the last moment; but finally the royalists were driven back to Capua in disorder. Victor Emmanuel, at the head of the Sardinian army, now crossed the Papal frontier, routed the troops under Lamoricière, and passed on into the Kingdom of Naples, where Garibaldi relinquished into his sovereign's hands the unconditional disposal of his army, and absolute

sway over the Neapolitan provinces. Francis II. was now besieged by the Sardinian forces in his stronghold of Gaeta, where on February 13, 1861, he was compelled to surrender to Victor Emmanuel. Garibaldi retired to Caprera, but in June, 1862, he raised a force of volunteers at Palermo, invaded Calabria, and marched upon Rome, which he believed must be wrested from the Pope before the unity of Italy could be accomplished. Victor Emmanuel, however, fearing that Garibaldi's attempt on Rome would bring about foreign intervention with disastrous consequences to Italy, dispatched an army to check his progress. Garibaldi was defeated by the Italian troops at Aspromonte August 29th, and taken prisoner, but was pardoned in October.

During the campaign of 1866 Garibaldi took the field, and was engaged in operations against the Austrians in the Tyrol. The year 1867 was disastrous for him. Impatient of the long delays in completing the unification of Italy, and bitterly opposed to the Papal power, he organized an open invasion of the Papal States, which the Italian Government could not countenance. France came to the aid of the Pope, the Garibaldians were defeated at Mentana, November 3d, and their leader was made a prisoner, but was afterwards allowed to return to Caprera, in the neighborhood of which a man-of-war was stationed to prevent his escape. He left Caprera to fight for the French Republic in 1870, and was nominated to the command of the irregular forces in the region of Burgundy. In 1871 he was returned a Deputy to the French National Assembly which met at Bordeaux, but encountered such bitter criticism of his conduct during the war that he returned to Caprera. He entered the Italian Parliament in 1874. After much hesitation he accepted from the Parliament an annual pension of 10,000 lire. In 1860 Garibaldi was inveigled into an unhappy marriage, which was annulled in 1879, when he married Francesca, a peasant, who had been an inmate of his family for many years. He died at Caprera June 2, 1882. Garibaldi's novels, *Clelia* and *Cantoni il volontario*, have little literary value. Of his two sons, the elder one, Menotti, fought with credit by his father's side.

BIBLIOGRAPHY. A comprehensive literature centres about Garibaldi, and only the most useful and accessible books may be mentioned. The first in importance is naturally Garibaldi's own *Memoirs*, translated into English by Werner, and published under the title, *Autobiography of Giuseppe Garibaldi* (London, 1889). This authorized edition contains a supplement by Jessie White Mario, and embodies all that Garibaldi wished to have published. Much is omitted which Garibaldi preferred not to discuss, and there are many minor errors, as the memoirs were written entirely from memory, without verification of dates and other facts. The volumes are, nevertheless, of great value. Dwight, *Life of General Garibaldi, Translated from His Private Papers* (New York, 1877), is also autobiographical. Consult also: Bent, *The Life of Giuseppe Garibaldi* (London, 1881); Marriott, *The Makers of Modern Italy* (New York, 1889), which includes three Oxford lectures, one on Garibaldi. See ITALY.

GARIBALDI (so called from its color, red having been worn by adherents of Garibaldi). A

name in California for the red perch (*Hypsypops rubicundus*).

GARIEP' RIVER. See ORANGE RIVER.

GARIGLIANO, gä'rë-lyä'nô (Lat. *Liris*, earlier *Clanis*). A river of South Italy, 92 miles long, which rises in the Abruzzi as the Liri (Map: Italy, H 6). It receives the waters of the Sacco, the Melsa (at this point changing its name to Garigliano), and the Rapido, and then flows sluggishly through marshes, past the ruins of Minturnæ, into the Gulf of Gaeta. In the marshy swamps near the river Marius found concealment when pursued by Sulla. On its banks in 1503 the Spaniards, under Cordova, won a famous victory over the French. On November 3, 1860, the Neapolitan troops north of the river were defeated by the Sardinians, and as a result the investiture of Gaeta began.

GARIGUE, gä'rëg' (Fr., uncultivated land, Cat. *garriga*, from *garrig*, oak). A term applied to the barren and rocky desert-like areas of the Mediterranean region, where neither shrubs nor trees give tone to the landscape.

GARLAND, AUGUSTUS HILL (1832-99). An American politician. He was born in Tipton County, Tenn., but when less than a year old was taken by his parents to Arkansas. He was educated at Saint Mary's College, Lebanon, Ky., and at Saint Joseph's College, Bardstown, Ky., studied law, and was admitted to the Arkansas bar in 1853, and soon became prominent both as a lawyer and politician. In politics he was a Whig, and was opposed to secession, but finally went with his State. He was elected to the Provisional Congress of the Confederate States in 1861; was reelected to the House of the same Congress in 1862, and was afterwards elected to the Confederate Senate, of which he continued to be a member until the close of the war. He then devoted himself to his profession, and in 1874 was elected Governor of Arkansas, under the new Constitution. He was a member of the United States Senate from 1877 to 1885, and from 1885 to 1889 was Attorney-General of the United States in the Cabinet of President Cleveland, after which, until his death, he practiced law in Washington, D. C.

GARLAND, HAMLIN (1860—). An American poet and story-writer, born at La Crosse, Wis., September 16, 1860, of Scotch descent. His youth was passed in various Western towns, among them the Quaker community Hesper, Iowa. He completed his school education at Cedar Valley Seminary, Osage, Iowa, in 1881, farmed and taught in Illinois and Dakota, went to Boston in 1884, and devoted himself to literature there till 1891, since when he has lived chiefly in the West. His first book was *Main-Traveled Roads* (1891), frankly realistic fiction. Somewhat similar in character are: *A Spoil of Office* (1893); *Prairie Folks* (1893); *A Little Norsk* (1893); and *Rose of Dutcher's Coolly* (1895), probably his best novel. Other novels are: *Jason Edwards* (1891); *A Member of the Third House* (1892); *Wayside Courtships* (1897); *Her Mountain Lover* (1901). He has also written a volume of vigorously iconoclastic criticism entitled *Crumbling Idols* (1894); *Prairie Songs* (1893), a volume of verse; *Ulysses Grant: His Life and Character* (1898), a

sympathetic biography; *The Trail of the Gold Seekers* (1899); *The Eagle's Heart* (1900); and *Captain of the Gray Horse Troop* (1902).

GARLAND, LONDON CABELL (1810-95). An American educator, born in Nelson County, Va. He graduated in 1829 at Hampden-Sidney College (Farmville, Va.) in 1833, was appointed professor of physics in Randolph-Macon College (Ashland and Lynchburg, Va.), and from 1835 to 1847 was president of that institution. In 1847-53 he was professor of mathematics and astronomy in the University of Alabama (University, Ala.), of which he was president from 1855 to 1866. Professor of physics and astronomy in the University of Mississippi (Oxford) from 1866 to 1875, he was appointed in the latter year chancellor of Vanderbilt University (Nashville, Tenn.), and professor there of physics and astronomy. He resigned from the chancellorship in 1893. He published *Trigonometry, Plane and Spherical* (1841), one of a projected series of text-books, the remaining manuscripts of which were destroyed by fire.

GARLIC (AS. *gärlëac*, from *gär*, spear + *lëac*, leek, so called from the shape of the leaves), *Allium sativum*. A bulbous-rooted plant, native of the East, cultivated from the earliest ages. The stem rises to the height of about two feet, is unbranched, and bears at the top an umbel of a few whitish flowers, mixed with many small bulbs. The leaves are grass-like, obscurely keeled, and not fistulous like those of the onion. The bulb, which is the part eaten, consists of about twelve to fifteen ovate-oblong cloves or subordinate bulbs. It has a penetrating and powerful onion-like odor and taste. It is in general use as a condiment with other articles of food in Southern Europe, but has only a limited use in the United States. Garlic, or its fresh juice, is also used in medicine. It owes its properties chiefly to oil of garlic. The cultivation of garlic is extremely easy; it is generally propagated by its cloves. Many species of the genus *Allium* are popularly called garlic, with some distinctive addition. *Allium oleraceum* is sometimes called wild garlic in England, and its young and tender leaves are used as a pot-herb. Its leaves are semi-cylindrical, and grooved on the upper side, and its stamens are all simple. In America, wild garlic is *Allium ceneale*, a perennial also known as field garlic and wild onion. This is a serious weed pest in pastures, hay and grain fields of the Eastern United States from New York to South Carolina. When eaten by cattle it imparts a very disagreeable odor and flavor to the milk, butter, cheese, and other dairy products. The species has hollow, thread-like leaves surrounding a slender scape, which bears an umbel of greenish-white or rose-colored flowers in mid-summer, which are followed in early autumn by either seeds or bulbets. The easiest way to eradicate it in fields is to alternate heavy cropping with clean cultivation. See ALLIUM; ALLIACEOUS PLANT; Plate of ONIONS, ETC.

GARLIC, OIL OF. When cloves of garlic are distilled with water, about 0.2 per cent. of a brown heavy oil, with an acrid taste and a strong disagreeable smell, passes over. By careful rectification from a salt-water bath, about two-thirds of the oil may be obtained in the form of a yellow liquid, which is lighter than

water, and which, when treated with chloride of calcium (in order to dry it), and subsequently distilled from fragments of potassium, passes over pure and colorless as sulphide of allyl, an organic compound of very considerable interest, whose formula is $(C_3H_5)_2S$. The crude oil also contains a compound of allyl still richer in sulphur than the sulphide. Sulphide of allyl exists not only in oil of garlic, but also in the oils of onions, leeks, cress, alliaria, radishes, asafetida, etc. It is a light, clear, pale-yellow oil, with a penetrating odor of garlic; it boils at $140^\circ C.$, and dissolves readily in alcohol and ether.

GARMAN, SAMUEL (1846—). An American naturalist, born in Indiana County, Pa. He graduated in 1870 at the Illinois State Normal University, was principal of the Mississippi State Normal School in 1870-71, was a pupil of Louis Agassiz in special work in natural history (1872-73), and received appointment as assistant in the departments of herpetology and ichthyology at the Museum of Comparative Zoölogy, Cambridge. His writings include: *Fishes and Reptiles from Lake Titicaca* (*Bulletin of the Museum*, vol. iii., 1871-76, No. 11); (joint author) *Exploration of Lake Titicaca* (ib., vol. iii., 1871-76, Nos. 11, 12, 15, and 16); *On Certain Species of Chelonioidea* (ib., vol. vi., 1879-80, No. 6); *New Specimens of Selachians in the Museum Collection* (ib., vol. vi., 1879-80, No. 11); *The Reptiles and Batrachians of North America* (*Memoirs of the Museum*, vol. viii., 1883, No. 3); and *Reptiles and Batrachians of the West Indies* (1887; printed in the *Bulletin of the Essex Institute*, and in monograph form).

GARNEAU, gâr'nô', FRANÇOIS XAVIER (1809-66). A Canadian historian, born in Quebec. Admitted in 1830 as a notary, he was appointed clerk to the Legislative Assembly, and from 1844 to 1864 was clerk to the municipal council of Quebec. He published an *Histoire du Canada, depuis sa découverte* (1845-48; 2d ed., revised and corrected, 1852; 3d ed. 1859), of which an unsatisfactory English translation by A. Bell appeared at Montreal in 1860 (2d ed. 1862). He also wrote *Voyage en Angleterre et en France* (printed in the *Journal de Québec* in 1855), and contributed to periodicals numerous poems, collected in part in Huston's *Recueil de littérature canadienne* (Montreal, 1848). Consult Casgrain, *Biographie de F. X. Garneau* (Montreal, 1886).

GARNET (ME. *garnet*, *grenat*, from OF. *grenat*, It. *granato*, from ML. *granatus*, garnet, either on account of its crimson color, from ML. *granata*, cochineal insect, supposed to be a seed or berry, or from Lat. *granatum*, pomegranate, as resembling in shape and color pomegranate seeds; in either case from Lat. *granum*, grain). An orthosilicate of varying composition that crystallizes in the isometric system. Some varieties of garnet are not quite so hard as quartz, others are considerably harder. When crystallized, garnets have a vitreous to resinous lustre. They occur in schists and slates, and in gneiss, granite, and limestone, and sometimes in lava and serpentine, being usually of secondary origin. Garnets are divided by Dana into three groups; viz. aluminum garnets, iron garnets, and calcium-chromium garnets.

The first group includes grossularite, or cal-

cium-aluminum garnet; pyrope, or magnesium-aluminum garnet; almandite, or iron-aluminum garnet; and spessartite, or manganese-aluminum garnet. Grossularite, sometimes called essonite, or hessonite, or cinnamon stone, varies in color from white to different shades of yellow and brown, and from pale-green to emerald-green. Gem varieties of the green grossularite are obtained in Siberia, and the brown-colored ones, or cinnamon stones, are found in Ceylon, where they are sometimes miscalled hyacinth. In the United States green varieties have been found at Brewster, N. Y., and red and yellow varieties in Phippsburg, Me., and Warren, N. H.; also at various places along the Alleghany range. A rose-red variety of grossularite, called rose garnet, from Xalostoc, Mexico, is used as an ornamental material when cut and polished. Pyrope, which is called precious or Oriental garnet, is of a deep-red to black color. The best known varieties are found at a number of places in Bohemia; excellent specimens are also obtained at the Kimberley mines in South Africa. In the United States, the finest pyrope garnets come from Arizona, southern Colorado, and New Mexico, where they are often called Arizona rubies, while the varieties from South Africa are known as Cape rubies. Almandite, which is the common garnet, varies in color from deep red to black. The transparent scarlet and crimson varieties, when cut, are called carbuncles; these were highly prized by the ancients. According to the Talmud, the only light that Noah had in the Ark was furnished by carbuncles. The finest almandite garnets are from Siriam, India; from Burke, Caldwell, and Catawba counties, N. C.; and from Idaho. The specimens found in the United States, although inferior to those from India, are generally of good enough quality to be used as watch-jewels.

Spessartite is of a dark hyacinth-red to brownish-red color; it is found in the Ural Mountains and in Amelia County, Va.

The second group comprises the garnets which have the general name of andradite. They range in color from light-yellow through various shades of green to red, brown, and black, and according to their colors they have special names, among which are demantoid for the green variety, and melanite for the black variety. They are found variously throughout the world, chiefly along mountain ranges.

The last group is formed by uvarovite, or calcium-chromium garnet, which is of an emerald-green color, and is found in Siberia, as well as at various localities in Canada.

According to their transparency and richness of color, garnets are cut and used for gem purposes. Among the ancients, garnets—especially the precious varieties—were cut and polished into various ornaments. Pliny describes a vessel formed from carbuncles, having the capacity of a pint. A number of fine ancient specimens of engraving on garnets are to be found in the larger collections. The common garnet is frequently ground and used for polishing and cutting other stones, and also for the manufacture of sand-paper. About 3000 tons of garnets for abrasive purposes are produced annually in the United States from mines in New York, Pennsylvania, and Massachusetts, the greater number of which are used in the shoe industry. Garnets of the

gem variety have been made artificially in Paris by the fusion of their constituents.

GARNET, HENRY HIGHLAND (1815-82). An Afro-American clergyman and orator, born a slave in New Market, Md. He was a pure-blooded negro of the Mendigo tribe. When he was ten years old his parents successfully escaped from Maryland, taking him with them, and in 1826 settled in New York City. He was educated at Canaan Academy, New Hampshire, and at Oneida Institute, near Utica, N. Y. After graduating at the latter institution in 1840, he studied theology, and two years later became pastor of a Presbyterian church in Troy. He became actively associated with the leaders of the abolition movement, and published for a time the *Clarion*, a weekly paper devoted to the cause. In 1850 he went to Europe, and spent the greater part of the next three years lecturing on the slavery question in Great Britain. He was a delegate to the peace congress at Frankfort in 1851, and in 1853 was sent to Jamaica as a missionary by the United Presbyterian Church of Scotland. In 1855 he returned to the United States to take charge of the Shiloh Presbyterian Church in New York City. There he remained until 1881, with the exception of a four years' pastorate at Washington, D. C., in 1865-69. Shortly before President Garfield's assassination he was appointed by him Minister Resident and Consul-General for the United States in Liberia. The appointment was renewed by President Arthur and confirmed by the Senate, but Garnet died a few months after taking charge of his new post.

GARNETT. A city and the county-seat of Anderson County, Kan., 50 miles northwest of Fort Scott; on the Missouri Pacific and the Atchison, Topeka and Santa Fé railroads (Map: Kansas, G 3). It has considerable trade in the products of the surrounding agricultural region, and manufactures furniture, flour, lumber, etc. Population, in 1890, 2191; in 1900, 2078.

GARNETT, JAMES MERCER (1840—). An American educator, philologist, and author, born at Aldie, Va. He graduated at the University of Virginia in 1859, served in the Confederate Army during the Civil War, and rose to be captain of artillery, and in 1867 was appointed professor of Greek in the Louisiana State University (then at Alexandria, now at Baton Rouge). Subsequently he was instructor in ancient languages and mathematics at the Episcopal High School (near Alexandria, Va.). From 1870 to 1880 he was president of Saint John's College (Annapolis, Md.), and from 1882 to 1896 professor of English literature in the University of Virginia. He was elected president in 1890 of the American Dialect Society, and in 1893 of the American Philological Association. He edited *Selections in English Prose* (1891); his other works include: *Translation of Beowulf* (1882, 1900); *Elene and Other Anglo-Saxon Poems* (1889-1900); and a *History of the University of Virginia* (1901).

GARNETT, RICHARD (1835—). An English librarian and author, born in Lichfield. He entered the service of the British Museum under Panizzi when he was sixteen years old, became superintendent of the reading room in 1875; and from 1890 to 1899 was keeper of printed books. From 1881 until 1890 Dr. Garnett had charge of

the preparation and printing of the great catalogue of authors of the museum. He has been president of the Library Association of the United Kingdom and of the Bibliographical Society. In his professional field he has edited the series of manuals entitled the "Library Series," to which he contributed *Essays in Librarianship and Bibliography* (1899). He has published several volumes of verse, including *Io in Egypt* (1859); *Iphigenia in Delphi* (1891); *Poems* (1893); and *The Queen and Other Poems* (1901). To the "Great Writers Series" he contributed lives of *Carlyle* (1887), *Emerson* (1888), and *Milton* (1890). Among his other works are: *Relics of Shelley* (1862); *The Twilight of the Gods and Other Tales* (1889); *Age of Dryden* (1895); *William Blake, Painter and Poet* (1895); *A History of Italian Literature* (1898); and *Essays of an Ex-Librarian* (1901). He was editor of the *International Library of Famous Literature*, and contributed many articles to the *Dictionary of National Biography* and the *Encyclopædia Britannica*. In collaboration with Edmund Gosse he published in 1902 *An Illustrated History of English Literature*.

GARNETT, ROBERT SELDEN (1819-61). An American soldier, born in Essex County, Va. He studied at the United States Military Academy; was appointed brevet second lieutenant of the Fourth Artillery in 1841; in 1841-42 was on duty on the northern frontier during the Canadian border troubles; and after serving as instructor in infantry tactics at the Military Academy (1843-44), and in the military occupation of Texas (1845-46), fought through the Mexican War. From 1846 to 1849 he was aide-de-camp to Major-General Taylor, and in 1847 was brevetted major for gallant and meritorious conduct at Buena Vista. In 1852-54 he was commandant at the Military Academy; in 1855 was promoted to be major; and in 1861 resigned from the United States Army, and was appointed a brigadier-general in the Army of the Confederate States. Placed in command of the forces in western Virginia, he was obliged to fall back before the superior numbers of the Federal troops under Major-General McClellan; was pursued and overtaken at Carrick's Ford (q.v.) (on the river Cheat), and was killed in the ensuing combat (July 13, 1861).

GARNIER, gār'nyā', JEAN JACQUES (1729-1805). A French historian, born at Gorron (Mayenne). Having arrived at Paris on foot, he entered the Minorite Order, and finally became adjunct professor of Hebrew in the Collège de France, of which in 1768 he was appointed inspector. In 1761 his memoir, *Traité de l'origine du gouvernement français*, was crowned by the Academy of Inscriptions, to which he was elected as associate. He was successor to Claude Villaret as historiographer of France, and wrote a continuation (1765-85) of the *Histoire de France* of Velly and Villaret. His further publications include an interesting work on *L'homme de lettres* (1764), and a treatise, *De l'éducation civile* (1765).

GARNIER, JEAN LOUIS CHARLES (1825-98). A French architect, born in Paris. He studied under Lévêil and Lebas at the Ecole des Beaux-Arts, and won the Prix de Rome for architecture in 1848. Afterwards he traveled extensively in Greece, Turkey, and Italy. In 1860 he was

architect for a section of Paris. A year later he won the competitive prize for plans for the new Opera House in Paris, which was fourteen years in building. Its style has been called 'bastard Renaissance.' The main feature of the building is the stairway. It contains decorative paintings by Baudry, Pils, and others, and is adorned with sculpture by Carpeaux, Joffroy, Guillaume, and Perraud. Garnier also built the Conservatory at Nice, the Casino at Monte Carlo, designed the tombs of Offenbach, Bizet, and Victor Massé in Paris, and, with Debacq, built the De Luynes Mortuary Chapel at Dampierre. He wrote: *Restauration des tombeaux des rois Angevins en Italie* (with 54 plates in folio); *A travers les arts* (1869); *Etude sur le théâtre* (1871); *Le nouvel Opéra de Paris* (1875-81); *Monographie de l'observatoire de Nice* (1892); and *Histoire de l'habitation humaine* (1894, with Ammann). He was a member of every architectural society of importance in France and abroad, and in 1889 was made commander of the Legion of Honor.

GARNIER, JOSEPH CLÉMENT (1813-81). A French economist. He was born at Beuil (Alpes Maritimes), studied at the Ecole du Commerce, and was appointed professor of mathematics and political economy in that institution. In 1842 he assisted in founding the French Society of Political Economy, and in 1846 the French Free-Trade Association. From 1845 to 1855, and from 1866 until his death, he was editor of the *Journal des Economistes*. He wrote a number of works which did much to popularize economic science in France, and which include an *Introduction à l'étude de l'économie politique* (1843); *Richard Cobden, les ligueurs et la ligue* (1846); and *Etude sur les profits et les salaires* (1848).

GARNIER, JULES ARSÈNE (1847-89). A French painter, born in Paris. He was a pupil at the Academy of Toulouse, and then of Gérôme in Paris. His works are genre and historical, and they are notable for clever composition. The best of them are: "The Right of the Seigneur" (1872); "The Tithe" (1873); "The King is Amused" (1874); "Capital Punishment" (1876); and "The Deliverer of Territory" (1878).

GARNIER, MARIE JOSEPH FRANÇOIS (1839-73), usually called Francis Garnier. A French officer and explorer, born at Saint-Etienne. He served under Admiral Charner in the French war with China, 1860-62, and remained in the new colony of Cochin-China as a civil officer. In 1866 Captain Doudart de Lagrée commanded an exploring expedition from the coast of Cambodia through Yun-nan to Shanghai with a view to increasing the opportunities for trade. Garnier accompanied him, explored the Mekong River, and on the death of the commander, successfully brought the expedition along the Yang-tse-kiang to the coast. A remarkable account of the expedition is given in his *Voyage d'exploration en Indo-Chine, pendant 1866-1868* (1873). After taking part in the defense of Paris in 1870-71, he again went to the East. Further explorations were followed by a commission from the Governor of Cochin-China to negotiate a treaty with the Viceroy of Tongking. The Viceroy, however, refused to negotiate, and Garnier, with 120 men, took Hanoi, the capital, and won further successes; but reinforcements were delayed, the

party fell into an ambushade, and Garnier was killed.

GARNIER, ROBERT (1534-90). A French dramatic poet, born at La Ferté-Bernard. He studied law at Toulouse, and held various positions under the State before he gave himself entirely to the writing of drama. His plays have little real action, and that little is clogged by the long speeches and interminable dialogues of the characters. Nevertheless, there is at times a freshness and vigor about much of his writing that suggests Corneille, and he is considered the greatest French dramatic author of his century. His works include: *Porcie, épouse de Brutus* (1568); *Les Juives* (1583); and *Bradamante* (1582). He also wrote a volume of poems, *Les plaintes amoureuses* (1565). His collected works were published in four volumes at Heilbronn in 1882-83. Consult: Bernage, *Etude sur Robert Garnier* (Paris, 1880); My-sing, *Robert Garnier und die antike Tragödie* (Leipzig, 1891); and Körner, *Der Versbau Robert Garniers* (Berlin, 1894).

GARNIER-PAGÈS, gâr'nyâ' pâ'zhès', ETIENNE JOSEPH LOUIS (1801-41). A French politician, born in Marseilles. He was admitted to the bar, in 1831 became member for Isère in the Chamber of Deputies, and in 1832 was one of the Liberals associated with Odilon Barrot in the preparation of the famous *Compte rendu*, in protest against the attitude of the Conservative Ministry. His Republicanism, however, was never violent, and his reputation was made as a prudent and forceful orator on matters of public business.

GARNIER-PAGÈS, LOUIS ANTOINE (1803-78). A French statesman, born in Marseilles. He was chosen to the Chamber of Deputies in 1841, to succeed his step-brother, Joseph Louis, and took high rank as leader of the opposition and a promoter of reform agitation. In February, 1848, he was made a member of the Provisional Government and Mayor of Paris, and in March, Minister of Finance. Circumstances forced him to extreme measures, of which the most unpopular was the celebrated tax of '45 centimes.' In May he was one of the executive committee of five appointed by the Assembly. In 1864 he was a member of the Corps Législatif, devoting himself as such especially to financial matters, and until the fall of the Empire had a part in the most important acts of the republican opposition. Having been reelected in 1869, he vigorously opposed war with Prussia, but though a member of the Government of National Defense, he played an unimportant rôle, and retired to private life in 1871. He published: *Histoire de la Révolution de 1848* (10 vols., 1861-72); *Histoire de la commission exécutive* (1869-72); and *L'opposition et l'empire* (1872).

GARNISHMENT (from *garnish*, from OF. *garnir*, *guarnir*, *uarnir*, Fr. *garnir*, from OHG. *warnôn*, Ger. *warnen*, AS. *wearnian*, Eng. *warn*). A process by which chattels, rights, or credits belonging to the defendant in an action, but which are in the possession of a third person, are seized and applied to the plaintiff's claim. The peculiarity of the process is indicated by the etymology of the term; garnishment meaning a warning or notice given to the third person not to pay money or turn over property to the

defendant. It has been called an equitable attachment of the claims or assets of a defendant in the hands of a third person. It is not a common-law process, and is regulated by statute in the States where it exists. Such statutes are, as a rule, strictly construed, and their requirements must be fully and fairly complied with by a plaintiff who would take advantage of them. It is held that only such property in the hands of the third party—the garnishee—is liable to this process as is not incumbered with trusts, and such as may be handed over or paid by the officer executing the process, under the order of the court and free from incumbrances, which can be properly determined and adjusted only by equity tribunals. Garnishment proceedings reach only such debts as are owing to the defendant at the time the process is served. A judgment obtained in a Federal court cannot be garnished in an action in a State court. Such garnishment would operate to oust the Federal court of its proper control over its own judgments. Debts owing by a public corporation to the defendant are not garnishable. If they were, municipal authorities might be compelled to occupy their time over contests in which the public had no interest. It may be laid down as a general rule that a person deriving his authority from the law to receive and hold property cannot be garnished for the same while holding it in that capacity.

As soon as the process of garnishment is duly served, the garnishee holds the property as a stakeholder or trustee. Accordingly, garnishment is known in some States as 'trustee process.' Consult Rood, *Garnishment* (1896), and the authorities referred to under ATTACHMENT.

GARO (gá'rò) or **GARROW HILLS**. Mountains overhanging the valley of the Brahmaputra (Map: India, F 3), which give their name to a western district of the Hill Division of Assam (q.v.). 3150 square miles in area, and reach their highest altitude at 4650 feet. The region has deep and extensive valleys, well watered and very fertile. Dense forests containing valuable sal trees, cover the hills, and coal is found in large quantities. Population of district, in 1891, 121,570; in 1901, 138,300. See GAROS.

GAROFALO, gá-rò'fà-lò, **BENVENUTO TISIO DA** (1481-1559). An Italian painter, born at Garofalo, near Ferrara. He studied under Panetta at Ferrara, and under Boccaccino at Cremona, and in 1499 went to Rome, where he became the pupil of Giovanni Baldini. After this he painted with Lorenzo Costa at Mantua. From 1509 to 1515 he was in Ferrara with Dosso Dossi, and then returned to Rome. Here he was an ardent admirer of Raphael. He was then called to Ferrara again, and executed for the Duke Alphonso I. some of his best paintings, such as "The Massacre of the Innocents"; "The Resurrection of Lazarus"; and "Christ on the Mount of Olives," now in the Church of Saint Francis. Until 1550 he painted at Ferrara, but many of the frescoes he did at that time have been destroyed. For the last nine years of his life he was blind. His other works include: "Virgin Enthroned," Ferrara Cathedral; "The Descent from the Cross," the Brera, Milan; "Nativity," in the Capitol, Rome; "The Marriage at Cana," the "Multiplication of the Loaves," in the Palazzo Braschi, Rome; "Virgin and

Child," in the Hermitage, Saint Petersburg; "The Triumph of Bacchus," one of his few mythological subjects, in the Dresden Museum; and "The Nativity," in the Doria Gallery, Rome. His finest works were executed in the manner of the Ferrarese School, to which he afterwards added a certain suavity, gained probably from his admiration of Raphael. His coloring is peculiarly vivid and attractive, and his pictures are most harmoniously composed.

GARONNE, gá'rún' (Lat. *Garumna*). The principal river in the southwest of France, rising within the Spanish frontier in the Val d'Aran, at the base of Mount Maladetta, in the Pyrenees (Map: France, F 7). About 26 miles from its source it enters France in the Department of Haute-Garonne, flows in a generally northeast course to Toulouse, then bends to the northwest, joined by the Dordogne about twenty miles below Bordeaux, widens into the estuary which bears the name of the Gironde, and enters the Atlantic at Pointe de Grave. Ocean steamers ascend to Bordeaux, and the river is navigable beyond Toulouse, which is connected with the Mediterranean by the Canal du Midi (q.v.). Total length, nearly 400 miles. With its 32 tributaries, the Garonne drains an area of about 38,000 square miles, and forms a system of navigable waterways of over 1400 miles, which is greater than that of any other French river. The Garonne is subject to destructive overflows. During the inundation of 1875 more than 7000 houses were destroyed.

GARONNE, HAUTE. See HAUTE-GARONNE.

GAROS, gá'ròz. A people inhabiting the region of the Garo Hills in western Assam, India. They are said to be related, physically and linguistically, to the Thai (Burmese, Siamese, etc.) stock, but have a considerable Aryan admixture, particularly in language. They have many interesting social customs, among them courtship by the woman, bridegroom-capture, etc. Besides the article by Godwin-Austen on "The Garo Hill Tribes," in the *Journal of the Anthropological Institute* (London), for 1871, reference may be made to Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872). A Bengali-Garo Dictionary was published by Ramkhe (1887).

GAR-PIKE. See GAR.

GARRARD, gár-rárd', **JAMES** (1749-1822). One of the early Governors of Kentucky. He was born in Stafford County, Va., served as a militia officer in the Revolutionary War, and was a member of the Virginia Legislature. In 1783 he removed with the early settlers to Kentucky, settling near the present Paris; and subsequently was a member of the convention which framed the first Constitution for Kentucky, and from 1796 until 1804 was Governor of the State. He was an active opponent of slavery.

GARRARD, KENNER (1828-79). An American soldier, born in Cincinnati, Ohio. He graduated at West Point in 1851, was on frontier duty and topographical duty for the most part until 1861, was captured in April, 1861, by Texan troops, and was on parole until exchanged in August, 1862. From September, 1861, to September, 1862, he was on duty at West Point, first as assistant instructor of cavalry, and afterwards (December 5, 1861, to September 25, 1862) as commandant, with the *ex officio* rank of lieu-

tenant-colonel. He became a colonel of volunteers in September, 1862; served in the Rappahannock campaign and the Pennsylvania campaign, participating in the battles of Fredericksburg, Chancellorsville, and Gettysburg; was promoted to be brigadier-general of volunteers in July, 1863, and to be major in the regular (cavalry) service in November; served in the Rapidan campaign from October to December, 1863; and from December, 1863, to January, 1864, was in charge of the Cavalry Bureau at Washington. From February to December, 1864, he commanded the Second Cavalry Division of the Army of the Cumberland, participating in the various operations about Chattanooga and in the invasion of Georgia; and from December, 1864, to July, 1865, commanded the Second Division of the Sixteenth Army Corps, and participated as such in the battle of Nashville, the capture of Blakely, and the movement upon Montgomery. In December, 1864, he was brevetted major-general of volunteers, and on March 13, 1865, he was brevetted brigadier-general in the regular army, and major-general in the regular army. He commanded the District of Mobile from August to September, 1865, was mustered out of the volunteer service in August, 1865, acted as assistant inspector-general of the Department of the Missouri from March to November, 1866, when he resigned from the service, and subsequently was a member of the Platting Commission of Cincinnati from 1871 to 1879, and of the Sewage Commission of the same city from 1875 to 1879.

GARRAUD, gá'ró', GABRIEL JOSEPH (1807-80). A French sculptor, born at Dijon. He was a pupil of Rude. His works include: "Hercule délivrant Prométhée" (1838); "Une jeune vierge avec l'enfant"; "La première famille sur la terre," in the Luxembourg Gardens; the statue of Laplace for the Observatory of Paris; and many busts.

GAR/RAWAY'S COFFEE-HOUSE. A famous London coffee-house, in Exchange Alley, Cornhill, which existed for over two hundred years. It was originally kept by one Garway, a dealer in coffee and tobacco. It is the scene of the first tea sales in London, also of the meetings of the shareholders of the South Sea Scheme, and of innumerable fashionable lotteries, sales, and exchanges.

GARRETT, ALEXANDER CHARLES (1832-). An American clergyman of the Protestant Episcopal Church, born at Ballymote, County Sligo, Ireland. He graduated at Trinity College, Dublin, in 1855; was curate of East Worldham, Hampshire (1856-59); and for the next ten years served as a missionary in British Columbia. In 1870 he became rector of Saint James's Church, San Francisco, and two years later dean of Trinity Cathedral, Omaha. In 1874 he was appointed Missionary Bishop of northern Texas, and retained the bishopric after the formation of the diocese of Dallas. He wrote: *A Charge to the Clergy and Laity of North Texas* (1875); *Historical Continuity* (1875); and the *Baldwin Lectures on the Philosophy of the Incarnation*.

GARRETT, GEORGE MURSELL (1834-97). An English organist and musical composer, born at Winchester. He studied under Elvey at Oxford, and S. S. Wesley at Winchester; from 1854 to

1857 was organist of the Madras (India) Cathedral, and in the latter year was appointed organist of Saint John's College, Cambridge. In 1875 he became organist to the university. His works include *The Shunammite*, a sacred cantata performed in 1882 at the Hereford Festival and by the Cambridge University Musical Society; church music, services, part-songs, and some compositions for the organ.

GARRETT, JOHN WORK (1820-84). An American railroad president, born in Baltimore. After pursuing a course of study in Lafayette College he entered, at the age of nineteen, upon a business life in a firm with his father and brother—Robert Garrett & Sons. He became identified with the Baltimore and Ohio Railroad as a director in 1857, and as president in 1858, and to the development of this system he devoted his energies during the remainder of his life. Under his administration the line became one of the most important means of communication between the seaboard and the interior. During the Civil War the road, which followed during much of its way the Potomac River, was crossed and recrossed by the contending armies, and was frequently broken by the Confederate forces. But the repairs were quickly made, and the road continued to be of the greatest service to the United States Government in the transportation of troops and materials. Mr. Garrett was closely associated with Johns Hopkins (founder of the university and the hospital which bear his name). He was one of the original trustees of the Johns Hopkins Hospital and University, and a liberal contributor to the Young Men's Christian Association, the Maryland Institute, and the Association for the Improvement of the Condition of the Poor. His son Robert succeeded to the presidency of the Baltimore and Ohio Railroad in 1884. Consult Scharf's *History of Baltimore City and County* (Philadelphia, 1881).

GARRETT, THOMAS (1789-1871). An American merchant, distinguished as a philanthropist and reformer. He was born in Upper Darby, Pa., of Quaker parentage; learned the trade of a cutler and scythe-maker, and in 1820 removed to Wilmington, Del., where he became an iron and hardware merchant. Here, also, he avowed his anti-slavery opinions without reserve, and became widely known as the friend of the slaves and of negroes generally. His name was familiar to the slaves of Delaware, Maryland, and Virginia; and during a period of forty years there was a constant procession of fugitives seeking his protection and aid. It is said that not less than 3000 of them were indebted to him for their freedom. He was compelled to resort to many ingenious devices in his work, but he made no secret of the fact that he was engaged in it, and such was his reputation for success that few slaveholders thought it worth while to pursue their runaways any farther after learning that they had fallen into his hands. In 1848 he was prosecuted by James Bayard before Judge Taney (q.v.); was finally convicted on what appears to have been insufficient evidence of having abducted two slave children; and was fined so heavily as to render him penniless. His business would have been utterly broken up at this time if his fellow-citizens of Wilmington had not volunteered to furnish him all the capital he needed. At the time of his death he

was universally beloved by the whites as well as the blacks.

GARRICK, DAVID (1717-79). A celebrated English actor, long manager of Drury Lane Theatre, and the author of numerous comedies. Descended on his father's side from a family of Huguenot refugees named De la Garrique, he was born at Hereford, February 19, 1717, and educated at Lichfield, the home of his mother's family. During his youth he went to live with an uncle, who was a wine merchant in Lisbon, but he soon returned to England and became a pupil of the famous Dr. Johnson. A few months later, in 1736, master and pupil left Lichfield together in the hope of improving their fortunes in London. Garrick attempted the study of law; then for a time he engaged in the wine business; but the dramatic instincts which he had shown even as a schoolboy proved too strong, and after some amateur acting and falling in love with the famous Peg Woffington, he made, under an assumed name, his début on the stage at Ipswich (1741) in a play called *Oroonoko*. He succeeded so well that on October 19th of the same year he appeared in London in the character of Richard III. After being engaged for the following season at Drury Lane, Garrick went in the summer of 1742 to Dublin, where he excited the Hibernian enthusiasm to an extraordinary degree. His success in London, however, was not without unpleasant incident, for a quarrel arose between him and his friend Macklin, which was taken up by their partisans, and on one occasion Garrick's performance had to be given up. In 1747 he became one of the patentees of Drury Lane. Two years later he married Mlle. Violetti, an excellent *danseuse* from Vienna. This seems to have alienated some of his company, especially of the feminine members, who went over to the opposition house, and in 1750 occurred the famous rivalry, when Drury Lane and Covent Garden were each playing *Romeo and Juliet*, Garrick and Mrs. Bellamy at the former and Spranger Barry (q.v.) and Mrs. Cibber at the latter, till after a dozen nights the town was tired and Covent Garden gave up the field. In 1763 Garrick visited the Continent, and made the acquaintance of Diderot and other noted people. He conducted in 1769 the memorable jubilee at Stratford-on-Avon in honor of Shakespeare. To Garrick seems to belong much of the credit of bringing back to the stage Shakespeare's plays in their original form, in place of the altered versions which had commonly been in use since the Restoration. During his management also at Drury Lane he made an end of the old custom of admitting spectators upon the stage, and introduced other improvements. His own last appearance was on June 10, 1776, in *The Wonder*, when at the close of the play he made an affecting speech of farewell. His health was failing, and he died less than three years later, in London, January 20, 1779. He was buried beneath the Shakespeare monument in Westminster Abbey.

Garrick is regarded as the greatest of English actors. He exhibited a Shakespearean universality in the representation of character, and was equally at home in the highest flights of tragedy and the lowest depths of farce. But the naturalness which so distinguished him upon the stage

often forsook him in real life. He was extremely sensitive to ridicule, and had a curious fashion of forestalling the malice of the critics by bringing out, on occasion, pamphlets of bantering attack upon himself. In his financial affairs he was considered close, though his generousities were many. He left a fortune of about £100,000. He was on terms of intimate friendship with Johnson, Goldsmith, Burke, and other men of letters, and was a member with them of the famous "Literary Club." As an author he does not rank very high, though some of his farces, like *The Lying Valet* and *Bon Ton, or High Life Above Stairs*, have been repeatedly published, and his prologues were often extremely ingenious. A collected (partial) edition of his dramatic works was brought out in London in 1768 and again in 1798. Many of his letters are preserved in the Forster Collection at the South Kensington Museum. On his life consult: Knight (London, 1894); Fitzgerald (ib., 1868); Murphy (Dublin, 1801); Davies (London, 1780); "Mémoires de Garrick," in *Bibliothèque de mémoires relatifs à l'histoire de France pendant le XVIII. siècle*, vol. vi. Paris, 1878; and Boaden (ed.), *The Private Correspondence of David Garrick*, with a biographical memoir (London, 1832).

GARRICK CLUB. A famous club in London, named in honor of the great actor David Garrick. It was founded in 1831 for the promotion of letters, and especially of the drama, and in 1864 took up its present headquarters in Garrick Street. It possesses an important and valuable collection of portraits of celebrated English actors, which are shown to members' visitors on every Wednesday. Here occurred the controversy between Thackeray and Edmund Yates, which brought about the estrangement between the former and Dickens.

GARRISON, WENDELL PHILLIPS (1840-). An American editor and author, born at Cambridgeport, Mass. He graduated at Harvard in 1861, and was appointed literary editor of the *Nation*, of New York, in 1865. In addition to contributions to periodicals, he has published: *What Mr. Darwin Saw on His Voyage Around the World* (1879); with F. J. Garrison, a life of *William Lloyd Garrison* (4 vols., 1885-89); *Parables for School and Home* (1897); *The New Gulliver* (1898); and other works.

GARRISON, WILLIAM LLOYD (1805-79). The leader of the radical Abolitionists in the anti-slavery struggle in the United States. He was born at Newburyport, Mass., December 10, 1805. As an apprentice in the Newburyport *Herald* office (1818-25) he became an expert printer, and, while yet a boy, foreman, and contributor to that and other newspapers; and in 1826 was editor of the Newburyport *Free Press*. Soon afterwards, as a journeyman in Boston, he met and was deeply influenced by Benjamin Lundy (q.v.), a pioneer Abolitionist. After a year spent in editing the *National Philanthropist*, a Boston temperance paper, and the *Journal of the Times*, at Bennington, Vt., he joined Lundy at Baltimore, in September, 1829, in conducting the *Genius of Universal Emancipation*. The views of the two associates differed widely, for Lundy favored gradual abolition and colonization, which Garrison opposed. This phase of activity was short-lived, for editorials urging immediate emancipation presently repelled subscribers. The pub-

lic mind, however, long indifferent to the evils of slavery, began to be aroused, though the agitation found foes more readily than friends. In April, 1830, Garrison was convicted of libel. After seven weeks in jail his fine was paid by Arthur Tappan, of New York, and the reformer turned to lecturing in Northern cities with a vehemence and fire not previously brought to this task. From this time dates the birth of a public sentiment which was to make slow headway against difficulties and opposition, and finally to triumph through a civil war.

In January, 1831, appeared in Boston the *Liberator*, a small sheet, soon to be enlarged and conducted weekly by Garrison till the end of 1865. The first number gave its keynote: "I will be as harsh as truth, and as uncompromising as justice. On this subject I do not wish to think, or speak, or write with moderation." Such a tone compelled attention, and the editor was widely denounced as a 'wild enthusiast,' as a 'fanatic,' and as a 'public enemy.' Apathy gave place to excitement, in the North as well as in the South. Hundreds of letters threatened Garrison's life; in December, 1831, Georgia offered \$5000 for his arrest and prosecution, and on October 21, 1835, a mob, led or incited by reputable Bostonians, broke up one of his meetings, and dragged him through the streets until he was rescued with difficulty by the police, who placed him in jail to insure his safety. In January, 1832, Garrison, with eleven associates, founded the New England Anti-Slavery Society, the parent of similar organizations. In this year he published *Thoughts on African Colonization*, denouncing that futile scheme of the moderate opponents of slavery. In 1833 he went to England to confer with the British emancipators, and on his return supplied a platform for the American Anti-Slavery Society, founded in December of that year in Philadelphia. Of this he was president from 1843 to 1865. He was again in England in 1840 and 1846. Meanwhile the American Abolitionists divided. The moderate wing, which favored political action and objected to participation of women in their meetings, parted from their former comrades in 1840, and contributed to form the Liberty and Free-Soil parties. The extremists, who obtained or soon gained control of the societies, were more logical in disregarding the distinction of sex no less than that of color, and more 'thorough' in disowning a Government which acknowledged and protected 'the sin' of human bondage. In 1840 Garrison denounced the United States Constitution, to the horror of most, as "a covenant with death and an agreement with hell." He hailed the secession of South Carolina and the guns fired on Fort Sumter as the end of 'the pro-slavery Union.' Many wrought with him in urging the President to recognize the situation as it was. With the Proclamation of Emancipation their triumph came, and with the end of the war their leader's occupation was gone. With other eminent guests of the Government he saw the flag replaced over Sumter. No longer a lonely protagonist, his age was provided for in 1868 by a 'national testimonial,' through admirers of his altruistic labors, and his last years were spent in less arduous journalistic and reforming services, with honor at home and abroad. He died in New York, May 24, 1879. Of his *Sonnets and Other Poems* (1843), some had

been penciled on the walls of his Baltimore cell in 1830. Selections from his writings and speeches appeared in 1852. Consult: The exhaustive biography by his sons, W. P. and F. J. Garrison, *William Lloyd Garrison, 1805-79: the Story of His Life Told by His Children* (4 vols., New York, 1885-89), and an essay by Goldwin Smith, *The Moral Crusader, William Lloyd Garrison* (New York, 1892).

GARRISON COURTS MARTIAL. See COURTS, MILITARY.

GARBOD, gār'rod, Sir ALFRED BARING (1819—). An English physician, born at Ipswich. He studied at University College and the University of London; was appointed assistant physician at University College Hospital in 1847, and in 1851 physician, and professor of therapeutics and clinical medicine. In 1863 he was appointed physician, in 1874 consulting physician to King's College Hospital, and in the former year also became a professor in the college. He was elected in 1856 a fellow of the Royal College of Physicians, and its vice-president in 1888. In 1858 he became a fellow of the Royal Society of Great Britain, and in 1896 physician extraordinary to Queen Victoria. His researches have been connected principally with the pathology of gout and rheumatic gout, or rheumatoid arthritis, on whose nature and treatment he published in 1860 a valuable work. He introduced lithia as a remedy for gout. He wrote also *The Essentials of Materia Medica and Therapeutics* (1885; many subsequent editions), which became authoritative on the subject, and has been much used for text-book purposes.

GARBOD, ALFRED HENRY (1846-79). An English zoölogist. He was born in London, studied there at University and King's Colleges, in 1871 was elected prospector to the Zoölogical Society of London, and in 1873 a fellow of Saint John's, Cambridge. From 1874 until his death he was professor of comparative anatomy at King's College, London, in 1875 was appointed professor of physiology at the Royal Institution of Great Britain, and in 1876 was elected a fellow of the Royal Society. His zoölogical studies were of high value, in particular those connected with the anatomy of birds, in which department he was a recognized authority. His publications include an edition (1879) of a monograph by Johannes von Müller (q.v.), the physiologist of Berlin, on the vocal organs of passerine birds, and numerous papers collected and edited by W. H. Forbes (1881).

GARBOT. The golden-eye duck (see GOLDEN-EYE); a French name used in English books. Consult Newton, *Dictionary of Birds* (London, 1893).

GARROTE, gār-röt' (Sp., stick). A mode of execution practiced in Spain. Originally it consisted in simply placing a cord round the neck of a criminal, who was seated on a chair fixed to a post, and then twisting the cord by means of a stick inserted between the rope and the back of the neck till strangulation was produced. Later a brass collar was used, worked by a screw. To such condemned persons as recanted the Inquisitors granted as a favor this mode of strangulation before they were burned. If the executioner was unskillful, however, the pain was sometimes very great. Garroting is also the

name given to a species of robbery in which the highwaymen suddenly come behind their victim, and throwing a cord, or handkerchief, or something of the sort round his neck, produce temporary strangulation till their purpose is effected.

GAR'ROW HILLS. See GARO HILLS.

GARRUCCI, găr-rŭo'chê, RAFFAELE (1812-85). A Roman Catholic archæologist. He was born January 23, 1812, became a Jesuit 1826, and after de Rossi was the greatest explorer of the catacombs of Rome. He died at Rome May 5, 1885. Of his numerous writings the masterpiece is *Storia dell' arte cristiana nei primi otto secoli della chiesa* (1872-81).

GARRU'PA. A fish. See GROUPER.

GARSHIN, găr'shên, VSEVOLOD MIKHAILOVITCH (1855-88). A Russian author, born in the Government of Yekaterinoslav. On graduating from a Saint Petersburg gymnasium in 1874 he entered the School for Mining Engineers, but left it to enroll as a volunteer in the army sent to Turkey in 1877. He based his powerful story *Four Days* on an incident that occurred after the first skirmish. The story itself, and the Turgenieff-like mastery of detail and story-telling, all combined to produce a sensation. A series of stories of about twenty-five to fifty pages followed, each increasing his popularity and fame; but in 1880 the mental malady which had already attacked him broke out anew, and nearly two years was spent in sanitariums and out-of-the-way villages to recuperate. In 1883 Garshin again resumed his literary work, was appointed secretary to the Railroad Congress, and married a physician. His frail constitution needed all the care she bestowed on him, and his health improved, but in 1888, in a fit of insanity, he killed himself. In all his sketches there is a noticeable lack of the epic element; the outward description of his personages is utterly neglected in the exposition of the labyrinth of conflicting emotions and feelings. But as psychological studies, his sketches, mostly dealing with moral and social questions in the manner of Tolstoy, are the nearest approach to the latter's mastery. His works, in three volumes, were in the ninth edition in 1890. Most of them have been translated into German, French, and English.

GAR'STON. A town and port of Lancashire, England, on the Mersey estuary, five and a half miles southeast of Liverpool (Map: England, D 3). It has a large coal-shipping trade, its two docks belonging to the port of Liverpool. The town maintains parks, recreation grounds, isolation hospital, and has planned a series of modern improvements in electric lighting, public offices, technical schools, and free library. Population, in 1891, 13,400; in 1901, 17,300.

GARTER, ORDER OF THE. The highest Order of chivalry in Great Britain. The Order of the Garter was instituted by King Edward III., and though not the most ancient is one of the most famous of the chivalrous orders of Europe. The original number of the Knights of the Garter was twenty-five, the Sovereign himself making the twenty-sixth. The story goes that the Countess of Salisbury let fall her garter while dancing with the King, and that the King stooped quickly to pick it up. This occasioned some indelicate jokes which caused the Countess to withdraw. The King exclaimed angrily, *Honi soit qui mal*

y pense, "Shame to him who evil thinks," and added that he would make this blue ribbon so glorious that all the courtiers would desire it. This story has absolutely no foundation in fact. Edward had formed the plan for the Order in 1344 and instituted it on April 23, 1349. It was founded in honor of the Holy Trinity, the Virgin Mary, Saint Edward the Confessor, and Saint George; but the last, who had become the tutelary saint of England, was considered its special patron, and for this reason it has borne the title of 'The Order of Saint George' as well as of 'The Garter.' A list of the original knights or knights founders is given by Sir Harris Nicolas. The Order was reorganized in 1831, when the number of knight companions was left at twenty-five, but the membership extended to include the Prince of Wales, and such descendants of George I. and foreign sovereigns as might be chosen. The emblem of the Order is a dark blue ribbon edged with gold, bearing the motto, *Honi soit qui mal y pense*, in gold letters. It is worn on the left leg below the knee. The Grand Master is always the monarch of England. The number in the Order is at present about fifty. The officers are the prelate (the Bishop of Winchester), the chancellor (the Bishop of Oxford), the registrar (the Dean of Windsor), the Garter King-of-Arms (q.v.), and the Gentleman Usher of the Black Rod. Consult Nicolas, *History of British Orders of Knighthood* (London, 1841-42). See ORDERS.

GARTER KING-OF-ARMS. An officer of the Order of the Garter and the chief heraldic authority in England. The office was instituted by Henry V., with the advice and consent of the knight companions. The duties of the Garter are to attend upon the knights at their solemnities; to inform those chosen to the Order of their election, and to summon them to the installation; to marshal funeral processions; to assign lords to their places in Parliament; and to be the executive officer of the King for the Order. The Garter is also the principal king-of-arms, taking precedence over the other three kings-of-arms in England. He is a member of the 'Heralds' College,' or 'College of Arms,' of which the Earl Marshal is the head. The Garter grants and confirms arms under the authority of the Earl Marshal, but as Garter King-of-Arms he is independent of him. See HERALDS' COLLEGE.

GARTER-SNAKE (so-called from its color-stripes). An elastic name given in North America to any of various small snakes, but properly applied to striped species of the genus *Eutania*, which includes those most often seen of all our serpents. The genus is widespread, and contains, according to Cope, twenty-four species north of the Isthmus of Panama. Several of these are very slender, mainly green with lighter stripes, and are popularly distinguished as ribbon-snakes (q.v.). One Oregon species is black, and some semi-tropical species have the stripes broken so as to form series of spots or cross-bars. The best-known species is the ordinary garter-snake (*Eutania sirtalis*), which is distributed over the whole United States, Southern Canada, and the lowlands of Mexico and Guatemala. Throughout this large area it presents a wide series of variations which have been distinguished by Cope, *Annual Report of the United States Na-*

tional Museum (Washington, 1898), as eleven sub-species, but his distinctions are difficult to follow.

The length of the garter-snake when fairly grown is about three feet, of which from one-fourth to one-fifth belongs to the tail. As a species it is the most widely distributed and most numerous in individuals of any of our serpents, except in the Western arid regions. This is due to its extreme fecundity, to its agility and ingenuity in pursuit of food or in escape from danger, and to its willingness to fight off assailants. It is to be found in all sorts of situations, but is partial to grassy meadows and to the borders of streams, where the frogs, toads, fish, mice, and shrews upon which it mainly feeds are numerous; and it takes to water willingly and swims well. Some other species of the genus are almost habitually water-snakes. All garter-snakes are able to climb well, wriggling easily up a rough tree-trunk, a wall of brick, or of rough boards, and they search the bushes for eggs and young birds in the spring, but rarely climb high. They are bold in coming about gardens and village streets, but enter cellars, dairies, and chicken-houses less often than do some larger serpents, such as the milk-snake. All garter-snakes retain the eggs in the oviduct of the mother until they hatch and the embryos have reached a length of $5\frac{1}{2}$ to 7 inches, when they are extruded, from 25 to 75 being produced (late in summer) by a single female; but when so many are born some will be small or even confined within the egg-covering when pressed from the vent. These young are able at once to take care of themselves, and will struggle vigorously for earth-worms, etc. They remain together, and are watched and protected by the mother, who will brave formidable perils in her anxiety for their welfare. It has been asserted repeatedly by credible witnesses that she receives them into her mouth and throat for temporary refuge from danger, whence they emerge as soon as possible. The courage and pugnacity of this snake are familiar facts; it is the only one of our common snakes that will ever come toward a man with threatening demeanor when attacked. Its bite is quite harmless so far as poison is concerned, but its strength and weasel-like courage make it a successful antagonist of many animals whose size would seem to give them immunity. It is itself, however, the favorite prey of the blacksnake, copperhead, and of many reptile-hunting birds and mammals. On the approach of cold weather these snakes seek some opening in the ground, creep as far in as practicable, and become dormant, emerging, however, rather earlier in the spring than most other serpents. In the West the burrows of ground-squirrels, badgers, etc., are favorite hibernacula; and in these retreats great numbers of the snakes often gather and entangle themselves into a ball of sleeping serpents—a practice induced, probably, by sexual impulses, as well as by a desire for mutual comfort.

In addition to the common and variable garter-snake (*Eutania sirtalis*) there occurs numerously in the Eastern United States the ribbon-snake (q.v.). Florida has a local species (*Eutania Sackeni*); and the Mississippi Valley and plains region possess a local species (*Eutania redix*), which is peculiar in its fondness for water and a fish diet. In the central region and

on the Pacific Coast is found another species (*Eutania elegans*), which exhibits many variations of color, and has habits similar to the Eastern form. Finally, many species belong to Mexico and Central America. See SNAKE.

GARTH, CALEB. A character in George Eliot's novel *Middlemarch*, a man of great physical strength and distinguished for his integrity and shrewdness, probably drawn from Robert Evans, the author's father.

GARTH, Sir SAMUEL (1661-1719). An English physician and poet. He was born at Bowland Forest, Yorkshire, in 1661, was educated at Peterhouse, Cambridge, and studied medicine at Leyden. Obtaining the degree of M.D. from Cambridge in 1691, he settled in London, where he was elected a fellow of the College of Physicians (1693), and was soon recognized as a wit and conversationalist. He was knighted in 1714, and appointed physician-in-ordinary to George I. and physician-general to the army. He died January 18, 1719. Garth gained deserved fame in his own time for a satirical poem entitled "The Dispensary" (1699), in which he ridiculed those physicians who opposed his plan for establishing a free dispensary for poor people. He also published "Claremont" (1715), a descriptive poem in imitation of Denham's "Cooper's Hill," and two years later contributed to a translation of Ovid's *Metamorphoses*. He was much admired by Pope and others. His verse is smooth but monotonous. Consult the sketch of Garth in Johnson's *Lives of the Poets* (London, 1854), and Chalmers, *Works of the English Poets*, vol. ix. (London, 1810).

GÄRTNER, gërt'nër, FRIEDRICH (1824--). A German architectural painter, born in Munich, the son of the architect Friedrich von Gärtner, with whom he went to Athens in 1840. After his return he studied at the Academy and under Simonsen, of Copenhagen, then in Paris (1846) under Claude Jacquand; visited Spain and Morocco in 1848, lived again in Paris, in 1851-57, and settled in Munich, where two of his paintings, "Interior of a Moorish House" and "Court of a Monastery by Moonlight" (1846), are in the New Pinakothek.

GÄRTNER, gërt'nër, FRIEDRICH VON (1792-1847). A distinguished German architect, born at Coblenz. His father, also an architect, removed in 1804 to Munich, where young Gärtner received his first education in architecture. To complete that education, he went in 1812 to Paris, where he studied under Percier, and in 1814 to Italy, where he spent four years in the earnest study of antiquities. The fruits of this labor appeared in 1819 in some views accompanied by descriptions of the principal monuments of Sicily (*Ansichten der am meisten erhaltenen Monumente Siciliens*). After a visit to England he was called, in 1820, to the chair of architecture in the Academy of Munich. With this appointment began his work as a practical architect. Many of the architectural masterpieces of Munich, and various other buildings throughout Germany, as well as the new royal palace at Athens (1836), are built after his plans. Among his Munich buildings are the Ludwigskirche, the Feldherrn-Halle, the Library, University, and the Wittelsbacher Palace (1831-44). In the style of his works, which have all a common impress, Gärtner represents the Renaissance

of mediæval architecture in its Romanesque form. It was thus peculiarly appropriate that he should have charge of the restoration of the mediæval cathedrals of Speier, Regensburg, and Bamberg. Gärtner became head Government surveyor of buildings and director of the Academy of Arts in Munich.

GÄRTNER, HEINRICH (1828—). A German landscape painter, born at Neustrelitz. He was a pupil of F. W. Schirmer in Berlin, and of Ludwig Richter in Dresden, whence he went to Rome to study the old masters, and there was also much influenced by Cornelius. He became favorably known after his return to Germany, through several decorative cycles, executed in private houses and villas, and was commissioned to paint some of the mural decorations in the new Court Theatre at Dresden, and after that the encaustic paintings in the Hall of Sculptures in the Leipzig Museum (1879). Three great landscape compositions by him (1883-85) adorn the staircase of the Agricultural Museum in Berlin. Of his oil paintings there is a "Landscape with the Return of the Prodigal Son" in the Leipzig Museum, and one with "Adam, Eve, Cain, and Abel" in the Dresden Gallery.

GÄRTNER, JOSEPH (1732-91). A German botanist. He was born at Kalw (Württemberg), studied at Tübingen and Göttingen, and after extensive travel was, in 1761, appointed professor of anatomy at the former university. From 1768 to 1770 he was professor of natural history and director of the botanical garden and the natural history collection at the University of Saint Petersburg. His most important work is *De Fructibus et Seminibus Plantarum* (1788-91), which, by its minutely accurate descriptions, comprising a thousand and more species, introduced a new era in plant morphology. The scientific value of the book was much increased by the addition of 180 copper-plate engravings.

GARTSHER/IE. A former village in Lanarkshire, Scotland, on the Caledonian Railway, two and one-half miles west-northwest of Airdrie (Map: Scotland, D 4). In 1871 it had 2000 inhabitants. The establishment of extensive iron-works, noted for the quality of their product, developed a prosperous town, which was incorporated with Coatbridge (q.v.) in 1885.

GARVE, gār've, CHRISTIAN (1742-98). A German philosopher. He was born at Breslau, studied at the universities of Frankfurt-on-the-Oder and Halle, in 1769 succeeded Gellert as professor of philosophy at Leipzig, but in 1772 was obliged by ill health to retire. His writings did much toward the popularization of philosophy in Germany. His work was highly valued by Kant, and by Frederick II., who bestowed upon him a pension of 200 thalers and requested him to prepare a translation (1783; 6th ed. 1819) of Cicero's *De Officiis*. Garve eulogized the King in the *Fragmente zur Schilderung des Geistes, Charakters und der Regierung Friedrichs II.* (1798). Among his further publications are a collection of essays, *Ueber verschiedene Gegenstände aus der Moral, der Litteratur und dem gesellschaftlichen Leben* (1792-1802), and translations (1798-1801, 1799-1802) of the *Ἠθικά* and *Πολιτικά* of Aristotle.

GAS. See GASES, GENERAL PROPERTIES OF.

GAS (popularly supposed to have been invented by the Belgian chemist Helmont, influenced by Dutch *gest*, spirit, but according to his own statement derived by him from Gk. *χᾶος*, *chaos*, chaos, the Dutch *g* being pronounced much like the Gk. *χ. ch*), ILLUMINATING. A term applied to any mixture of combustible gases that may be used as an illuminant. The raw materials which have been employed for making such gas include a variety of substances rich in carbon and hydrogen, such as bituminous coal, wood, resin, oils and fats, and petroleum. When subjected to destructive distillation these substances yield water, tar, gas, and a residue of coke or charcoal. The principal sources of illuminating gas are, however, bituminous coal and petroleum. Cannel coal is used to a certain extent as an enricher or means of increasing the illuminating value, but has been largely superseded for this purpose by petroleum. As commercially supplied, illuminating gas is of two kinds, coal-gas and carbureted water-gas.

COAL-GAS.

Coal-gas is the gas produced by the destructive distillation of bituminous coal.

HISTORY. The existence of inflammable gases issuing from the earth has been known from very early times. In 1659 Thomas Shirley communicated to the Royal Society a paper describing experiments on a gas issuing from a well near Wigan in Lancashire, and resulting in his opinion from the decomposition of coal. Dr. John Clayton, in a paper presented to the same society, in 1739, described the production of a similar gas from coal heated in a closed vessel. It was not, however, until 1792 that the practical value of coal-gas as an illuminant was demonstrated by William Murdock, a Scotchman, who constructed apparatus by which he lighted his home and office in Redruth, Cornwall. In 1798 he moved to Soho, and introduced the illuminant in the Soho foundry. The experiment proved highly successful, and the plant was soon enlarged so as to give light to the principal shops in the vicinity. In 1805 Murdock introduced gas in the cotton-mills in Manchester. Meanwhile, Lebon had used coal-gas in his home in Paris in 1799, and his experiments attracted the attention of Winsor, the 'father of modern gas lighting,' who, on his return to England soon after, urged the use of coal-gas for general illumination. In consequence of his agitation, various buildings in London were lighted by this means, but it was not until 1810 that he secured the incorporation of the Gas Light and Coke Company, and even then the Royal charter was not granted until 1812. Westminster Bridge in London was first lighted by gas in 1813, and in 1815 Guildhall was similarly illuminated. As a street illuminant, gas was first introduced in Saint Margaret's parish in London. Paris was lighted in 1820, and thereafter the use of gas for street illumination was gradually extended throughout the Continent. In the United States the use of illuminating gas was agitated as early as 1812; it was successfully introduced in Baltimore in 1821, in Boston in 1822, in New York gradually between 1823 and 1827.

THE COAL. A good gas-coal should contain only a small percentage of ash and sulphur, and should yield, upon distillation, a comparatively large percentage of volatile matter of good illu-

minating value, and a good coke amounting to from 55 per cent. to 65 per cent. of the original weight of the coal. A gas-coal showing the following analysis by weight may be considered as the standard for the United States: Volatile matter, 33 per cent. to 35 per cent.; fixed carbon, 55 per cent. to 60 per cent.; ash, 4 per cent.

FIG. 1. COAL-GAS RETORT, WITH DIRECT-FIRE FURNACE.

to 6 per cent.; sulphur, 0.4 per cent. to 0.6 per cent. A pound of such coal will yield, upon distillation, about five cubic feet of gas, possessing an illuminating value of from 15 to 17 candle power when burned in an Argand burner.

Under proper conditions, a falling off in any direction may compensate for a proportionate betterment in another. Thus an extra amount of sulphur may be offset by an increased yield of gas, or a harder, better coke. Comparative cheapness of price may also turn the scale in favor of an otherwise inferior local coal. Good gas-coals of practically the above composition are found in Pennsylvania, in the Pittsburg fields; in West Virginia, in the West Virginia and Kanawha fields; and also in Tennessee, Indian Territory, and Colorado; while others not so good are found in Alabama, Kansas, and Washington. In Europe the coal-fields of England furnish the best gas-coals, these English coals being of very nearly the composition given above, except that they contain less ash, but more sulphur.

APPARATUS. The distillation of the coal is carried on in closed retorts, heated by suitable furnaces. Originally made of cast-iron and circular in cross-section, these retorts are now made of fire-clay and are oval or D-shaped. They

are of varying dimensions, a very common size for the United States being 16 in. \times 26 in. \times 9 ft. inside, and are set in groups of from three to nine, there being usually six in a group. The

FIG. 2. CROSS-SECTION OF HYDRAULIC MAIN.

furnaces by which these groups are heated are of two kinds—direct fire and generator. In the former the carbon of the fuel is burned directly to carbonic acid, while in the latter the combustion of the carbon is performed in two stages, the first taking place in the furnace proper and forming carbonic oxide, which is burned in the second stage to carbonic acid, this secondary combustion taking place between the retorts. The use of generator furnaces results in greater economy of fuel and the attaining of a higher temperature in the retorts than is possible with

FIG. 3. SECTION AND ELEVATION OF ROTARY GAS SCRUBBER.

direct-fire furnaces, both of which advantages are secured to a still greater degree by the use of recuperators, in which the heat of the outgoing products of combustion is transferred to the incoming air. The retorts are either set horizontally, or, as has been done to a great

extent in Europe during the last few years, at an angle of from 29° to 32° to the horizontal. The object of this inclination is to permit the charging of the coal into, and the discharging of the coke from, the retorts to be performed by gravity instead of by manual labor or by machinery, as is necessary when they are set horizontally. The comparative merits and economy of inclined retorts and horizontal retorts charged and drawn by machinery is a matter that is being actively discussed by gas engineers in all countries. In large gas-works coal and coke handling machinery is employed, sometimes to such an extent that the coal is unloaded from the cars or vessels in which it is brought to the gas-works, transported to the retort-house, and charged into the retorts, and the coke drawn, carried to the yard, and stacked or loaded for sale without being touched by hand. Retorts of the size mentioned will take charges of from 250 to 350 pounds of coal, according to the degree to which they are heated.

To the open end of each of the retorts is bolted a cast-iron mouthpiece, of the same cross-section as the retort, and from 14 to 16 inches long. On the outer end of the mouthpiece is hinged, so that it can be readily opened and closed, a cast-iron or steel lid, which, when closed, makes a gas-tight joint with the face of the mouthpiece. On the side of the mouthpiece a bell is provided, into which is inserted the lower end of the standpipe, or pipe through which the gas passes away from the retort. On the top of the standpipe is a bridge or arch pipe, from which hangs a dip-pipe, which is bolted to the hydraulic main (a large pipe generally U-shaped, and made of steel), and passing down into this main dips below the surface of the ammoniacal liquor, with which the hydraulic main is partly filled, and by being thus sealed prevents the return of any gas to the retort when it is open for drawing and charging.

From the hydraulic main the gas passes to the exhauster, a rotary pump driven by a steam-engine, employed to relieve the retorts of the pressure thrown by the weight of the gas-holders and the friction encountered by the gas as it passes through the apparatus. It then goes into a tar-extractor, in which the gas is subjected to friction and impact for the removal of such of the heavy tar as has not been condensed out in the hydraulic main. After the removal of the tar, which should be effected at a temperature not lower than 100° F., the gas is cooled in the condensers to a temperature of about 50° to 60° F. These condensers may be either atmospheric condensers or water-condensers. The atmospheric condensers employ air, and have concentric steel shells forming an annular gas space exposed to air on both the inner and outer circumferences. They are used to perform the first part of the cooling, which is completed by the water-condensers, these being somewhat similar in construction to a tubular boiler, the water passing through the tubes in one direction, while the gas passes outside of them in the opposite direction.

Having been cooled, the gas passes to the washers and scrubbers for the removal of the ammonia gas which it still contains. In the washer the gas is caused to bubble through water, while in the scrubber it is caused to

pass in thin streams over wetted surfaces, the object in each case being to expose the gas to intimate contact with water. Scrubbers are of two general types—tower scrubbers, vertical steel cylinders filled with bundles of thin boards which are wet by water caused to flow over them by the force of gravity, and rotary scrubbers, fitted with bundles of wooden rods mounted on a horizontal shaft and kept wet by being rotated through the water or ammoniacal liquor, with which the lower part of the scrubber is kept filled.

From the scrubber the gas passes to the purifiers. These are usually four in number, and the gas passes through three of them consecutively, while the fourth is cut out for cleaning and refilling. They are cast-iron boxes with open tops, which are closed by means of removable covers made of light steel plates. When in place over the boxes the sides of these covers are sealed in water contained in 'cups' cast on the sides of the boxes, and the escape of gas is thus prevented. The purifiers are filled with one or more layers of slaked lime or oxide of iron, the latter being the most commonly used in the United States.

From the purifiers the gas passes to the station meter, where it is measured by means of a drum divided into either three or four compartments. The meter is partly filled with water and the inlets and outlets to the different compartments are so arranged in connection with this water that gas cannot simultaneously enter and leave a compartment. The pressure of the gas causes the drum, which is mounted on a shaft, to revolve so that each compartment is alternately filled and emptied; and since each is filled with a definite volume of gas, the volume of gas passing through the meter is accurately measured, and is recorded by suitable mechanism.

After passing through the station meter the gas is conveyed to the gas-holder, a cylindrical vessel open at the bottom, but closed on top, made of steel sheets. The lower edge of the gas-holder is always kept sealed in water contained in a masonry or steel tank, in which the holder is free to rise and fall, being so guided in the tank and along columns rising above the tank as to move freely up and down while being prevented from tilting. The guiding is performed by rollers or wheels attached at equal distances around the top and bottom of the cylinder, and in the case of telescopic holders at the top and bottom of each of the sections, working against rails or channel irons fastened to the inside of the tank wall and of the columns. All large gas-holders are telescopic, that is, are made with one or more outer sections, which are merely rings, in addition to the inner section closed on top. At the bottom of each of the sections, except the outermost, is a 'cup,' an annular trough having its inner side formed by the bottom course of the section, its bottom by a channel iron, and its outer side by a course of sheets riveted to the outer edge of the channel iron. At the top of each of the outer sections is fastened a 'grip,' which is a cup turned upside down. Gas is admitted to and drawn from the holder by pipes passing down on the outside of the tank under and through its foundation, and up on the inside to a point above the water-

level. When gas is admitted it enters the space between the closed top, or crown, and the water in the tank. As it continues to enter, the pressure increases until it is sufficient to overcome the weight of the holder, which then begins to rise and continues to do so as long as gas is entering faster than it is passing out. When the inner section is completely filled with gas the cup filled with water engages the grip of the next section, and as gas continues to flow into the holder, raises this section, the water in the cup forming a seal which prevents the escape of any gas. When the holder descends the outer section lands on the bottom of the tank, and the inner section continuing to go down, the cup and grip separate. The columns, by which the holder is guided and prevented from tilting as it rises above the tank, are built up of structural steel and are connected together at the top and intermediate points by girders, and also by diagonal ties, so that the whole of the guide framing is bound together into what is practically a rigid cylinder. Originally built in very small sizes, and with only a single lift, gas-holders have been made larger and with more lifts, until the largest holder yet built, one at the East Greenwich Works in London, consists of six lifts, and contains, when full, 12,000,000 cubic feet of gas. The largest holders built in the United States have five lifts and a capacity of 5,000,000 cubic feet. In the case of one of these holders, the upper lift, and in the case of the 12,000,000 cubic feet holder, mentioned above, the two upper lifts are allowed to

the ends of each rope being attached to the holder at two points diametrically opposite each other, one at the top and the other at the bottom of the same section, passing over pulleys in such a way that as the holder rises and falls the rope is taken up at one end and paid out at the other at an equal rate, so that the two points to which it is attached are forced to travel along vertical lines.

PROCESS OF MANUFACTURE. When the coal is placed in the retort the volatile matter is driven off by the exposure to heat, rapidly at first and then more and more slowly. The reactions taking place in the retorts are complex and not perfectly understood; but in general they consist of the decomposition of the coal into coke and heavy hydrocarbons, and the breaking down of the latter into lighter hydrocarbons, with the setting free of hydrogen and marsh gas; and when the breaking down is carried too far, of solid carbon, which is deposited on the interior of the retort. Reactions also occur between some of the nitrogen and hydrogen, the hydrogen and sulphur, and the carbon and nitrogen by which comparatively small amounts of ammonia, sulphureted hydrogen, and cyanogen are formed. The coke which is left in the retort is composed almost entirely of uncombined carbon, with a percentage of ash dependent upon the amount of ash in the coal. The extent to which the hydrocarbons are broken down increases with the temperature at which the retorts are maintained, and therefore the volume of the gas produced increases, and its illuminating value de-

FIG. 4. SECTION THROUGH GAS-HOLDER.

rise above the guide framing, their stability being maintained by the weight of the lower lifts which they carry. In some cases, usually those of comparatively small holders, the guide framing has been completely done away with, the guiding being performed either by means of spiral guides fastened to the inside of the tank wall, and to the inner surfaces of the sections of the holder, or by means of wire ropes,

creases, with each increase in the temperature of the retorts. The product of illuminating value and quantity is, however, up to a certain point, greater with high than with low heats, and the retorts are usually heated to a temperature of from 2000° to 2300° F. The gas produced is deteriorated in illuminating value if exposed to prolonged contact with the hot walls of the retort, and to reduce the extent of this contact to

a minimum the volume of the charge of coal should be as large as possible in proportion to the size of the retort. The existence of a pressure in the retort also increases the contact between the gas and the walls, and it is to avoid this, as well as leakage of gas through minute cracks in the clay, that the pressure is taken off the retort by means of the exhauster. In the United States the length of charge or time the coal is left in the retorts is usually four hours, the heat and the weight of charge being so proportioned that the gas is all driven off in this time. In England the length of charge is usually five to six hours.

The gas leaving the retort is a mixture of permanent gases, principally hydrogen, marsh gas, and carbonic oxide, with some carbonic acid, nitrogen, sulphureted hydrogen, ammonia and cyanogen, hydrocarbon vapors that can be retained in the gas by proper treatment and are the most important light-giving constituents, and hydrocarbon vapors that cannot be retained in the gas when it is reduced to ordinary temperatures. The problem to be solved in the cooling of the gas, which begins as soon as it enters the standpipe, is the removal of these heavy vapors in such a manner as to leave in the gas a sufficient quantity of the lighter vapors to saturate it fully at the minimum temperature and maximum pressure to which it is to be subjected in the future. After the gas has been cooled it is necessary to remove the ammonia and sulphureted hydrogen, and in some cases the carbonic acid and cyanogen are also taken out.

The heaviest of the vapors condense in the hydraulic main, forming tar, which must not be allowed to rise to the level of the lower edges of the dip-pipes, since if brought into intimate contact with the gas it will absorb the lighter hydrocarbon vapors. For this reason it is also necessary that the heavy tar that is not deposited in the hydraulic main should be removed from the gas before it is cooled, and this is done by the friction tar-extractor. The lighter tar is then condensed out by the cooling effected in the condensers. This cooling should be done very gradually to avoid the condensation of vapors that should be retained in the gas. As the gas cools, some of the water-vapor, with which it is saturated, condenses and absorbs a portion of the ammonia, forming ammoniacal liquor. The tar and ammoniacal liquor thus formed in the hydraulic main and the condensers are run off through suitable drains into wells. The portion of the ammonia that still remains in the gas when it leaves the condensers is removed in the washer and scrubber. By using weak ammoniacal liquor as the washing liquid in the first stages of the scrubbing, the ammonia is made to combine with carbonic acid and sulphureted hydrogen, the resulting liquor being an aqueous solution of carbonate, sulphide, and various other salts of ammonia.

The gas leaving the scrubbers contains as impurities carbonic acid and sulphureted hydrogen, as well as small quantities of other sulphur compounds and cyanogen. It is necessary to remove the sulphureted hydrogen and reduce the sulphur compounds to an amount not to exceed 25 grains per 100 cubic feet of gas, since these substances produce sulphurous oxide when burned, and thus give rise to disagreeable fumes

if present in any quantity. The carbonic acid is sometimes removed also, although, being harmless except as it affects the illuminating value, it is usual in the United States to allow it to remain in the gas. For its removal it is necessary to employ, in the purifiers, hydrate of lime, which combines with it, forming carbonate of lime. Lime will also combine with sulphureted hydrogen, and was formerly the sole substance employed for its removal, which can, however, be effected much more economically by the use of hydrated sesquioxide of iron, either prepared artificially, or in the shape of a natural bog ore; and this has largely superseded lime. The reaction between the oxide of iron and the sulphureted hydrogen results in the formation of sulphide of iron, which is again changed to oxide when the fouled material is exposed to the air. The material can thus be used over and over again until it becomes so charged with the sulphur, deposited at each revivification, as to be rendered inactive. The oxide of iron also absorbs some of the cyanogen, and when spent is of value for the manufacture of cyanides and of sulphuric acid. After passing the purifiers the gas is ready for distribution, being measured solely for the convenience of the manufacturer; but, as the demand is not uniform from hour to hour, and it is necessary that the rate of production should be practically so, the gas-holders are provided to store the excess quantity made during the time of small demand for use at the time of large demand.

The scheme of condensation and purification outlined is that usually employed in the United States. In Europe it is becoming customary to scrub the gas with a solution of an iron salt to remove the cyanogen more completely and in a more merchantable form than is done in the purifiers, and also with tar oils to remove naphthalene, a hydrocarbon vapor, which, when the gas is chilled, condenses at once to the solid form in light flakes, and at times causes much trouble by stopping the small pipes of the distribution system. When the naphthalene is not removed it is necessary to add to the gas, if trouble is experienced, a hydrocarbon vapor that will condense, at the same time that the naphthalene crystallizes, to a liquid capable of dissolving the crystals, and so prevent them from forming obstructions in the pipes.

It will be seen that in addition to the gas there are produced in the manufacture of coal-gas coke, tar, and ammoniacal liquor, all of which are valuable, the coke as a fuel, the tar as a raw material for the manufacture of paving and roofing pitch, artificial dye-stuffs, various drugs, etc. (see COAL-TAR), and the ammoniacal liquor as a raw material for the manufacture of ammonia in various forms. The products from 100 pounds of gas coal will be, about, 65 pounds of coke, 500 cubic feet of gas, .6 gallon of tar, and 1.3 to 1.5 gallons of ammoniacal liquor containing .23 to .32 pound of pure ammonia.

CARRURETED WATER-GAS.

Carbureted water-gas is produced by mixing with non-luminous water-gas sufficient oil-gas, obtained from petroleum, to give the required illuminating power. It is made by decomposing steam in the presence of incandescent carbon so that the hydrogen is set free, and the oxygen unites with the carbon giving carbonic oxide.

These two gases, with small amounts of methane, carbon dioxide, and nitrogen, form water-gas, which, while combustible, does not burn with a luminous flame until enriched with oil-gas, made in a separate operation, or, as is more common, the mixture takes place as the oil-gas is made.

HISTORY. Although it was shown by Fontana, in 1780, that a combustible gas could be formed by the reaction between steam and incandescent carbon at high temperatures, which is the basis of all water-gas manufacture, and between 1823 and 1858 many patents were taken out aiming to take advantage of this reaction, the commercial development of the manufacture of water-gas and carbureted water-gas is of comparatively recent date. This development was made almost entirely in the United States, where both anthracite coal, a desirable source of carbon, and petroleum, for the manufacture of oil-gas, were plentiful and cheap. In the earlier forms of apparatus the water-gas was made from coal raised to incandescence in externally heated retorts, similar to coal-gas retorts, and the amount of fuel required proved too great for the success of the process. In 1871 Tessie du Motay erected in New York an apparatus for the manufacture of 'oxygen' gas, which, although it proved unsuccessful, was later developed into the generator-retort form of carbureted water-gas apparatus, and in 1873 Lowe erected, in Phoenixville, Pa., the first apparatus of the generator-superheater type, covered by his patent taken out in 1872. In 1875 Lowe took out, as a result of his experience in construction, another patent, the basic patent for apparatus of this class.

When the proper temperature is reached, the blast is shut off, the outlet for the escape of the products of combustion closed, and steam is admitted to the fire, forming water-gas. The water-gas is led from the generator into a small gas-holder, called a relief holder. This is necessary, as the action of the generator is intermittent, because the production of water-gas rapidly cools the fire below the gas-making temperature, to which it must be brought back by again putting on the blast, while the gas must pass through the rest of the apparatus continuously and at a uniform rate. From the holder it is led above a series of steam-heated shelves, on which naphtha is vaporized, and the mixture of gas and vapor then passes through externally heated retorts, the vapor being converted by the heat into

FIG. 5. DOUBLE SUPERHEATER LOWE CARBURETED-GAS APPARATUS.

APPARATUS AND PROCESS OF MANUFACTURE. In the generator-retort type of apparatus the water-gas is made in a generator, a steel shell lined with fire-brick, which after a fire has been kindled in it is filled with coal that is brought to incandescence by means of a forced blast of air.

a permanent gas. The crude carbureted water-gas so formed is drawn from the retorts by an exhauster and condensed and purified, without being scrubbed, in the manner described under the heading *Coal-Gas*.

In the generator-superheater type of appa-

ratus the water-gas is made and carbureted in one operation. In its most common form it consists of three brick-lined steel cylindrical vessels connected together and called the generator, the carbureter, and the superheater. The generator contains the coal, and the carbureter and superheater are filled with fire-brick piled in a checker-work. This checker brick is heated by the combustion of the producer gas formed in the generator while the coal is being brought to incandescence by a forced blast. When the proper temperature has been reached in all the vessels the blast is shut off, the stack-valve on top of the superheater, through which the products of combustion escape during the heating-up period, or 'blow,' is closed, and steam is turned into the generator. As soon as the production of water-gas is begun, oil is admitted at the top of the carbureter, is vaporized by the heat of the checker brick, and is taken up by the water-gas and carried through the checker-work in the carbureter and superheater, being converted into a permanent gas by the exposure to heat to which it is thus subjected. After leaving the superheater the gas passes through a water seal, and is then condensed and run into a relief holder, the use of which is necessary for the reason given above. An exhauster draws the gas from this holder and forces it through the purifiers and station meter into the storage holder. The generator-superheater type is the one that is generally employed at present, having replaced almost all the earlier installations of the generator-retort type.

Carbureted water-gas is a mixture of essentially the same gases as are found in coal-gas, though in different proportions, the following being representative analyses of each gas after purification by oxide of iron:

	Coal-gas, per cent.	Carbureted water-gas, per cent.
Carbonic acid.....	1.60	2.7
Oxygen.....	0.39	0.7
Heavy hydrocarbons.....	4.25	12.8
Carbonic oxide.....	8.04	30.7
Hydrogen.....	47.04	32.4
Marsh gas.....	36.02	13.9
Higher paraffins.....		2.4
Benzene vapor.....	0.50	0.6
Nitrogen.....	2.16	3.8
	100.00	100.0

In the case of carbureted water-gas, however, the crude gas contains no ammonia or cyanogen, and a smaller amount of sulphureted hydrogen and sulphur compounds than are found in crude coal-gas. It is estimated that from 70 per cent. to 75 per cent. of the total amount of illuminating gas sold in the United States is carbureted water-gas, while English gas-works, in the year 1900, sent out only 8 per cent. of carbureted water-gas.

DISTRIBUTION OF GAS.

From the gas-holder the gas is conveyed to the consumers by means of *main pipes*, laid under the surface of the streets, from which branch or *service* pipes are led to the houses. The pressure on the mains, which varies in ordinary practice from $1\frac{1}{2}$ to 4 inches of water ($\frac{1}{8}$ pound to $\frac{1}{2}$ pound per square inch), is furnished by the weight of the gas-holder, and is regulated to meet

the variation in the demand for gas by a *governor* on the holder outlet. This governor consists of a valve fastened to an inverted bell sealed in water, the weight of the valve and bell being supported by the pressure of the gas in the mains. If this falls, the bell falls, opening the valve, and so, by allowing more gas to pass, brings the pressure back to the proper point. The amount of pressure can be varied by the use of removable weights to vary the total weight to be supported.

The main pipes vary in internal diameter from 3 to 48 inches. They are usually cast-iron bell and spigot pipes, made in lengths 12 feet long, which are connected together with lead or cement joints, but wrought-iron pipe with screwed joints is sometimes used for the smaller sizes. The services are always made of wrought-iron pipe. (See PIPES.) The mains must be laid so as to drain to certain points, at which provision is made for removing the water and such hydrocarbon vapors as condense from the gas, and the services should drain into the mains.

During the past two or three years the use of high pressure (10 pounds to 20 pounds per square inch) has been advocated for the distribution of gas in localities having a scattered population, and several distribution systems using this pressure have been installed, and are now being operated. In such systems wrought-iron pipe is used exclusively.

The amount of gas supplied to each consumer is measured by means of consumers' meters, which are of two kinds, wet meters and dry meters. The wet meters are similar to the station meter, and were the first ones employed; but on account of various difficulties connected with their use, the chief of which in cold climates is the danger of freezing, they have, in the United States, been almost entirely replaced by dry meters. A dry meter consists of a rectangular box, made of tin plate, divided into two main compartments by a horizontal partition. The lower of these compartments is also divided into two equal parts by a vertical partition. The measuring apparatus consists of two bellows, one in each of the divisions of the lower compartment, each formed by a circular metal disk, to the circumference of which is fastened one edge of a leather diaphragm having its other edge fastened to the central partition, the whole forming a gas-tight space. The alternate opening and closing of these bellows by the pressure of the gas as it is admitted, first into the spaces inside and then into the spaces outside of them, furnishes motion which, by suitable mechanism, is made to operate valves controlling the flow of gas into and out of the bellows and outer spaces in such a way that gas cannot pass simultaneously into and out of any given space, and also to work the train of gears which records the amount of gas passed through the meter. The mechanism also controls the extent to which the bellows can open and close, so that a fixed and definite volume of gas passes into and out of the meter each time one is filled and emptied. The house pipes, which are usually wrought iron, should drain to the meter, where any condensation can be run off if necessary.

BURNERS. The principal forms of gas-burners used for the development of light from the gas are the flat flame, the Argand, and the incandes-

cent. The flat-flame burners are either 'batswing,' in which the gas issues from a narrow slit cut through the rounded top of the tip, or 'fishtail,' in which the gas issues from two circular holes in a flat tip, inclined in such a way that the jets of gas strike against each other and are spread out in a sheet of flame. The tips are usually made either of steatite or of a species of enamel. Although in their early forms these two types produced flames of different shapes, whence their names, as now made they produce flames that are practically identical. The Argand burner is circular in form, and consists of a hollow steatite or metal ring, the top of which is pierced with small holes, through which the gas issues. Air, drawn in by the draught produced by a glass chimney, is supplied to both the inner and outer circumferences of the flame. In the incandescent burner the gas is burned in an atmospheric burner giving a non-luminous flame, the heat of which is used to raise to incandescence a hood or mantle composed of oxides of rare earths, which are very refractory. The mantles most commonly employed are composed of approximately 99 per cent. of thoria and 1 per cent. of ceria. This combination has been found to yield the greatest amount of light, and the use of such mantles increases the amount of light obtainable from a foot of gas to four or five times what it can be made to yield in flat-flame or Argand burners. As the amount of light that may be obtained from gas, when burned in incandescent burners depends largely upon the calorific value, and but slightly upon the illuminating value, as shown by the legal method of testing (for which see PHOTOMETRY), the increasing use of these burners has given rise to a discussion of the advisability of changing from the old illuminating-value standards by which the quality has been judged to a calorific-value standard. In some cities in Europe, where it is possible to make a gas of good calorific but low illuminating value, much more cheaply than a gas with a higher illuminating value, the legal illuminating value has been reduced to ten candles. In London the legal standard for two of the three gas companies has been in the last two years reduced from 16 to 14 candles, and the London County Council gave notice, in 1902, of its intention to promote a bill in Parliament making the change compulsory upon the third company.

USE OF ILLUMINATING GAS FOR FUEL PURPOSES. During recent years there has been a large development of the use of gas for cooking; for such heating as is not required to be continuous; and for industrial purposes where it is important to have a high and easily controllable temperature. A great number of gas companies have been very active in seeking for business along these lines, until in some cases the output of gas for fuel purposes is greater than that for illuminating purposes. This development of the sale of gas for fuel also affords an argument in favor of the adoption of a calorific-value standard, as mentioned above.

The total quantity of gas reported as sold in the United States for lighting and heating during the year 1900, according to the Twelfth Census, was 68,265,496,168 cubic feet, as compared with 36,519,511,510 reported for 1890, an increase of 87 per cent. Of the amount sold in

1900, about 1,712,000,000 was a by-product from the manufacture of coke, and was sold to distributing companies for resale to consumers; the balance of the output was made by 877 gas-works, which number may be compared with 742 reported in 1890, and only 30 in 1850. The capital invested in the gas industry, according to the reports, increased from \$6,674,000 in 1850 to \$258,771,745 in 1890 and \$567,000,506 in 1900. The total receipts for gas sold in 1900 were \$69,432,582, or \$1.035 per thousand cubic feet, which latter figure may be compared with \$1.42 per thousand in 1890. By-products sold in 1900, including tar, coke, and ammoniacal liquor (not separately reported), amounted to about \$4,283,204, which, with \$2,000,907 from rents and sales of appliances, brought the total revenues of the gas-works up to \$75,716,693. The total output of English gas-works in 1900 was about 150,000,000,000 cubic feet.

SANITARY ASPECTS. Toward the close of the nineteenth century the attention both of sanitarians and of those interested in gas manufacture was directed to the sanitary aspects of the use of illuminating gas. The importance of this phase of the subject had recently been increased by the frequent substitution of water-gas for coal-gas. In water-gas the most poisonous agent—carbonic acid—is increased, as compared with coal-gas, from 6 or 7 per cent. to about 30 per cent. This change, however, was not necessary to make illuminating gas an active poison to breathe. The danger in the use of illuminating gas arises from two sources: (1) From unburned gas which escapes into the atmosphere through defective pipes or fixtures, or through burners accidentally open, and (2) from vitiation of the atmosphere through the products of burning gas.

The National Board of Fire Underwriters has published a table of gas losses compiled from data furnished by fifteen companies, which shows that over 14 per cent. of the total product of gas plants leaks into the streets and houses of the cities supplied. The danger to houses from escaping gas is much greater in the winter time, when the street surface is frozen, and when houses, on account of their higher temperature, act as chimneys to draw in the ground air, and with it the gas which has leaked into the soil. Gas thus escaping may follow water or sewer pipes, and enter even those houses which have no gas connections.

In order to remove the constant menace to life and property, through explosion and asphyxiation, which is afforded by leaky gas-mains, the whole matter should be under the strictest surveillance and control by the public. The introduction in our large cities of subways for underground pipes and wires would remedy the evil by rendering gas-mains easily accessible for constant inspection. In this way the slightest leak would be detected. The danger of deterioration of the mains through rust, and of their breaking through settlement of the soil, would also be removed.

While the consumption of gas does vitiate the atmosphere of a room to a certain extent, an ideal system of ventilation is possible, in which burning gas is not a hindrance, but an essential part. An example of such a system is the British Houses of Parliament, in which,

by means of flues placed over the jets, the heat or surplus energy of the gas-flame assists in producing a pure atmosphere. A similar system of ventilation could be carried on in an ordinary room with a thirteen-foot ceiling, in conjunction with the chimney in the room, and the combustion of one cubic foot of gas could be made, by a suitable flue, to change the atmosphere of a room $15 \times 15 \times 11$ feet once per hour. In this event, the three feet per hour consumed by an incandescent burner could be made abundantly to light and ventilate that space.

BIBLIOGRAPHY. Journals devoted to the subject of the manufacture and distribution of gas appear in all the leading languages, and of these the *Journal of Gas Lighting* (London) was first issued in 1849. For a full description of the subject of gas-lighting, see: Articles on "Gas" in *Encyclopædia of Chemistry* (Philadelphia, 1877); Spon's *Encyclopædia of Industrial Arts* (London and New York, 1879); Thorp, *Dictionary of Applied Chemistry* (London, 1891); Wagner, *Handbook of Chemical Technology* (New York, 1895); Richards, *A Practical Treatise on the Manufacture and Distribution of Coal Gas* (London, 1877); King's *Treatise on the Science and Practice of the Manufacture and Distribution of Coal Gas*, edited by Newbigging and Fewtrell (London, 1878); Colyer, *Gas Works: Their Arrangement, Construction, Plant, and Machinery* (London, 1884); Chester, *Bibliography of Coal Gas* (Nottingham, 1892); Atkinson Butterfield, *The Chemistry of Gas Manufacture* (Philadelphia, 1896); O'Connor, *The Gas Engineer's Pocket-Book* (New York, 1898); Wanklyn, *The Gas Engineer's Chemical Manual* (London, 1888); Dent and others, "Lighting," in *Chemical Technology*, vol. ii. (Philadelphia, 1895); Hunt, "Gas Lighting," in *Chemical Technology*, vol. iii. (Philadelphia, 1900).

GAS, NATURAL. A gaseous member of the paraffin series (see HYDROCARBONS), petroleum being a liquid member and asphalt a solid one. It is formed by the decomposition of animal matter, as in the case of the Ohio and Indiana gas, and from vegetable matter, as in the Pennsylvania gas, this decay having occurred within the rocks and probably at moderate temperatures. When once formed it accumulates in the pores of the rocks in which it originated, or in overlying layers, but is usually kept from escaping to the surface by the presence of some layer of impervious rock. It is then obtained by the piercing of these strata by wells, or where the beds have been fissured by folding or faulting it may issue from natural channels.

COMPOSITION. Natural gas is made up chiefly of marsh gas or methane (CH_4), which may form 90 or 95 per cent. of the entire volume of the gas; but other gaseous paraffins, such as ethane (C_2H_6) and propane (C_3H_8), are not uncommonly present. Since the liquefying pressure of the last two gases is lower than the pressure found to exist in many natural-gas reservoirs, it is probable that they exist in liquid form within the pores of the rock, and vaporize when they pass out into the well-tube. Besides the gaseous paraffins natural gas often contains small but varying amounts of nitrogen, carbon dioxide, carbon monoxide, olefiant gas, oxygen, hydrogen, ammonia, and hydrogen sulphide. The following

analyses give the composition of natural gas from different American localities:

MODE OF OCCURRENCE. Natural gas is found most often in sandstone and shale, but may also occur in limestone. Two types of accumulation may be recognized, viz.: in impervious rocks, such as shales and limestones, and in porous rocks, such as sandstone. The former type or shale gas usually forms small wells of varying pressure, and is not necessarily associated with petroleum; the deposits have staying qualities, and do not depend on the structural arrangement of the containing strata. Sandstone or reservoir gas, on the other hand, is found in great wells, often accompanied by oil, and while the rock pressure in any one area is fairly constant, at the same time these wells usually give out suddenly. The structure of limestone and sandstone formations containing natural gas, and, indeed, also petroleum, is often that of a low anticlinal, the gas and oil being found at and near the crest, respectively, while on either flank there is often an abundance of water. This theory of gas accumulation is known as the 'anticlinal theory,' and was developed by Profs. E. Orton and I. C. White. It has been noticed in all gas-fields that when the reservoir is tapped the gas usually rushes out as though under great pressure, this being spoken of as rock pressure. Prof. E. Orton believed that this pressure was hydrostatic, and due to the head of water in the rocks overlying the gas, the amount of pressure in the Ohio field being equal to a column of water whose height was equal to the elevation of Lake Erie above the gas-bearing stratum. While this theory may hold in some cases, still I. C. White has pointed out that in others the rock pressure is much greater than the artesian pressure in the same region, and furthermore that the exhaustion of the gas is not always followed by a flow of water. In such cases the rock pressure must be due to the expansive force of the gas. The original rock pressure varies in different fields, and is not infrequently as high as 300 or 400 pounds per square inch at the mouth of the well, and in some wells may exceed 1000 pounds per square inch. Several of the newer wells in West Virginia having a depth of from 2700 to 3200 feet showed a rock pressure ranging from 1000 pounds to 1300 pounds per square inch. A decrease in pressure is always likely to follow with time, as in the case of the first well opened at Findlay, Ohio, where the pressure fell from 450 pounds in 1886 to 170 pounds in 1890. In the early days of gas-well drilling the supply appeared so inexhaustible that the newly drilled wells were often allowed to blow off gas for several days or weeks before attempts were made to cap them.

DISTRIBUTION. The productive horizons of natural gas cover the entire series of Paleozoic rocks, and reservoirs are found even in Tertiary strata. The main supply for the United States comes from the Appalachian field, and the Ohio-Indiana field. The former extends from New York into Tennessee, and contains specially productive districts in Pennsylvania and West Virginia. The gas is obtained from several sandstone beds within the Devonian, and is closely associated with oil, the two owing their accumulation to the presence of a series of low anticlinal folds. The sandstone beds or 'sands' are separated by varying vertical distances, and are known by different names. The Ohio-Indiana field is unique in that the gas which is associated with oil occurs in Trenton limestone, along a dome-shaped uplift of rock known as the Cincinnati Arch, and especially where the rock has been rendered somewhat porous by dolomitization. This anticline extends in a northeast-southwest direction from Indiana into Ohio. In addition gas has also been obtained in Ohio from the Sub-Carboniferous. Both of these areas in Ohio are now nearly exhausted, and the supply obtained within the State comes from new and small fields. In southeastern Kansas gas is obtained from the Carboniferous shales, the area which is known as the Iola gas-field having come into prominence during the last few years. Its product is important because of the fact that the field lies not far from the Ozark zinc region, and the gas is employed for smelting the ores. The gas is found at depths ranging from 500 to 1000 feet. Some natural gas is also obtained from Kentucky, Illinois, Texas, South Dakota, Colorado, California, Missouri, and Texas, but the amount produced in most cases is small.

MINING AND USES. The methods used for drilling gas-wells are the same as those employed for sinking oil-wells. When the gas is first struck the pressure has in rare cases been sufficiently great to blow out the string of drilling tools weighing over 1000 pounds. As soon as practicable the well is capped, and the supply is piped to the site of consumption or to storage tanks. As the gas is often required for use at some distance from the well, the construction of pipe-lines has become an important feature of the natural-gas industry. With high rock pressure the gas may reach the market unaided, but with low pressure it is necessary to locate pumping stations at different points along the pipe. The pipes used vary in diameter from two inches to three feet, and are made of wrought iron or steel. One of the first lines was that laid in 1882 from Wilcox to Colegrove, Pa., a distance of 20 miles. Later, with the depletion of the gas-fields around Pittsburgh, it became necessary to pipe the gas for that city from greater distances, and at the present time some of it is being piped from Doddridge County, W. Va., a distance of over 100 miles. The pipe-lines from Wetzel County, W. Va., to Akron and Canton, Ohio, are over 150 miles long. So extensive has been the construction of pipe-lines that at the close of 1901 there were 22,000 miles of them in operation.

When first used the price of natural gas was low and no attempt was made to measure it, as it appeared to be widely distributed and to exist in inexhaustible quantities, but the giving out of some of the districts and the rapid fall in rock

pressure led to the use of meters and a rise in the value of the gas. On account of its cleanliness and excellent calorific power, natural gas has become an important source of light, heat, and power in many States, so that in 1901 it was used in thirteen States, by 1545 companies, representing a total of 5742 manufacturing establishments, including iron-mills, steel-works, glass-factories, brick-factories, and lead and zinc smelters. In addition to this it was used in many hundred private houses for heating or illumination.

Natural gas has a high calorific power, 1000 cubic feet having the power to evaporate 1000 pounds of water at 212° F. About 50 candle-power can be obtained by the consumption of 2½ cubic feet per hour. In fuel value, 12 cubic feet of natural gas is equal to about one pound of coal. Its illuminating power is low, unless used with some patent burner, such as the Welsbach light. The production of the United States in 1901 was valued at \$27,067,500, exclusive of the amount piped in from Canada.

HISTORY. The use of natural gas in China and Persia is said to date back to a very remote period. In the United States General Washington is said to have visited a burning spring on the Great Kanawha River, near the present site of Charleston, W. Va.; but the first recorded use of natural gas in this country was in 1821 at Fredonia, N. Y., where it was piped from a well for illuminating purposes. In 1841 it was used in the Great Kanawha Valley for heating salt-furnaces, but its extensive use did not begin until 1872, at Fairview, Pa. In 1875 it was first used for iron-smelting at Etna Borough, near Pittsburgh, and in 1886 was brought to Pittsburgh from the Haymaker well near Murrysburg, 19 miles distant. Since then its use has steadily increased.

GASCOIGNE, gäs-koin', GEORGE (c.1535-77). An English poet. He was born about 1535, the son of Sir John Gascoigne, of Cardington, Bedfordshire, and was educated at Trinity College, Cambridge, but left without a degree, entering, it is said, the Middle Temple before 1548. In 1555 he became a student of Gray's Inn; in 1557-59 he was member of Parliament; about 1560 he married and settled at Walthamstow. To escape his numerous creditors he went to Holland in 1572, where he served with distinction under William, Prince of Orange; but was captured by the Spaniards under the walls of Leyden and sent back to England after an imprisonment of four months. He accompanied Queen Elizabeth on her memorable visit to Kenilworth in 1575, and was commissioned by Leicester to write verses and masques for her entertainment. These appeared in *The Princely Pleasures* (1576). He died October 7, 1577, while on a visit to his friend George Whetstone, at Stamford, Lincolnshire. Gascoigne is best known by his lyrics, such as "The Arraignment of a Lover" and "A Strange Passion of a Lover." But much of his other work is of very great historical interest. *The Supposes*, an adaptation of Ariosto's *Gli Suppositi*, is the earliest extant comedy in English prose. It was produced at Gray's Inn in 1566. Aided by Francis Kinwelmersh, he wrote *Jocasta*, a free rendering of Euripides's *Phænissæ*. This is the second earliest English tragedy in blank verse. *The Steel Glass* (1576), written in blank verse, is our earliest regular verse satire. *Certain Notes of Instruction Concerning the Making of Blank Verse* (1575) is the earliest English critical essay. An edition of Gascoigne's *Works* was published by Jeffes (London, 1587). His *Complete Poems* were edited by W. C. Hazlitt, Roxburghe Library (London, 1868-69). For his principal poems, consult the excellent edition, with full biographical notes, edited by Arber (London, 1868). Consult Lee, *Dictionary of National Biography*.

GASCOIGNÉ, Sir WILLIAM (c.1350-1419). An English judge during the reign of Henry IV. He was made a sergeant-at-law in 1397, and in 1400 became Chief Justice of the King's Bench. In this high office he distinguished himself both by his integrity and ability, and the older English law reports contain many abstracts of his opinions, arguments, and decisions. In July, 1403, he was joined with the Earl of Westmoreland in a commission for levying forces against the insurrection of Henry ('Hotspur') Percy. In popular, though unauthenticated, story he is chiefly celebrated for the fearlessness with which he defended the immunities of his judicial office from interference by the Court. On one occasion, the legend runs, when one of the dissolute companions of young Prince Henry, afterwards Henry V., was arraigned before Gascoigne for felony, the Prince demanded his release, and, on being ordered out of the courtroom, rushed upon the judge and struck him. Gascoigne immediately committed the Prince to prison, and Henry, so the story goes, conscience-stricken, submitted. The King, on being informed of the occurrence, is said to have thanked God for having given him "both a judge who knew how to administer the laws and a son who respected their authority." Shakespeare, in *Henry*

IV., Part II., represents the young Henry V. as bidding Gascoigne retain, under a new king, the office whose honor he knew so well how to defend. Historically, this is untrue, as Gascoigne seems to have resigned immediately after Henry V.'s accession. He died December 17, 1419.

GASCON. A fish. See SAUREL.

GASCONADE, gäs'kōn-äd'. A right tributary of the Missouri, rising in Wright County, Mo. (Map: Missouri, E 3). It flows north-northeast, and empties into the Missouri at Gasconade after a course of about 250 miles. It is partly navigable for light steamboats at high water.

GASCON, gäs'kōn', **GASCONNADE**, gäs'kō-näd'. A term employed to denote a boaster or braggart, and any extravagant or absurd vaunting, the inhabitants of the district once known as Gascony having long been notorious in this respect.

GAS'CONY (Fr. *Gasconne*, Lat. *Vasconia*, from *Vascones*, the Basques). An ancient duchy in the southwest of France. Its boundaries were the Bay of Biscay, the River Garonne, and the Western Pyrenees. The modern departments of Landes, Gers, Hautes-Pyrénées, and the southern portions of Haute-Garonne, Tarn-et-Garonne, and Lot-et-Garonne are embraced within its ancient boundaries. It derived its name from the Basques or Vasques, who, driven by the Visigoths from their own territories on the southern slope of the Western Pyrenees, crossed to the northern side of that mountain range in the middle of the sixth century, and settled in the former Roman district of Aquitania Tertia or Novempopulana. In 602, after an obstinate resistance, the Basques were forced to submit to the Franks. They passed under the sovereignty of the dukes of Aquitania, who for a time were independent of the Crown, but were afterwards conquered by Pepin and later by Charles the Great. Subsequently the district became incorporated with Aquitania (q.v.). Consult: Monlezun, *Histoire de la Gasconne* (6 vols., Auch, 1846-50); Blade, *Contes populaires de la Gasconne* (Paris, 1886). Blade is also the author of six other works on the subject.

GAS-ENGINES. A name given to certain prime movers in which the expansive energy developed by an explosive or inflammable gas upon ignition communicates reciprocating motion to a piston within a cylinder. From the fact that the ignition and consequent development of heat take place within the engine cylinder itself, these motors are often called internal-combustion engines. The combustible mixture used may be any hydrocarbon gas or vapor mixed with a suitable proportion of atmospheric air.

HISTORICAL DEVELOPMENT. In 1678 the Abbé d'Hautefeuille invented an engine in which the explosive power of gunpowder was employed to drive a piston in a cylinder. This was the prototype of the modern gas-engine. Two years later the eminent Dutch physicist Christian Huygens devised a similar gunpowder engine. No further development of the internal-combustion engine occurred until 1791, when John Barber, an Englishman, specified in a patent the use of a mixture of a hydrocarbon gas and air and its explosion in a vessel which he called an exploder. Some years later a fellow countryman of Barber's, John Street, took out a patent for

the production of an explosive vapor by means of a liquid and air, ignited by a flame, in a suitable cylinder so as to drive machinery. In 1799 Philip Tebon, a Frenchman, took out a patent in which was described the construction and principle of operation of an engine using coal-gas as the explosive, and two years later he secured a second patent on an improved form of the same engine. Several inventors followed Tebon with designs for gas-engines, some of which were highly ingenious machines, but none of which attained any practical utility. Indeed, up to 1860 no internal-combustion engine had appeared which was capable of regular and comparatively efficient work.

In 1860 Lenoir, a Frenchman, invented the first practical gas-engine. This engine resembled in external appearance a simple-cylinder horizontal steam-engine, and was double-acting. Gas was drawn into the engine during the first half of the forward stroke, and exploded by an electric spark from a Ruhmkorff coil when the piston was commencing the second half of the forward stroke. The exploding gases, after having done their work, were drawn out through the exhaust on the return stroke, during which work was being done by a similar explosion on the other side of the piston. A water-jacket prevented the cylinder walls from becoming overheated. The engine ran smoothly and regularly, and its development raised high hopes that the successful substitute for the steam-engine had appeared. The machine, however, was enormously expensive in its consumption of gas, and had so many other defects that it soon disappeared. The principal good accomplished by Lenoir's work was to direct attention again to the gas-engine, which had been lost sight of in

operations for each impulse. No engine was built by Beau de Rochas, and for sixteen years the existence of his invention remained practically unnoticed. Meanwhile, in 1867, two Germans, Otto and Langen, patented an engine in which the explosion of gases in the cylinder served only to obtain a partial vacuum underneath the piston, which was, therefore, forced down by the excess of atmospheric pressure above it. This engine was very crude mechanically, but it consumed about one-half the gas consumed by the Lenoir engine, and large numbers were sold. This was the first atmospheric engine to attain commercial importance.

In 1878 Dr. Otto, encouraged by his previous success, brought out his gas-engine. In this engine the German engineer reinvented the Beau de Rochas cycle, and applied it in the construction of an actual engine. In the Otto engine the cylinder was continued back beyond the stroke of the piston to form a compression chamber into which the mixture of air and gas was drawn during the forward stroke of the piston. The mixture was compressed in this chamber during the return stroke, the pressure rising at the end of the stroke to from 45 to 60 pounds per square inch. At this point in the cycle of movements a flame was brought into contact with the compressed gases, and they were ignited. This ignition or explosion raised the temperature of the gases to 1500° Centigrade, and drove forward the piston under a pressure of about 150 pounds per square inch. During the second return stroke the piston drove out the products of combustion. The heating of the cylinder was prevented by a water-jacket. Special attention was paid by the inventor to the efficiency of his engine, and in order to increase it he diluted

LONGITUDINAL SECTION OF OTTO-CROSSLEY GAS-ENGINE.

the labors of developing the steam-engine. Not much importance came of this renewed study until 1862, when M. Beau de Rochas took out a patent for the working principles of an internal-combustion motor. These principles were set forth as follows: During the forward stroke of the piston the explosive mixture was to be drawn into the cylinder, and during the return stroke this volume of gas was to be compressed; at the beginning of the second forward stroke the explosion was to take place, driving the piston forward, the gases being expelled during the second return stroke. As will be observed, the invention called for an engine with a cycle of four distinct

the air and gas drawn into the cylinder with a portion of the gases already burnt in the previous stroke. This caused a less violent explosion, the gases continuing to burn during the entire stroke of the piston. As the piston received a driving impulse only once in every four strokes, or two revolutions, regularity of motion had to be secured by heavy fly-wheels. Otto's engine was a

marked improvement over any previous internal-combustion engine. It consumed only 915 liters of gas per horse-power per hour, as compared with a consumption of 1380 liters by the Otto and Langen engine, and 2700 liters by the Lenoir engine. After the expiration of Otto's patents various other inventors began turning out four-stroke cycle engines, and some of them have succeeded, by improvements in mechanical details, and by using gas at higher initial temperatures, in reducing the consumption of fuel and increasing the efficiency of the motor generally. Another set of inventors devoted themselves to the devising of different

cycles. Of these only Dugald-Clerk and Griffin will be referred to at present.

In the ideal internal-combustion motor we should have at least one explosion or impulse for every revolution, instead of one every two revolutions, as in the Otto engine. For this reason inventors have tried to construct gas-engines with a two-stroke cycle. One of the most notable of these will be described, but it may be remarked at the beginning that no motor of this type has been able to compete with those of the Otto type. The two-stroke cycle engine was invented by Dugald-Clerk. There were two cylinders of equal diameter placed side by side; the first of these was the power-cylinder, in which the explosion took place; the other was used for compressing the explosion mixture, and also for supplying at each revolution a volume of fresh air for blowing out the products of combustion in the power-cylinder. The Clerk engine had the advantage of giving an impulse every revolution, and thus permitted the use of a lighter fly-wheel; its great disadvantage was that, owing to the sudden combustion, it was less efficient than the Otto engine. Clerk's two-stroke cycle engine was followed by several others of the same type, but of different construction. Griffin's engine had two explosions for every three revolutions, or six strokes of the piston, and was double-acting. The cycle of operation was as follows: (1) Gases drawn into the cylinder; (2) compression of gases; (3) ignition and expansion; (4) products of combustion expelled; (5) volume of fresh air drawn into cylinder to expel products of combustion; (6) this volume of fresh air expelled.

WORKING PRINCIPLES. Some notion of the working principles of the gas-engine has been conveyed in the descriptions of the preceding section. Broadly speaking, gas-engines may be divided into the following classes: (1) Engines igniting at constant volume without previous compression; (2) engines igniting at constant volume with previous compression; and (3) engines igniting at constant pressure with previous compression. In the first class a specified amount of gas is drawn into the cylinder at ordinary atmospheric pressure, the inlet valves are then closed, and the charge is ignited, that is, a constant volume of gas at atmospheric pressure, or without compression, is ignited to give the impulse. To this class belongs the Lenoir engine and also, as a subclass, the Otto and Langen engine previously described. In the second class, as in the first class, the volume of gas is constant, but it is compressed before explosion. To this class belong the Otto engine and by far the greater number of other gas-engines now in use. In the third class the gas is compressed outside of the engine cylinder, and enters the cylinder under pressure, ignition taking place as soon as it emerges at the inlet. To this class belongs the Brayton engine.

EXPLOSIVES USED. The explosives used in gas-engines are coal-gas, water-gas, vapors, produced by a mixture of air and petroleum or its volatile distillates. Engines using oil vapors are often called oil-engines, gasoline-engines, etc., and they comprise the necessary apparatus for providing the vapor, in addition to the parts usual to the gas-engine. These vapor-producing apparatus are of numerous forms. Besides the

kinds of gases and vapors mentioned, any carbon-hydrogen gas may be employed. Thus, in recent years, there has been quite an extensive use of the waste gases from the blast-furnaces (see IRON AND STEEL) for operating gas-engines.

IGNITION. The ignition of the explosive mixture is usually performed by one of the following methods: A flame may be introduced into the cylinder or uncovered to the gases in the cylinder by the opening of a suitable port in the cylinder walls; an electric spark may be made to pass through the gases between two electrodes entering the cylinder, or a tube of porcelain or iron heated to incandescence by an external flame is uncovered to the gases by a port in the cylinder walls.

CAPACITY AND EFFICIENCY. Gas-engines are frequently built up to 400 and 500 horse-power. In America even larger gas-engines have been constructed, and the Westinghouse Works now build these machines as large as 650 horse-power, one of the latter capacity being shown in Fig. 3 of the accompanying plate. By the efficiency of a gas-engine is meant the percentage of the total heat units in the coal or oil used which the engine converts into work. This percentage is from 17 to 19 per cent. for engines using gas from coal, and from 14 to 16 per cent. for oil-engines. The efficiency of the steam-engine is about 12 per cent. of the coal.

USES. Gas-engines may be used for any purpose that a steam-engine is used for within the limits of their capacity. As compared with the steam-engine its qualities are as follows: It requires no boiler and only small storage space for oil or gas; it is ready for operation at a moment's notice, since no time is lost in getting up steam, as in a steam boiler; there being no fire or furnace, there are no ashes; it does not require a skilled operator to run it. These qualities, as will readily be seen, give the gas-engine a peculiar field of usefulness of its own. A few of its familiar uses will illustrate this point. These are automobile propulsion, launch and yacht engines, submarine boat engines, and small industrial works where small amounts of power are required only occasionally. In each of these cases the fact that a boiler, furnace, and store of fuel are obviated by its use makes the gas-engine a particularly suitable motor.

BIBLIOGRAPHY. Among the many books dealing with gas-engines, the following will be found useful: Hutton, *Heat and Heat Engines* (New York, 1899); Dugald-Clerk, *Theory of the Gas Engine* (New York, 1891); id., *The Gas and Oil Engine* (New York, 1899); Donkin, *A Text-Book on Gas, Oil, and Air Engines* (London, 1900); Hiscox, *Gas, Gasoline, and Oil Vapor Engines* (New York, 1900); Parsell and Weed, *Gas Engine Construction* (New York, 1900).

GASES, ANALYSIS OF. See ANALYSIS, CHEMICAL.

GASES, GENERAL PROPERTIES OF. The study of the nature and properties of gases has yielded many of the most important results of modern science. Practically the entire structure of modern chemistry rests on our knowledge of gases. The birth of the science, as already explained in the article CHEMISTRY, followed almost immediately the discovery of the common gases. The fruitful theories of modern organic chemistry are based entirely on the general prop-

3. WESTINGHOUSE 8-CYLINDER VERTICAL GAS-ENGINE Operating Direct Current Engine Type Generator.

erties of gases; and in the latter part of the nineteenth century general theoretical chemistry received a powerful impulse by the extension of the laws of gases to dilute solutions. (See SOLUTION.) On the other hand, the physicist has been led, by the study of gases, to a clear and simple explanation of the phenomena of heat and of many other general phenomena forming important chapters in modern physics. And, of course, through chemistry and physics the applied and natural sciences, too, owe a great deal to our knowledge of gases. All this importance of gases is due to the comparative simplicity of the laws followed by them. The simplicity of the laws is, in turn, readily explained from the standpoint of the molecular conception. Molecules are minute particles of matter. When they are very near to one another there must naturally come into play, between them, forces whose effects are practically nothing when the molecules are widely separated. Under ordinary pressures a substance occupies a much greater volume in the gaseous than in the liquid or solid state. Thus, an amount of water occupying, at 0° C., one cubic centimeter if liquid, would, if vaporized at the same temperature and under ordinary atmospheric pressure, occupy over 773 cubic centimeters. Evidently the molecules of a gaseous substance must be very far apart, and their mutual influence very slight. In other words, the number of causes determining the properties of gases must be smaller, and hence the properties themselves must be less complex than those of liquids or solids. Of course, as the volume within which a gas is compressed is made smaller and smaller, the relative simplicity of properties gradually disappears. (See MOLECULES—MOLECULAR WEIGHTS.) Under certain conditions of pressure and temperature, the properties of a substance in the gaseous and liquid states even become identical. (See CRITICAL POINT.) This shows that simplicity of properties, while generally found in the gaseous state, is not strictly characteristic of it. Other characteristics may be found mentioned under AGGREGATION, STATES OF.

It is explained in the articles on HYDROSTATICS and HYDRODYNAMICS how liquids and gases have certain properties in common, viz. all those which depend upon fluid pressure, which is defined as the force per unit area. It is shown in those articles:

(1) The pressure at any point in a gas is the same in all directions, and its value is $\rho gh + P$, where ρ is the average density of the gas above the point, g is the acceleration due to gravity of a freely falling body, h is the vertical distance from the point to the top of the gas (if it is inclosed in a reservoir), and P is a pressure uniform throughout the gas, due to the reaction of the walls of the reservoir against the outward expansive force of the gas. In all ordinary cases of gases h is not large, and so ρgh may be neglected, because ρ is extremely small; and P is the principal term. In the case of the atmosphere, however, P is zero and h large.

(2) The pressure of the gas against the containing walls or against any solid immersed in it is perpendicular to the solid, if the gas is not flowing.

(3) Archimedes's principle applies to gases, viz. if a solid or a drop of liquid is immersed

in the gas it is buoyed up with a force equal to the weight of the displaced gas.

(4) If a gas escapes from a reservoir through a small opening in a thin wall, its velocity of

'efflux' is given by the formula $v = \sqrt{\frac{2p}{\rho}}$, where p

is the difference in pressure of the gas inside the reservoir and outside. (This is not the total pressure, but the partial pressure due to this particular gas. See Dalton's Law, below.)

(5) If a gas is flowing steadily but slowly through a tube or irregular cross-section, the pressure is greatest where the velocity is least, and vice versa. This is the principle of the 'atomizer,' the 'injector' for steam boilers, etc.

The densities of gases at 0° C. and standard pressure are as follows:

Air, 0.001293; carbon dioxide, 0.01974; hydrogen, 0.0000896; oxygen, 0.001430. The special properties of gases have been stated in the form of laws:

DALTON'S LAW. If several gases are contained in the same reservoir they are distributed uniformly through it, so that the mixture is everywhere the same, and the total pressure on the walls is the sum of the partial pressures; by 'partial' pressure is meant that pressure which each gas by itself would exert on the walls if the other gases were removed. This law of pressures has been shown recently to be not perfectly exact.

BOYLE'S LAW. If the temperature of a gas is kept constant, and its volume changes, the resulting pressure and density are such that one is proportional to the other. In symbols,

$p = k\rho$; or writing $\frac{m}{v}$ for ρ , $pv = km$, where

m is the mass and v is the volume. This law, too, is only approximate; for as the pressure on the gas is increased, the product pv does not remain a constant quantity, but first decreases and then increases. (For hydrogen gas the product pv increases without any preliminary decrease.) This means that at high pressures gases are less compressible than they would be if Boyle's law were obeyed exactly. This law, $pv = \text{constant}$ at constant temperatures, was first stated by Robert Boyle in 1662 as the result of careful experiments on air; fourteen years afterwards it was published by Mariotte.

It is a consequence of Boyle's law that the elasticity of a gas at constant temperature numerically equals the pressure. If a gas is compressed rapidly its temperature rises, and so the pressure is increased; the elasticity for a sudden compression or rarefaction equals γp , where γ is the ratio of the two specific heats for the gas and for ordinary gases has the value 1.4. (See ELASTICITY.) An instrument for measuring high pressures in a fluid is made, called a closed 'manometer,' the principle of which depends upon Boyle's law. It consists of a device to trap a definite mass of gas in a closed tube by means of some liquid, such as mercury, and to have the column of mercury compress the gas as the pressure to be measured is increased; the volume of the gas varies inversely as the pressure on it.

If a gas is allowed to expand freely, doing no external work—e.g. take two reservoirs connected by a tube with a stop-cock, compress the gas in

one and rarefy it in the other, then let the stop-cock be opened—it is observed that there is practically no energy required to produce the expansion. This shows that any forces of attraction between the molecules must be extremely small. (See HEAT.) It is found by experiment that if the pressure on a gas is kept constant, but the temperature changed, the volume changes at the rate given by the formula

$$v = v_0(1 + \beta t),$$

where v is the volume at $t^\circ \text{C.}$; v_0 , that at 0° ; β is a constant, the same for all gases approximately. Similarly, if the volume is kept constant, and the temperature changed, the pressure will change according to the law

$$p = p_0(1 + \beta t),$$

where p is the pressure at $t^\circ \text{C.}$; p_0 , that at 0° ; β is a constant the same for all gases and the same as in the above formula for the change of volume. The value of this 'coefficient of expansion' is almost exactly $\frac{1}{273}$ or 0.003662. This law for the change in pressure or volume of a gas as the temperature is altered, viz. that β is the same for all gases, was discovered almost simultaneously by Charles, Dalton, and Gay-Lussac.

Another law, known as the 'law of combining volumes,' may be found explained under CHEMISTRY.

The experimental laws for gases may be deduced theoretically for a mechanical system of perfectly elastic spheres thrown at random into a space bounded by rigid walls. If the number of spheres is great enough to allow the application of the principle of statistics, it can be shown that the pressure on the walls owing to the impact of the spheres is $p = \frac{1}{3} m n u^2$, where m is the mass of each sphere, n is the number of spheres per cubic centimeter, u^2 is the mean value of the squared velocities of the spheres. The density is then $m n$; and the formula may be written $p = \frac{1}{3} \rho u^2$.

It may also be shown that the mean kinetic energy of translation of the spheres — $\frac{1}{2} m u^2$ — has properties identical with those of the temperature of a gas; consequently the above value of the pressure satisfies Boyle's law. The law for the expansion with temperature may also be derived, viz. that β is the same for all gases.

Again, if there are several sets of spheres inclosed in the same space

$$p = \frac{1}{3} (m_1 n_1 u_1^2 + m_2 n_2 u_2^2 + \text{etc.}),$$

which is Dalton's law. And if there is equilibrium

$$\frac{1}{3} m_1 u_1^2 = \frac{1}{3} m_2 u_2^2 + \text{etc.},$$

and therefore

$$p = \frac{1}{3} m_1 u_1^2 (n_1 + n_2 + \text{etc.}),$$

which states that for a given value of $\frac{1}{3} m_1 u_1^2$ (i.e. temperature) the pressure depends simply on the number of the spheres per cubic centimeter, not on their masses. This is equivalent to Avogadro's rule (q.v.), another of the general principles concerning gases. Looked at in a different way: If there are two sets of spheres in different reservoirs at the same pressure, $m_1 n_1 u_1^2 = m_2 n_2 u_2^2$; if further their values of $m u^2$ are the same (i.e. their temperatures), $m_1 u_1^2 = m_2 u_2^2$. Hence $n_1 = n_2$, or they have the same number of spheres per cubic centimeter. The densities of the two are $\rho_1 = m_1 n_1$, $\rho_2 = m_2 n_2$; so if the pressures and 'temperatures' are the same

$$\frac{m_1}{m_2} = \frac{\rho_1}{\rho_2},$$

which is the formula used in determining the 'molecular weights' of gases. See MOLECULES—MOLECULAR WEIGHTS.

It can be shown, further, that the greatest possible value of γ , the ratio of the specific heats, is 1.67; but if the molecules are complex, so that there is internal energy in them, γ must be less. It is interesting to note that for helium, argon, and mercury vapor $\gamma = 1.67$, as found by direct experiment.

The properties of the pressure due to the atmosphere around the earth are discussed in the article ATMOSPHERE. Only a few points need be mentioned here. The pressure is measured by a barometer (q.v.) and is found to nearly equal that of 76 centimeters of mercury at sea-level and at 45° latitude, i.e. $76 \times 13.6 \times 980$ or 1,013,300 dynes per square centimeter. The barometer was invented by Torricelli, a pupil of Galileo; and the first instrument was made and used by Viviani in 1643. Pascal in 1648 showed that the height of the barometer varied with different heights above the earth, and proved that the pressure of the atmosphere obeyed the laws of liquid pressure. Von Guericke invented the air-pump (q.v.) in 1650, and without knowing of Torricelli's work discovered the properties of atmospheric pressure. He did not publish an account of his work, however, until 1672. Boyle published in 1660 an account of his experiments with an air-pump illustrating the properties of the pressure due to the air.

The action of lift-pumps, siphons, etc., depends upon atmospheric pressure. Air-pumps are instruments designed to exhaust the gas from a closed space such as a glass bulb.

GASES, LIQUEFACTION OF. See CRITICAL POINT; LIQUEFACTION OF GASES; REFRIGERATION.

GASKELL, Mrs. ELIZABETH CLEGHORN (1810-65). An English novelist, born in Chelsea, September 29, 1810, the daughter of William Stevenson. When she was only a few weeks old her mother died, and she was brought up by her aunt at Knutsford, in Cheshire—the village afterwards described in *Cranford*. She was sent to school at Stratford-on-Avon, where she learned Latin, French, and Italian. In 1832 she married Rev. William Gaskell, a Unitarian minister of Manchester. Her first novel, *Mary Barton*, appeared anonymously in 1848. It was followed by *Ruth* (1853); *Cranford* (1853); *North and South* (1855); *Lizzie Leigh* (1855); *Sylvia's Lovers* (1863); *Cousin Phillis* (1865); *Wives and Daughters* (1866); and many short tales. Mrs. Gaskell's usual aim was to combine instruction with pleasure. Her first novel and several others depict the habits, thoughts, privations, and struggles of the industrial poor, as she herself had observed them in Manchester. Her classic, however, is *Cranford*, which describes with de-

lightful humor a town given over wholly to spinsters. Mrs. Gaskell also wrote one of the very best biographies—*Life of Charlotte Brontë* (1857). She died November 12, 1865. Consult the article on Mrs. Gaskell in *Dictionary of National Biography*, vol. xxi. (London, 1890).

GASKELL, WALTER HOLBROOK (1847—). An English physiologist. He was born at Naples, Italy, was educated at Trinity College, Cambridge, studied medicine at University Hospital and Leipzig University, and in 1883 was appointed university lecturer in physiology at Cambridge. In 1889 he became fellow of Trinity Hall, and in the same year received the gold medal of the Royal Society for his investigations regarding the sympathetic nervous system. Several important articles from his pen on this subject have appeared in the *Journal of Physiology*. His name is identified with the theory that the central nervous system in vertebrates has resulted from the coalescence of the alimentary canal and the central nervous system of some crustacean-like ancestral form. In 1896 he was elected president of the physiological section of the British Association for the Advancement of Science.

GAS'OLINE. See PETROLEUM.

GASOMETER. See GAS, ILLUMINATING.

GASPARI, gá-spà'rè, GAETANO (1807-81). An Italian musician, composer, and musical historiographer, born at Bologna. He studied composition under B. Donelli, at the Liceo Musicale, which institution he entered in 1820 and was more or less connected with throughout his life. As a student, he won the first prize in composition (1827), and one year later was made honorary maestro. In 1840 he was appointed professor of solfeggio. The interval between 1828 and 1839 had been spent at Cento and Imola, where he resided as *maestro di cappella*. A tardy recognition of his talents secured for him in 1855 the appointment of librarian to the Liceo, as well as the chair of æsthetics. From 1857 to 1866 he held the important appointment of *maestro di cappella* at the Church of Saint Petronio. In 1866 he became a member of the royal deputation for historical research in the Romagna, and personally prepared the report on the musicians of Bologna. Already famous for his scholarly attainments, his work with the royal deputation increased his prestige, and led him to devote himself entirely to historical research. His compositions are comparatively unimportant, and were almost entirely written for the services of the Church. Of his many writings, the essay *Ricerche, documenti e memorie riguardanti la storia dell' arte musicale in Bologna* (1867) is among the most important. He died at Bologna.

GASPARI, gá-spà'ràn', AGÉNOR ETIENNE, Count de (1810-71). A French statesman and author, son of Count Adrien Etienne Pierre de Gasparin (1783-1862), born at Orange. In 1836 he entered the Cabinet of his father, then Minister of the Interior, as chief of a department, became master of requests in the Council of State in 1837, and in 1842 was elected to the Chamber of Deputies from Bastia in Corsica; but he failed of reelection in 1846, and put all of his enthusiasm into his written work. He wrote on the separation of Church and State, *Les intérêts généraux du protestantisme français* (1843), and *Christianisme et paganisme* (1846); on the abolition of slavery, *Esclavage*

et traite (1838); *Un grand peuple qui se relève* (1861); and *L'Amérique devant l'Europe* (1862); on the reform of home life, *La famille* (1865); *La liberté morale* (1863); *La conscience* (1872); and *L'ennemi de la famille* (1874); and in connection with the Franco-German War, *La déclaration de guerre, un protêt* (1870); *La république neutre d'Alsace* (1870); and *Appel au patriotisme et au bon sens* (1871). From 1849 until his death he lived at Geneva. Consult: Naville, *Le Comte Agénor de Gasparin* (Geneva, 1871); Borel under the same title (2d ed., Paris, 1870); Bar Fey-Boisier, *La Comtesse Agnes de Gasparin et sa famille; correspondance et souvenirs, 1813-1894* (2 vols., Paris, 1902).

GASPARI, VALÉRIE BOISSIER, Countess de (1813-94). A French woman of letters, born at Geneva. She was the wife of Agénor, Count de Gasparin (1810-71) (q.v.). She lived a great part of her life in the Canton Vaud, Switzerland, and was a prolific writer, mostly on religious and social topics. In addition to a number of translations of English and American authors, she published *Le mariage au point de vue chrétien* (1842), a work which won the Montyon prize from the French Academy; *Allons faire fortune à Paris* (1844); *Un livre pour les femmes mariées* (1845); *Il y a des pauvres à Paris et ailleurs* (1846), which won the Montyon prize of the Academy; *Quelques défauts des Chrétiens d'aujourd'hui* (1853); *Des corporations monastiques au sein du protestantisme* (1855); *Les horizons prochains* (1859); *Les horizons célestes* (1859); *Vesper* (1861); *Les tristesses humaines* (1863); and *La lèpre sociale* (1870).

GASPARINO DA BARZIZZA, gíl'spà-rè'nò dà bär-tsè'tsà (?-1431). An Italian humanist, born at Barzizza (Province of Bergamo). He taught successively at Venice and Padua, and in 1418 was called by Filippo Maria Visconti to Milan to establish a school there. Following the initiative of Petrarch, he placed great emphasis on the art of Latin epistolography, causing his scholars to imitate as nearly as might be the style of the letters of Cicero. This matter of polite letter-writing occupied an important place among the studies of Renaissance scholars, and *Epistolaria*, or 'guides to correspondence,' were prepared for the instruction of beginners. It is said that Gasparino intended to fill with conjectural material the numerous lacunæ existing in all manuscripts of the *De Oratore* then known, but was prevented by the discovery at Lodi (1419) of a complete manuscript, known as the *Codex Laudensis*, from which he then supplied the gaps. His complete works appeared at Rome in 1723.

GASPARY, gäs'pà-rè, ADOLF (1849-92). A German Romance philologist, born in Berlin. He studied there and at Munich and Freiburg, in 1879 was appointed lecturer in Romance languages at the University of Berlin, and in 1880 a professor at Breslau. In 1891 he accepted the appointment to a professorship at Göttingen, but owing to illness, never entered upon his duties there. He ranks among the foremost of recent Italian scholars in Germany. His most important work is his *Geschichte der italienischen Literatur* (vols. i. and ii., 1885-88; incomplete); *Die sizilianische Dichterschule des dreizehnten Jahrhunderts* (1878). Both of these have appeared

in Italian translations, the former at Turin in 1887-91, the latter at Leghorn in 1882.

GASPÉ, gäs'pä'. The most easterly district in the Province of Quebec, Can., consisting of the counties of Gaspé and Bonaventure, chiefly a peninsula projecting into the Gulf of Saint Lawrence, between the estuary of the same name on the north and the Bay of Chaleurs on the south (Map: Quebec, H 5). It consists of an elevated plateau traversed by the Schikshock or Notre Dame Mountains, ranging from 3500 to 3800 feet in height and terminating in Cape Gaspé, a bold headland of sandstone 690 feet high. Area, 7500 square miles. Population, in 1891, 47,700; in 1901, 52,200, the greater number of the inhabitants being of French descent. Lumbering and fishing are the chief occupations of the country.

GASPÉ. A village in the Province of Quebec, Can., which gives its name to the district (q.v.) and the bay on which it stands (Map: Quebec, J 5). It is the commercial centre of the extensive fishing industries of the region, and is a favorite summer resort for sportsmen attracted thither by fine angling and the varied scenery. The United States is represented by a consul and a vice-consul. It was here that Jacques Cartier landed in 1534, and took formal possession of the country for the King of France. It was the scene of the destruction of a French fleet in 1627; in 1760 it was captured by the English. Population, in 1891, 307; in 1901, 454.

GASPÉ, PHILIP IGNATIUS (1714-87). A French-Canadian soldier. He accompanied De Longueuil on the expedition against the Chicacha and Natchez Indians (1739), and subsequently led troops from Mackinac in attacks on the English colonists. In 1750-52 he was in command of a fort on the Saint John River, and in 1758 led the Canadian militia in the defense of Fort Carillon (better known under its English name of Ticonderoga), when 3600 troops under Montcalm repulsed an English army about four times as numerous under Abercromby. After the surrender of Quebec in 1759, he commanded the grenadiers of De Lévis.

GASPEREAU, gäs'pär-ö (Fr.). The alewife; so called in Eastern Canada.

GASS, gäs, WILHELM (1813-89). A German Protestant theologian, born in Breslau. He studied at Breslau, Halle, and Berlin, became a lecturer in theology at Breslau in 1839, and in 1846 was appointed professor. Subsequently he was professor at Greifswald from 1847 to 1861, at Giessen in 1861-68, and from 1868 at Heidelberg. His chief work is *Geschichte der protestantischen Dogmatik* (4 vols., 1854-67). His other publications include: *Gennadius und Pletho, Aristotelismus und Platonismus in der griechischen Kirche* (1844); *Die Mystik des Nikolaus Kavalas vom Leben in Christo* (1849); and *Geschichte der christlichen Ethik* (2 vols., 1881-87). He was an associate editor of the *Zeitschrift für Kirchengeschichte*, and of the *Theologischer Jahresbericht*.

GASSENDI, gäs'sän'dé', or **GASSEND**, gäs'sän', PIERRE (1592-1655). An eminent French philosopher and mathematician. He was born at Champcerier, a little village of Provence, in the Department of Basses-Alpes. His unusual powers of mind showed themselves at an early

age; and at the age of sixteen he became instructor of rhetoric, then professor of theology, at Aix, and in 1616 professor of philosophy. He meanwhile applied himself with zeal to the study of the natural sciences that were taught in his day, and was especially interested in astronomy and anatomy. In philosophy he became disgusted with scholasticism and undertook to maintain certain theses against the Aristotelians. His polemic appeared at Grenoble in 1624, and was entitled *Exercitationes Paradoxicæ adversus Aristoteleos*. He drew a distinction between the Church and the scholastic philosophy, denying that the former must stand or fall by the latter. In 1623 he was appointed provost of the cathedral at Digne, an office which enabled him to pursue without distraction his astronomical and philosophical studies. At the recommendation of the Archbishop of Lyons, a brother of Cardinal Richelieu, Gassendi was appointed in 1645 professor of mathematics in the Collège Royal de France, at Paris, where he died, October 14, 1655. As a philosopher, Gassendi revived and maintained, with great learning and ingenuity, the doctrines of Epicurus, as he found the atomistic philosophy most easily brought into harmony with his own scientific acquirements and modes of thought. His Epicureanism, however, was not allowed to interfere with his loyalty to the Catholic faith. He reconciled the two views by holding that God is the First Cause, who created matter in the form of atoms, and endowed these with motion, which thus becomes their indefeatable characteristic. His great philosophical opponent was Descartes (q.v.). His philosophy was in such repute that the savants of that time were divided into Cartesianes and Gassendists. The two chiefs themselves always entertained the highest respect for each other, and were at one time on the friendliest terms. Gassendi ranked Kepler and Galileo among his friends, and was himself the instructor of Molière. His principal work is entitled *De Vita, Moribus, et Placitis Epicuri* (1641), to which the *Syntagma Philosophiæ Epicuri* (1649) properly belongs. It contains a complete view of the system of Epicurus. His *Institutio Astronomica* (1645) is a clear and connected representation of the state of the science in his own day; in a later work he gave the biography of Tycho Brahe, Copernicus, and other astronomers, and a history of astronomy down to his own time. His works were collected and published in six volumes, at Leyden (1658), and at Florence (1728). Consult: Thomas, *La philosophie de Gassendi* (Paris, 1889); Martin, *Histoire de la vie et des écrits de Gassendi* (Paris, 1853); Kiefl, *Gassendie Erkenntnistheorie und seine Stellung zum Materialismus* (Fulda, 1893).

GASSER, gäs'ër, HANS (1817-68). An Austrian sculptor, born at Eisentratten, Carinthia. He studied in Vienna under Amerling, Klieber, and Kühssmann, and afterwards in Munich with Schwanthaler. His works include the statue of Adam Smith at Oxford, allegorical statues for the arsenal and other public buildings of Vienna, and the monuments to Wieland at Weimar, and Maria Theresa at Klagenfurt and Wiener-Neustadt. One of his best works is the "Donauweibchen" in the Vienna Stadtpark.

GASSER VON VALHORN, gäs'sër fön fäl'hörn. JOSEPH (1816-1900). An Austrian sculp-

tor, brother of Hans Gasser, born at Prägraten, Tyrol. First instructed by his father, a joiner and wood-carver, he studied afterwards at the Vienna Academy under Schaller, Klieber, and Kähssmann, and from 1845 to 1849 in Rome, whither he had gone with a Government stipend. After his return he executed for the portal of the Cathedral of Speier five statues of heroic size, representing "The Holy Virgin;" "Archangel Michael;" "John the Baptist;" "Saint Stephen;" and "Bernard of Clairvaux." Among the numerous works intrusted to him subsequently in Vienna, where he had settled in 1852, are to be noted the statues of Emperor Maximilian I., Frederick the Warlike, and Leopold of Hapsburg, in the Arsenal; the marble statues of the "Seven Liberal Arts," in the staircase of the opera house; twenty-four statues in Saint Stephen's Cathedral; and especially the sculptures for the Votivkirche, including the "Coronation of Mary," "Group of the Trinity," "Statue of the Redeemer," and the large bas-reliefs on the three main portals. He was professor at the Academy from 1865 to 1873, and a title of nobility was conferred on him in 1879.

GASSION, gá'syôn', JEAN DE (1609-47). A French general, born at Pau. He fought under the Prince of Piedmont in 1625, and under the Duke de Rohan in 1628. In 1629 he joined a troop of French volunteers and entered the service of Gustavus Adolphus. With him he fought at Leipzig (1631), and saved his life afterwards at the siege of Ingolstadt. As a reward the King gave him command of a regiment. He further distinguished himself at Nuremberg and Lützen. After the King's death he returned to France and fought bravely in the battles of Charmes and Neuchâtel, and at the sieges of Dôle, Hesdin, and Landrecies. In 1638 he was made *maréchal-de-camp* and materially assisted in the French victory of Rocroi (1643). He received the baton of a marshal of France in 1643. Four years afterwards he died from the effects of a wound received under the walls of Lens.

GASSNER, gäs'nër, JOHANN JOSEPH (1727-79). A priest who gained renown as an exorcist. He was born at Bratz, near Bludenz, in the Tyrol, and became a Catholic priest at Klösterle, in the diocese of Chur (1758). The accounts of demoniacs in the New Testament, with the writings of celebrated magicians, brought him to the conviction that most diseases are attributable to evil spirits, whose power can be destroyed only by conjuration and prayer. He began to practice on some of his parishioners, and succeeded in at least attracting notice. The Bishop of Constance called him to his residence, but having come to the conviction that he was a charlatan, advised him to return to his parsonage. Gassner betook himself, however, to other prelates of the Empire, some of whom believed that his cures were miraculous, and he gained influential supporters, although innumerable attacks were made upon his methods and the genuineness of his cures. Consult his life by Zimmermann (Kempten, 1787).

GAST, gäst, FREDERICK AUGUSTUS (1835—). An American clergyman of the Reformed Church in the United States, born at Lancaster, Pa. He graduated in 1856 at Franklin and Marshall College (Lancaster), studied at the Mercersburg Theological Seminary (now at Lancaster), and in '859-65 was pastor at New Holland, Pa. In

1865 he was chaplain of the Forty-fifth Pennsylvania Volunteers, in 1865-67 pastor at London and Saint Thomas, Pa., and in 1867-71 principal of the academy connected with Franklin and Marshall College. In 1871 and 1872 he was assistant professor in the college, from 1871 to 1873 a tutor in the Lancaster Theological Seminary, and in 1873 was appointed professor of Hebrew and Old Testament theology in the latter institution. His articles upon the Old Testament and allied subjects have been published in theological periodicals.

GASTEIN, gä'stîn. A valley in the Austrian Duchy of Salzburg, celebrated for its mineral springs. It is a side valley of the upper Salzach Valley, and is about 25 miles long and one and one-quarter miles broad, with an elevation of between 3000 and 3500 feet. It is traversed by the River Ache, which forms near Wildbad-Gastein two magnificent waterfalls, the upper, the Kesselfall, 200 feet, and the lower, the Bärenfall, 280 feet in height. The principal villages are Bockstein, Hof-Gastein, and Wildbad-Gastein. Hof-Gastein, with a number of old gold and silver mines in the vicinity, contains a military hospital, and in the open platz there is a bust of the Emperor Francis I., who in 1828 caused a conduit of upward of five miles in length to be constructed for the purpose of conveying the mineral waters thither from Wildbad. Wildbad, the principal watering-place, is a fashionable health resort, and contains a number of hotels and villas. The water of the springs is considered efficacious in the case of nervous and skin diseases.

GASTEIN, CONVENTION OF. A treaty concluded at Wildbad-Gastein, August 14, 1865, between Austria and Prussia, regulating the relations of these two powers with respect to the duchies of Schleswig-Holstein (q.v.) and Lauenburg, which they had taken from Denmark, and occupied in common. Schleswig was placed under Prussian administration, and Holstein under Austrian, while Lauenburg was annexed to Prussia. Austria ceding its share for 2,500,000 rix thalers. See GERMANY.

GASTEROMYCETES (Neo-Lat. nom. pl., from Gk. γαστήρ, *gastēr*, stomach + μύκης, *mykēs*, mushroom). The group of fungi that includes the puffballs. See BASIDIOMYCETES.

GASTINE, gä'stên', CIVIQUE (1793-1822). A West Indian reformer and author, born at Fort de France in the island of Martinique. In 1809 he began the study of law at Philadelphia, Pa., but, owing to views expressed in a public address regarding equality between whites and blacks, was obliged, in 1813, to make his escape to Paris. There he began, in 1815, to publish a journal called *L'Ami du Noir*, whose utterances frequently subjected him to imprisonment or fines. Finally, upon the publication of his *De la nécessité de faire un traité de commerce avec Haïti* (1821), he was banished. He proceeded to Hayti, where he was granted an annual pension of 5090 francs, and appointed Secretary of Foreign Relations. His further publications include an *Histoire de la république de Haïti* (1819), and an *Histoire de l'esclavage dans la Louisiane* (1820).

GASTINEAU, gä'stê'nô', BENJAMIN (1823—). A French author, born at Montreuil-Bellay. He was at first a printer, but afterwards became

a writer, and first attracted attention by a series of articles in *L'Ami du Peuple* in 1851, which led to his arrest and deportation to Algeria. He returned to France in 1854, but his connection with the *Guetteur de Saint-Quentin*, which he edited in 1856-58, brought upon him the displeasure of the Government, and he was again deported. After several years' absence he was again in France, and after the insurrection of March, 1871, was placed in charge of the Mazarin Library by the Communists. For this he was in the following year again sentenced to deportation (in his absence), but returned to France after the general amnesty. In addition to frequent contributions to the reviews, he published a large number of books, mostly of a political or historical nature, of which the most important are: *Lutte du catholicisme et de la philosophie* (1844); *Le bonheur sur terre* (1844); *La guerre des Jésuites* (1845); *L'orpheline de Waterloo* (1847); *Le régime de Satan, ou les riches et les pauvres* (1848); *Les femmes et les mœurs de l'Algérie* (1852); *Histoire de la folie humaine* (1862); *Les femmes des Césars* (1863); *Les génies de la liberté* (1865); *Les socialistes* (1865); *Les drames du mariage* (1865); *Les victimes d'Isabelle II.* (1868); *L'impératrice du Bas-Empire* (1870); *Le centenaire de Voltaire* (1878); *Les femmes et les prêtres* (1888); and *Les crimes des pêtres de l'église*.

GASTINEL, gâ'sténél', LÉON (1823-). A French composer, born at Dijon. He was a pupil of Halévy, and won the Prix de Rome for his cantata *Vélasquez* (1846). His operas include: *Le miroir* (1853); *L'opéra aux fenêtres* (1857); *Titus et Bérénice* (1860); and *Le buisson vert* (1861); and the oratorios, *Le dernier jour* (1853); *Les sept paroles*; *Saul*; *La fée des eaux*. He also wrote a cantata *Mexico* (1863), and several masses, symphonies, and overtures, besides chamber music and songs.

GASTON, gâ'stôn', MARIE. The nom-de-plume with which Alphonse Daudet signed the *Lettres de mon Moulin* (1866).

GASTON, WILLIAM (1778-1844). An American orator and jurist, born in Newbern, N. C., of French Huguenot descent. He graduated at Princeton in 1796, was admitted to the bar in 1798, and in the following year was elected to the North Carolina Senate. He was a Presidential elector in 1808, and from 1813 to 1817 was a Federalist member of Congress, where he achieved a reputation as an orator by an able speech in opposition to the Loan Bill in 1815. After his retirement from Congress he engaged actively in law practice, and added to his reputation as one of the most eloquent orators in the South. He was elected frequently to the North Carolina Legislature, where he was the framer of the act establishing the present Supreme Court of the State. After the disappearance of the Federal Party he became a Whig, and zealously opposed the South Carolina nullification doctrine. He served as a judge of the Supreme Court of North Carolina from 1834 until his death.

GASTON III., COMTE DE FOIX. See FOIX.

GASTON DE FOIX, de fwā, DUC DE NE-MOURS. See FOIX.

GASTORNIS (from *Gast-on* Planté, the discoverer of the bird + Gk. *δρυς*, *ornis*, bird). A genus, or perhaps a family (Gastornithidæ), of

extinct gigantic birds, larger than and related to the ostriches, whose bones are found in the Lower Eocene of France and England, and which is represented in coeval formations in the United States by the genus *Diatryma*. "In the European gastornis the component bones of the skull remained separate throughout life, and . . . there may have been a tooth on each side of the upper jaw." See BRONTORNIS.

GASTRÆA THEORY (Neo-Lat., from Gk. γαστήρ, *gastēr*, stomach). A theory propounded by E. Haeckel, according to which the gastrula stage in the development of animals (see EMBRYOLOGY) is a recapitulation of a hypothetical common ancestor—the gastræa; for just as the two-layered gastrula stage, although sometimes disguised by the presence of much yolk, is common in the embryological development of the Metazoa, so in their phylogenetic development there was a primitive type that was the starting-point from which all the various metazoan types have developed along diverging lines. The gastrula is the type which seems to be the common one in the embryological development of the Metazoa. The hypothetical phylogenetic type, the starting-point of the Metazoa, Haeckel named 'gastræa.' The Gastræidæ were supposed to be of world-wide distribution, and of many families and genera. The outer and inner layers of the gastrula and the gastræa Haeckel homologized with the ectoderm and endoderm of the Metazoa. This theory, however, should not be wholly ascribed to Haeckel, for the homologies of the germ-layers had already been pointed out by Kowalewsky, Von Baer, Remak, and others. Kowalewsky concluded from his embryological researches that the nervous layers and the ectoderm of insects and vertebrates are homologous, and that the germinal layers of Amphioxus and vertebrates correspond with those of ascidians and worms. Kowalewsky, indeed, believed "that the homologies of the general layers in the different types afford a scientific basis for comparative anatomy and embryology, and must be recognized as the starting-point for the proper understanding of the relationships of the types." The generalizations of Haeckel, although based largely on such work as Kowalewsky's, are much bolder than those just quoted.

The simplest and probably the most primitive gastrula seen in vertebrate development is that of Amphioxus. The blastula, or stage that is antecedent to the gastrula in Amphioxus, is composed of a single layer of cylindrical cells closely joined in the shape of a hollow sphere. At one place in this sphere, called the vegetative pole, the cells are larger and contain more yolk-granules than the cells of the rest of the circumference. The vegetative surface begins to flatten and then to push toward the inside of the sphere. This inpushing is termed 'invagination.' As the cavity formed by invagination grows larger, the original cleavage cavity in the sphere grows smaller, until finally it is wholly obliterated. The resulting individual is two-layered and cup-shaped with one large opening to the exterior, the primitive mouth or blastopore. This double-layered, cup-shaped individual is the gastrula, and its inner cavity is the primitive intestine. Neither this mouth nor the intestine is homologous with the mouth or the intestine of the adult animal. The two primary germ-layers of

the gastrula are known as ectoderm and entoderm. The outer or ectoderm is the sensitive layer, and the inner is the nutritive layer. C. E. von Baer calls them, in view of their function, the two primitive organs of the animal body. By the separation and differentiation of cells from one or the other, or both of these layers, all subsequent development and differentiation of the body is brought about. Embryonic stages quite like this of the *Amphioxus* are known to exist in the *Cœlenterata*, some *Scolecida*, *Echinodermata*, and some *Annelida*, in addition to those of the higher vertebrates.

As Huxley has pointed out, the *Porifera* and *Cœlenterata* very nearly approach the conditions of the gastræa. The fresh-water hydra and the microhydra, for example, are two-layered animals with a central digestive cavity surrounded by both layers and opening to the exterior at a point about the margins of which the two layers are continuous. This permanent mouth is the terminal aperture of the gastræa and serves both for the ingestion and extrusion of materials, while in the *Porifera* it serves as the permanent egestive opening only. Consult: Hæckel, "Die Gastræatheorie, die phylogenetische Classification des Thierreichs und die Homologie der Keimblätter" (Jena, 1874); "Die Gastrula und die Eifurchung der Thiere" (Jena, 1875); "Ursprung und Entwicklung der thierischen Gewebe: Ein histogenetischer Beitrag zur Gastræatheorie," (Jena, 1885), all published in *Zeitschrift für Tiermedizin*; Kowalewsky, "Weitere Studien über die Entwicklungsgeschichte des *Amphioxus lanceolatus*, nebst einem Beitrage zur Homologie des Nervensystems der Würmer und Wirbelthiere," in *Archiv für Mikroskopische Anatomie*, vol. xiii. (Bonn, 1877); Bütschli, "Bemerkungen zur Gastræatheorie," in *Morphologisches Jahrbuch*, vol. ix. (Leipzig, 1884).

GASTRITIS (Neo-Lat., from Gk. *γαστήρ*, *gastēr*, stomach). A disease in which the mucous membrane of the stomach is the seat of disordered action accompanied by inflammation. Acute gastritis may be of three forms: (1) *Acute catarrhal gastritis*, in which there is a feeling of fullness, production of gas in the stomach, nausea, slight pain, severe headache, often rise of temperature, possibly vomiting, diarrhœa or constipation, with furred tongue. It is caused by errors in diet, such as excessive quantities of food, ice-cold drinks, spiced or fermented food, or alcoholic beverages. It is very common, and, except in the aged, has a favorable prognosis. Emptying the stomach by washing with a tube or pump is good treatment in some instances. Some aperient is generally very desirable, and the stomach should be rested for about three days. (2) *Toxic gastritis* is caused by alcohol, phosphorus, arsenic, corrosive sublimate, chlorate of potash, mineral acids, caustic alkalies, etc. The symptoms are as given for acute catarrhal gastritis with vomiting of blood, torturing thirst, small pulse, cyanosis, cold perspiration, and even coma and death in grave cases. The treatment consists in antidoting the poison taken, and in

some cases washing the stomach. (3) *Purulent or phlegmonous gastritis*, in which variety small abscesses form in the submucous or muscular layer of the stomach walls. After dyspeptic symptoms for several days, burning pain, thirst, revulsion against food, fever reaching 103° to 105° F., small, irregular pulse, vomiting of mucus and bile, and generally diarrhœa follow. Death generally supervenes in from four days to two weeks.

In *chronic gastritis* the symptoms are as in the acute catarrhal form, persisting permanently, with constipation alternating with diarrhœa, pyrosis, scanty urine, cold hands and feet, coated tongue. There is generally a decrease in the secretion of gastric juice, and low acidity, as learned from a test meal. Diet and hygiene, occasional lavage, intragastric electrization, certain mineral waters, and very little drugging, help many cases to enjoy life for years.

PATHOLOGY. In acute catarrhal gastritis, the mucous membrane of the stomach is swollen and red, and coated with an increased amount of mucus, although the secretion of gastric juice is less than normal. The cells of the mucous membrane, both mucous and peptic, are swollen and granular, and there may be considerable infiltration of the intertubular tissue with serum and leucocytes. In the acute gastritis due to the taking of irritant poisons such as strong acids, caustic alkalies, corrosive sublimate, etc., the changes in the stomach are directly proportioned to the quantity and strength of the poison taken. Thus, strong acid in large quantities may not only destroy the entire mucous membrane of the stomach, but may cause extensive destruction of the deeper coats, even causing perforation. Smaller quantities destroy portions of the mucous membrane and underlying tissue, with consequent sloughing and cicatrization. In chronic gastritis the stomach may be of normal size, small, or enlarged. The mucous membrane may be thickened, or thinner than normal, and is usually coated with thick tenacious mucus. It may be red and congested, or of a dull gray color. There are atrophy of the gastric tubules and an increase in the tubular connective tissue. The stomach walls are sometimes greatly thickened from the formation of new fibrous tissue, and the capacity of the organ is thus greatly diminished. A form of gastritis characterized by the formation of a false membrane is known as croupous, membranous, or diphtheritic gastritis. In connection with suppurative processes in other parts of the body, there may be suppuration with abscess formation in the walls of the stomach, this condition constituting what is known as suppurative or purulent gastritis.

GASTROCHÆNA, *gāstrō-kē'nā* (Neo-Lat., from Gk. *γαστήρ*, *gastēr*, stomach + *χάλυξ*, *chalkein*, to gape). A genus of lamellibranchiate mollusks, having a delicate shell of two equal valves, gaping very much in front. The animal sometimes takes possession of an already existing cavity, which it often coats with a calcareous lining, so as to form a tube, to which the valves of its shell are cemented; sometimes burrows for itself in sand, coral, or calcareous rocks, and lines its hole with a shelly layer. One species (*Gastrochæna modiolina*), common in the Mediterranean, perforates shells and limestone, making holes about two inches deep and half an inch in diameter. The tubes of some of the tropical species

which live in sand are very curious. See WATER-ING-POT SHELL.

GASTROCNEMIUS, gās'trōk-nē'mī-ūs, **MUSCLE** (Neo-Lat. from Gk. γαστροκνήμη, *gastroknēmia*, calf of the leg, from γαστήρ, *gastēr*, stomach + κνήμη, *knēmē*, knee). The muscle which forms the greater part of the calf of the leg. It arises by two heads from the two condyles of the femur or thigh-bone, and is inserted through the tendo Achillis into the posterior part of the heel-bone. In man this muscle possesses great power, and is constantly called into use in standing, walking, leaping, etc. In walking it raises the heel, and with it the entire body from the ground; and, the body being thus supported on the raised foot, the other leg is carried forward. From its close association with the erect position, it is much less developed in other mammals than in the human subject.

GASTRO-ENTERITIS (Neo-Lat., from Gk. γαστήρ, *gastēr*, stomach + ἔντερον, *enteron*, intestine). An inflammatory disease of the stomach and small intestine resulting in disordered function, vomiting, and diarrhœa. In children the disease is called cholera infantum (q.v.). It is the 'summer diarrhœa' which proves fatal to so many infants fed on cow's milk from unclean bottles. In children it is ushered in by slight fever, fretfulness, diarrhœa, coated tongue, and loss of appetite. In a few days the diarrhœa becomes worse, the stools are thin, green, yellow, or brown, and contain undigested food and mucus, and their odor is very offensive. The infant becomes pale, and rapidly emaciates. It may improve from this point and recover in a week; or it may suddenly suffer from a rise of temperature to 103° or 105° F., cry much, evince great thirst, and exhibit a weak pulse. Stupor, sunken eyes, general relaxation, and even convulsions may follow. Vomiting supervenes on taking any food or water, and death results from exhaustion. The treatment includes: change of air to a cooler climate, or an excursion into the country, or on the salt water three times a week; out-of-door life, in hammock or carriage, sponge bathing to allay restlessness and fever, scrupulous cleanliness, withholding all food for twelve to twenty-four hours, allaying thirst with small quantities of barley water, followed by nursing every four hours, for two or three minutes at a time, washing out the stomach once, in the worst cases, and irrigation of the large intestine by means of a tube, after giving a laxative, repeating the irrigation two or three times a day. A saline solution of one ounce to the gallon, at 80° F., is preferable. Subgallate or subnitrate of bismuth, calomel, salicylate of sodium, salol, hydrochloric acid, opium with great care in selected cases, and stimulants, all have their value.

Gastro-enteritis of adults is discussed under CHOLERA. See also ENTERITIS.

GASTRO-ENTERITIS (in cattle). The chief symptoms of this disease in cattle are dullness, dry skin, fullness of the left flank, and staring coat—the hair standing on end. The pulse is weak, the gait staggering, and the bowels constipated. The animal grunts with each breath, especially when lying down, and dies in convulsions. The more common causes of the trouble are too long intervals between feeding, sudden

changes of diet, sudden checking of perspiration, and violent exercise immediately after eating.

When the disease is supposed to originate from imperfectly digested food, one pint of castor-oil should be given, followed by liberal doses of linseed tea, to which carbonate of magnesia has been added. This may be administered three or four times daily along with ten drops of tincture of aconite.

GASTROMANCY. See SUPERSTITION.

GASTROPODA (Neo-Lat. nom. pl., from Gk. γαστήρ, *gastēr*, stomach + πούς, *pous*, foot). A class of mollusks characterized by having a distinct head, usually bearing eyes and tentacles, and moving by a large creeping disk or 'foot.' The head and foot are bilateral, but the rest of the body (except in Patella, etc.) is unsymmetrical. The animal is usually protected by a single or univalve shell, which is more or less spirally coiled, inclosing the visceral mass, i.e. heart, stomach, liver, and reproductive glands. Moreover, these mollusks have, besides two pharyngeal horny teeth, a rasp-like lingual ribbon (radula) forming a part of the odontophore situated in the mouth or buccal cavity. There are, in the typical forms, two plume-like gills (ctenidia) inclosed in a mantle-cavity, but there may be only one, while in the air-breathing forms (Pulmonata, or land-snails) the animal breathes the air through the wall of the mantle-cavity itself, which forms the pulmonary sac or lung. The 'foot' is a broad creeping disk, situated behind the head, and it is usually seen from beneath to be broad and flat. See illustration under FIG-SHELL.

STRUCTURE. A heart contained in its pericardial sac is always present, except in the parasitic Entoconcha, while in some genera, as Neritina (periwinkle) and Haliotis (abalone), it, as in the clam, is perforated by the intestine. In a few genera there are two auricles to the heart, but as a rule only one is present. A ventricle is always present. There is but a single kidney (nephridium). The digestive canal is doubled on itself, the vent opening on one side of the mouth. In certain opisthobranchs the stomach is lined with series of teeth, sometimes sharp and chitinous. In some nudibranch gastropods (see NUDIBRANCHIATA) the intestine has numerous lateral offshoots, or gastro-hepatic branches, which resemble similar structures in the planarian and nematode worms.

The nervous system varies in the number of ganglia, but is usually represented by the 'brain,' a pair of supraœsophageal ganglia, with connecting threads (commissures) passing around the gullet to the infraœsophageal or pedal ganglia, thus forming the œsophageal nerve-ring; there are also a pair of buccal ganglia, while the visceral and abdominal ganglia, all connected by commissures, are situated at a varying distance from the head. The ears, or 'otocysts,' are usually near the pedal ganglia, but are always innervated from the cerebral ganglion, or 'brain.'

The animal in certain forms is bisexual or hermaphroditic, in others the sexual glands exist in separate individuals. The eggs are laid in capsules of various sizes and shapes, usually attached to seaweeds or rocks, or deposited freely in the sand. Land-snails lay their eggs loose under stones or leaves in damp places. The embryo on hatching passes through a well-marked metamorphosis,

the two more important stages being the trochosphere and veliger, the latter differing from the trochosphere or top-shaped primitive stage in swimming about by means of a pair of sail-like flaps.

Soon after the shell of a gastropod begins to form, the foot grows larger, the eyes and tentacles appear, when the young sinks by gravity to the bottom and gradually assumes the snail condition of maturity. The eyes may be absent

A YOUNG GASTROPOD.

'Veliger' stage: v, velum; f, foot; o, operculum; br, gill-chamber; sh, primitive shell.

in those marine forms which actively burrow in the sand, though the single pair of tentacles persists. In the land-snails there are two pairs of tentacles, the upper and longer pair containing both the eyes and the optic nerve with the olfactory nerve, which ends in groups of cells.

A distinctive feature in gastropods is the 'odontophore,' an apparatus of muscles bearing the radula or 'lingual ribbon,' a solid flattened ribbon-like or rasp-like plate armed with transverse rows of sharp siliceous teeth. This rasp is drawn back and forth over a tendon like a pulley. By means of this rasp the land or pond snail cuts slits into leaves, swallowing the pieces, or the marine forms, such as the *Sycotypus* (see COXCH) or the 'drill,' files a hole into the clam or oyster, so as to get at the flesh within the tightly closed shell of its victim.

Certain forms, as the *Murex* (q.v.) of the Mediterranean, secrete the Tyrian dye of the ancients, and a similar fluid is secreted by the com-

STRUCTURE OF A GASTROPOD.

1. Diagram of the structure of a gastropod (the common whelk). f, muscular 'foot'; op, operculum; t, one of the tentacles or feelers; e, eye-stalk, at the base of the tentacle; p, proboscis, retracted, with the mouth at its extremity; oe, gullet; g, stomach; l, intestine, terminating in the anus; n, n, salivary glands; l, liver and ovary; ov, oviduct; h, heart; bc, gill, contained in a hood of the mantle; s, breathing-tube or siphon; c, c, main nerve-ganglia. 2. Shell, with animal removed; a, spire whorls, separated by sutures; b, body whorl; m, outer lip of 'mouth'; n, notch for the siphon at the base of columella. 3. Egg-capsules of the whelk.

mon *Purpura* of our coast. This fluid is formed in a peculiar 'adrectal gland' situated at the side of the rectum. It is colorless, but turns purple on exposure to the air.

The shell of different gastropods varies greatly in shape. In the limpets (*Patella*) it is low and conical; in most of the species it is spiral, made up of whorls. The greater number of shells are 'dextral,' i.e. the spire turns to the right; in a few cases they are sinistral or turn to the left.

Over 22,000 species are known, of which about 7000 species are fossil; there are about 6500 species of land-snails alone.

CLASSIFICATION. Gastropods are divided into two subclasses: (1) Streptoneura, "in which the visceral commissures are twisted into a figure of 8, and in which the sexes are distinct;" and (2) Euthyneura, in which the visceral commissures are not so twisted, and in which the sexes are united. The former contains the order Aspidobranchia, which includes the limpets, ear-shells, top-shells, turban-shells, etc.; and the order Pectinibranchia, which contains the bulk of the other marine shell-bearing forms. The latter subclass also has two orders: Opisthobranchia, containing the sea-hares (*Aplysia*), pelagic pteropods, etc.; and Pulmonata, containing the land and fresh-water air-breathing snails and slugs.

FOSSIL GASTROPODS. Gastropod shells are found in all the geological formations from those of lowest Cambrian age to those of recent time, and they occur usually in abundance in those formations above the Cambrian. The earliest forms are limpet-like shells (*Scenella*) and a capulid (*Stenotheca*) in the *Olenellus* zone of the Lower Cambrian system. Very soon, in the Upper Cambrian a few turreted gastropods appear (*Raphistoma* and *Straparollina*). These true gastropods are in the Cambrian associated with a host of slender conical shells, the hyolithids, which are often classed with the pteropods, but which should more properly be placed with the tubicolous worms.

In the Ordovician the gastropods are widely differentiated and are represented by numerous genera and abundant individuals, with such well-known forms as *Pleurotomaria*, *Bellerophon*, *Raphistoma*, *Murchisonia*, *Maclurea*, *Euomphalus*, and others. In the Silurian a further evolution has taken place, manifested principally in the increased ornamentation of genera that come up from the Ordovician, and in the creation of new genera from those already existing. Some of the important forms are *Loxonema*, *Murchisonia*, *Platyostoma*, *Pleurotomaria*, *Bucania*, *Trematonotus*, *Euomphalus*. The Devonian formations are still richer in species and are characterized by such forms as *Loxonema*, *Turbo*, *Euomphalus*, *Platyostoma*, *Platyceras*, *Acroculia*, *Macrocheilus*. In the Carboniferous the same genera are present with the addition of *Naticopsis*, *Vermetus*, and *Actæonina*. The Permian gastropod fauna is about the same as that of the Carboniferous. The majority of the Paleozoic gastropods belong to the more primitive, less specialized subclass of the Streptoneura, and especially to the order Aspidobranchia, and it is worthy of note also that the Paleozoic genera are as a rule holostomatous, i.e. they have shells with non-siphonate apertures.

The Triassic formations at the beginning of the Mesozoic show important changes in the gastropod fauna. The Paleozoic pteropods have dropped out; the *Bellerophon*idae, the Devonian *Platyceridae* and *Platyostomidae* have disappeared,

and the euomphalids have become less abundant, and a new type of shell, the siphonostomatous, appears with the families Cerithiidae and Melaniidae, in which the siphon is, however, shorter than in the later members of these families. The important genera are Chemnitzia, Loxonema, Rissoa, Eulima, Trochus, Turbo, Pleurotomaria, Cerithium, Helcion. In the Jurassic the Valvatidae, Viviparidae, Melaniidae, Aporrhaidae, Strombidae, Columbelloidae, Cypræidae begin their existence and the fauna is strongly siphonostomatous. One Jurassic family, the Nerineidae, which began in the Trias and continued into the Cretaceous, is a very characteristic Mesozoic shell, that may be recognized by its slender turreted spire, resembling that of its allies the Cerithiidae, and by the peculiar longitudinal septa that project from the columella and walls of the whorls into the central cavity of the shell.

The Cretaceous ushers in another lot of families: Solariidae, Cassididae, Doliidae, Tritonidae, Buccinidae, Muricidae, Purpuridae, Volutidae, Olividae, Cancellaridae, Pleurotomidae, Conidae, in fact, all the more specialized families of the Ctenobranchiata, including more pronounced siphonate forms. The gastropods hold third rank among the Cretaceous mollusks, being excelled by the clams and cephalopods. In the Tertiary the gastropods rise to first rank. Among the few new families appearing in the Tertiary the more important are the Harpidae and Ovulidae. The siphonostomate shells attain here their highest development, and are more prominent than any others. All the Tertiary forms are closely allied to modern forms; indeed, the majority of the Pliocene fossils and a small per cent. of the Miocene species are still living in the modern ocean. At the present day the gastropods are enjoying rapid progressive evolution.

The history of terrestrial and fresh-water gastropods is interesting. The earliest form known is Pupa, found in the Devonian beds of Saint John, N. B., while a Pupa and a Zonites, remarkably close to the existing species, have been found in the coal measures of the Carboniferous. In the Mesozoic are found numerous fluviatile genera, such as Planorbis, Melania, Hydrobia, Valvata, Physa, Limnaea, Amnicola, and Carychium. In the Cretaceous appear, in addition to those already cited in the Jurassic, Vivipara, Glandina, Bulimus, Goniobasis, Lioplax, Pleuroceras, and in the Tertiary deposits the land and fresh-water snails are quite as abundant as they are at the present time.

Some interesting evolutionary series have been worked out among fossil gastropods. Neumayr has shown how Vivipara of the Miocene beds of Slavonia starts in the lower layers as smooth shells with rounded whorls, and changes, or evolves, through the succeeding overlying beds by successive intermediate stages into a more elevated shell, with concave whorls and nodose surfaces, that occurs only in the highest beds. Hilgendorf, and afterwards Hyatt, showed the peculiar transformations of Planorbis in the fresh-water Miocene beds of Steinheim, Württemberg. Other similar evolutionary series have been worked out for the Melaniidae, Cerithiidae, Volutidae, Mitridae, and Turritellidae.

1897); Fischer, *Manuel de conchyliologie et de paléontologie conchyliologique* (Paris, 1897); Tryon and Pilsbry, *Manual of Conchology* (16 vols., Philadelphia, 1879-96); Pelseneer, *Introduction à l'étude des mollusques* (Brussels, 1894); Lang, *Text-book of Comparative Anatomy*, translated by Bernard, vol. ii. (London and New York, 1896), which contains an excellent bibliography of gastropod anatomy and physiology; Walther, "Die Lebensweise der Meeresthiere," in *Einleitung in die Geologie*, part ii. (Jena, 1893); Gould, *Invertebrates of Massachusetts*, edited by Binney (Boston, 1870). For fossil gastropods, see Von Zittel and Eastman, *Text-book of Paleontology*, vol. i. (London and New York, 1900), where a good bibliography of fossil gastropods is given; see also Ulrich and Scofield, "The Lower Silurian Gastropoda of Minnesota," in *Minnesota Geological and Natural History Survey, Paleontology*, vol. iii., part ii. (Minneapolis, 1897); Lindström, "On the Silurian Gastropods and Pteropods of Gotland," in *Kongliga Svenska Vetenskaps-Akademiens Handlingar*, vol. xix., No. 6 (Stockholm, 1884); and Dall, "Contributions to the Tertiary Fauna of Florida," in *Transactions of the Wagner Free Institute of Science*, vols. iii. and iv. (Philadelphia, 1895-97). See articles on MOLLUSCA, and on the various families and genera of gastropods.

GASTROSTOMY (from Gk. γαστήρ, gastēr, stomach + στήμα, stoma, mouth). An operation which is performed for the relief of stricture of the gullet. Its object is to relieve the patient from the imminent risk of starvation, by introducing food directly into the stomach through an external opening. The well-known case of Alexis Saint Martin, and numerous experiments on the lower animals, first led to the introduction of the operation as a practical surgical procedure.

GASTROTOMY (from Gk. γαστήρ, gastēr, stomach + τομή, tomē, a cutting, from τέμνω, temnō, to cut). An incision into the cavity of the abdomen (q.v.) for the purpose of removing some diseased structure or foreign body. The term has also been applied to the Cæsarean operation (q.v.).

GASTRULA. See EMBRYOLOGY; GASTRÆA THEORY.

GASZYNSKI, gâ-shîn'skê, KONSTANTY (1809-66). A Polish poet, born at Malawies. He fought in the insurrection of 1830, and afterwards went to France and settled at Aix in Provence. During this exile he wrote much verse and prose, which has frequently been translated into French. His sonnets are particularly elegant. His works include: *Poczye* (1844); *Sicilanka młodości* (1855); *Rzeczy pamiętnikow Macieja Rogowskiego* (1847); *Kontuszoire pogadanki* (1851); *Listy z podróży po Włoszech* (1853); and *Pan Decydery Boczek* (1846). He also contributed to magazines and newspapers. His complete works were published in 1870-74.

GATA, gâ'tâ, CAPE DE. See CAPE DE GATA.

GATACRE, gât'â'kêr, Sir WILLIAM FORBES (1843-). An English soldier. He entered the Seventy-seventh Foot in 1862, passed at the Staff College in 1874, and from 1875 to 1879 was instructor in surveying at the Royal Military College. In 1889-90 he commanded the Mandalay Brigade, and in 1898 was in command of the

British forces in the Sudan during the first march against Atbara. He also commanded the British division in the advance against Khartum and Omdurman, and was assigned to the command of the troops of the Eastern District. During the Second Boer War he commanded the third division of the South African Field Force. He attained the rank of lieutenant-general.

GATAKER, gät'a-kër, THOMAS (1574-1654). A Puritan clergyman, critic, and author, born in London. He was educated at Saint John's College, Cambridge, and in 1596 was nominated a fellow of Sidney Sussex College. In 1601 he became lecturer at Lincoln's Inn, and from 1611 was rector of Rotherhithe (Surrey). He declined the mastership of Trinity College, Cambridge, and in 1643 was appointed a member of the Westminster Assembly of Divines. In 1645 he was elected one of seven empowered for draughting a confession of faith. He was a scholar of unusual acquirements in Hebrew and the classics. His *Marcus Antoninus de Rebus Suis* (1652), with the Greek text accompanied by a version and commentary in Latin, has been called by Hallam "the earliest edition of any classical writer published in England with original annotations." He also prepared commentaries on Isaiah, Jeremiah, and Lamentations for the Assembly's *Annotations* (1645, 1651). His *Opera Critica*, including a *De Novi Instrumenti Stylo Dissertatio* (1648), were edited by Witsius (Utrecht, 1698). Several controversial writings and a collection of sermons (1637) also appeared from his pen. Consult Brook, *The Lives of the Puritans* (3 vols., London, 1813).

GATCHINA, gä'chè-nä. A town of Russia in the Government of Saint Petersburg, situated about 23 miles south-southwest of the capital on a small lake formed by the Izhora (Map: Russia, D 3). It is especially worthy of mention for its imperial palace, constructed in 1770, which contains 600 rooms, a theatre, and art collections. It is surrounded by a magnificent park. It originally belonged to Prince Orloff, who received it from Catharine II. After his death it reverted to the Crown and became the favorite summer residence of Czar Paul I., who bestowed municipal rights upon the town in 1797. Gatchina is a very popular summer resort with the residents of the capital. Population, in 1897, 14,735.

GATE CITY. A popular name for Keokuk, Iowa, from its situation at the head of navigation on the Mississippi, and for Atlanta, Ga., which was so named by Jefferson Davis on account of the importance of its position.

GATE HOUSE PRISON. A prison in Westminster, London, from which, on October 29, 1618, Sir Walter Raleigh was led to the scaffold in Old Palace Yard.

GATE OF THE LIONS. See LION GATE.

GATE OF THE MEDITERRANEAN. The Strait of Gibraltar, as the passage between the Atlantic and the Mediterranean.

GATES, HORATIO (1728-1806). An American soldier, prominent in the Revolutionary War. He was born at Malden, Essex County, England, his parents being servants in the household of the Duke of Leeds. He entered the army when very young, came to America in 1755, and, as major, served under Braddock (q.v.) and was severely

wounded at the defeat of the latter on July 9th of the same year near Fort Duquesne (Pittsburg). In 1760 he was stationed, as brigademajor, under General Monckton, at Fort Pitt (Pittsburg), and in 1762 was Monckton's aide at the capture of Martinique. Buying a farm in Berkeley County, Va., in 1763, he lived there in retirement until July, 1775, when Congress appointed him adjutant-general in the regular army, with the rank of brigadier. In 1776 he was appointed to the command of the army which had lately retreated from Canada, and immediately began intriguing to supplant General Schuyler as the commander of the Northern Department. This he did through the influence of the New England delegates in Congress, on August 2, 1777. The army under his command, after fighting the battles of Stillwater and Saratoga, forced Burgoyne to surrender on October 17th. (See SARATOGA, BATTLES OF.) Gates received nearly all of the credit, though Schuyler, Arnold, and Morgan had done most of the work, and he had been conspicuous chiefly for incapacity and for an apparent lack of personal courage. Soon afterwards he entered into the schemes of the Conway Cabal (q.v.), whose object was to have him appointed, in Washington's stead, as commander-in-chief. For a time he was president of the newly organized Board of War, but was detected in several falsehoods, became discredited, and withdrew in 1778 to his farm in Virginia, where he remained until 1780, when he was put in command of the Army of the South. Owing chiefly to his wretched generalship, his forces were totally defeated near Camden, S. C. (q.v.), on August 16th by Lord Cornwallis, and on December 2d he was superseded by General Greene. A court of inquiry, appointed to investigate his conduct, sat until 1782, and finally acquitted him. He then again retired to his Virginia farm, and lived there until 1790, when, after freeing his slaves, he removed to New York City, where he remained until his death, April 10, 1806. Personally, he was handsome, affable, and courteous, and in society was a general favorite. For his part in the Saratoga campaign, consult Stone, *Campaign of Lieutenant-General Burgoyne* (Albany, 1877).

GATES, LEWIS EDWARD (1860-). An American critic, born at Warsaw, N. Y. A graduate of Harvard, he has been chiefly connected with that institution in the departments of English and comparative literature. He has won reputation as a subtle critic, especially by his essays on Cardinal Newman, Francis Jeffrey, and Matthew Arnold prefixed to volumes of selections from their writings edited for use in colleges. Among his other books may be named *Studies and Appreciations* (1900).

GATES, MERRILL EDWARDS (1848-). An American educator. He was born at Warsaw, N. Y., the son of Seth Merrill Gates (q.v.), graduated at the University of Rochester in 1870, and from 1870 to 1882 was principal of the Albany Academy. From 1882 to 1890 he was president of Rutgers College, and from 1890 to 1899 was president of Amherst College. He became widely known through his efforts to promote education, civil-service reform, and ballot reform, and in 1884 was chosen chairman of the United States Board of Indian Commissioners. Among his publications are: *Sidney Lanier, Poet and Artist*;

Land and Law as Agents in Educating the Indians; and International Arbitration.

GATES, SETH MERRILL (1800-77). An American lawyer, born at Winfield (Herkimer County), N. Y. He was admitted to the bar in 1827, and in 1833 was elected to the State Legislature of New York. In 1838, and again in 1840, he was elected a member of Congress, and in 1848 was defeated as the Free-Soil candidate for the Lieutenant-Governorship of New York. He draughted, in 1843, the protest signed by the Whigs in Congress against the annexation of Texas to the Union. In 1838 he became editor and proprietor of the *Le Roy Gazette*. So pronounced was he in his hostility to slavery that a Southern planter offered a reward of \$500 for his apprehension.

GATES, Sir THOMAS (?-c.1621). The first regular Colonial Governor of Virginia under the Virginia Company. He was born probably at Colyford, Devonshire, England; entered the military service; accompanied Sir Francis Drake on his voyage to America in 1585-86, and for his conduct at the capture of Cadiz was knighted in June, 1596. In 1598 he entered Gray's Inn, and in the following year was engaged in public service at Plymouth; but soon afterwards he enlisted, together with Sir Thomas Dale (q.v.), in the service of the Netherlands. He was one of the first petitioners for royal license to colonize Virginia and was one of the incorporators of the first Virginia charter of 1606. Having obtained a leave of absence from the States-General, he was chosen the first Deputy Governor of Virginia, and was placed in command, with Sir George Somers and Captain Newport, of the fleet of nine vessels, carrying 500 colonists, which sailed for America in 1609. The *Sea Venture*, carrying Gates, Somers, and Newport, was wrecked on the Bermudas, where, within the next nine months, two new vessels were constructed. Leaving the Bermudas on May 10, 1610, Gates arrived at Jamestown in May, near the close of the 'starving time,' and was installed with great ceremony as Deputy Governor, replacing George Percy, the retiring president of the King's Council. The famished colonists clamoring to be taken from Virginia, Gates crowded them upon four small vessels and started with them for England, but was met at the mouth of the James River and turned back by Lord De La Warr (q.v.), who, in turn, was installed as Governor. Gates was sent to England for a new supply of cattle; returned to Jamestown in 1611 with six ships and 300 colonists, and remained as Lieutenant-Governor until March, 1614. He afterwards served on one of the committees of the Virginia Company, and in 1620 was appointed by James I. one of "the first moderne and present Council established at Plymouth, in the County of Devon, for the planting, ruling, and governing of New England in America." For an account of the administration of affairs in Virginia by Gates, consult Brown, *The First Republic in America* (Boston, 1898).

GATESHEAD. A large manufacturing town in Durham County, England, on the south bank of the Tyne, opposite Newcastle, of which it is practically a suburb, and with which it is connected by three bridges (Map: England, E 2). The community is almost entirely industrial, and

finds employment in the neighboring coal-mines, in the Gateshead Fell quarries celebrated for 'Newcastle grindstone,' in the locomotive works of the Northeastern Railway, in iron ship-building yards, iron-foundries, cable and wire-ropes factories, and in chemical, cement, and glass works. At Gateshead a large portion of the first Atlantic cable was manufactured. Its history dates from the Roman occupation, and some portions of the town are very ancient. The chief architectural features are the town hall, free library, various denominational churches, and the restored parish church of Saint Mary's, established in the eleventh century, and in 1080 the scene of Bishop Walcher's murder by an avenging English mob. Daniel Defoe's dwelling, where he wrote *Robinson Crusoe*, is in the Hillgate district. The town owns a profitable corporation quay, and maintains baths, wash-houses, cemeteries, public parks, recreation grounds, and public libraries. There are steam tramways; gas and water are supplied by private companies. Gateshead sends a member to Parliament. Population, in 1891, 85,000; in 1901, 110,000. Consult Welford, *History of Newcastle and Gateshead* (Newcastle-on-Tyne, 1884-85).

GATESVILLE. A city and the county-seat of Coryell County, Tex., 45 miles west of Waco, on the Leon River and on the Saint Louis Southwestern Railroad (Map: Texas, F 4). It is the seat of the State House of Correction and Reformatory. The city ships cotton, grain, and live stock, and has cotton gins and compress, flouring and planing mills, etc. Population, in 1890, 1375; in 1900, 1865.

GATEWAY. The passage or opening in which a gate or large door is hung. This may be either a mere opening in a wall or a covered way vaulted or roofed over. It differs from a doorway in that it does not open directly into a building. A monumental gateway and doorway are often both called a *portal* (q.v.). The gateway, being a most important point in all fortified places, is usually protected by various devices. It is flanked by towers with loopholes, from which assailants may be attacked, and is frequently overhung by a machicolated battlement, from which missiles of every description were poured upon the besiegers. City gates, and gates of large castles, have in all ages been the objects of great care in construction; and when from some cause, such as the cessation of constant fighting, or a change in the mode of warfare, gateways have lost their importance in a military point of view, they have maintained their position as important architectural works, and where no longer useful, have become ornamental. In very ancient times, we read of the 'gate' as the most prominent part of a city where proclamations were made, and where the kings administered justice. This was especially the case in the Orient, where the gateway held the same place as the Greek *agora* and the Roman Forum, business of all kinds being transacted there. Hence the modern term 'The Sublime Porte' used of the Turkish Government. Such gateways are often mentioned in the Old Testament, and the great Assyro-Babylonian city gates, especially those of Sargon's city, at Khorsabad (q.v.), illustrate the texts. They were great inclosures with cool passages and courts where scribes, venders, and lawyers sat. The Greek and Roman

gates were frequently of great magnificence. The Propylæa at Athens is a beautiful example, and the triumphal arches of the Romans were often identical with their city gates. The Lion Gateway at Mycenæ and the city gates of Segni and Alatri in Italy are good examples of early Cyclopean structures before the seventh century B.C. Those at Frentino, Viterbo, and Falerii show the pre-Roman arched style. The Roman gates at Verona, the Golden Gateways at Jerusalem, the gates at Spalato and Benevento, and others in Gaul, Syria, Asia Minor, and North Africa show every variety of design and number of openings. In the Middle Ages the city gateways were often crowned by towers of imposing architecture, especially in North Germany, as in Lübeck and Nuremberg, and the same was the case with the gateways of bridges and secular buildings, such as those of Oxford and Cambridge. The castle gateways, of which many remain, have but seldom any decorative character, being for defense, but the monastic doorways, leading into the great inclosed courts, were often architecturally beautiful, as in the Cistercian monastery at Casamari in Italy, with its double porch, porter's lodge, and living-rooms. The abbey gates of Canterbury and Bury Saint Edmund's are well known. All closes, whether of abbeys, colleges, law courts, guilds, fraternities, or the like, had architectural gateways. The Gothic Renaissance and Rococo styles are especially rich in designs, which have been followed by modern architects. Parks, private grounds, and avenues are often entered through such gates.

GATH (Heb., wine-press). One of the five cities of the Philistines. It was probably situated at the modern Tell es-Safiyeh, 'the white hill'; though the Crusaders identified it with Yebna, the ancient Jamnia, and some modern scholars have adopted this view. The first mention of Gath is in the list of Palestinian towns conquered by Thothmes III., where it is referred to as Kntu (Kintu). In the Amarna letters it occurs several times as Gimti and Ginti, there being an Egyptian governor in this city in the time of Amenhotep IV. Its position on the borders of Judean territory made it of great importance in the wars with the Philistines. The Philistine champion Goliath (q.v.) came from Gath (I. Sam. xvii. 4). David took refuge with Achish, King of Gath (ib. xxi. 10), and probably also obtained a wife in Gath. It is possible that Gath was in the hands of the Israelites in the time of David. Whether Solomon and Rehoboam were able to keep it cannot be determined in view of the probable late date of the statements. During the wars with Assyria Gath seems to have formed a part of Ashdodite territory. Sargon mentions in the Khorsabad inscription that he besieged and conquered Gimtu, probably in the year B.C. 711. The absence of Gath in many passages where the other Philistine cities are mentioned may be accounted for by its being regarded as a dependency of Ashdod. In the days of Eusebius and Jerome the city still existed, and the description of the site in the *Onomasticon* seems to point to Tell es-Safiyeh. At this place the *Blanca Guarda* was erected by Foulques of Anjou in 1144. The fortress was taken by Saladin in 1191, and recaptured and fortified by Richard in 1192. Situated on a hill 300 feet above the plain

with steep walls upon three sides, it was at all times a difficult place to capture and an important stronghold. There is to-day a small village on the top of the hill. Consult: Smith, *Historical Geography of the Holy Land* (London, 1895); Buhl, *Geographie des alten Palästina* (Leipzig, 1896).

GÂTHÂS, gâ'thâz (Av. *gâtha*, Skt., Pali *gêthā*, song). The name applied to certain metrical compositions, both in the Avesta and in Sanskrit Brahmanic and Buddhistic literature. The Gathas of the Avesta comprise 17 hymns (Yasna 28-34, 43-51, 53), which contain 232 stanzas, besides three in Yasna 27. 13-14 and Yasna 54. They are composed in five metres, which are reckoned by the number of feet, not by their quantity, as in Greek and Latin. These metrical schemes, which are of great antiquity, are composed respectively of three-line stanzas of 7 + 9 (or sometimes 8) syllables (Ahunavaiti), five-line stanzas of 4 + 7 syllables (Ushtavaiti), four-line stanzas of 4 + 7 syllables (Spentamainyu), three-line stanzas of 7 + 7 syllables (Vohukhshathra), and four-line stanzas, whose first two lines have 7 + 5, and the last two 7 + 7 + 5 syllables (Vahishtoishiti). The dialect in which these hymns are written differs considerably from the ordinary Avesta, and is more archaic in character. If we may reason on the analogy of the Gathas of the Buddhist Jatakas (q.v.), where verse alternates with prose, it might be plausibly suggested that the Avesta Gathas represent but a small part of the original content of this portion of the Zoroastrian Scriptures. There may have been a large amount of prose between the stanzas which has been lost. The Iranian tradition ascribes the authorship of the Gathas to Zoroaster (q.v.) himself. They are of peculiar difficulty, owing in part to the inflectional system of the Gatha-Avesta dialect, and in part to the numerous words which occur but once in them and have no representatives, so far as known, in any other Indo-Iranian or even Indo-Germanic language. Their interpretation is aided, however, to a large degree, by a Pahlavi version with glosses, which was translated into Sanskrit by a Parsi priest, Neryosangh, probably about A.D. 1200. These versions, while important, are not altogether trustworthy, mainly on account of the decay of grammatical knowledge of the Avesta language. They are, notwithstanding, indispensable in interpreting the Gathas, and mainly through their aid the meaning of the hymns is now for the most part tolerably certain.

In India the term Gatha was employed in the Brahmanas (q.v.) to denote verses of religious content which did not belong to any of the four Vedas. (See VEDA.) It became wider in its scope in the Buddhistic literature, and denoted especially that part of the sacred canon which comprised the Dhammapada, Theragatha, Therigatha, and the pure verse sections of the Suttanipata, and also to the verses in the Jatakas. It is most commonly applied, however, to the North Buddhist Lalita-Vistara (q.v.), composed in verse mingled with prose. This work is in a dialect, probably artificial, of Prakrit words with Sanskrit terminations, and on account of this peculiarity the language of the Lalita-Vistara is often called the Gatha dialect, although prose works were sometimes written in it. Consult: Haug, *Die fünf Gâthâs* (Leipzig, 1858-60); Bartholomæ, *Die Gâthâs und heiligen Gebete des altiranischen*

Volkes (Halle, 1897); Mills, *A Study of the Five Zarathushtrian [Zoroastrian] Gāthās* (Oxford, 1892-94); id., *A Dictionary of the Gāthic Language of the Zend Avesta* (ib., 1901 et seq.); id., *The Gāthās of Zarathushtra [Zoroaster] in Metre and Rhythm* (ib., 1900); Müller, "Der Dialekt der Gāthās des Lalitavistara," in *Beiträge zur vergleichenden Sprachforschung*, vol. viii. (Berlin, 1876). See *AVESTA*; *LALITA-VISTARA*; *ZOROASTER*.

GATINEAU, gā'tè'nō'. A large river of Quebec, Canada, rising in a connected chain of large lakes immediately north of the forty-eighth parallel of latitude (Map: Canada, P 7). It flows first south-southwest, and then almost due south, and falls into the Ottawa one mile below Ottawa City. The length of the river is estimated at 400 miles; it receives a number of tributaries, and is extensively used for floating down the lumber of the upper region.

GATLING, RICHARD JORDAN (1818-1903). An American inventor. He was born in Hertford County, N. C., and during his boyhood he acquired considerable skill and mechanical acumen working as his father's assistant in the perfection of a machine for sowing cottonseed. His principal invention, and the one by which he became famous, was the revolving gun, since known by its inventor's name. In 1886 he invented a new gun-metal of steel and aluminum. Congress afterwards voted him \$40,000 to experiment on a new method of casting cannon. Among his other inventions may be noted a hemp-breaking machine and a steam plow. Although a graduate of the Ohio Medical College (1850), he never practiced medicine. See *MACHINE GUN*; *ORDNANCE*.

GATSCHET, gā'shā', ALBERT SAMUEL (1832—). An American philologist and ethnologist, born at Saint Beatenberg, Bern, Switzerland. He studied at the universities of Bern and Berlin, made investigations regarding the Swiss dialects, and published *Ortsctymologische Forschungen als Beiträge zu einer Toponomastik der Schweiz* (1865-67), and *Promenade onomatologique sur les bords du Lac Léman* (1867). In 1868 he removed to the United States, where until 1877 he was connected with the staffs of various German newspapers, and in that year was appointed ethnologist of the Government Geological Survey. He became linguist to the Bureau of American Ethnology in 1879. From 1874 he made extensive study of the languages of the North American Indians, in particular those of the Tonkawa, Yuma, Chumeto, Hitchiti, Creek, and Timucua tribes. Among the many valuable treatises published by him, in both English and German, are: *Zwölf Sprachen aus dem Südwesten Nordamerikas* (1876); *Analytical Report upon Indian Dialects Spoken in Southern California, Nevada, and on the Lower Colorado River* (1876); "Classification of Western Indian Dialects," in volume vii. of the *Report of the Geological Survey West of the 100th Meridian* (1879); *Volk und Sprache der Timucua* (1881); *Indian Languages of the Pacific States and Territories and of the Pueblos of New Mexico* (1882); "A Migration Legend of the Creek Indians," in No. 4 of Brinton. *Library of Aboriginal American Literature* (Philadelphia, 1884-88); and "The Indians of Southwestern Oregon," in *Contributions to North American Ethnology*, vol. ii. (Washington, 1890). For a further list of

titles, consult Pilling, *Bibliography of North American Languages* (Washington, 1885).

GATSCHINA, gā'chē-nā. See *GATCHINA*.

GATTEAUX, gā'tō', JACQUES EDOUARD (1788-1881). A French sculptor and engraver, born in Paris. He was the pupil of his father, Nicholas Marie Gatteaux, and won the Prix de Rome (1809) for medaling. He was one of the founders of the 'Galerie Numismatique des Illustrations Françaises' in Paris. He was employed by the French Government to strike a medal commemorative of the establishment of the School of Architecture. Others of his famous medals are those for the "Holy Alliance" and the Peace of 1814. He was elected to the Institute in 1845, and left his art collection to the Ecole des Beaux-Arts and the Louvre. His busts include those of Michelangelo, in the Louvre, and of Rabelais, at Versailles.

GATTERER, gāt'ër-ër, JOHANN CHRISTOPH (1727-99). A German historian, born at Lichtenau. He studied at the University of Altdorf, and in 1759 became professor of history at Göttingen, where from 1767 he was also director of the historical institute established by himself in 1764. He was the first to introduce into the historical courses of German universities geography, diplomacy, heraldry, and other auxiliary studies. The most important of his works are: *Die Weltgeschichte in ihrem ganzen Umfange* (2 vols., 1785-87), and the *Versuch einer allgemeinen Weltgeschichte bis zur Entdeckung von Amerika* (1792). Consult *Elogium Gattereri*, by Heyne (Göttingen, 1800).

GATTI, gāt'tè, BERNARDINO (c.1497-1575). called 'Il Sojaro' (the cooper). An Italian painter, born at Parma. He was the pupil of Correggio, and so like him in his manner that his pictures have been mistaken for that master's. A French critic says: "Gatti had the misfortune to be born a copyist in a century of mighty geniuses." He also imitated Pordenone, and was selected to complete the frescoes left unfinished by him in the Santa Maria di Campagna, Piacenza. Gatti's works include paintings in the Parma Cathedral and in the Church of Saint Peter there, and an altarpiece, "Madonna with the Rose Garland" (1531), his principal work, in the Cathedral of Pavia.

GATTY, Mrs. MARGARET (1809-73). An English novelist. She was born in 1809, and in 1839 married a clergyman, and passed most of her life after marriage at Ecclesfield, in Yorkshire, becoming widely known by *The Fairy Godmothers* (1851) and *Parables from Nature* (five series, 1855-70), translated into the leading languages of Europe. In 1866 she started a monthly periodical for young people, called *Aunt Judy's Magazine*, which, after her death in 1873, was continued by her daughters till 1885. Here first appeared nearly all the stories of her daughter, Mrs. Juliana Ewing (q.v.).

GAU, gou (Ger., district). A word used to designate those portions of a district outside of a town. It embraced several communities, and was governed by a *graf*. Its use prevailed during the Middle Ages as a name for a political division of the German country, having especial reference to the power of the military and judicial authorities.

GAUBIL, gô'bél', ANTOINE (1689-1759). A French Jesuit missionary to China, and a scholar of great versatility. He was born at Gaillac, became a Jesuit at the age of fifteen, and in 1723 was sent to China, where he learned Chinese and Manchu with wonderful facility. His scholarship won him a place at Court, in spite of the Emperor's aversion to the missionaries, and his influence kept the Jesuits from being disturbed. He was made interpreter, and was especially prominent in carrying on diplomatic correspondence with Russia, besides being head of the Imperial Colleges under Kien Lung when he succeeded Yung Ching. A correspondent of the Paris Academy of Sciences and a member of the Academy of Saint Petersburg, he was one of the earliest European sinologists. Père Gaubil died in Pekin. He wrote: *Histoire de Gentchiscan et de toute la dynastie des Manchoux* (1739); *Traité de chronologie chinoise* (1814); and a translation of *Le Chou King* (1771), besides many letters and sketches published in *Lettres édifiantes* and in Rémusat, *Nouveaux mélanges asiatiques*.

GAUCHOS, gou'chôz (countrymen). Pastoral nomads of Chaco, in the Argentine Republic, South America, the offspring of whites and Indians of the Pampas. They are tall and handsome, with a proud and dissolute expression of countenance. They wear mustaches, and have long black hair hanging down their backs. Their costume is brightly colored. They are very polite, and possess high ideas of their own equality and dignity. These hybrids can scarcely be traced to their original Guaycuru Indian components; but since the white infusion has ceased the people are reverting to the Indian type, thus showing a most interesting example of the formation of a new race. The free, wild life of the Pampas has developed the Gauchos into an alert, vigorous people, expert horsemen and cattlemen, who wield the lariat with great skill. The bolas (q.v.) is also employed in the chase and in warfare.

The Gauchos eat meat exclusively for months together, and with it a large proportion of fat. It has been observed that they dislike dry meat. Curiously enough, they do not eat salt. The men are proficient in leather-working, and the women weave belts and dress skins.

GAUDEAMUS (Lat., Let us rejoice). The first word and the title of a well-known Latin student song popular in Germany and America. It is based partly on a Latin song dating from 1267, and existed in the eighteenth century in a somewhat obscene form, with German as well as Latin verses. The present version dates from 1781. The song recalls the transitory character of human things, and urges the enjoyment of life before old age comes on.

GAUDEN, ga'den, JOHN (1605-62). An English prelate and author. He was born at Mayland, Essex, where his father was vicar. After education at Bury Saint Edmund's, he entered Saint John's College, Cambridge, and obtained the degrees of B.A. and M.A. While a tutor at Oxford he took the degree of B.D. at Wadham College in 1635, and D.D. in 1641. His pupil, Sir Francis Russell, presented him with the living of Chippenham in 1640, and the same year he was the appointed preacher to the House of Commons. After the Restoration, in 1660, he

was appointed Bishop of Exeter, and in 1662 was translated to the bishopric of Worcester. He died four months later (September 20, 1662). His publications number some thirteen or more books, which appeared between 1642 and 1660. At first he was inclined to the Parliamentary cause, but in the end he strongly opposed the Puritan excesses. Among his more forcible writings may be mentioned *Cromwell's Bloody Slaughter House; or, His Damnable Designs in Contriving the Murder of His Sacred Majesty King Charles I. Discovered* (1660). He is best known on account of the controversies which have raged over the authorship of *Eikon Basilike*, a book attributed to Charles I. himself. It was published immediately after the execution of the King, and, according to Malcolm Laing, "had it appeared a week sooner, it might have saved the King's life." The Bishop claimed its authorship in correspondence with Chancellor Hyde, Lord Clarendon (1660-62). Burnet in 1674 stated that the Duke of York told him that Dr. Gauden was the author, and in November, 1686, at the sale of the Marquis of Anglesey's choice library of books, the 'famous memorandum' was found in the peer's copy of the *Eikon Basilike*—"King Charles II. and the Duke of York have both assured me that this work was none of the King's compiling, but made by Dr. Gauden, Bishop of Chester(?), which I here insert for the undeceiving of others in this point, by attesting so much, under my hand." A sharp controversy arose, which has been revived on various occasions up to as late as 1880. In *Who Wrote Icon Basilike?* (3 vols., 1824-28), Dr. Christopher Wordsworth 'proves' that the King did. Sir James Mackintosh, reviewing Wordsworth's book in the *Edinburgh Review* (xliv.), 'proves' that Gauden wrote it. Macaulay, Guizot, and other historians sustain Gauden's claim. Consult Almach, *Bibliography of the King's Book* (London, 1896). See EIKON BASILIKE.

GAUDRY, gô'drê', ALBERT (1827-). A French paleontologist, born at Saint-Germain-en-Laye. From 1853 he traveled in the Orient, and from 1855 to 1860 in Greece, where he was occupied with paleontological researches. He was then appointed assistant naturalist in the Museum of Natural History in Paris, where in 1872 he became professor. In 1882 he was elected a member of the French Academy of Sciences. His works include: *Recherches scientifiques en l'Orient* (1855); *Animaux fossiles et géologie de l'Attique* (2 vols., 1862-67); *Animaux fossiles du Mont-Lébéron*, with Fischer and Tournouër (1873); and *Enchainements du monde animal dans les temps géologiques* (1878).

GAUDY, gou'dê, FRANZ BERNHARD HEINRICH WILHELM, Baron von (1800-40). A German author, born in Frankfort-on-the-Oder. In 1818 he entered the Prussian Army, but resigned from the service in 1833 to follow a wholly literary career, and at Berlin was a friend of Chamisso, with whom he edited the *Deutscher Musenalmanach* for 1839. His best-known work is his humorous and frequently epigrammatic verse. Some of his poems became widely popular. Of his prose writings, *Tagebuch eines wandernden Schneidergesellen* (1836) and *Venezianische Novellen* (1838) are still popular in Germany. The more important of his writings appeared at Berlin in 1853 (8 vols.), edited by Arthur Müller.

GAUERMANN, gou'ér-mán, FRIEDRICH (1807-62). An Austrian genre, landscape, and animal painter, born at Miesenbach, Lower Austria, September 20, 1807. He was a son of the landscape painter Jakob Gauermann. Under his father's direction he began studies in landscape, and he also diligently copied the etchings of the chief masters in animal painting which were contained in the Academy of Fine Arts and the Imperial Library of Vienna. In the summer he made art tours in Styria, Tyrol, and Salzburg. Two animal pieces which he exhibited at the Vienna exhibitions of 1824 were regarded as remarkable productions for his years, and led to his receiving commissions in 1825 and 1826 from Prince Metternich and others. His reputation was greatly increased by his picture "The Storm," exhibited in 1829, and from that time his works were much sought after and obtained correspondingly high prices. His "Field Laborer" was regarded by many as the most noteworthy picture in the Vienna Exhibition of 1834, and his numerous animal pieces have entitled him to a place in the first rank of painters of that class of subjects. Gauermann was sincere and exact in his representation of German peasantry, according to their locality, individual habit, and environment, and though he is largely represented by pictures of animals, he painted such rural scenes as: "Husbandmen Ploughing;" "Cows, Sheep, a Horse, etc." (in the Leipzig Museum); "Rural Smithy;" and "Watering Place in the Tyrol" (Berlin National Gallery). He was made member of the Munich Academy in 1836. Gauermann left at his death, which occurred at Vienna, July 7, 1862, over 1000 oil paintings, 565 drawings, and 15 unfinished pictures.

GAUGE (from OF. *gaugē*, *jauge*; connected with ML. *gaugatum*, gauging of a wine-cask, *jalgium*, right to gauge wine-casks, and probably with *jalea*, gallon, OF., Fr. *jale*, bowl). In mechanics, an instrument for determining the dimensions, quantity, force, capacity, etc., of anything. Gauges are of various forms, and are employed for numerous purposes in engineering and the arts. Gauges to secure precision in the dimensions and forms of manufactured articles are made of hardened steel, or of case-hardened wrought iron, formed to the exact outline to be secured and accurately dimensioned. Such gauges are extensively used in machinery manufacture where interchangeability of corresponding parts is sought. Wire gauges are circular disks of hardened steel, having round the edge a series of notches of different sizes of openings corresponding to the standard wire sizes of the Birmingham or other gauges. In the Birmingham wire gauges the sizes run from No. 1, denoting a wire diameter of 0.3 inch, to No. 34, denoting a wire diameter of 0.004 inch. Similar gauges are used for measuring the thickness of metal plates. Pressure-gauges for measuring the pressure of steam or other gas inside a closed vessel are familiar to all. In the most usual form the pressure of the gas acts to cause a pointer to move around a graduated dial. The steam-boiler gauge is a familiar example of such devices. Wind-gauges are arrangements by which the wind blowing against a plate diaphragm actuates a recording device which records the pressure. (See **ANEMOMETER**.) Water-gauges consist of a strong glass

tube with metal fixtures at its ends, which connect the tube with the interior of a steam boiler. The lower end of the tube connects with the boiler below the lowest water-line, and the upper end connects with it above the highest water-line, and the level of the water between the two points is observable by the height at which it stands in the glass. Screw-gauges consist of a U-shaped frame of steel at the end of one arm of which is a steel plug pointing toward the opposite arm, through whose end runs a finely threaded thumb-screw with a graduated head. To measure with this device the end of the plug is brought into contact with one side of the object, and the screw run out into it touches the other side; a reading of the graduated head shows the distance apart of the end of the plug and the end of the screw, and therefore the thickness of the object. See **CALIPERS**; **RAILWAYS**.

GAUGENGIGL, gou'gen-gē'g'l, IGNAZ MARCEL (1856—). An American genre painter, born at Passau, Bavaria. He studied under Raab and Diez at the Munich Academy. Afterwards he came to America, and settled in Boston in 1879. His subjects are usually interiors, with several figures painted in the miniature style of Meissonnier. His pictures are: "The Duel," "The First Hearing," "My Studio," and "On the Promenade."

GAUGER. A United States custom-house officer whose duty is to gauge or measure casks and other hollow vessels, containing liquids liable to duty. Local officers are to be found in many States also, whose duties are of a similar nature. These are often known as sealers of weights and measures.

GAUGUA, gou'gwá. See **GUAGUA**.

GAUL (Lat. *Gallia*). The name given by the Romans to that portion of Western Europe which is in the main identical with France, although extending beyond the bounds of the modern State. In the earliest times this region, bounded by the Atlantic, the Rhine, the Alps, the Mediterranean, and the Pyrenees, was inhabited by the Gauls, who had overrun the territory, and had brought under control the earlier peoples, such as the Ligurians, along the southern coastline, and the Iberians, who had subjugated the southwestern section and are represented by the Basques of modern days. The Greeks founded Massilia (Marseilles), a Phœcean colony, about B.C. 600. They called the people *Κελταί*, either, as Thierry suggests, extending the name of one tribe to the entire race, or using a generic term to indicate the collective Celtic people. Later the Greeks named the country *Γαλαρία*, and the Romans spoke of the Galli and of Gallia. These words are cognate with the native title *Gaeltachd*, which means 'the land of the Gauls,' and which designated the territory above defined, but did not include the two islands known as Albion or Albin, the White Island, and Erin (*Eri* or *Iar* = the West), the Isle of the West, which were inhabited by the same race.

Julius Cæsar is the first writer who enlightens us in regard to this people. He speaks of Gaul as being divided among the three peoples, the Belgæ, the Aquitani, and the Galli, or, "as they are known in their own tongue," Celtæ. The Belgæ dwelt on the north with the Seine as their southern boundary, the Aquitani in the south between the Garonne and the Pyrenees, while the

Celtæ dwelt between them. All these differed in language, customs, and laws. This description is substantially correct, although Cæsar does not mention all the races of Gaul, nor does he recognize the fact that the Aquitani were really distinct in race from the Belgæ and Celtæ, who were closely related. The Aquitani were Iberian in stock, and this racial difference was indicated by marked differences in temperament and physical characteristics. The Gauls were tall, of light complexion, sociable in disposition, given to fighting in large numbers, while the Aquitani were dark, reserved in disposition, and fond of fighting in small bands, traits which are found among the Basques to-day.

Cæsar mentions numerous tribes belonging to the three nations distinguished by him. Such were the Helvetii, the Sequani, and the Aedui along the Rhône and Saône, and the Arverni (modern Auvergne) among the mountains (Cevennes); along the Loire the Namnetes, Senones, and Carnutes, and between the Loire and the Seine the Armorican or maritime tribes, such as the Veneti. The Bellovacii, Suessiones, Nervii, and Morini were tribes of the Belgæ.

The part the Gauls played in the ethnic distribution of the early peoples of Europe was remarkable. In their nomadic history they wandered far and wide throughout Europe, Asia, and Africa. From their home in Western Europe they spread to Britain, invaded Spain, swarmed over the Alps into Italy, and, extending their conquests to the Tiber, burned Rome (B.C. 390). Other tribes of Gaul traversed Eastern Europe and Asia Minor, ravaged Macedonia and Thessaly, passed through Thermopylæ, and pillaged Delphi. In B.C. 241, meeting with Attalus, King of Pergamus, they were driven back into the mountain district near the Halys River, and there they established the independent principality of Galatia, or Gallo-Græcia, which became a power among the peoples of Asia. This represents the first period of their history. The second is the history of their settlements in various parts of the world, and the development of their peculiar institutions, influenced as they were by environment and modified by the introduction of foreign elements. Thus in Phrygian Galatia the Gallic civilization was combined with those of Greece and Phrygia, and in Italy their manners and customs were affected by their contact with the Romans. Finally, in the struggle to maintain their freedom, they met the Romans on every side. As Thierry says: "The Gauls and Romans followed each other over the earth to decide the old quarrel of the Capitol." It was the long conflict between a ferociously active but undisciplined people and the sturdy, disciplined prowess of the Romans. The northern part of Italy, because of the early invasion of the Gauls, was termed by the Romans Gallia Cisalpina, i.e. 'Gaul this side of the Alps,' as viewed from Rome. This territory was also known as Gallia Citerior, to distinguish it from Gallia Transalpina or Gallia Ulterior. Here the contest was waged for centuries, the Romans gradually pushing their sway up to the Alps and establishing colonies in the Gallic towns.

Then the Romans passed over the Alps, invited by the people of Massilia (B.C. 154), who sought assistance against their neighbors; but the invaders did not cease to interfere with the affairs of Southern Gaul until the entire region

from the Alps to the Pyrenees became a Roman province. This was known as Gallia Provincia (Provence), and Narbo became the capital city. The wars of Julius Cæsar, which ended with the eighth campaign, in B.C. 50, in the conquest of Gaul, resulted in the formation of a new province, Aquitania. To this province was given the name Gallia Comata, or long-haired Gaul, just as Cisalpine Gaul had been termed Gallia Togata, and the old province Gallia Braccata, from the word *braccæ*, meaning the trousers (breeches) worn by the people. The third period in the history of Gaul dates from the time of Augustus, for in B.C. 27 Gaul became a part of the Roman Empire when that Emperor organized the peoples of Gaul in four provinces: Narbonensis, the old province; Aquitania, with the Liger (Loire) as the northern boundary; Lugdunensis, named from the town of Lugdunum (Lyons), between the Loire, the Seine, and the Saône; and Belgica, between the Seine and the Rhine, with the North Sea as the northern boundary. This division was not changed until the fourth century, when Gaul was divided into two great dioceses, the *diocesis Galliarum* and the *diocesis Viennensis*. The former was subdivided into eight provinces, and the latter into seven provinces. The Emperor Claudius did much toward the complete Romanization of Gaul, and later emperors completed what Augustus had begun. In the history of the Imperial period the Gauls had an important part; their fortunes rose and fell with the fortunes of the Roman people.

In the many contests of later Imperial times their land was the scene of fierce conflicts, and when the races of the north and east fought and overcame those of the south, their land was traversed again and again by great migrations of the Burgundians, Goths, and Franks, until out of the ruin there arose a new empire, and the history of mediæval and modern Europe began. See FRANCE.

GAUL, ALFRED ROBERT (1837-). An English organist and composer, born at Norwich. He studied under Zechariah Buch, organist of Norwich Cathedral, from 1854 to 1859 was organist at Fakenham (Norfolk), and in 1859 was appointed organist of Saint Augustine's (Edgebaston), Birmingham. His works include an oratorio, *Hezekiah* (1860); two sacred cantatas, *Ruth* (1881) and *The Holy City* (1882), the latter of which has been very popular in the United States; a *Passion Service* (1882); an historical cantata, *Joan of Arc* (1887); and anthems and part-songs.

GAUL, GILBERT WILLIAM (1855-). An American painter, born at Jersey City, N. J. He studied under J. G. Brown, and was a pupil of the National Academy of Design, where he first exhibited in 1872. His works include: "Indian Girl" (1880); "Old Beau" (1881); "Charging the Battery," "News from Home"

(1882); "On the Lookout" (1885); and "Wounded to the Rear." He is at his best in his battle pictures, which are characterized by clever coloring and notable dash and spirit.

GAUL, goul, GUSTAV (1836-88). An Austrian historical genre and portrait painter, born in Vienna, where he studied for five years at the Academy under Rahl. After a visit to Italy he turned his attention particularly to the specimens of the Venetian School in the Dresden Gallery, and on subsequent journeys to France and Holland supplemented his studies from the works of Rubens and Rembrandt. He painted with predilection historical genre scenes, and as a portrait painter was much sought by members of the Imperial family, also by the foremost actors and actresses of Vienna. Among several other celebrities he portrayed Ludwig Spohr, Professor Hyrtl, and Sophie Schroeder. His copies after the old masters were held in great esteem. His brother FRANZ (1837—) painted some battle pieces, but gradually made himself indispensable as a designer of costumes and figures for the Imperial Opera and the Burgtheater.

GAULEY (gə'lé) **MOUNTAINS**. A portion of the mountain range in Pocahontas County, W. Va., which farther south becomes the Cumberland Mountains (q.v.). The name is also locally applied to mountains in Nicholas County, through which flows the Gauley River.

GAULEY RIVER. A river rising in the Gauley Mountains, Pocahontas County, W. Va. After a southwest course it unites with New River at Gauley Bridge, to form the Great Kanawha, a tributary of the Ohio.

GAULIN, gó'lán' (West Indian name). In Jamaica and the West Indies, a heron.

GAULS. See **GAUL**.

GAULT. A division of the Cretaceous system of England separating the Lower and Upper Greensands. It consists of a dark, plastic clay, sometimes sandy or marly, and attains a thickness of from 100 to 300 feet. It is exposed along the southeastern coast of England, one of the best sections being near Folkestone.

GAULTHERIA

(Neo-Lat. nom. pl., from *Gaultier*, a Canadian physician). A genus of low or trailing shrubs, belonging to the order Ericaceæ, a number of species of which occur in North and South America, Asia, Australia, and Tasmania. Among the best-known is *Gaultheria procumbens* (wintergreen), a common plant in evergreen woods from Canada to Georgia, especially in the mountainous districts at the south. It is also called checkerberry, deerberry, boxberry, partridge-berry, and mountain tea. The stems are trailing with ascending tips,

GAULTHERIA.

which bear the dark-green, smooth leaves and the scarlet berries. The foliage has the same flavor as that which characterizes the sweet birch (*Betula lenta*). The whole plant contains a volatile oil, oil of wintergreen, which is obtained by distillation. This oil is used to some extent in medicine as a stimulant, antiseptic, and diuretic, but its chief use is as a flavor. Other species, especially the Asiatic, are used as a source of the flavor. *Gaultheria shallon*, found from Alaska to California, is a shrub two or three feet high. It is known as 'salal,' and its black berries are edible. The fruits of wax-cluster (*Gaultheria hispidula*) and *Gaultheria antipoda* of Tasmania are edible, those of the latter being considered the better.

GAUNTLET, or **GANTLET**, gänt'lét (OF. *gantelet*, diminutive of *gant*, glove, from ML. *wantus*, glove, from Dutch *want*, OSwed. *wante*, glove, mitten). In mediæval armor, a glove usually of leather covered with iron, which formed part of the equipment of knights and men-at-arms. The back of the hand was covered with scale-work of plates joined together, so as to permit the hand to close. Gauntlets were introduced about the middle of the thirteenth century. They were often thrown down by way of challenge, like gloves. They were frequently used in heraldry, the fact of their being for the right or left hand being expressed by the words 'dexter' or 'sinister.'

GAUNTLET, EMILIA. The eminently virtuous sweetheart of Peregrine Pickle, in Smollett's novel of the latter name.

GAUNTLETT, HENRY JOHN (1805-76). An English organist and composer, born at Wellington. He studied law and practiced successfully, but at the same time devoted his leisure to the organ, holding numerous important positions as an organist. In 1836 he began the agitation in favor of substituting the C organ in place of the F and B organs. In this he was aided by the organ-builder William Hill, and the movement was finally successful. He also advocated the application of electricity to the action. Of his compositions, the best are his hymn tunes, though his chants and anthems are also excellent. He compiled numerous collections of hymns, most important being the *Comprehensive Tune Book* (1846-47); *Church Hymn and Tune Book* (1844-51); and the *Gregorian Psalter* (1846). He died at Kensington.

GAUPP, goup, GUSTAV (1844—). A German genre and portrait painter, born at Markgröningen, Württemberg. Preparatory to becoming a lithographer, he studied in Stuttgart, Vienna, and London, but turned to painting in 1870, as a pupil of the Academy at Munich, and, from 1873 on, of Piloty, whose brilliant coloristic treatment he adopted. To acquaint himself with the works of the old masters, he went to Italy in 1878, and after his return painted for a time chiefly portraits: in 1880-82 at Hamburg, then for two years in London, after which he settled at Stuttgart. A historical genre scene, "Sacking of a Convent by Lansquenets" (1876), is in the Gallery at Strassburg, and "A Game of Chess" (1895) in the Stuttgart Museum.

GAUR, gour, or **GOUR**. The mediæval capital of Bengal, situated on the arm of the Ganges called the Bhagirathi, in latitude 24° 52' N. and longitude 88° 10' E. According to tradition,

the city was founded in the twelfth century by Lakshmanasena of the Vaidya Dynasty of Bengal, who called it, after his own name, Lakshmanavati, or, in the vernacular, Lakhnauti. Lakhnauti continued for the most part to be the seat of rulers who governed Bengal and Behar, sometimes as confessed delegates to the Delhi sovereigns, sometimes as practically independent kings. From the year 1338, with the waning power of the Delhi dynasties, the Kingdom of Bengal acquired a substantial independence which it retained for more than two centuries. One of the earliest of the kings during this period, by name Ilyas Shah, transferred the seat of government (c.1350) to Panduah, a place about 16 miles north by east of Gaur. After some occasional oscillation, the residence was again (c. 1446) transferred to Gaur by Nasrud-Din Mahmud Shah I., by which name the city is generally known thenceforward, that of Lakhnauti disappearing from history. On account of its somewhat unhealthful situation, Suliman Kirani (1564-65) abandoned Gaur for Tandah, a place somewhat nearer the Ganges. Mu'umin Khan, a general of Akbar, when reducing these provinces in 1575, was attracted by the old site, and resolved to readopt it as the seat of local government. But a great pestilence (probably cholera) broke out at Gaur, and swept away thousands, the general-in-chief being himself among the victims. Gaur cannot have been entirely deserted, for the Nawab Shuja-ud-Din, who governed Bengal 1725-39, built a new gate to the citadel. The city is now in ruins, its remains being scattered over a vast area. Consult Ravenshaw, *Gaur: Its Ruins and Inscriptions* (London, 1878).

GAUR, gar or gour (Hind., from Skt. *gāura*, white). A wild ox (*Bos gaurus*) of India, probably the largest existing species of wild cattle, and the one hunted by Indian sportsmen under the misnomer 'Indian bison.' An old bull may stand six feet high at the withers, and specimens have been recorded whose horns measured 39 inches, and had a basal circumference of 19 inches; but the average is less than this; the cow is in every way smaller. The animal is massively built, with regularly upward-curving yellowish horns decidedly flattened at their base, and has a distinct ridge above the shoulders produced by great upstanding spines of the vertebræ. The ears are very large, the dewlap inconspicuous, and the tail comparatively short. In color, old bulls are dark brown, sometimes nearly black, with the crown of the head and the muzzle gray, and the lower parts of the legs pure white. The hair is fine and glossy. This grand animal is to be found in small bands throughout all the forested parts of India (except Ceylon) to the foothills of the Himalayas, and thence through the hilly districts of Assam and Burma down into the Malay Peninsula, where there are two forms, one called *sladong*, and the other *sapio*, in *Proceedings of the Zoological Society of London* (London, 1899). It roams widely, but keeps to the jungle, and is so alert and cunning in escape, and so formidable when brought to bay, that its chase is justly regarded as among the finest sports with a rifle in the world, and among the most dangerous, as it must always be pursued on foot. An old bull makes an even match for the tiger himself. Nevertheless, it is not pugnacious, and rarely or never attacks human beings

except when wounded or brought to bay, but shyly retreats from man whenever possible. These cattle have not been domesticated, except partially by some semi-wild hill tribes east of the Ganges in company with their gayals, who keep them as food. Consult: books of natural history and sport in India and Burma, especially Sanderson, *Thirteen Years Among the Wild Beasts of India* (London, 1893), noting that most of these writers call the animal 'bison'; also Blanford, *Fauna of British India: Mammals* (2 vols., London, 1888-91); Blanford, "On the Gaur and Its Allies," in *Proceedings of the Zoological Society of London* (London, 1890). Compare GAYAL; and see Plate of WILD CATTLE.

GAURISANKAR, gou'ri-sāp'kēr, MOUNT. See EVEREST, MOUNT.

GAUSS, gous, KARL FRIEDRICH (1777-1855). A German mathematician, one of the most brilliant mathematicians of modern times. He was born at Brunswick, the son of a day laborer. After three years (1792-95) in the Carolineum at Brunswick, he went to the University of Göttingen, where he remained from 1795 to 1798, devoting all of his attention to mathematics. When at Göttingen he was already in possession of the idea of least squares (see LEAST SQUARES, METHOD OF), and in March, 1796, he discovered the proposition that a circle can be divided into seventeen equal arcs by means of elementary geometry, the first extension of the ancient Greek knowledge in this particular. During his university career at Göttingen, he also worked upon his *Disquisitiones Arithmeticæ* (1801, 2d ed. 1889), a treatise which soon brought him into prominence before the scientific world. The German astronomers being unable to locate the planet Ceres, discovered by Piazzi at Palermo, January 1, 1801, Gauss invented a new method for calculating the position of heavenly bodies, and thus enabled Zach (December 3, 1801) and Olbers (December 4, 1801) to rediscover the planet. His *Theoria Motus Corporum Cælestium* (1809), vol. vii. of his *Werke* (1871; German by Haase, Hanover, 1865), completely established his reputation, so that Laplace recognized him as the first mathematician in Europe. The latter part of his life was devoted largely to two branches of applied mathematics, geodesy and electricity; he measured the meridian from Altona to Göttingen (1821-24), and he may be considered as the founder of the mathematical theory of electricity. With Weber he established telegraphic connection between the magnetic and the astronomical observatories at Göttingen (1833), and published the *Resultate aus den Beobachtungen des magnetischen Vereins* (6 vols., 1838-43), and the *Atlas des Erdmagnetismus* (1840). He also wrote on the theory of surfaces, least squares, and other subjects of mathematics, physics, and astronomy. His collected works were published by the Göttingen Academy (vols. i.-vi., Göttingen, 1863-74; vol. vii., Gotha, 1871; 2d ed., 8 vols., Göttingen, 1870-1900). For his life, consult Schering (Göttingen, 1887).

GAUSSEN, gō'sān', LOUIS (1790-1863). A Swiss Protestant theologian. He was born in Geneva, and in 1816 became pastor of Satigny, near that city. He held strongly to the old Calvinistic teachings, and refused to use a new and revised catechism which had been substituted for Calvin's. For this he was censured by

the majority of the Geneva ministers, and in 1832 was deposed by the consistory. In the same year, with Merle d'Aubigné and Galland, he formed the 'evangelical society' for the circulation of Bibles and tracts. In 1836 he became professor of theology in the new evangelical school at Geneva. He held to the verbal inspiration of the Scriptures in its most extreme form. Among his works translated into English are: *Theopneustics* (1841); *It is Written* (1856); *Lessons for the Young on the Six Days of Creation* (1860); *Canon of Scripture* (1862).

GAUTAMA, gou'tā-mā. The name of a family and of several individuals known in connection with the early Vedic literature of India. This appellative is a patronymic from Gotama, and was borne also by Buddha. (See GOTAMA.) It was especially preserved also as the name of an early Hindu teacher or lawgiver, the author of a work known as the *Institutes of Gautama*. These legal aphorisms, like the institutes of Apasamba, Baudāyana, and Vasishtha (q.v.), are important in connection with early Hindu law. For a translation, consult "Sacred Laws of the Aryans," in Müller, *Sacred Books of the East*, vol. ii. (Oxford, 1879 et seq.).

GAUTAMA BUDDHA, gou'tā-mā būd'ā. The great religious teacher and reformer of early India. His name is variously given. Its form as Gautama (q.v.) was a common appellative in ancient Sanskrit and appears in Pali as Gotama. It was a family designation, and for this reason the title Gautama Buddha is sometimes given in English as 'Buddha the Gotamid, or of the Gautama family.' Often he is called Sākya-muni, Sage of the Sākya Clan, as he was descended from this tribe, and frequently he is styled Siddhārtha, or, in Pali, Siddhartha, 'the one who successfully attains his aim.' The designation Buddha is an epithet and signifies the Enlightened One. Similarly Bodhisatva, or Pali Bodhisatta, means 'one who possesses the verity of knowledge,' and it is an attribute applied to each of a long line of Buddhas who have reached or will attain to perfect enlightenment and wisdom.

Buddha was born in the sixth century before the Christian Era, but the precise date is not known. His home was in the region of India to the northeast of Benares, and the town where he was born was Kapila-vastu, modern Kohāna, not far from the borders of Nepal. Tradition states that he was born in a garden sacred to the goddess Lumbini, and it is likely that the very place which the faith at least hallowed as his birthplace was discovered a few years ago by Alois Führer, but so many inaccuracies were connected with his identification of the column of Asoka, which marked the spot, that discredit has been thrown on the authenticity of the entire identification.

The name of Buddha's father is given in the sacred texts as Suddhodana, and his mother is known as Māyā in the Buddha-vamśa. It is generally thought that he was a prince of the royal blood, but this statement is not found in the oldest documents. For that reason doubt has, perhaps wrongly, been raised on this particular point. However that may be, the consensus of opinion is agreed that Siddhārtha's mother died when he was but seven days old, and that he was intrusted to the care of her sister, Mahā-

Prajāpati, of the Gotamid family. We know little that is authentic regarding his youth and education; but later tradition has woven a garland of legend about his youthful attainments and achievements, his talents and his virtues. A reflex of these Oriental descriptions may be gained from Sir Edwin Arnold's romantic poem *The Light of Asia*.

Prince Siddhārtha, if so we may style him before he attained to Buddhahood, was married, and had a son named Rāhula. It was shortly after the birth of this son, in his thirtieth year, when he had fulfilled the obligation which the Hindu creed required to be discharged to one's ancestors, that he left his wife, child, home, and kingdom, and wandered forth to take up the life of an ascetic. This was the method of procedure that the Brahman faith authorized; this was the manner of seeking the path of salvation. Finding his way to Rājagriha, he devoted himself to such rigorous and excessive asceticism that he nearly lost his life. Discovering that all this was idle and futile for him, he gave himself up solely to thought and meditation, which gradually led him to evolve his religious and philosophic theory of the general existence of evil, its origin, and its eradication. The place where the light dawned upon his soul is still pointed out. He was seated beneath a pipal-tree near the village that is now known as Buddh-gaya, to the southeast of Benares. The tree has ever since been sacred as the Bo-tree (q.v.). The emancipation of his spirit found expression in rhythmical stanzas, and he enjoyed at that moment, even while alive, the perfect peace of Nirvāna. To his enlightened eyes the cause of misery and sorrow was desire; the only relief was to pluck from the heart this lust, and to achieve this he pointed out the Eightfold Path of truth and right. See BUDDHISM.

After attaining the Buddhahip he proceeded to find the five ascetics with whom he had been associated in his recluse life near Benares. He wished to impart first to them the newly won joy and the solution of life's problems; after that to his family, kinsmen, countrymen, and to all mankind. Wandering up and down the Ganges region, the Holy Land of India, he continued to preach, and in parable, precept, and practice to impart the tenets of redemption. The purity of his life, the gentleness of his manner, the earnestness of his teaching, and the firmness of his conviction, won thousands upon thousands to accept his simple creed, and 'take refuge in Buddha.' Even during his lifetime his doctrines spread widely through India, and they became established in Ceylon hardly less than two centuries after his death. There is even a tradition, though not generally accepted, that Buddha himself twice visited the island. See Bo-TREE: CEYLON.

Much of Buddha's time was spent in founding monastic orders, and in developing lines along which the religion was destined in the future to grow. His life was a long one, eighty years, more than twoscore of which were devoted to his ministry. The time of his death is believed to have been about B.C. 480, but some latitude must be allowed for inaccuracy in the deductions. The place where he died was near Kusi-nagara, some 80 miles to the east of his birthplace, and about 120 miles to the northeast of Benares. A detailed account of the death

scene, even naming the disciples who were present, especially the beloved Ananda, is given in the Buddhist scriptures. Abundant incidents regarding Buddha's teaching and preaching may be gathered from the same sources. As to precise biography, in the strict sense of the term, there is none that is ancient, but the material may be collected from the Pali texts. The introduction to the Jātākas (q.v.), or book of birth stories, gives an account of the previous existences of the Buddha, and a sketch of his life down to his thirty-sixth year. The two Sanskrit metrical works entitled *Buddhacarita* and *Lalita Vistara* (q.v.) contain biographical accounts, but they are not earlier than the first and the second centuries of our era; while the Pali poem *Jina Carita*, 'Story of the Victorious One,' written in Ceylon, is as late as the twelfth century A.D., and the *Malalankara Watthu* is of uncertain date. But the continued publication of Pali texts, Tibetan writings, Chinese records, and Ceylonese accounts, is adding new information each year regarding the history of Buddha, of whose historical existence there is no longer any question, and fresh archaeological discoveries and researches are contributing extensively to the knowledge already gained. For bibliography, see **BUDDHISM**.

GAUTHERIN, gô'trân', JEAN (1765-1825). A French statuary, born in Paris. His first work of importance was "Narcisse au Bain," in plaster (1868). This was followed by numerous works in stone, bronze, and marble, such as "L'industrie des tissus," in the Palais de Trocadéro; "Le travail" (1884), in the Luxembourg Gardens; "La ville de Paris;" the façade of the Hotel de Ville; and "Portrait de femme," a marble bust in the Luxembourg Museum.

GAUTIER, gô'tyá', EMILE THÉODORE LÉON (1832—). A French paleographer and historian of literature, born at Havre. He was educated at Laval and at the Collège Sainte-Barbe, Paris, entered the Ecole des Chartres in 1855, and was appointed archivist in the national archives at Paris in 1859. In 1871 he was appointed professor of paleography in the Ecole des Chartres. He was made Chief Secretary of the National Archives in 1886, and was elected to the Institute in 1887. He is recognized as one of the greatest authorities on mediæval European literature, and his works on early French literature, in particular, are especially valuable. His numerous published works include: *Comment faut-il juger le moyen âge?* (1858); *Quelques mots sur l'étude de la paléographie et de la diplomatique* (1858); *Définition catholique de l'histoire* (1860); *Scènes et nouvelles catholiques* (1861); *Benoît II.* (1863); *Etudes historiques pour la défense de l'église* (1864); *Etudes littéraires pour la défense de l'église* (1865); *Epopées françaises* (2 vols., 1866-67); *Portraits littéraires* (1868); *La chanson de Roland* (1874), which won the Guizot prize in 1878; *Vingt nouveaux portraits* (1878); *La chevalerie* (1884); *Histoire de la poésie religieuse dans les cloîtres, des IXe et XIe siècles* (1887); *Portraits du XVIIIe siècle* (1888); and *Etudes et tableaux historiques* (1890).

GAUTIER, JUDITH (1850—). A French poet and historical novelist. She was born in Paris, the daughter of Théophile Gautier and the noted

singer Carlotta Grisi, was married to Catulle Mendès, but soon separated from him. She is an Oriental scholar, and her works deal mainly with Chinese and Japanese themes. Among them are: *Le dragon impérial* (1869); *L'usurpateur* (1875); *La femme de Putiphar*, a Persian romance (1884); and *La marchande de sourires*, a Japanese drama (1888).

GAUTIER, MARGUERITE. The name of an idealized courtesan, who is the heroine of *La Dame aux Camélias*, by the younger Dumas. By a quaint translation of sound rather than sense the name has been changed to "Camille" in the English adaptation.

GAUTIER, THÉOPHILE (1811-72). A noted French poet, critic, and novelist. Born at Tarbes, August 31, 1811, he went as a child to Paris, and was educated there. He showed special interest in the Latin of the Decadence and the French of the Renaissance, being attracted less by the normal than by the primitive or the over-refined. He became a painter, then a 'flamboyant' Romanticist, joining as a leader in the 'Battle of Hernani' (see HUGO), defying conventionality by his flowing hair and far-famed scarlet waistcoat. His poems of this period, *Premières poésies* (1830), and *Albertus* (1832), show a highly developed technic and a minute power of description. Then followed *Les Jeunes-France* (1832), stories of nonchalant irony, mocking alike romantic liberty and classic restraint. Gautier's next book, *Mademoiselle de Maupin* (1835), a curious attempt at self-analysis, was a frank expression of hedonism. Its art is fascinating, but it treats the fundamental postulates of morality with a contempt that closed the Academy to him for life. *Fortunio* (1837) is also frankly pagan. In 1836 Gautier put on the harness of journalistic criticism, embracing art and the drama, and his later works were, perforce, less offensive to the moralists. "They have made me a kennel," he writes in a poem of this time, "where I watch, pressed down in the feuilleton of a newspaper, like a crouching dog." The best of the short stories printed in 1845, *La morte amoureuse*, bears the date of 1836. The deadening effect of this hack work wore off in the fifties. He produced during this decade the masterful short stories, *Arria Marcella*; *Jettatura*; and *Avatar*; and the curiously antiquarian *Roman de la momie*. But none of these approaches in interest *Le capitaine Fracasse*, which had been announced in 1836 and appeared in 1861 and 1863 (2 vols.), as "a bill drawn in my youth and redeemed in middle life." It is a true classic of Romanticism, illustrating a minute knowledge of the epoch of Louis XIII. such as Gautier had already been showing in a series of literary studies, *Les grotesques* (1844). Several of his short stories had reflected a preoccupation with phantom love, and this was the subject of *Spirite* (1865), his last and least interesting novel.

In literary criticism Gautier's most significant works are his *Histoire du Romantisme* (1854), and his essays on Baudelaire and Lamartine. An important event in his life was his change from the staff of *La Presse* (1836-54) to the *Moniteur* (later the official journal of the Second Empire). Until his death he was a critic of authority in Paris, and exceptional for the charm of his paragraphs. These articles were assembled

in *Histoire de l'art dramatique en France* (6 vols., Paris, 1858-59). In these he inveighed against the classic and the bourgeois drama. Gautier was a great traveler for his time, and described his journeys in many books—*Voyage en Espagne* (1843); *Zigzags* (1845); *Italia* (1852); *Constantinople* (1854); *Loin de Paris* (1864); *Quand on voyage* (1865); *La Russie* (1866), etc. Some of these volumes—those on Italy and Spain, for instance—are still widely read, owing to his graceful, limpid language, and his fondness for discovering artistic effects.

His particular claim to fame, however, lies in his unique gifts as a poet as represented by his masterpiece, *Emma et Camécès*—a rather small collection of poems written between about 1850 and 1865. They are nearly all in geometrical stanzas of four lines and eight feet, and are distinguished for their impeccable daintiness, exhibiting Gautier's love of miniature effects and his adoration for the sculptural and for the color white. The volume is Parnassian rather than Romantic. In its pages there is no flesh and blood; life appears merely as plastic form and picturesque hue. The *Poésies* may be thought of perhaps as a French pendant to the little poems of Heine, and quite as exquisite in their way. Likely the most famous of them, and certainly as characteristic as any, is the one entitled *Symphonie en blanc majeur*. It celebrates the author's worship of the white, cold divinity of the passionless nude which forever torments him with its mute, sphinx-like messages of inert beauty.

Gautier was a connecting link between the Romantic and the Parnassian in France, uniting in his pages the pictorial exotic with the pagan plastic, in accordance with his celebrated saying: "I am one for whom the visible world exists." In treating his soulless images he employed with the accuracy of a true artist a vocabulary famed for its rich resources. For forty years he was one of the interesting and conspicuous figures of the Paris literary and art world. A somewhat grotesque personality, he wore by preference the mask of a grave stoic in a sort of relaxed hopeless attitude toward his impecunious destiny. He detested the necessities and ordinary duties of life. When he spoke, it was to give utterance to some memorable remark or resigned witticism, or to indulge in a droll monologue composed of the sublime and the absurd. He was a cosmopolitan, remarkably open for a Frenchman to foreign influences. Loving and extolling the beautiful wherever he observed it, he was the champion of all unknown persons or newcomers who had anything pleasing to offer the Parisian public. He died in Paris, October 23, 1872.

GAUTIER DE COSTES, gô'tyá' de kôst. See LA CALPRENÈDE.

GAUTING, gou'ting. **EREMIT VON**. See HALLBERG-BROICH, THEODOR M. H.

GAUTSCH VON FRANKENTHURN, gouch fôn frâpk'en-töörn, PAUL, Baron von (1851—). An Austrian statesman, born and educated in Vienna. After holding various offices in the governmental service, he was employed (1874) in the Ministry of Education, and in 1885 became its chief. He was made a baron in 1890, but three years later was forced to resign. Minister of Education under Badeni (1895), he became Prime Minister two years later, and retained the Department of Interior until March, 1898, when the German opposition to his Bohemian policy was so strong that his Cabinet resigned.

GAUZE (Fr. gaze, ML. *gazzatum*; probably of Eastern origin; cf. Pers. *gazi*, thin, coarse cotton cloth, less probably from the Syrian city of *Gaza*). A light transparent fabric, originally made of silk. The openness of texture is obtained by crossing the warp threads between the threads of the weft, so that the weft passes through a succession of loops in the warp, and the threads are thus kept apart, without the liability to sliding from their places, which would take place if simple weaving were left so loose and open. Large quantities of medicated and antiseptic cotton gauze are used by surgeons. *Bolting cloth* is a gauze made of unsized silk for separating the products of a flour-mill. (See FLOUR.) Fine wire cloth is called *wire gauze*. The term is also applied to light woven fabrics of silk, linen, or cotton, such as are used in the manufacture of summer underwear.

GAVARNI, gâ'vár'né' (1804-66). A noted French caricaturist and illustrator of great originality and verve, an historical satirist of inexhaustible inventive power who portrayed types of French character, and in particular the various phases of Parisian life. His real name was Guillaume Sulpice Chevallier, and he was born in Paris, January 13, 1804. When a mere boy he was placed with an architect, then at the age of thirteen was apprenticed to a maker of mathematical instruments, and two or three years later studied mechanical drawing at the Conservatoire des Arts et Métiers. This was all the artistic training he ever received. In 1825 he was sent by one of his patrons to draw and engrave the bridge at Bordeaux, for which he was to receive 1200 francs a year, but finding the employment uncongenial, he threw it up before the year was out, and wandered about for some months, apparently without aim. By a lucky chance he found a benefactor at Tarbes in M. Leleu, the superintendent of the Cadastre in the Pyrenees, who gave him employment and made him at home in his family, until an offer of regular work took him back to Paris in 1828. In 1829 he adopted his *nom de guerre*, derived from the beautiful valley of Gavarnie in the Pyrenees. In 1830 he made the acquaintance of Emile de Girardin, who invited him to make the designs for *La Mode*, and it was in its office that he met Balzac, who, shortly after, asked him to illustrate his *Peu de chagrin*. Other papers also had the aid of his pen and pencil, and theatrical tailors and costumers found in him a valuable assistant, but his greatest success was as a satirist of the dandyism of the day. With the year 1832 the period of uncertainty came to an end, and from that date he could count upon an appreciative and faithful public. Two years

later he founded the *Journal des Gens du Monde*, of which he was at once editor and illustrator, and to which he contributed verse and prose, illustrating both with charming drawings. The undertaking proved unprofitable, and after struggling through six months of existence, landed its parent in the debtor's prison at Clichy. While, restored to liberty, he was hesitating as to his future course, he received a liberal offer from the proprietor of the *Charivari*. Modifying the publisher's idea, the artist produced the series of drawings known as "Les fourberies de femmes en matière de sentiment," which was soon followed by "La boîte aux lettres." Illustrating the Bohemian world in which he lived, series after series flowed from his pencil, all instinct with vivacity and force, and drawn mostly from the shady side of Paris life, like "Les lorettes," "Les coulisses," "Le carnaval," "Les étudiants," "Les débardeurs," etc., while later he embodied in other series his studies in superior strata of society, as in the well-known "Les enfants terribles," and in "La politique des femmes," "Impressions de ménage," "Nuances et sentiments," and others.

In 1844 he married Jeanne de Bonabry, but the union did not prove happy, and three years later he went to London. He returned in 1852, so deeply impressed by the scenes of degradation and wretchedness he had witnessed that it seemed to color all his future work, and it is said that he never laughed again nor made others laugh. He continued the practice of his art, but his tone was sterner, and his satire became more biting. Some of the series of this last period exhibit his tendency to be a moralist, as may be noticed in "Les partageuses," "Les lorettes vieilles," and "Les propos de Thomas Virelogue." During his last years he inclined more and more toward scientific pursuits, and passed most of his time in his garden at Auteuil with his two boys, continually changing its aspect, and never finishing the new design. He died there, November 24, 1866.

The *Catalogue raisonné de l'œuvre de Gavarni*, issued by Armelhaut and Bocher (Paris, 1873), conveys an adequate idea of the extraordinary amount of work performed by this unique prince of the pencil. In the Bibliothèque Nationale, Paris, his drawings fill fifteen folio volumes, but they represent little more than half of his work. For his biography, consult: Duplessis (Paris, 1876); Goncourt (ib., 1879); and Forgues (ib., 1888); also Mirecourt, *Les contemporains* (ib., 1854); Beraldi, *Les graveurs du XIX^{ème} siècle* (ib., 1888); and Curtis, *Masters of Lithography* (New York, 1897).

GAVARNIE. A frontier village in the Department of Hautes-Pyrénées, France, on the Gave-de-Pau, 34 miles south of Tarbes. The village originated in a hospital of Knights Templars, and is famous for the Cirque de Gavarnie, three miles to the south, a natural amphitheatre, nearly nine miles in circumference, surrounded by three ranges of limestone mountains, rising respectively to an altitude of 6900, 8500, and 9000 feet, the intermediate slopes being covered with glaciers. Thirteen cascades fall into the Cirque, the principal one, the Cascade de Gavarnie, fed by the Gave-de-Pau, having a drop of 1385 feet. Population, in 1901, 269.

VOL. VIII.—32.

GAVAZZI, gá-vât'sé, ALESSANDRO (1809-89). A popular Italian preacher and reformer. He was born at Bologna, became a monk of the Barnabite Order in 1825, and in 1829 professor of rhetoric at Naples. He entered the priesthood and acquired great reputation as an orator and advocate of liberal ideas. In 1840 he was transferred to Rome. He was one of the foremost supporters of the liberal policy that marked the beginning of the pontificate of Pius IX., and was prominent in the patriotic movements of the time. When Rome was captured by the French (July, 1849), he escaped to England, and lectured in that country and in Scotland. He also visited the United States and Canada, where his reception was not always favorable. In 1850 he renounced Catholicism, and became pastor of an Italian church in London. In 1860, having returned to Italy, he accompanied Garibaldi in the campaign of that year. After the battle of Mentana (1867) he devoted himself entirely to the Free Church of Italy, which he organized in 1870. He established a theological school of the Church at Rome in 1875, and became its professor of dogmatics, apologetics, and polemics. He made his last visit to America in 1881. He died in 1889. He published: *Orations* (London, 1851); *Recollections of the Last Four Popes* (London, 1859); *Records of Two Years' Christian Work in Italy* (London, 1868). For his life, consult: King (London, 1860); *Lectures in New York*, with life by Campanella and Nicolini, corrected by himself (New York, 1853).

GAVELKIND (Ir. *gabhail-cine*, from *gabhail*, tenure + *cine*, family). An ancient form of tenure in England, which antedated the Conquest, and which, in the county of Kent and in some parts of Northumberland and Wales, survived the coming and the disappearance of the feudal system. Its principal characteristic was the fact that the lands so held passed by descent to all of the sons of the tenant equally, instead of going, under the feudal rule of primogeniture, to the eldest son alone. Though Blackstone, probably with reason, ascribes a Celtic origin to this tenure, it seems to be the general opinion of English legal writers that it prevailed over the whole kingdom in Anglo-Saxon times, and that in Kent and elsewhere it was among the 'liberties' which the people were permitted to retain at the Conquest. In Wales gavelkind obtained universally till the time of Henry VIII. (34 and 35 Henry VIII., c. 26), and in some parts of England it is not yet abolished. In Kent all lands that have not been disgavelled by act of Parliament are held to be gavelkind. In addition to the characteristics of this tenure already noticed, Blackstone mentions the following: (1) The tenant is of age sufficient to alien his estate by feoffment at the age of fifteen. (2) The estate does not escheat in case of an attainder for felony, their maxim being, "the father to the bough, the son to the plow." (3) In most places the tenant had a power of devising lands by will before the statute authorizing the devise of lands generally was made. See **TENURE**, and consult Blackstone, *Commentaries*, and the authorities cited under **TENURE**.

GAVESTON, PIERS, Earl of Cornwall († 1312). The favorite of Edward II., King of England. His father was a Gascon knight attached to the royal household of Edward I. Here, from an early age, Piers was a companion of the heir

apparent, who, on his accession to the crown, created him Earl of Cornwall. He was witty and clever, but unscrupulous in the pursuit of his ambitious designs. Presuming on the King's regard for him, his attitude toward the English barons was of such a nature as to excite their enmity. His nomination as regent of the kingdom during the royal absence in France in the early months of 1308, and the honors conferred upon him at the coronation in the same year, aroused the open hostility of the barons, in compliance with whose demands the King was forced to send Gaveston out of the kingdom, making him, however, Lord Lieutenant of Ireland. In July, 1309, he was recalled, and, firm in the King's favor, grew more insolent than ever. This led Parliament to insist upon his banishment in October, 1311. In less than two months, however, he returned, and was reinstated in royal favor, whereupon the barons rose in arms, besieged Gaveston in Scarborough Castle, captured him, and beheaded him on Blacklow Hill, near Warwick, on June 10, 1312.

GA'VIAL, or **GHARIAL** (from Hind. *ghariyal*, fish-eater). A fish-eating crocodile of Northern India (*Gavialis Gangeticus*), differing from true crocodiles and from alligators in the great length and slenderness of the muzzle, and the cartilaginous swelling at its extremity (in old males) around the orifice of the nostrils by which it may be largely inflated. The teeth are very numerous, about 120; the longest of the lower jaw are received into notches in the upper, as in the true crocodiles. The head is broad, the narrow muzzle begins abruptly, and in it the branches of the bone of the lower jaw are united and prolonged as one. There are two great perforations in the bones of the skull behind the eyes, externally marked by depressions. The plates which cover the back and the nape of the neck are united. The crest of the tail is much elevated; the feet are webbed to the extremity of the toes. Its habits are as aquatic as those of the crocodile of the Nile. It attains a great size, but, owing to the slenderness of its muzzle, is esteemed less dangerous than a true crocodile of smaller size. The genus dates from the Upper Chalk period. See CROCODILE.

GAVINIÉS, gá'vé'nyá', **PIERRE** (1726-1800). A French violinist and composer. He was born at Bordeaux, and was a self-taught musician. When only fifteen he made his début at a "concert spirituel," an enterprise which he in part projected. His success was immediate; Viotti, hearing him play, remarked that he was *le Tartini de la France*. From 1795 until his death he was professor of the violin at the Paris Conservatory. His style is said to have been formed upon that of the old Italian masters, and was remarkable for its expressive and sympathetic qualities. He was of greatest importance in the development of violin technique in France, where he is considered the founder of the modern school of violin-playing. His compositions for the violin are for the most part very difficult, and comprise *Les vingt-quatre matinées*, six violin concertos, and nine violin sonatas. He also composed a three-act comic opera, *Le prétendu* (1760), which met with considerable success. He died at Paris.

GAVIOTA (Neo-Lat., from Lat. *gavia*, sort of bird, probably a sea-mew). A species of gull

(*Larus cirrocephalus*), very familiar about the harbor of Buenos Ayres and neighboring parts of South America. Consult *Proceedings of the Zoological Society of London* (London, 1871).

GAVOTTE, gá-vôt'. A French dance, whose name is derived from the *Gavots*, a people inhabiting the Pays-de-Gap, in Dauphiné. Originally a peasant dance, it was introduced at Court in the sixteenth century, and was largely remodeled in the seventeenth and eighteenth centuries. Its distinctive feature consisted of the performers raising their feet clear of the ground, instead of shuffling along, as was usual in dances of this character. Kissing and merry-making played a great part in the old gavotte, but subsequently it became almost as stiff and formal as the minuet. As a theatrical dance the gavotte was effective and popular. Glick and Grétry in particular having written famous ones. The music is in alle-breve time; in two parts, the first of four, the second of eight bars, and each part is repeated. As each phrase begins with an up beat, the fundamental rhythm of the gavotte is

by which the second bar has a remarkable cæsura. Some of Bach's suites contain excellent examples of the gavotte. It generally commences on the third beat of the bar, though this rule is not without its exceptions. See SUITE.

GAVRE, gá'vr'. A small town in Belgium, near Ghent. In 1453 it was the scene of a crushing defeat of the citizens of Ghent by Philip the Good, Duke of Burgundy.

GAUVROCHE, gá'vròsh'. A street urchin in Victor Hugo's *Les Misérables*, so typical of his class as to have well-nigh given his name to it.

GAWAIN, gá'wán, **SIR**. One of the knights of the Round Table. He is the nephew of King Arthur (q.v.), and his ally in the war with Launcelot. He tries in vain to pull the magic sword from the magic stone, fails in the quest of the Holy Grail (q.v.), and dies from wounds received in a fight with Launcelot. Consult: Malory, *Morte d'Arthur*; and Tennyson, *Idylls of the King*. The name is also given to a knight in *Amadis of Gaul*.

GAY, gá, **CLAUDE** (1800-73). A French traveler and naturalist, born at Draguignan, France. He pursued scientific studies primarily in Paris, and after a few months' travel in Greece and Asia Minor, sailed, in 1828, from Chile with the intention of making an extensive study of the flora of the South American continent. With the exception of a short period in 1832-33, which he spent in Paris supervising the construction of some scientific instruments of his own invention, Gay remained in South America until 1843, making extensive researches in Chile and parts of Peru, and collecting a great mass of material, not only in regard to the flora of the country, but its physical characteristics and political history as well. In 1843 he returned to Paris, where, by means of financial aid furnished by the Chilean Government, he was enabled to publish (in Spanish) his monumental *Historia física y política de Chile* (24 vols., 1843-51, with an atlas in 2 vols.). Gay spent 1856-58 in travel in Russia and the Orient, and in 1858 was commissioned by the Academy of Sciences, of which he

had been elected a member, to study mining in the United States, the results of his investigations being incorporated in an interesting work entitled *Rapport à l'Académie des Sciences sur les mines des Etats-Unis* (1861). Among his other publications were: *Consideraciones sobre las minas de mercurio de Andacolla é Iltapel con su posición geológica* (1837); *Origine de la pomme de terre* (1851); *Triple variation de l'aiguille aimantée dans les parties ouest de l'Amérique* (1854); *Carte générale du Chili* (1855).

GAY, DELPHINE, Madame de Girardin (1804-55). A French novelist and miscellaneous writer. She was born at Aix-la-Chapelle, the daughter of Sophie Gay (q.v.), and in 1831 became the wife of Emile de Girardin (q.v.). Of her numerous but ephemeral productions a comedy, *La joie fait peur*, and a novel, *Le lorgnon* (1831), are sufficiently typical. She died in Paris.

GAY, EDWARD (1837—). An American painter, born in Dublin, Ireland. He studied under James Hart at Albany, N. Y., and afterwards in Germany, first under Schirmer at Karlsruhe, and then under Lessing at Düsseldorf. His well-known landscape "Broad Acres" was awarded a prize of \$2000 by the American Art Association, and was given by it to the Metropolitan Museum of Art in New York City in 1887. Other works by him are "Rye Fields in Early June," and "Salt Marshes" (1885), both in water-color.

GAY, JOHN (1685-1732). An English poet and dramatist, born in 1685 at Barnstaple, Devonshire, of an ancient but impoverished family. After attending the free grammar-school he was apprenticed to a London mercer, but, dissatisfied with the occupation, he soon abandoned it. In 1712 he was appointed secretary to the Duchess of Monmouth. He had already written "Wine" (1708), a poem in blank verse; and a pamphlet entitled *The Present State of Wit* (1711), which gives an account of the current periodical literature. In 1713 he published a poem descriptive of country life, called "Rural Sports." It was dedicated to Pope, whose acquaintance Gay had made two years before. Now under Pope's influence, he produced *The Fan* (1714) and *The Shepherd's Week* (1714), a series of pastorals aimed against Ambrose Philips. Appointed secretary to Lord Clarendon, Envoy to Hanover, he was abroad in the summer of 1714. Returning to England in September, he addressed an epistle to the newly arrived Princess of Wales (October). His next production was a farce in ridicule of popular tragedies, entitled *What-d'-ye-Call-It* (1715). It contains the famous song, "'Twas when the seas were roaring." Next came *Trivia* (1716), descriptive of outdoor life in London. This was followed by an unsuccessful comedy, *Three Hours After Marriage* (1717). Three years later he published a collection of his poems with additions, by which he cleared \$1000. Here first appeared his finest ballad, "Sweet William's Farewell to Black-ey'd Susan." Entering into the South Sea speculations (1720), he lost everything, and became dependent on his friends, the kindest of whom were the Duke and Duchess of Queensberry. In 1724 he produced for Drury Lane Theatre the tragedy of *The Captives*, which met with some success. Three years later came the

popular verse-tales entitled *Fables*, the best of their kind in English. Gay was yet to gain his great fame. His Newgate pastoral, the *Beggar's Opera*, was first performed at Lincoln's Inn Fields, January 29, 1728. It ran for sixty-three days, was revived the next season, and performed in all the great English towns. Gay wrote a sequel entitled *Polly*, which was prohibited; but it succeeded remarkably in book form. Gay died December 4, 1732. A second series of *Fables* appeared posthumously (1738). The *Fables*, with memoir, were edited by Dobson (London, 1882); and the *Poetical Works* by Underhill (London, 1893). Consult: Johnson, *Lives of the Poets* (London, 1854); and Thackeray, *English Humorists* (London, 1853).

GAY, gâ, SOPHIE NICHULT DE LALETTE (1776-1852). A French novelist, born in Paris, July 1, 1776. Her novel *Laure d'Estell* (1802) has a sort of biographical interest, for it was written to indicate how much the author liked Madame de Staël and disliked Madame de Genlis. *Léonie de Montbreuse* (1813), *Anatole* (1815), and *Ellénore* (1847) are sufficiently characteristic of her other works. She died at Brussels, March 5, 1852.

GAY, SYDNEY HOWARD (1814-88). An American journalist and historian. He was born in Hingham, Mass., studied for a time at Harvard, then traveled, worked in a counting-house in Boston, and afterwards studied law, but became an abolitionist, and was precluded from practicing by his refusal to take the oath to support the Constitution. He became a lecturing agent for the American Anti-Slavery Society in 1842, and the editor of the *National Anti-Slavery Standard*, the official organ of the society, in 1844. He accepted a position as an editorial writer on the *New York Tribune* in 1842, and from 1862 to 1866 was its managing editor. Subsequently he was managing editor of the *Chicago Tribune* from 1868 to 1871, and an editorial writer on the *New York Evening Post* from 1872 to 1874. Though nominally only a collaborator, he actually wrote nearly the whole of Bryant and Gay's *Popular History of the United States* (1876-80), a work whose comprehensiveness, clearness, and accuracy soon gave it a high rank among compendiums of American history. He also wrote a *Life of Madison* (1884) for the "American Statesmen's Series;" the chapter on Amerigo Vespucci in Winsor, *Narrative and Critical History of America* (1886-89); and many articles on historical subjects for the magazines.

GAY, WALTER (1856—). An American painter, born at Hingham, Mass. He was a pupil of Bonnat in Paris, and in 1880 became a member of the Society of American Artists. His "Fencing Lesson" was exhibited at the Salon of 1879, and "The Spinners" received honorable mention in 1885. "Le Bénédicité," his best picture, was bought by the French Government for the Luxembourg. He received the decoration of the Legion of Honor in 1894, and a silver medal at the Paris Exposition of 1900.

GAY, WINCKWORTH ALLAN (1821—). An American landscape painter, born at Hingham, Mass. He studied under Robert Weir at West Point and Troyon in Paris. After 1877 he spent many years abroad. His pictures of New England scenery are the best of his works, and among

these may be especially mentioned the "Mackerel Fleet Off Beverly Coast" (1869).

GAYA, gī'a, or **GYA**. The capital of the District of Gaya, in the Presidency of Bengal, British India, on the Phalga, an affluent of the Ganges, 57 miles south of Patna, by rail (Map: India, E 4). A place of great sanctity, being the birthplace of Buddha, it is annually visited by thousands of pilgrims. It consists of the old native town, Gaya proper, and Sahibganj, the modern European and trading quarter. Of its many shrines and temples the most important is the Temple of Vishnu, crowned by an octagonal pyramid over 100 feet high. Its public institutions include a well-attended high school and a hospital with a branch for women. Population, in 1891, 80,400; in 1901, 71,200. Buddha Gaya, seven miles to the south, the ancient dwelling-place of Buddha, is the seat of a famous temple, which dates from B.C. 543, and has a pipal-tree, the descendant of the one under which the saint attained Nirvana.

GAYAL, gī'al (probably from Skt. *gaya*, household), or **MITHAN**. A species of native cattle (*Bos frontalis*), closely related to the gaur, which has long been more or less domesticated among the hill tribes of Northeastern India, and thence eastward through Assam to the Chinese borders, where it is known as *mithan*. It was formerly considered a race of the gaur (q.v.), but is now known to be a distinct species, which Blanford asserts to exist wild in Tenasserim. It resembles the gaur, but is of less size, has proportionately shorter limbs, less of a ridge on the back, and the horns shorter and less compressed at the base. The head is very broad and flat at the upper part, suddenly contracted toward the nose, with a very wide space between the horns. The prevailing color is brown, generally dark, but in some of the herds parti-colored and white ones are frequently seen. The Keskis, of Tipperah, and other eastern hill tribes keep herds of gayals, which they permit to roam at large during the day in the forests, but which return home at night of their own accord. Their milk is extremely rich, but not abundant; the natives, however, do not use the milk, but rear these cattle entirely for their flesh and skins. They are never used in agricultural labor nor as beasts of burden; and though occasionally interbred with captive gaurs, have given rise to no domestic race. Beyond the fact that it is, like the gaur, an inhabitant of the forests, and is surprisingly agile among rocky hills, nothing is known of the habits of the gayal in a wild state. See Plate of WILD CATTLE.

GAYANGOS Y ARCE, gī-ān'gōs é ār'thā, PASCUAL DE (1809-97). A Spanish historian. He studied at Madrid and later in France; held office under the Spanish Government (1833-36), then lived for a time in London, where he translated into English Al Makkari's *History of the Mohammedan Dynasties* (1840). He became professor of Oriental languages at the University of Madrid, and in 1881 Director of Public Instruction. Resigning soon afterwards, he spent much of his time in London. The historian Prescott, in his preface to *Ferdinand and Isabella*, acknowledges the valuable services of Señor de Gayangos, and he repeats these acknowledgments in his *Philip II*. He refers particularly to the remarkable facility of Gayangos "in deciphering the

mysterious handwriting of the sixteenth century," with which "he combined such a thorough acquaintance with the history of his country as enabled him to detect, amid the ocean of manuscripts which he inspected, such portions as were essential to my purpose." Among his works are: *Historia de los reyes de Granada* (1842); a Spanish edition of Ticknor, *History of Spanish Literature*; *Cartas y Relaciones de Hernán Cortés al Emperador Carlos V.* (1870), and many contributions to periodicals.

GAYARRÉ, gā'ür-rā', CHARLES ETIENNE ARTHUR (1805-95). An American historian. He was born at New Orleans, La., January 9, 1805, was educated in the College of New Orleans, studied law in Philadelphia, and was admitted to the bar in 1829. Returning to New Orleans, he was soon made a member of the Legislature, Deputy Attorney-General of the State, and presiding judge of the New Orleans City Court. In 1835 he was chosen United States Senator, but on account of ill health did not serve, and spent the next eight years in Europe. After his return he was twice again elected to the Legislature, and was for seven years (1846-53) Secretary of State for Louisiana, doing much for the State Library and for local historical studies. He was in favor of secession, and advocated the emancipation and arming of the slaves. But although a prominent figure of the public life of Louisiana, his main bent was literary, and in the course of his long life he published many volumes, including some romances and dramas. He is best known, however, as the historian of his State. He died in New Orleans, February 11, 1895. Among his books we may cite: *Histoire de la Louisiane* (1847); *Romance of the History of Louisiana* (1848); *Louisiana, Its Colonial History and Romance* (1848-52); *Louisiana, Its History as a French Colony* (1851); *History of the Spanish Domination in Louisiana* (1854); and *Philip II. of Spain* (1866). The complete *History of Louisiana* appeared, in 1866, in four volumes. His romance *Fernando de Lemos* gives an interesting picture of old New Orleans.

GAYER, gī'ēr, KARL (1822—). A German forester, born at Speier. In 1855 he was appointed professor of forestry at Aschaffenburg, whence he was in 1878 called in the same capacity to the University of Munich. In his work entitled *Der Waldbau* (4th ed. 1898), he introduced a new method of instruction in forestry, based upon a stricter adherence to natural laws. His manual of forestry, entitled *Die Forstbenutzung* (8th ed. 1894), is the authority on that subject in Germany. Other works by the same author are: *Wald im Wechsel der Zeiten* (1889), and *Der Femeischlagbetrieb in Bayern* (1895).

GAY HEAD. See MARTHA'S VINEYARD.

GAYLEY, CHARLES MILLS (1858—). An American author. He was born at Shanghai, China, and was educated in England, at the University of Michigan (1878), and at Giessen and Halle, Germany. In 1880 he became associated with the University of Michigan, where he remained as assistant professor of Latin until 1889, when he accepted a call as professor of English in the University of California. His publications include: *Representative English Comedies* (5 vols.; vol. i., 1901); *Classical Myths in English Literature* (1893); *Methods and Ma-*

serials of Literary Criticism (with F. N. Scott, 1899).

GAY-LUSSAC, gä' lu'säk', JOSEPH LOUIS (1778-1850). One of the most distinguished chemists and physicists of the nineteenth century. He was born at Saint Léonard le Noblat (Haute-Vienne). In 1794 he was sent to Paris, and was admitted to the Ecole Polytechnique in 1797. After three years' study, Berthollet, who was then professor of chemistry in the Ecole Polytechnique, selected him as his assistant at Arcueil, where the Government chemical works were situated. In 1801 the young chemist published his first memoir, which treated of the dilatation of gases and vapors, and which was speedily followed by others, on the improvement of thermometers and barometers, on vapor-tensions and the determination of vapor-densities, and on capillary action. In association with Biot, he was commissioned by the Institute of France to make a balloon ascent, with the view to ascertaining whether magnetic force existed at considerable heights above the surface of the earth, or only on the surface, as had been asserted by some physicists. Alexander von Humboldt investigated with him the properties of air brought down from a height of more than 23,000 feet, and their joint memoir to the Academy of Sciences (read on October 1, 1804) contained the first announcement of the fact that oxygen and hydrogen unite to form water in the simple proportion of one volume of the former to two volumes of the latter. The simplicity of the ratio in which these gases stood to each other in their combining proportions induced Gay-Lussac to study the combining volumes of other gases, and thus led him to the important discovery of the law of volumes, which was announced in 1808, and is one of the most general and important laws in the whole domain of chemistry. In 1809 he was made professor of chemistry at the Ecole Polytechnique. Davy's discoveries of potassium and sodium, by the decomposing action of the electric current, having excited much attention in France, Napoleon directed Gay-Lussac and Thénard to pursue this class of researches. The results of their investigations appeared in two volumes, under the title *Recherches physico-chimiques*, in 1811. Among the most important of the discoveries announced in these volumes were a new chemical process which yielded potassium much more abundantly than the electrolytic method, the isolation of boron, and new and improved methods of analyzing organic compounds. Gay-Lussac was also the first to obtain hydriodic and iodic acids and cyanogen. He also investigated the manufacture of hydrated sulphuric acid, bleaching chlorides, alcohols, and alkalies employed in commerce. In 1805 he was chosen a member of the Committee of Arts and Manufactures, established by the Minister of Commerce. In 1818 he was appointed to superintend the Government manufactory of gunpowder and saltpetre, and in 1829 he received the lucrative office of chief assayer to the mint, where he introduced several important improvements. In 1831 he became a member of the Chamber of Deputies; in 1832 professor of chemistry at the Jardin des Plantes; and in 1839 he was made a peer of France. He never took an active part in politics, and was diligently engaged in scientific research until his last illness. From 1816

he was co-editor of the *Annales de chimie et de physique*, in which many of his original memoirs were published. He also wrote: *Cours de physique* (1827); *Leçons de chimie* (2 vols., 1828); and other works. Consult: *American Journal of Science* (1850); Biot and Gardeur le Brun, *Notices biographiques sur Gay-Lussac* (Châlons, 1850). See CHEMISTRY; AVOGADRO'S RULE.

GAY-LUSSACIA. A genus of shrubs of the natural order Ericaceæ (q.v.), named after the French chemist J. L. Gay-Lussac. The species, of which about 40 are natives of North and South America, bear alternate serrate or entire leaves, racemes of red, white, or reddish-green flowers, and black or blue, generally edible fruits. Some species are deciduous, some evergreen. The former, though hardy, are not markedly ornamental; the latter are nearly all attractive in both foliage and flower, but little cultivated in cold countries, on account of their tenderness. Like their close relatives, the species of *Vaccinium*, they thrive in peaty or sandy soils and in partial shade.

GAYN'HAM, or **GARN'HAM**, Dr. One of the most lax of the degraded clergymen who, while confined as prisoners in the Fleet, performed secret marriages in the eighteenth century. He claimed in court to have lent himself to 2000 such marriages. He is described as a lusty man, and is also called the "Bishop of Hell."

GAY SABER, gä sä'bar'. A small association or committee, originally known as "The very gay company of the seven troubadours of Toulouse," which met first in 1324 at Toulouse. Its object was the restoration of the Provençal language and customs, and the rules which it adopted are still in force in the annual floral games held at Toulouse on May 1st.

GAZA, gä'zä. A city in Southern Syria, the modern Ghazze, three miles from the Mediterranean coast, and about 50 miles southwest of Jerusalem. It was once the most important member of the Philistine Pentapolis, and a flourishing centre of Hellenistic culture, and is still an emporium of trade and a place of considerable size, with a population of about 35,000. Gaza is mentioned as Gazatu in a list of places in Palestine captured by Thothmes III. It is referred to in the Amarna correspondence under the form Khazati. In the time of Rameses II. it was still an Egyptian possession. But the Philistines seem to have secured the city when they were repelled in their attack upon Egypt in the reign of Rameses III. Probably the city was not captured by the tribe of Judah at the time of the Hebrew invasion, as stated in Judges i. 18, since the editorial gloss contradicts the context. In the narrative of Samson (q.v.), Gaza figures prominently, and he is said to have carried away the gates of this city (Judges xvi. 3). The Assyrian inscriptions do not mention the city until the reign of Tiglathpileser III. (B.C. 745-728), when 'Chanun, King of Gaza,' resisted his attacks, was defeated, and fled to Miluchha in B.C. 734. In B.C. 720 this King again offered resistance, aided by Sibe, King of the north Arabian country of Muzri. Sargon defeated him at Rahpia and carried him and 9000 of his people away into captivity. Gaza seems to have taken no part in the rebellion of Ashdod in B.C. 713-711, or in that of Hezekiah of Judah in B.C. 701, and its King Sil

Bel was therefore presented with a part of Hezekiah's territory. Sil Bel is mentioned as a faithful vassal of Asurbanipal (B.C. 668-626); and even in the time of Nabunaid of Babylonia (B.C. 556-539) the vassals of Gaza are mentioned. During the Achæmenian period the city must have been of great importance. Herodotus (ii. 159), who calls it Kadytis, says that it seemed to him not inferior to Sardis. In B.C. 332 it was taken by Alexander only after a siege of two months, the Persian General Bates, with the aid of Arabian mercenaries, offering a stout resistance. Gaza was destroyed in B.C. 96 by Alexander Jannæus, the Nabatean King Aretas failing to send aid. The ruined city is referred to in Acts viii. 26, and also in a Greek geographer as ἐρημος, *erêmos*, 'desert.' The port grew up into a new Gaza. Under the Roman administration Gaza was rebuilt, and attained to a significance that it had scarcely possessed before. Hellenic culture made it a rival of Antioch, Alexandria, and Athens. In its temples Greek gods were worshipped; Greek art flourished among its wealthy citizens; from its schools went forth famous rhetoricians, philosophers, and poets. Representatives of Neo-Platonism, such as Proclus, Olympianus, and Isidor, taught in Gaza in the fifth and sixth centuries, the last of them even after the closing of the school of Athens in 529. Christianity also found here philosophically educated defenders, such as Procopius, Choricus, and Johannes. But both the native faith, the worship of the god Marna, 'our lord,' and the Greek cults continued in Gaza longer than in any other great Syrian city. Omar captured the city in 634. The Crusaders found it in ruins. In 1149 Baldwin II. built a citadel which he left to the Templars to defend. Saladin plundered the city in 1170, but could not take the citadel until 1187. Napoleon took it in 1799. Consult: Clermont-Ganneau, *Archæological Researches in Palestine* (London, 1896); Stark, *Gaza und die philistäische Küste* (Jena, 1852); Smith, *Historical Geography of the Holy Land* (London, 1895); and Gatt, in *Zeitschrift des deutschen Palästina-Vereins*, vol. i. (1888).

GAZA, THEODORUS (c.1398-c.1475). A famous teacher of the Greek language and literature in the West, the successor of Emmanuel Chrysoloras. He was born in Thessalonica, and came to Italy between the years 1435 and 1440, apparently from Constantinople. The Latin language he learned under Vittorino da Feltre at Mantua, and studied so assiduously that in three years he was a master of the tongue: soon after 1441 he was appointed professor of Greek in the newly established school at Ferrara. About 1450 Pope Nicholas V. invited him, along with other learned Greeks, to Rome, where he was appointed to the chair of philosophy. At this time he made a Latin translation of Aristotle's *Problemata* in mechanics and of his *History of Animals*. Later he made translations of many other Greek works. After the death of Pope Nicholas, King Alfonso gave him an invitation to remove to Naples in 1455; but the death of this monarch in 1458 necessitated his return to Rome, where he found a patron in Cardinal Bessarion, who obtained for him a small benefice in Southern Italy. But the learned Greek longed for Rome, to which he returned for a time under the Popes Paul II. and Sixtus IV. He died in Calabria about 1475.

Gaza has been warmly praised by subsequent scholars, such as Politian, Erasmus, Scaliger, and Melancthon. His principal writings are his *Introductio Grammatica Libri IV.* (a work on the elements of Greek grammar, first published by Aldus Manutius, at Venice, A.D. 1495, and long held in high repute), a number of epistles to different persons on various literary subjects, and a variety of important translations into Latin, besides those already mentioned, portions of Aristotle, Ælian, Theophrastus, Saint Chrysostom, Hippocrates, and other Greek writers. Consult: Hodus, *De Græcis Illustribus* (London, 1742); also Voigt, *Wiederbelebung des klassischen Altertums*, vol. ii. (Berlin, 1893).

GAZALAND, gâ'zà-lând. A portion of Portuguese East Africa (q.v.).

GAZE (ME. *gasen*, from dialectic Swed. *gasa*, to stare). A term in heraldry (q.v.), descriptive of a hart or stag represented *affrontée*, or looking full-faced from the field. Such an animal is said to be at gaze.

GAZELLE, gâ-zèl' (OF. *gazel*, gazelle, Sp. *gazela*, from Ar. *ghazal*, gazelle, from *ghazila*, to be affectionate). A name applied to various small, slender, and graceful antelopes, with large, liquid eyes and short horns. About twenty species are known in Southwestern Asia and Northern Africa. They are distinguished from each other by the length of the ringed and usually lyrate horns, and by color; but the differences are often hard to define, and some zoölogists regard as mere varieties what others hold to be perfectly distinct species. The best known species is the true gazelle (*Gazella dorcas*), which exhibits the typical characters of the group in their highest perfection. It is of a light tawny color, the under parts white; a broad brown band along each flank; the hair short and smooth. The face is reddish fawn-color, with white stripes at each side, inclosing a dark triangular space. The horns of the old males are nine or ten inches long, bending outward and then inward, like the sides of a lyre, also backward at the base and forward at the tips; then tapering to a point and showing thirteen or fourteen permanent rings. The horns of the female are smaller. The ears are long, narrow, and pointed; the eyes very large, soft, and black; there is a tuft of hair on each 'knee;' the tail is short, with black hairs on its upper surface only and at its tip. This gazelle is a native of the north of Africa, Asia Minor, Syria, and Arabia. It was known to the ancients, and is described by Ælian under the name *dorcas*, which was also given to the roe-deer. The speed of the gazelle is such that it cannot be successfully hunted by any kind of dog, but in some parts of the East it is taken by the assistance of falcons, and is also captured in inclosures made near its drinking-places. Although naturally very wild and timid, it is easily domesticated, and when taken young becomes extremely familiar. Tame gazelles are very common in Asiatic countries, and Oriental poetry abounds in allusions to their beauty and gentleness.

Various other species of gazelles should be mentioned. The commonest species of the Sahara is Loder's (*Gazella Loderi*), called 'reem' by the Arabs of Algeria, which lives on berries and leaves, and is said never to drink.

Another species of the eastern Sahara high-

GAZELLES AND SMALL ANTELOPES

1. KLIPSPRINGER (*Oreotragus saltator*).
2. NAKONG (*Tragelaphus spekei*).
3. COMMON or DORCASS GAZELLE (*Gazella dorcas*).
4. SPRINGBOK (*Gazella eucochore*).

5. GUIB (*Tragelaphus scriptus*).
6. ISABELLINE ANTELOPE (*Gazella isabellina*).
7. CHOUSINGA (*Tetracerus quadricornis*).
8. BLACKBUCK (*Antelope cervicapra*).

lands is the admi or mountain gazelle (*Gazella Cuvieri*), which often comes down at night in small bands to feed upon the grain in the valleys. It is twice the weight of the dorcas, and in quickness and facility in eluding observation it is almost equal to the aoudad. The common gazelle of Arabia is *Gazella Arabica*. Abyssinia and the open country southward have several species, among them the beautiful Kordofan species (*Gazella isabellina*), isabelline in color, with a reddish instead of the usual black tail; Grant's (*Gazella Granti*), very numerous about Kilimanjaro, and having the longest horns of the genus; the long-necked greenuk (*Lithocranius Walleri*); the diminutive Thomson's gazelle, and others. In South Africa the springbok (*Gazella euchores*) is widespread and familiar. (See SPRINGBOK.) West Central Africa has several local species, of which the swift gazelle (*Gazella mohr*) and the korin are perhaps best known; and the dig-dig and dama (q.v.) are familiar in the Sudan.

Of the Asiatic gazelles the Indian chinkara (*Gazella Bennetti*), known to Anglo-Indian sportsmen as the 'ravine deer,' is the most familiar. It inhabits the plains from Central India to Persia, keeps to the broken country, and is so exceedingly swift as to furnish excellent sport with greyhounds or falcons, and is also much hunted with the cheeta (q.v.). It is light chestnut in general color above, and has long, ringed horns; the buck stands about twenty-six inches high at the shoulders. Two other species inhabit the lofty plains of Mongolia and Thibet, and a third, the Persian gazelle (*Gazella gutturosa*), is well known from the Caspian Sea to the desert of Gobi. Blanford's writings on the zoölogy of India and Persia contain extensive accounts of these and other Asiatic forms. See ANTELOPE, and the names of various species; and Plate of GAZELLES.

GAZETTE (It. *gazetta*, gazette, small coin; probably a diminutive of Lat. *gaza*, Gk. γάφα, treasure). A newspaper. In 1566 the Venetian Government established an official news-sheet, which was not printed at first, but only written out and exhibited in public places. The fee for reading it was a small coin called *gazetta*. The name was soon applied to the sheet itself. The *London Gazette*, founded in 1665, is the official organ of the Government. It appears twice a week. It is recognized in law as the medium of official and legal documents. Similar gazettes are published in Edinburgh and in Dublin. The word *gazette* is now common as a part of the title of many newspapers. See NEWSPAPERS.

GAZETTEER. A geographical dictionary, more or less descriptive and statistical. The word is connected with *Gazetier*, gazetteer, a writer in newspapers; and one of the early publications of this character (that of Laurence Echard) was entitled: "The Gazetteer's or Newsman's Interpreter, being a Geographical Index of all Considerable Cities, Patriarchships, Ports, etc., in Europe." The oldest known geographical dictionary is the sixth-century fragment of Stephanus Byzantius. Some of the best known of modern gazetteers in the English language are Blackie's *Imperial* (Glasgow, 1850); Alexander Keith Johnston's (1850, new ed. 1877); Lippincott's *Pronouncing Gazetteer of the World* (Philadelphia, 1855; new ed. 1880; supplement, 1900);

Longman's *Gazetteer of the World* (London, 1895). A monumental encyclopædia of universal geography is Vivien de Saint-Martin's *Nouveau dictionnaire de géographie* (Paris, 1877-1900). A very exhaustive gazetteer (as far as the number of entries is concerned) is the so-called Ritter's *Geographisch-statistisches Lexikon* (Leipzig, 1874; new ed. 1894). On a smaller scale is the *Dizionario geografico universale* of G. Garollo (Milan, 1898), a work remarkable for its accuracy. As a type of special gazetteer on a magnificent scale, may be mentioned Hunter's *Imperial Gazetteer of India* (London, 1881; new edition 1886-88). There are special gazetteers of the individual States of the American Union.

GAZ/OGENE. See AERATED WATERS.

GEARING (from *gear*, AS. *gearice*, from *gearu*, ready, Eng. *yare*). A term applied to the parts of machinery by which motion in one part of a machine is communicated to another; gearing consists in general of toothed wheels, friction-wheels, endless bands, screws, etc., or of a combination of these. When the communication between the two parts of the machine is interrupted the machine is said to be *out of gear*; and when the communication is restored it is said to be *in gear*. Gearing has also for its object the increasing or diminishing of the original velocity, and in reference to this is distinguished by the term 'multiplying' or 'retarding.' See GEAR-WHEEL.

GEAR-WHEEL. A toothed wheel used to transmit motion and power from one part of a machine to another. Gear-wheels are of great variety of forms, the most common being spur wheels, in which the teeth are parallel to the

TYPICAL GEAR-WHEELS.

1. Spur gear. 2. Worm wheel and gear. 3. Internal gear. 4. Spur gear. 5. Bevel gear. 6. V-shaped gear. 7. Bevel gear.

axis of the wheel; bevel wheels, in which the teeth are cut radially in the face of a cone; worm wheels, in which the teeth are cut spirally. A familiar example of spur gearing is found in the works of a watch, and the ordinary chainless bicycle affords a simple example of bevel gears. The various forms of gear-wheels and their theoretical design will be found described in treatises on machine design, which should be consulted for technical details of this nature. Consult: Kent, *Mechanical Engineer's Pocket Book* (New York, 1900); and Reuleaux, *The Constructor* (Philadelphia, 1893).

GEARY, gā'ri or gē'ri, JOHN WHITE (1819-73). An American soldier and politician. He was born of Scotch-Irish parentage in Westmoreland County, Pa., was educated at Jefferson College, but left before graduating, and entered upon a commercial career at Pittsburg, at the same time studying both civil engineering and law.

He then engaged for some time in civil engineering in Kentucky, and on the outbreak of the Mexican War was chief engineer and superintendent of the Allegheny Portage Railway. This position he resigned, and helped recruit the Second Pennsylvania Volunteer Regiment, in which he became lieutenant-colonel, and served throughout the war. After the capture of the City of Mexico he was promoted to the rank of colonel, and was placed in command of the city. After peace was declared he settled in San Francisco, where, in 1849, he was appointed the first American postmaster, and was given authority to organize post-offices and mail routes on the coast. In the same year he became the first American *alcalde* of San Francisco, and in 1850, upon the adoption of an American system of municipal government for the city, was chosen its first Mayor. He was active in the movement that resulted in giving California a new constitution, was a prominent member of the convention which drew it up, and took a leading part in securing the admission of California into the Union as a free State. After serving a year as the head of the Democratic State Committee he returned to Pennsylvania, where he remained in retirement until 1856, when he was appointed by President Pierce Territorial Governor of Kansas, succeeding Shannon, whose vacillation had aroused the hostility of both the Free-State and Pro-Slavery factions. Geary's rule in Kansas was impartial and firm, and in a few months he restored order, and was able to report to Washington a most satisfactory condition of affairs. Had the Pierce Administration supported him satisfactorily, or had the incoming Buchanan Administration shown any intention of doing so, there might have been an end of bloodshed in Kansas. But the predominance of pro-slavery men in the councils of both Pierce and Buchanan appeared to Geary to render all that he had accomplished of only temporary effect, and, disgusted with the conduct of affairs, he resigned soon after Buchanan's inauguration. At the beginning of the Civil War Geary raised the Twenty-eighth Pennsylvania Volunteer Infantry, of which he became colonel, served with distinction in the Army of the Potomac, and was promoted brigadier-general in April, 1862. He was wounded at the battle of Cedar Mountain in the following August, and commanded the Second Division of the Twelfth Army Corps at Chancellorsville and Gettysburg. Transferred to the Army of the Cumberland, he distinguished himself at the battles of Wauhatchie and Lookout Mountain, and later commanded a division on Sherman's march to the sea, serving as military governor of Savannah after its capture. In 1865 he received the brevet rank of major-general. He was elected Governor of Pennsylvania as a Republican in 1866, and was reelected in 1869, serving until within eighteen days of his death.

GEBA, zhā'ba. A short river in Portuguese Guinea, West Africa, flowing in a southwestern direction through the colony, and entering the Atlantic by a wide estuary. At its mouth is situated the small town of Geba.

GEBAL, gē'bal. See BYBLOS.

GEBANG (gē-bāng') **PALM** (native name), *Corypha Gebang*. A fan-leaved palm, native of the East Indies, where it is one of the most useful plants. The trunks of this palm become sixty

to eighty feet high and two feet in diameter, with leaves eight to ten feet in diameter. Its stem yields a kind of sago; its root is medicinal, being both emollient and slightly astringent, so as to be particularly adapted to many cases of diarrhœa; its leaves are used for thatch, for making broad-brimmed hats, and for various other economic purposes; its young leaves are plaited into baskets and bags, in the manufacture of which many of the people of Java find employment; the fibres of its leafstalks are made into mats, ropes, baskets, nets, cloth, etc. To the genus *Corypha* belongs also the talipot palm (q.v.).

GEBAUER, gā'bou-ēr, JAN (1838—). A Czech philologist, born at Ubislavice, Bohemia, and educated at the University of Prague, where he was appointed instructor in literature, and was elected to the professorship of Slavic philology in 1881. He published a number of translations from the Russian, Bulgarian, and Sanskrit, but is best known for his studies and researches into the ancient Czech language and literature, in which his most important publications are: the *Nova rada* of Smil Flaška (1876), and *Žaltář Wittenberský* (1880). He also wrote Czechic grammars (1890 and 1896) and an Old-Czechic dictionary. From 1874 he was associate editor of the *Listy Filologické*.

GEBER, gā'bēr. The name assigned to the author of a vast number of Arabic works on alchemy, astrology, and magic, as well as some of genuine scientific value. Who Geber was is uncertain, and some Arabic scholars have even denied his existence. His full name may have been Abu Musa (or Abdallah) Jabir ibn Hajjan es-Sufi, and it is said he lived in the eighth or ninth century. He appears to have resided for some time at Cufa, and according to some Cufa was his birthplace; others say Damascus, and still others favor Harran in Mesopotamia or Tarsus in Cilicia. About twenty-six works attributed to Geber are known by title, the manuscripts of many being in the libraries of Leyden, Paris, and elsewhere. There are Latin translations of some of them, *Geberi Philosophi de Alchimia Libri Tres* (1531), and *Geberi Arabis Chimia sive Traditio Summæ Perfectionis et Investigatio Magisterii* (1668). An English translation of the latter, and of other treatises, by Russell, appeared in 1678. So great was Geber's fame that for many centuries his experiments were repeated by European chemists. Roger Bacon called him *Magister Magistrorum*. Consult Berthelot, *La chimie au moyen âge*, vol. iii. (Paris, 1893); Wüstenfeld, *Geschichte der arabischen Aerzte* (Göttingen, 1840).

GEBHARDT, gep'härt. EDUARD VON (1838—). A distinguished German historical painter, born at Saint Johannes, Esthonia. After studying at the Academy of Saint Petersburg (1855-58) and at the School of Art in Karlsruhe for the next two years, part of which he spent in traveling, he became in 1860 the pupil of Wilhelm Sohn at Düsseldorf, where he permanently settled, was appointed professor at the academy in 1873, and became one of the most conspicuous ornaments of that institution. His works mark a new departure in the pictorial treatment of religious subjects in Germany, upon which, in keeping with the modern realistic tendency, he endeavored to impress a national stamp after the manner of the

Flemish and German masters of the fifteenth and sixteenth centuries, endowing his figures with the costume and features typical of that period. The more important among the many biblical scenes he painted are: "Entry of Christ into Jerusalem" (1863); "Christ on the Cross" (1866, Reval Cathedral); "The Last Supper" (1870, National Gallery, Berlin), one of his finest creations, masterly in characterization of the life-sized figures; "Crucifixion" (1873, Hamburg Gallery), with a strong leaning toward the Old-Flemish School; "Ascension of Christ" (1881, National Gallery, Berlin), another masterpiece, life size, of more ideal conception; "Taking Care of Christ's Body" (1883) and "Jacob and the Angel" (1893), both in Dresden Gallery; "Christ and the Rich Youth" (1892) and "Sermon on the Mount" (1893), both in Düsseldorf Gallery; "Healing of the Palsied" (1895, Breslau Museum). Of several episodes from the period of the Reformation may be mentioned "The Reformer at Work" (1877, Leipzig Museum). To some pre-Raphaelite impressions received on a visit to Italy in 1882, a cycle of six mural paintings, "Scenes from the Life of Christ" (completed 1891), in the Cistercian Monastery at Lokkum, bear witness. He also painted many excellent portraits, and was awarded the great gold medal at the Berlin Exhibition of 1886. Consult the monographs by Rosenberg (Leipzig, 1899) and Schaarschmidt (Munich, 1899).

GEBHARDT, gēph'ärt, OSKAR LEOPOLD VON (1844—). A German Protestant theologian, born at Wesenberg in Esthonia, and educated at Dorpat, Tübingen, Erlangen, Göttingen, and Leipzig. In 1893 he was appointed chief librarian and professor of paleography in the University of Leipzig. He published *Græcus Vencus* (1875); Theile's *Novum Testamentum Græce* (11th to 16th ed. 1875-1900); *Das Neue Testament griechisch und deutsch* (4th ed. 1896); Tischendorf's *Novum Testamentum Græce* (6th ed. 1894; and an editio minor, 2d ed. 1891); *The Miniatures of the Ashburnham Pentateuch* (1883).

GEBHART, zhā'bār', EMILE (1839—). A French writer, born at Nancy. He was educated at the Lycée of Nancy and the Ecole Française d'Athènes; from 1860 was professor of foreign literatures at Nancy, and from 1879 of Romance literatures in the faculty of philosophy at Paris. His works include: *De l'Italie* (1876), and *Les origines de la Renaissance en Italie* (1879), both crowned by the Académie Française. In 1896 he was elected to the Académie des Sciences Morales et Politiques.

GEBIRS, gā'bérz. See GHEBERS.

GEBLER, gā'blér, OTTO (1838—). A German painter, born in Dresden. He was a pupil at the academy there, and afterwards studied in Munich under Piloty. He is entirely an animal painter, and there is often an element of humor in his careful works, the best of which are: "Obstinate Sheep;" "Disturbed Domestic Peace" (1863); "Art Critics in the Stable" (1873), National Gallery, Berlin; "Sheep and Spaniel" (1878); "Two Poachers" (1880); and "Reynard's End" (1883), New Pinakothek, Munich.

GEBLER, TOBIAS PHILIPP, Baron (1726-86). An Austrian statesman and dramatist. He was born at Zeulenroda, Saxony, and was educated at Jena, Halle, and Göttingen. After travels abroad he was (in 1748) appointed secretary of

legation of the Netherlands at Berlin. Five years later he entered the Austrian service, in which he found rapid promotion, rising to the rank of Vice-Chancellor of the Court in 1782. He was a liberal statesman, and rendered efficient service to the cause of education. He also tried to reform the stage, and himself wrote some plays, now forgotten. His *Theatralische Werke* were published in three volumes in 1772-73. His drama *Der Minister* was very popular in its day (1771).

GEBWEILER, gā'vi-lér (OHG. *Gebunclare*). A town in Upper Alsace, Germany, situated at the mouth of the Blumenthal, about 17 miles south-southwest of Colmar (Map: Germany, B 4). It has a splendid twelfth-century church in the Transition style, and a fourteenth-century Dominican church, now used as a market and concert hall. Gebweiler is one of the industrial centres of Alsace. Among its products are machinery, cotton and woolen goods, wooden articles, soap, and brick, and especially white wines of a superior grade. Gebweiler is mentioned as early as 774. Population, in 1890, 12,367; in 1900, 13,259, mostly Roman Catholics.

GECKO. A lizard of the family Geckonidæ, which naturalists have divided into many genera. The geckos are of small size, and generally of repulsive aspect; the colors of most of them are dull, and the small granular scales with which they are covered are in general mingled with tubercles. The legs are short, the gait usually

STRUCTURE OF A GECKO'S FOOT.

a, the whole foot, from above; b, under side of a toe, with its clinging ridges; c, diagram of a section through a toe, showing the ridges in section; d, a few ridges, in section, magnified, showing their bristles; e, f, bristle-cells, much enlarged. (After Semper.)

slow, measured, and stealthy, although geckos can also run very nimbly when danger presses,

and often disappear suddenly when they seem almost to be struck or caught. The feet are remarkable, being adapted for adhering to smooth surfaces, so that geckos not only readily climb trees or walls, but creep inverted on ceilings, or hang on the lower side of large leaves. The body and tail are never crested, but are sometimes furnished with lateral membranes, variously festooned or fringed, and sometimes so large as to be of use to arboreal species in enabling them to take long leaps from branch to branch. Such is the case with the flying or fringed gecko (*Ptychozoon homalocephalum*) of the Malaysian region. The geckos feed chiefly on insects. They are quarrelsome, and will sometimes devour their eggs or young, and even their own tails and exuviated skins. They are natives of warm climates, and are very widely distributed over the world, and are more or less nocturnal in their habits. Two species are found in the south of Europe, both of which frequently enter houses, as do the geckos of Egypt, India, Ceylon (the 'chucha'), and other warm countries. Only one gecko (*Sphaerodactylus notatus*) dwells in the United States, although three or four kinds are found in southern California and Mexico. It is scarcely two inches in length, and is sparingly found in Florida and Cuba.

The name 'gecko' is derived from a peculiar cry often uttered by some of the species, which in some of them resembles syllables distinctly pronounced, while others are described as enlivening the night in tropical forests by a harsh cackle, such as that which gives the 'croaking lizard' (*Thecodactylus lævis*), so abundant in Jamaica, its lugubrious name. The geckos have, in almost all parts of the world where they are found, a bad reputation as venomous, and as imparting injurious qualities to food which they touch; but there is no good evidence in support of any such opinion. They lay a few eggs in some warm hollow of a stump, or similar place, and pay little attention to them or to the young. In cool countries they hibernate. Consult: Gadow, *Amphibia and Reptiles* (London, 1901); Gosse, *A Naturalist's Sojourn in Jamaica* (London, 1851). See the article LIZARD.

GED, WILLIAM (1690-1749). The inventor of the art of stereotyping. He was born in Edinburgh, where he was employed for some years as a goldsmith and jeweler. In 1725 he took out a patent for making stereotyped plates from pages of type. He met with active opposition from both compositors and type-founders. He was ruined financially by a man named Fenner, with whom he entered into partnership in London. He procured, in 1731, a contract for printing Bibles and prayer-books by his process from Cambridge University, but had turned out only two prayer-books when his failure compelled his return to Edinburgh and the surrender of the contract. In Edinburgh he printed, in 1744, an edition of *Sallust* from stereotyped plates, but he was never able to carry his ideas out successfully, and died in poverty.

GEDDES, géd'dès, ALEXANDER (1737-1802). A biblical critic, translator, and miscellaneous writer. He was born in Scotland in 1737, of Roman Catholic parents, and educated for a priest in his native country and in Paris, where

he acquired an excellent knowledge of languages. In 1764 he returned to Scotland, and for fifteen years held various positions as priest, and became distinguished by his charities, his liberality of sentiment, and decided literary ability. In 1779, in consequence of difficulties with his bishop, he left his church, and the next year was dismissed on charges of having attended Protestant worship and gone hunting. He went to London, and devoted himself to literature, although he still occasionally officiated as priest till 1782. With the support of Lord Petre he was able to carry out a work long planned, viz. a translation of the Bible into English for the use of Roman Catholics. After various preliminary publications to pave the way, the first volume appeared in 1792 under the title, *The Holy Bible, or the Books Accounted Sacred by Jews and Christians, otherwise called the Books of the Old and New Covenants, faithfully translated from the Corrected Text of the Original, with Various Readings, Explanatory Notes and Critical Remarks*. In 1797 the second volume was published, carrying the translation as far as the end of the historical books; and in 1800 a third volume was issued, containing his *Critical Remarks on the Hebrew Scriptures*. The opinions enunciated in these volumes, especially in the last, were, for their time, startlingly heretical, and approximated to some of the results of modern criticism. The tone is decidedly rationalistic, and the author had little tact in presenting his views. As a result, Protestants and Roman Catholics united in their condemnation, although the translation was in the main excellent, and many of the remarks of value. In 1792 his translation was interdicted by the Roman Catholic authorities in London. Geddes died in London, February 26, 1802, and mass was prohibited over his remains. For his life, consult Good (London, 1803).

GEDDES, ANDREW (1783-1844). A Scotch painter, born in Edinburgh. He was a pupil of the Royal Academy, and traveled much abroad. In 1810 he exhibited his "Draught Players"; after that he gave himself almost entirely to portrait painting for several years. He also became an excellent etcher of portraits. His other works include: "Discovery of the Scottish Regalia" (1821); "Christ and the Woman of Samaria" (1832); "Devotion"; and "Dull Reading." His portraits are truthful, well drawn, and full of life.

GEDDES, JAMES (1763-1838). An American engineer. He was born near Carlisle, Pa., but removed, in 1794, to Onondaga County, N. Y., where he engaged in the salt business. He was one of the earliest and most active advocates of the Erie Canal, and made the first surveys of the route in 1808. After serving in the State Legislature, and as a county judge, he was a Representative in Congress from 1813 to 1815. In 1816 he became supervising engineer of the Erie Canal, and in the following year chief engineer in the construction of the Champlain Canal. His success in these undertakings gave him the reputation of being the foremost canal engineer in the country, and his services were much in demand. In 1827 he surveyed and laid out the line of the Chesapeake and Ohio Canal, and in 1828 was made chief engineer of the State canals in Pennsylvania.

GEDDES, JAMES LORRAINE (1827-87). An American soldier, born in Edinburgh, Scotland, who came to Canada with his family at the age of ten. In 1843 he revisited Scotland, whence he subsequently went to India. After a course at the British Military Academy, Calcutta, he entered the army, and won distinction in the Punjab campaign, after which he returned to Canada. In 1857 he emigrated to Vinton, Iowa. He fought in the Civil War from 1861 to 1865, distinguished himself at Shiloh, Vicksburg, Corinth, and Mobile, and in 1865 was brevetted brigadier-general of volunteers. During the latter years of his life he was prominently associated with the Iowa College of Agriculture. As an author he is widely known through his celebrated war-songs, such as "The Soldier's Battle Prayer," and "The Stars and Stripes."

GEDDES, JENNY. Popularly supposed to have been the name of a woman who inaugurated a riot in Saint Giles's Church, Edinburgh, on Sunday, July 23, 1837. When the Dean of Edinburgh began to read from a service-book prepared by Archbishop Laud, and highly obnoxious to the Scotch Presbyterians, some old woman in the congregation cried out indignantly, and threw her stool at the Dean's head. A great tumult ensued, which proved the death-blow of the liturgy in Scotland. Who the woman really was is uncertain. It has been claimed that she was the wife of one John Mein, and others say her name was Hamilton. Consult *Proceedings of the Society of Antiquaries of Scotland*, vol. iii. (Edinburgh, 1852).

GEDDES, PATRICK (1854—). A Scotch botanist, biologist, and educator, born in Perth. He was educated at University College (London), the Sorbonne, and the universities of Edinburgh and Montpellier, and was appointed demonstrator of practical physiology at University College, of natural history at Aberdeen, and of botany at Edinburgh, as well as lecturer on natural history at the Edinburgh School of Medicine. Perhaps his most important work was that in connection with his University Hall project at Edinburgh, a student colony similar in design to Mansfield College at Oxford. He showed great interest in municipal art and education, and also became director of a printing establishment interested chiefly in the publication of works of Celtic literature. His publications include *The Evolution of Sex* (with J. Arthur Thompson) and *Chapters in Modern Botany*. In an article entitled "The World's First Sociological Laboratory" (*American Journal of Sociology*, 1899), Prof. Charles Zeublin, of the University of Chicago, gives a very instructive account of Professor Geddes's educational experiments in Edinburgh.

GEDIKE, gä'di-ke, FRIEDRICH (1754-1803). A German educator, born at Boberow, Brandenburg. He studied theology at Frankfort-on-the-Oder, and was successively director of the Werdersche Gymnasium (1779-91) and of the Köllnische Gymnasium, Berlin (1793-1803), which institutions greatly improved under his administration. He was one of the foremost educators of his day, and greatly promoted the advancement of education throughout Prussia. His works include: *Schulschriften* (1789-95); *Vermischte Schriften* (1801); and *Geschichte des Friedrich-*

Werderschen Gymnasiums, a centenary publication (1781).

GEDIMIN, gä-dé'min, or GEDYMIN, Grand Prince of Lithuania, about 1315-40. He fought against the Teutonic Knights and the Russians, and conquered a large portion of Russia, including Kiev. He was killed in an assault upon a castle of the Teutonic Knights. The city of Vilna was founded by him in 1320.

GEDON, gä'don, LORENZ (1843-83). A German architect and sculptor, born in Munich, where he studied sculpture and applied art, and in 1872 made his mark with the erection of the Palais Schack. Equally at home in the German Renaissance, the baroque, and rococo styles, he applied his greatest decorative talent to the architectural arrangement and decoration of the buildings for the various industrial exhibitions in Munich in 1876, 1879, 1882, and 1883, but especially to the adornment of the German art room at the Paris Exposition of 1878, which led to a complete reform in decorating picture galleries. His principal structure is the Heylshof in baroque style at Worms, besides which he executed much admirable work of a decorative nature in the gorgeous castles of King Ludwig II., in the town hall, and in private palaces in Munich.

GEEFS, gäfs. A family of Belgian sculptors. **GUILLAUME GEEFS** (1806-83) was a sculptor of the classical school of Canova. He was born at Antwerp, September 10, 1806, the son of a baker. He studied at the academy in Antwerp, and in 1828 won the grand medal and a stipend, which enabled him to study in the atelier of the elder Ramey in Paris. Returning to Belgium about 1830, he made the monument of General Beilliard, and in 1833 the tomb of the Count Frédéric de Mérode, now in the Cathedral of Brussels—the most striking of his works. He designed also the monument to the victims of the Revolution of 1830, in the Place des Martyrs in Brussels. He made the Rubens monument in Liège. In the Paris Exposition of 1855 Geefs exhibited a colossal marble statue of King Leopold I. of Belgium, and his statue of the "Amorous Lion." He made numerous other monuments, statues, and busts. Geefs was Chevalier of the Légion d'Honneur in France, and held many Belgian orders. He died January 24, 1883. His wife, **FANNY ISABELLE MARIE, née Corr** (1814-83), was successful as a painter, especially in genre subjects.

JOSEPHS GEEFS (1808-85). The brother of Guillaume. He was born in Antwerp, was educated there and in Paris and Rome, and was appointed professor in the academy at Antwerp in 1841. He made the equestrian statue of King Leopold I. in Antwerp in 1868, the statue of Van Hogendorp in Rotterdam, 1860, the sculpture of the front of the Flemish theatre in Antwerp, 1872. **ALOYS GEEFS** (1817-41), a younger brother, was also a sculptor, but of less importance. Consult: *Bartholeyns, Guillaume Geefs, sa vie et ses œuvres* (Brussels); Génard, *Anvers à travers les âges* (ib., n.d.); Hymans, *Bruxelles à travers les âges* (ib., n.d.).

GEEL, gäl, JAKOB (1789-1862). A distinguished Dutch scholar, born at Amsterdam, and educated at the Athenæum of that city, principally under Van Lennep. After living at The Hague from the year 1811 as a family tutor, he became second librarian at Leyden in 1823, and

in 1833 head librarian and honorary professor. He had made himself meanwhile known as a classical philologist by editions of Theocritus, with the *Scholia* (1820); of the *Anecdota Hemsterhusiana* (1826); of the *Scholia in Suetonium* of Ruhnken (1828); of the *Excerpta Vaticana* of Polybius (1829); and his *Historia Critica Sophistarum Græcorum* (1823) had called forth several treatises on the same subject from German philologists. In 1840 appeared his edition of the *Olympicus* of Dio Chrysostom, accompanied by a *Commentarius de Reliquis Dionis Orationibus*; and in 1846 he issued the *Phænissæ* of Euripides, with a commentary, in opposition to Hermann. All these works, which are written in pure and pleasing Latin, are models of thorough scholarship, as well as of taste and method. Geel contributed further to the revival of classical learning in the Netherlands by the establishment, along with Bake, Peerlkamp, and Hamaker, of the *Bibliotheca Critica Nova*, in 1825. The national literature is also indebted to him not only for the translation of German and English works into Dutch, but also for original treatises on various æsthetical subjects. He won, moreover, the gratitude of the learned throughout Europe by his liberality as a librarian, and especially by his *Catalogus Codicum Manuscriptorum, qui inde ab Anno 1741 Bibliothecæ Lugduni Batavorum Accesserunt* (1852).

GEELBEC, gäl'bék (Dutch, yellow-beak). The Dutch local name in Cape Colony, South Africa, for the commonest wild duck (*Anas flavirostris*).

GEELONG, gē-lông'. A city of Victoria, Australia, picturesquely situated on the south side of Corio Bay, 45 miles southwest of Melbourne by rail (Map: Australia, G 6). The discovery of gold-fields in the neighborhood in 1851 added to the prosperity of the city, which had become noted for its wool trade. The first woolen mill in Victoria was erected here. Alongside of the railway jetty, which is 1000 feet long, large ships can load and discharge their freight. There are various industries, especially manufactures of woolen cloth, paper, and rope. Other industries are tanning, meat-preserving, and fishing. There are a produce exchange, a mechanics' institute, botanical gardens, public park, a college, and a public library. The district is exceedingly fertile. Limestone and a kind of marble are found in the neighborhood. Population, in 1891, 11,700; in 1901, 12,400.

GEELVINK (gäl'vink) **BAY**. An inlet of the Pacific Ocean, on the northern coast of Dutch New Guinea (Map: East Indies, J 5). It penetrates 300 miles inland, and receives a number of rivers.

GEER AF FINSPÅNG, yār äv fin'spång, LOUIS GERHARD, Baron de (1818-96). A Swedish statesman and author, born at Finspång. He was Minister of Justice from 1858 to 1870, and was reappointed to that office in 1875. In the following year he was also appointed president of the Ministry, which position he retained until 1880, when he became chancellor of the universities of Sweden. He introduced numerous legislative reforms bearing on religion, the penal code, maritime and military laws, and copyright, and, above all, the organization of the chief legislative departments of the Government, and the introduction of the two chambers with popular representation (1866). Besides several short stories,

essays on æsthetics, and biographical works, he published his memoirs, *Minnen* (1892).

GEERTZ, garts, JULIUS (1837-1902). A German genre and portrait painter, born in Hamburg, where he first studied under the brothers Gensler. At the School of Arts in Karlsruhe, from 1856 to 1860, he was a pupil of Descoudres, then in Düsseldorf of Jordan. In 1864 he went to Paris to study the old masters, and after visiting Brittany and Holland settled at Düsseldorf, where his genre scenes, serious and humorous, especially those from child life, met with great favor. Besides "The Criminal after the Sentence" (1873), which made his reputation, there may be mentioned "Sour and Sweet" (Royal Château of Babelsberg); "Invested" and "Capitulated," two merry juvenile scenes; "Prisoners of War;" "Fight between Poacher and Forester" (1883); and "The Village Hero" (1884). In 1890-91 he was in New York, and painted portraits of Carl Schurz (Liederkrantz Hall), Oswald Ottendorfer, and other prominent German-Americans.

GEESTEMÜNDE, gē'ste-mun'de. A seaport in the Prussian Province of Hanover, Germany, at the mouth of the Geeste, directly opposite Bremerhaven, of which it is a shipping rival, 32 miles northwest of Bremen (Map: Prussia, C 2). The town dates from 1846, when the construction of the harbor was begun. The main basin, opened in 1863, is 1846 feet long, 386 feet wide, and 23 feet deep. The petroleum basin (1875) has a length of 772 feet and a breadth of 145 feet. To the northwest of the main basin is the deep-sea fisheries basin (opened 1896), 3960 feet long, 364 feet wide, and 14½ feet deep. There are large dry docks and several extensive shipyards. The harbor, which is one of the largest artificial waterways in Germany, is never frozen. Geestemünde is heavily fortified. Its trade is very considerable in petroleum, rice, coal, woolens, cereals, fish, sails, wire ropes, etc. Among its many educational institutions is a school of navigation. Population, in 1890, 15,500; in 1900, 20,100.

GEEZ, gēz (Ethiopic ግዕዝ). The ancient native name of the Semitic inhabitants of Abyssinia, the classical Ethiopia, and of their language, now a dead tongue. The word means literally 'wandering,' and designates the people as 'wanderers,' 'nomads,' and their language as the speech of 'freemen.' See ETHIOPIA; SEMITES; SEMITIC LANGUAGES.

GEFFCKEN, gēf'ken, FRIEDRICH HEINRICH (1830-96). A German jurist, born at Hamburg, and educated at Bonn, Göttingen, and Berlin. He was secretary of the legation at Paris in 1854; represented Hamburg at Berlin in 1856, and in 1859 he was Minister of the Hanse cities at Berlin, and later (1866) at London. In 1888 he was arrested at the instance of Prince Bismarck to answer to the charge of treason, as he had published without authority in the *Deutsche Rundschau* quotations from the journal of Frederick III. After an inquiry of three months, Geffcken was set free. His works, published anonymously, include: *Die Reform der preussischen Verfassung* (1870); *Der Staatsstreich von 1851 und seine Rückwirkung auf Europa* (1870); *Die Verfassung des deutschen Bundesstaats* (2d ed. 1870); and *L'impasse orientale* (1870); and, signed, *Die Alabamafrage* (1872); *Das Deutsche Reich und die Bankfrage*

(2d ed. 1874); *Staat und Kirche* (1875; in English by Taylor, 1877); *Zur Geschichte des orientalischen Krieges, 1853-56* (1881); *Politische Federzeichnungen* (2d ed. 1888); and *Frankreich, Russland und der Dreibund* (1893).

GEFFRARD, zhá'frár', FABRE (1806-79). President of Haiti. He was the son of Nicholas Geffrard, one of the founders of Haitian independence, and was born at Anse Veau, Haiti. In 1821 he entered the army as a private soldier, attaining the grade of captain in 1843, in which year he joined Hérad in rebellion against Boyer, whom he defeated near Jacmel. Having been appointed general of division in 1845, he was deprived of his command by President Riche, who was jealous of his popularity, and tried by a court-martial. After the death of Riche (1847), he regained his influence. From 1849 to 1856 he was actively engaged in the army, and distinguished himself in the campaign of 1856 against Santo Domingo, particularly in the retreat from San Juan. Finding that it was the intention of the Emperor Faustin (Soulouque) to arrest him, he proclaimed himself president in December, 1858, and drove Soulouque from Port-au-Prince, January 15, 1859. In spite of the insurrections he had to repress, Geffrard gave Haiti the most moderate government it had as yet enjoyed. Commerce and industry prospered with the reduction of taxes, and schools were founded in many parts of the country. Nevertheless, the revolutionary spirit continued active, and Salnave, who had twice attempted a rising and failed, was finally successful in February, 1867, when Port-au-Prince went over to him, and Geffrard was compelled to flee to Jamaica, where he died.

GEFFROY, zhe-frwá', EDMOND AIMÉ FLORENTIN (1806—). A French actor and painter. He was born at Maignelay (Oise), and studied at the College of Angers. With little preliminary training, he made his successful first appearance in the rôle of Orestes in *Andromaque* at the Théâtre Français (1829), and from that time until his resignation in 1865 was regarded as one of the principal actors at that theatre. He played at the Odéon from 1872 to 1878. He also achieved considerable fame as a painter, and was a pupil of Amaury-Duval. Many of his principal works were exhibited in the Salon, such as "Charles VII. and Agnes Sorel" (1839); "La Sainte Vierge et l'enfant Jésus" (1841); "Les sociétaires de la Comédie Française" (1842); and another of the same title (1863-64), which contains portraits of Mmes. Augustine Brohan, Arnould-Plessy, Bonval, Judith, Favart, and many other distinguished actors and actresses of that celebrated theatre.

GEFFROY, MATHIEU AUGUSTE (1820-95). A French historian, born in Paris. He graduated at the Ecole Normale in that city in 1840. After holding professorships at the lycéums Clermont-Ferrand, Louis le Grand, and elsewhere, he was successively appointed professor at Bordeaux and at Paris, and subsequently conducted the French School at Rome, becoming director of that institution in 1875. His historical works cover a wide field, and embrace: *Histoire des états Scandinaves* (1851); *Des origines et de la formation de l'Europe moderne* (1853); *Marie Antoinette: Correspondance secrète* (with Arneth, 1874); *Mme. de Maintenon d'après sa correspondance authentique* (1887).

GEFLE, yév'le. The capital and chief commercial town of the Swedish Län of Gefleborg, situated at the mouth of the river Gefle, about 71 miles north of Upsala (Map: Sweden, G 6). The town has been in great part rebuilt since the fire of 1869. The principal buildings are the castle, the fine town hall, the library, and the high school. The town is increasing in industrial importance, producing chiefly linen, sailcloth, cotton goods, and tobacco. There is also some ship-building and iron-molding. A large export trade is carried on in the iron and lumber of the surrounding districts; imports are mainly grain, cotton, spices, textiles, and fertilizers. Population, in 1900, 29,522.

GEGENBAUR, gá'gen-bour, JOSEPH ANTON VON (1800-76). A German historical painter, born at Wangen, Württemberg. His first efforts without instruction were so promising that Robert von Langer admitted him at the age of fifteen to his class in drawing at the Munich Academy. In 1820 he brought to Stuttgart the portraits of his parents and a "Saint Sebastian," which so favorably impressed the sculptor Dannecker that he recommended the young artist to King William. By a royal stipend Gegenbauer was enabled to study three years longer in Munich, and then, until 1826, in Italy, where, besides sketching diligently from nature, he devoted himself particularly to the works of Raphael, and developed high qualities as a colorist. To his appreciation of Raphael his "Expulsion from Paradise" and "Moses Striking the Rock," both in the Royal Palace at Stuttgart, bear witness. His first attempt in fresco-painting, "Hercules and Omphale," made in 1826 on one of the walls of his studio, was bought by Thorwaldsen for his museum at Copenhagen. A copy in oil on a smaller scale is in the Stuttgart Gallery. On his return to Stuttgart he was intrusted with the execution of frescoes in the Royal Villa Rosenstein, near Cannstatt, depicting the story of "Cupid and Psyche" according to Apuleius, and "The Four Seasons." After a second sojourn in Italy, from 1829 to 1835, he was appointed Court painter at Stuttgart, and for nearly twenty years was employed in decorating a number of rooms in the new royal palace with episodes from the mediæval history of Württemberg. Besides these important works, his principal creations, he painted many excellent portraits and easel pictures of religious and mythological subjects, in Stuttgart and in Rome, where in his latter years he regularly passed the winter, and where he died. In all his creations he proved himself a draughtsman of superior skill, with a perfect command of the human form, and his frescoes are to be commended for great power of invention, clearness of composition, spirited animation in the figures, and an unusually rich and vigorous coloring.

GEGENBAUR, KARL (1826-1903). A German comparative anatomist. He was born in Würzburg, Germany, and studied medicine in Würzburg, where he was a pupil of Kölliker and of Virchow; received the degree of M.D., and was afterwards privat-docent from 1853 to 1855. In the latter year he became professor of anatomy and director of the Anatomical Institute in Jena, and remained there until 1873, when he became professor of anatomy at Heidelberg. He spent two years in Sicily studying invertebrate life,

making important researches on pteropods and heteropod mollusks. He also worked on the histology of Limulus. He is not only the leading comparative anatomist in Germany, but one of the first class, ranking with Huxley and Owen, and is distinguished by the great range of his learning, which covers the entire field of animal morphology, as well as by the boldness of his speculations. He was the first comparative anatomist to place the study of anatomy on an evolutionary basis, and thus became the founder of modern anatomy. His most important works are: *Grundzüge der vergleichenden Anatomie* (1870); *Grundriss der vergleichenden Anatomie* (1878), translated into English by F. J. Bell, under the title *Elements of Comparative Anatomy* (1878); *Lehrbuch der Anatomie des Menschen* (1883; 3d ed. 1886); *Vergleichende Anatomie der Wirbelthiere mit Berücksichtigung der Wirbellosen* (1898). Since 1876 he has edited the *Morphologisches Jahrbuch*, which he founded. In his *Comparative Anatomy of Vertebrates* (1898) Gegenbaur shows how conditions prevailing among invertebrates can be made to throw light upon the more complicated vertebrate forms. Gadow characterizes this great work as "a mine of most suggestive ideas." In this, as in all his works, he strives to derive any given organ from some earlier, more ancestral or generalized structure, instead of being satisfied with its conditions or its present degree of specialization. Gegenbaur's most fruitful work was his theory of the origin of limbs and their girdles from the embryonic visceral arches. His views on the derivation and evolution of free limbs were also the outcome of a masterly research.

GEHENNA (Gk. *Γέεννα*, or *Γέεννα*, *Geenna*). A term used in the New Testament as a designation of the place of punishment of the wicked after death. The word is a transliteration of the Aramaic *Gehennam* or *Gehinnam*, which is an equivalent of the Hebrew *Ge Hinnom*. (For origin of name, see HINNOM, VALLEY OF.) In the New Testament it never refers to the valley south of Jerusalem. It occurs twelve times. Outside of the Synoptic Gospels it is found only in James iii. 6, where the tongue is said to be set on fire by Gehenna. In Luke it is used only once—viz. xii. 5, where God is said to have the power of casting into Gehenna after He has killed. In the corresponding passage in Matthew (x. 28) the disciples are warned to fear Him who is able to destroy both soul and body in Gehenna. The only passage in Mark that has the word is ix. 43-47, where it occurs three times, the sacrifice of a head, a foot, or an eye being recommended in preference to Gehenna (cf. Matt. v. 29, 30; xviii. 8, 9). In addition to the parallels to the passages quoted from Mark and Luke, Matthew records three sayings of Jesus, in which He declares that the man who says *more*, i.e. 'thou fool,' is liable to the Gehenna of fire (v. 22); that the Pharisees make their proselyte twice as much a son of Gehenna as they are themselves (xxiii. 15); and that the Pharisees are a brood of vipers not likely to escape the judgment of Gehenna (xxiii. 33). Whether Jesus actually used the language ascribed to Him upon these occasions, and, if so, what meaning He attached to the term, are questions that have been seriously discussed without any definite agreement having been reached. It will be noted that all of

these statements are found only in Matthew; that xxiii. 23-33 seems to be a duplicate of the words of John the Baptist; and that Luke (xvii. 1, 2) records the saying as to offenses that must come, without the amplifications of Matthew and Mark. It is also manifest that in some instances the word is used in a figurative sense. The counsel to sacrifice hand, foot, or eye can certainly not be taken literally, and there is no valid reason for supposing that Gehenna is, in the same connection, to be understood more literally. Manifestly Jesus cannot have intended to draw such a distinction between an angry disposition and a contemptuous epithet like *raka*, 'empty head,' on the one hand, and a similar epithet, *more*, 'fool,' on the other hand, as to affix temporal penalties for the former and eternal punishment for the second. As He cannot have desired the local courts to take cognizance of the feelings of a man's heart, or the supreme court to make a capital case of a hasty word, but must have used *beth din* and *Sanhedrin* figuratively, so He is likely to have employed Gehenna in a similar way. 'Son of Hell' as a characterization of a hypocrite and formalist is also to be understood as a figure of speech. But in Matt. x. 28 (Luke xii. 5) Gehenna is evidently meant to be taken more literally, of man's fate after death. The most natural interpretation of this passage is that the destruction of both body and soul in Gehenna means complete cessation of being. But the evangelical tradition scarcely permits any definite conclusions on this point. See HADES; HELL.

GEIB, gip, KARL GUSTAV (1808-64). A German criminologist, born at Lambsheim, Bavaria. He studied at Heidelberg, Munich, and Bonn, and was strongly influenced by the eminent professors Mittler and Mittermayer. In 1832 he was sent to Greece as secretary to the members of the regency appointed during the minority of King Otho, and upon his return was appointed to the chair of law at the University of Zurich. In 1842 he was appointed professor of criminal and civil procedure at that institution, whence he was called in the same capacity to Tübingen. In his investigations Geib was a strict adherent of the historical method. The work entitled *Geschichte des römischen Kriminalprozesses bis zum Tode Justinians* (1842), although superseded by more recent investigations, had an extraordinary influence upon the development of the science of jurisprudence in Germany. It is characterized by thoroughness and profound research.

GEIBEL, gi'bel, EMANUEL (1815-84). A popular German poet. He was born at Lübeck, October 17, 1815; was graduated at Bonn (1836); lived for two years in Berlin in literary society; went as tutor to Athens (1838); traveled extensively with Ernst Curtius in the Grecian Archipelago, and returned to Lübeck in 1840. He led a studious life there and on the Rhine, at Stuttgart, Hanover, and Berlin; received a pension from the King of Prussia in 1843, and in 1852 was made professor of æsthetics at Munich. He returned to Lübeck in 1868, and resided there till his death, on April 6, 1884. His fame rests chiefly on his lyric poetry: *Gedichte* (1840); *Juniuslieder* (1848); *Neue Gedichte* (1856); *Gedichte und Gedenklblätter* (1864); *Spätherbälblätter* (1877); and the posthumous *Gedichte aus dem Nachlass* (1896). He wrote also two trage-

dies—*Brunhild* (1858) and *Sophonisbe* (1868)—and a comedy, *Meister Andrea* (1865). He collaborated with others in several volumes of noteworthy translations—namely, *Klassische Studien*, with Ernst Curtius (1840); *Volkslieder und Romanzen der Spanier* (1843); *Spanisches Liederbuch*, with Paul Heyse (1852); *Romanzero der Spanier und Portugiesen*, with Schack (1860); *Fünf Bücher französischer Lyrik*, with Leuthold (1862). Selected translations from Greek and Latin poets appeared as *Klassisches Liederbuch* (1875). Geibel's Works are in eight volumes (3d ed. 1893); his correspondence is contained in part in *Briefe an Karl Freiherrn von Malsburg* (1885). For his biography, consult: Goedeke (Stuttgart, 1869); Litzmann (1887); Leimbach (Wolfenbüttel, 1894); and Gaedertz (Leipzig, 1897).

GEIERSTEIN, g'ēr-stin, ANNE OF. The heroine of Scott's novel of the same name; a noble German-Swiss heiress, supposed to possess supernatural powers, and hence called 'The Maiden of the Mist,' which appellation furnishes the subtitle of the story. She finally marries a son of the exiled Earl of Oxford.

GEIGER, g'g'er, ABRAHAM (1810-74). A distinguished rabbi and Jewish scholar. He was born at Frankfort-on-the-Main, and was educated at Heidelberg and Bonn. At Bonn he gained a prize for an essay on the Jewish sources of the Koran, published (1833) under the title *Was hat Mohammed aus dem Judentum aufgenommen?* (reprint of Eng. trans., Madras, 1898), which is still of considerable value. In 1832 he became rabbi in Wiesbaden, and in 1835 one of the editors of the *Zeitschrift für jüdische Theologie*. In 1838 he was chosen associate rabbi at Breslau; in 1863 he removed to Frankfort, where he was rabbi until 1870, and was then elected to the charge of the largest Jewish congregation in Germany—namely, at Berlin—and remained there till his death, in 1874. In 1862 he founded the *Jüdische Zeitschrift für Wissenschaft und Leben*. Geiger's work was mainly in theological lines, and he was one of the foremost advocates of the 'reform' of Judaism, standing for liberality in the construction and observance of the Jewish traditional law. In line with this work he published a new Hebrew ritual, and became professor in the 'Hochschule für die Wissenschaft des Judenthums,' a school to train Jewish rabbis according to the modern interpretation of Judaism, which he had helped to found. Endowed with an unusually active mind, he worked untiringly, and of his extremely numerous works on Jewish history, literature, and theology, only a few can be mentioned here: *Lehr- und Lesebuch zur Sprache der Mischna* (1845); *Beiträge zur jüdischen Literaturgeschichte* (1847); *Discan des Castellers Abu'l-Hassan Juda ha-Levi* (1851); the two very important works, *Urschrift und Uebersetzungen der Bibel in ihrer Abhängigkeit von der innern Entwicklung des Judentums* (1857) and *Sadduzäer und Pharisäer* (1863); a collection of lectures published under the title *Das Judentum und seine Geschichte* (1864-71); and *Salomo Gabirol und seine Dichtungen* (1868). His posthumous works, *Nachgelassene Schriften*, were published by his son Ludwig; the last volume of this collection contains his biography and letters. The most important of his works

is the *Urschrift*, an exceedingly valuable contribution to the history of Old Testament literature.

GEIGER, LAZARUS (1829-70). A German philologist, born at Frankfort-on-the-Main. He studied at Bonn, Heidelberg, and Würzburg. During the last nine years of his life he was instructor in German, Hebrew, and mathematical geography at the Jewish High School of Frankfort. His principal philological works are respectively entitled: *Ursprung und Entwicklung der menschlichen Sprache und Vernunft* (2d ed. 1899), and *Der Ursprung der Sprache*.

GEIGER, LUDWIG (1848—). A German writer, author of numerous works on the history of civilization and of literature, born at Breslau. After study at Heidelberg, Göttingen, and Bonn, he became lecturer in history at Berlin in 1873, and in 1880 was appointed to a chair of modern literature there. His more important researches have been concerned with the history of humanism, to which he contributed such valuable studies as *Nikolaus Ellenbog, ein Humanist und Theolog des sechzehnten Jahrhunderts* (1870); *Johann Keuchlin, sein Leben und seine Werke* (1871); *Petrarca* (1874), an examination of Petrarch's significance as author and scholar, in which biographical detail is subordinated; and *Renaissance und Humanismus in Italien und Deutschland* (1882). He also thoroughly revised Jakob Burckhardt's *Die Kultur der Renaissance in Italien* (7th ed., 2 vols., Leipzig, 1899). In 1880 he began the publication of the *Goethe-Jahrbuch*, and from 1886 to 1892 was proprietor and an editor of the *Zeitschrift für Geschichte der Juden in Deutschland* (5 vols.), in connection with which subject he published the antedated volumes *Das Studium der hebräischen Sprache in Deutschland vom Ende des fünfzehnten bis zur Mitte des sechzehnten Jahrhunderts* (1870), and *Geschichte der Juden in Berlin* (1871). Others of his works include *Vorträge und Versuche* (1890), and *Berlin 1688-1840* (2 vols., 1893-95).

GEIGER, g'g'er, NIKOLAUS (1849-97). A German sculptor and painter, born at Lauingen, Bavaria. He was a pupil of Knabl at the Munich Academy. In 1873 he went to Berlin, and soon became known through ornamental work in a private palace. After a visit to Italy he studied painting in Munich, and in 1884 returned to Berlin, where he was awarded a gold medal in 1886, was elected member of the Academy in 1893, and was made professor in 1896. His most important works in Berlin are the groups of "Inspiration" and "Homage of Art" (1886), in the Exhibition Building; the high relief, "Adoration of the Magi" (1894), in Saint Hedwig's Church; and "Centaur and Nymph," in the National Gallery. A frieze in relief for the Soldiers' Monument at Indianapolis may also be mentioned, and of his paintings "The Communion of the Saints," on the ceiling of Saint Hedwig's, Berlin, is the most noteworthy.

GEIGER, WILHELM (1856—). A German Orientalist. He was born at Nuremberg, the son of an evangelical clergyman, and was educated especially at the University of Erlangen, under the Iranian scholar Spiegel, whom he succeeded in 1891 as professor of Sanskrit and Indo-Germanic philology. Among his publications on Indo-Iranian subjects are: *Aogemadaëd ein Parsentractat* (1879); *Handbuch der Awesta-*

sprache (1879); *Ostiränische Kultur* (1882), translated into English as *The Eastern Iranians* (London, 1885); *Elementarbuch der Sanskrit-Sprache* (1888); *Ceylon* (1898); *Litteratur und Sprache der Singhalesen* (1901); and, as co-editor and contributor, *Grundriss der iranischen Philologie* (1885—).

GEIJER, yî'er, ERIK GUSTAF (1783-1847). A Swedish historian, poet, and composer, born at Ransäter, Wermland, January 12, 1783. He was educated at the Gymnasium of Karlstad and at the University of Upsala, and in 1803 competed successfully for an historical prize offered by the Academy of Sciences at Stockholm. In 1806 he obtained his master's degree from Upsala, and in 1809 traveled in England. The year following he became a lecturer in history at Upsala, and in 1815 assistant to Fant. In 1817, on the death of his chief, Geijer was made professor in his place. Geijer was hardly less famous as a poet than as an historian, and he exercised a marked influence on the poetic literature of Sweden. According to the testimony of his countrymen, his *Sista Skalden*, *Vikingen*, *Odal-bonden*, and other heroic pieces place him in the foremost rank of Swedish poets. He and his friends Adlerbeth, Tegner, and Nikander adhered to the 'Gothic' School of poetry, which owed its origin to the Society of the Goths, established as early as 1810; they published at the same time a magazine, *Iduna* (1811-24), in which first appeared several of Geijer's best poems. Great as is the value of Geijer's historical works, he did not complete any one of the vast undertakings which he planned. Of the *Svea Rikes häfder* (or Records of Sweden), which were to have embraced the history of his native country from mythical ages to his own times, he finished only the introductory volume. His *Svenska folkets historia* (3 vols., 1832-36), which was intended to form one of the series of European histories edited by Leo and Ukert, was not carried beyond the abdication of Queen Christina (1654), the reason probably being the author's conversion to liberalism in history and politics; yet, incomplete as they are, these works rank among the most valuable contributions to Swedish history. To Geijer was intrusted the task of examining and editing the papers which Gustavus III. (q.v.) had bequeathed to the University of Upsala, with the stipulation that they were not to be opened for fifty years after his death. In fulfillment of his charge, Geijer arranged these papers in a work which appeared in 1843-45 under the title of *Gustaf III:s efterlemnade papper*; but they contained little or nothing of value. During the last ten years of his life Geijer took an active part in politics; but although his political writings possess great merit, the very versatility of his powers diverted him from applying them methodically to the complete elaboration of any one subject. In addition to being an historian, poet, and publicist, Geijer was well known as a musician and composer of no mean order. He set many of his own songs to stirring music, and poems of his rendering appear in the Swedish Service Book. In 1814-15 he cooperated with Afzelius in producing a three-volume edition of Swedish folk-songs of the Middle Ages. In 1846 increasing ill health forced him to resign his position as professor at Upsala. He died April 23, 1847, at Stock-

holm. He left some personal memoirs of value, *Minnen* (Upsala, 1834). His collected works, *Samlade Skrifter*, with a bibliographic treatise by Teodblad (8 vols.), appeared at Stockholm (1873-75). His *History of the Succedes* down to Charles X. was translated into English by Turner, with biographical introduction (London, 1845). For brief biographical treatises, consult: Malmstroem (Upsala, 1848); Fries (Stockholm, 1849); and Carlson (Stockholm, 1870).

GEIKIE, gē'ki, Sir ARCHIBALD (1835—). A distinguished British geologist, born in Edinburgh, where he attended the high school and university. Becoming a member of the Geological Survey of Scotland under Murchison, he was raised in 1867 to the office of director. From 1871 to 1882 he held the Murchison professorship of geology and mineralogy in the University of Edinburgh, resigning the position to become general director of the Geological Survey of the United Kingdom and director of the Museum of Practical Geology in London. Geikie is an eminent authority and contributor on geological subjects. His studies in inorganic geology, particularly physiography, dynamism, and the structure of the earth, show a keen appreciation of natural processes, while his geological text-books are models for arrangement, general balance, and facility of expression. He is a member of many scientific societies in Great Britain and other countries, including the Royal Society of London and the Institute of France, and has received the honorary degrees of D.C.L. from Oxford, D.Sc. from Cambridge, and LL.D. from Edinburgh. In 1891 he was elected president of the Geological Society of London, an honor that was accompanied the same year by the title of knight. He has also served as president of the British Association for the Advancement of Science. In 1897 Geikie visited the United States to deliver the first series of lectures on the George Huntington Williams foundation at Johns Hopkins University. Among his more important works, some of which have passed through several editions, are the following: *Scenery of Scotland, Viewed in Connection with Its Physical Geography* (1869); *Field Geology* (1879); *Text-book of Geology* (1882); *Class-book of Geology* (1886); *Ancient Volcanoes of Britain* (1897); *The Founders of Geology* (1897); and *Types of Scenery and Their Influence on Literature* (1898).

GEIKIE, JAMES (1839—). A Scottish geologist and author, brother of Sir Archibald Geikie, born at Edinburgh. He was educated at Edinburgh University, was appointed an assistant in the British Geological Survey in 1861, and in 1869 was made director of the Survey in Scotland. In 1882 he was elected to succeed his brother as Murchison professor of geology and mineralogy at Edinburgh University, where he subsequently was made dean of the Faculty of Science. His works include: *The Great Ice Age* (1874); *Prehistoric Europe* (1882); *Outlines of Geology* (1884); *Songs and Lyrics of Heinrich Heine and Other German Poets* (1887); *Fragments of Earth-Lore* (1892); and *Earth Sculpture; or, The Origin of Surface Features* (1898).

GEIKIE, JOHN CUNNINGHAM (1824—). An English clergyman and writer. He was born in Edinburgh. He studied at Queen's College, To-

ronto, Canada; held Presbyterian pastorates at Halifax, N. S., and at Toronto, and later in England. In 1876 he took priest's orders in the English Establishment, and was successively settled in Dulwich (1876), Paris (1879), Barnstaple (1883), and Norwich (1885). He retired to Bournemouth in 1889. His wide fame rests upon his *Life of Christ* (1876); his history of the *English Reformation* (1878); *Hours with the Bible* (1880); *The Holy Land and the Bible* (1887).

GEILER VON KAYSERSBERG, gî'lër fôn ki'zërz-bërk, JOHANN (1445-1510). A famous German preacher, born at Schaffhausen, but brought up by his grandfather at Kaysersberg (Alsace), whence his epithet. He was educated at Ammersweier and at Freiburg, and soon after his taking orders went to Basel, where he became dean of the philosophic faculty (1474) and a professor of theology (1475). A year later he returned to Freiburg, and became rector of the university. In 1478 he became preacher at the Cathedral of Strassburg, and held this office for thirty-two years. Of his sermons, the best known are the cycle called *Navicula sive Speculum Fatuorum* (1510). In the same satiric form and showing the same power and religious depth are *Das Schiff der Pönitz* (1514), *Der Seelen Paradies* (1510), and *Christliche Pilgerschaft* (1512), all first composed in Latin and delivered in German. His more important works may be found in Lorenzi, *Geilers ausgewählte Schriften* (1881-83), and an excellent biography and general criticism in Gödeke, *Grundriss zur Geschichte der deutschen Dichtung*, vol. i., p. 397 sqq. (1884). Consult: Lindemann, *Johann Geiler von Kaysersberg, ein katholischer Reformator am Ende des fünfzehnten Jahrhunderts* (1877); and Schmidt, *Histoire littéraire de l'Alsace à la fin du XVème siècle* (1879).

GEILFUS, gîl'fûs, GEORG (1815-91). A Swiss historian, born at Lampertheim, Germany. He studied at Giessen, and in 1856 was appointed rector of all the schools of Winterthur, a position which he retained for twelve years. Besides numerous minor writings, historical and biographical, he published the important work entitled *Helvetia. Vaterländische Sage und Geschichte* (4th ed. 1879).

GEINITZ, gî'nîts, HANS BRUNO (1841-1900). A German geologist and paleontologist. He was born at Altenburg, and was educated at Berlin and Jena. He was appointed professor of mineralogy and geognosy at the Polytechnic Institute of Dresden in 1850, and director of the Museum of Mineralogy there in 1857. His works include: *Charakteristik der Schichten und Petrofakten des sächsisch-böhmischen Kreidegebirges* (1843); *Die Versteinerungen der Steinkohlenformation in Sachsen* (1855); *Geologie der Steinkohlen Deutschlands und anderer Länder Europas* (1865); *Carbonformation und Dyas in Nebraska* (1866); *Geologie von Sumatra* (1875); *Ueber fossile Pflanzen und Tierarten in den argentinischen Provinzen San Juan und Mendoza* (1876).

GEISHA, gâ'e-shâ (Chino-Japanese, person of pleasing accomplishments). One of a class of young women in Japan endowed with more than the ordinary share of personal attractions, elegant and accomplished in the arts of gayety, and especially in music and the peculiar rhythmic dances of the country, who form the chief feature

at entertainments in the average social life of Japan. It is customary to speak of geishas as 'singing girls.' They correspond, in some degree, to the Almech of Egypt and other parts of the Orient. Usually the training of the girl begins when she is seven years old. The geisha is the imposing theme of a large number of rhapsodical and erotic writers on Japan, but in the new and better social life of Japan and reconstruction in national habits and ideals, the solution of the geisha problem is a serious one.

A capitation tax of one yen per month is levied on each geisha. Consult: Bacon, *Japanese Girls and Women* (Boston, 1891); and Chamberlain, *Things Japanese* (London, 1891).

GEISHÜSLER, gîs'hüs-lër, OSWALD. See MYCONIUS, OSWALD.

GEISSEL, gîs'sel, JOHANNES VON (1796-1864). A German Roman Catholic prelate. He was born at Gimmeldingen in the Palatinate, and was educated at the Episcopal Seminary in Mainz. In 1819 he was appointed professor at the Gymnasium of Speyer, and three years later became a member of the chapter. He was made dean in 1836 and bishop in 1837. In 1842 he became the coadjutor, and three years later the successor, of the Archbishop of Cologne. After the Revolution of 1848 he was chosen a member of the Prussian Constituent Assembly, and it was largely due to his influence that the independence and rights of the Church in Prussia were assured by the new Constitution. In 1850 his services were recognized by promotion to the cardinalate. He was a zealous defender of the Ultramontane position in Germany, and distinctly favored the Jesuits. One of his most noteworthy achievements was the suppression of Hermesianism. (See HERMES, GEORG.) The long-delayed completion of the Cologne Cathedral was undertaken about the time of his appointment as coadjutor, and he was able in 1863 to celebrate its successful termination, with the exception of the towers. His writings, edited by Dumont (1869-76), include addresses, novels, poems, and miscellaneous writings. A work of great magnitude is that entitled *Der Kaiserdom zu Speyer* (2d ed. 1876). Consult also Remling, *Cardinal von Geissel* (Speier, 1873).

GEISSLER, gîs'lër, HEINRICH (1814-79). A German scientific instrument maker, born at Igelshieb, Saxe-Meiningen. After acquiring considerable proficiency as a glass-blower, he established at Bonn, in 1854, his well-known factory for making chemical and other scientific apparatus. He was noted for his inventive genius, and also for the excellence of the scientific instruments of his manufacture. The celebrated mercurial air-pump used for obtaining high vacua, and known as the 'Geissler pump' (see AIR-PUMP), was first constructed by him, as were also the well-known Geissler's tubes (q.v.).

GEISSLER'S TUBES. The general name for sealed vessels arranged to show the brilliant effects of electricity passed through rarefied gases. They usually consist of glass tubes and bulbs with platinum wires inserted to form the electrical connections. These tubes are filled with various rarefied gases, and show an infinite variety of delicate lights in figures or patterns, depending upon the shape of the tubes, the arrangement of the wire connections inside, the gas, and the degree of rarefaction. The effects pro-

duced, besides being very curious, are of value to the investigator, as they afford a means of examining various incandescent gases with the spectroscope, and numerous other experiments.

GEIST, gíst (Ger., 'spirit'). Used oftenest in the compound term *Zeitgeist*, or 'spirit of the age,' 'time-spirit,' introduced into English literary language by Matthew Arnold.

GEITNER, gít'nër, ERNST AUGUST (1783-1852). A German chemist, born at Gera. After conducting a chemical factory at Lössnitz, he founded another at Schneeberg, in 1815, which he conducted until his death. He was eminent as a chemical investigator, and was the discoverer of the alloy *argentan*, or German silver. He also devoted considerable attention to the chemistry of dyeing, and was the first to utilize chromic salts for animal and vegetable dyes. He published: *Briefe über die Chemie; Die Familie West, oder Unterhaltungen über Chemie und Technologie*; and several important writings on the scientific preparation of grape-sugar and grape-syrup from potato-flour.

GEITONOGAMY, gít'ò-nòg'á-mí (from Gk. γείτων, *geitôn*, neighbor + γάμος, *gamos*, marriage). Cross-pollination between flowers on the same plant; contrasted with xenogamy (q.v.). See POLLINATION.

GELA (Lat., from Gk. Γέλα). In ancient times, an important town on the southern coast of Sicily, on the river of the same name. It was founded by a Rhodian and Cretan colony, B.C. 690. Its rapid prosperity may be inferred from the circumstance that as early as the year B.C. 582 Agrigentum was founded by a colony from Gela. After Cleander had made himself tyrant in the year B.C. 505, the colony reached its highest pitch of power under his brother Hippocrates, who subdued much of East Sicily. Gelon, the successor of Hippocrates, pursued the same career of conquest, and Syracuse itself fell into his hands, and was even made his principal residence, Gela being committed to the government of his brother Hiero. Here Æschylus, after having been honorably received by Hiero, died and was buried about B.C. 456. During the Carthaginian wars it suffered greatly, but its ruin was completed by Phintias, of Agrigentum, who before B.C. 280 removed the inhabitants to a town in the neighborhood which he had founded and named after himself. Its site is believed to be occupied by Terranova, at the mouth of the Fiume di Terranova.

GELADA (jél'á-dá) **BABOON**. See BABOON.

GELASIUS. The name of two popes. (1) **GELASIUS I.** (Pope 492-96). He restated the supremacy of Rome over Constantinople, and insisted on the removal of the name of Acacius, Bishop of Constantinople, from the official list of holy persons for whom prayers were to be offered. During his pontificate the canonical books of the Old Testament were determined by a council at Rome. He vigorously opposed the Manichæan, Pelagian, and Arian heresies, and defended the purity of Christian life against immoral heathen practices. After his death he was canonized, his day being November 18th. His works are in Migne, *Patrol. Lat.*, lix. Consult his life by Roux (Paris, 1880); the *Gelasian Sacramentary*, edited by Wilson (Oxford, 1894).

(2) **GELASIUS II.** (Pope 1118-19). He was born of noble descent at Gaeta, about 1050. He received his theological education in the Abbey of Monte Cassino, and afterwards held the office of cardinal-deacon, under Urban II., and of chancellor under Paschal II. On the death of Paschal II. he was elected Pope by the cardinals. Cencius Frangipani, a partisan of the Emperor Henry V., laid violent hands upon him and threw him into prison, but he was set at liberty through the general uprising of the people in his behalf. The sudden appearance of the Emperor, however, compelled him to leave Rome for Gaeta, and the Imperial party chose an antipope, Burdinus, Archbishop of Braga, Portugal, under the name of Gregory VIII. Gelasius held a council at Capua, and excommunicated his rival and the Emperor. Returning to Rome, under the protection of the Norman princes, he lay concealed for a while, narrowly escaping capture once more by the Frangipani, and, after wandering through Italy and France, died at Cluny in 1119. His letters are in Migne, *Patrol. Lat.*, clxiii.

GELATIN (from Neo-Lat. *gelatina*, from Lat. *gelatus*, p.p. of *gelare*, to freeze, from *gelu*, frost), or **GLUTIN** (not *gluten*). A hard, yellowish, transparent, elastic substance obtained from connective animal tissues, especially the organic constituents of bones. If bones are treated with cold dilute acids, their mineral matter is dissolved out, the residual organic matter, called *ossein*, retaining the shape of the bones and gradually swelling up to a transparent elastic mass. If this ossein is cautiously treated with hot dilute acids, or simply for a long time with boiling water, it is hydrolyzed and converted into gelatin. In using acids, caution is necessary in order to prevent their attacking the gelatin produced by them from ossein. The ordinary commercial process for preparing gelatin consists in carefully washing the connective tissue employed (intestines, bladders, etc.), then cutting it and digesting in a dilute solution of soda lye for ten days at a moderate heat. The material is then removed into an air-tight chamber lined with cement, where it is heated at a temperature of 70° F. It is next transferred to revolving cylinders supplied with an abundance of clean cold water for washing, and afterwards is placed in another chamber, lined with wood, where it is bleached and purified by exposure to the fumes of burning sulphur, after which it is washed with cold water to remove traces of sulphurous acid. The next operation is to squeeze it as dry as possible and transfer it to the gelatinizing pots, which are large earthen vessels inclosed in steam-tight wooden cases. Into these vessels water is poured, and the mass is kept at a high temperature by means of steam coils surrounding the pots. By this process the gelatin is dissolved out of the tissue and is strained off while still hot. It is then poured out in thin layers, which, as soon as they are sufficiently cool and consolidated, are cut into small oblong plates and laid on nets to dry. If the solution is dark-colored it may be purified by treatment with animal or vegetable charcoal. The gelatin of bones may be extracted on a large scale by the combined action of steam and a current of water trickling over their crushed fragments in a properly constructed apparatus. When the gelatin is to be used as an article of food, the bones must be quite fresh,

well preserved in brine, or dried by a stove, and should be crushed by passing between grooved iron rollers. The purification of commercial gelatin may be effected by soaking in distilled water for some days in order to remove salts, dissolving in hot distilled water, and filtering while hot into 90 per cent. alcohol. The gelatin then separates in the form of white thready masses, which can be subsequently dried. The pure gelatin thus obtained contains only about one-half per cent. of ash, and although distinctly different as a chemical substance from the proteids, it resembles the latter in percentage composition.

Gelatin is readily digested and absorbed in the animal body, forming a food-stuff of considerable value, especially in training diets. Physiological research has shown, however, that it is in no case transformed into true proteid matter, and cannot therefore serve as material from which animal tissues are built up.

Gelatin is soluble in concentrated acetic and mineral acids; if thus treated it loses its gelatinizing property, but the solution may be used as a cement for glass and for certain other purposes. In contact with cold water it swells up to an elastic transparent mass, which is mechanically combined with much water; the mass readily dissolves in warm water, but on cooling, the solution 'gelatinizes,' and thus gelatin is extensively used for culinary purposes, being employed as a vehicle for other materials; for instance, in making jellies. Gelatin is further used in taking casts and impressions for electrotyping, and besides being employed for gelatin dry plates in photography, it is used in the carbon processes of photographic printing, which depends on the power of certain bichromates to render the gelatin insoluble when exposed to the action of light. This last property has also led to the use of gelatin as an insoluble glue or waterproofing material. Gelatin is one of the ingredients of printers' rollers; it is also employed in dyeing, and as a size in paper-making and painting. As a fining it is employed in beer-brewing, and it also finds application in medicine as a coating for pills and capsules. The crude gelatin, prepared by the simplest processes, is called *glue*, and has valuable applications as a cement.

Consult: Davidowsky, *Practical Treatise on the Raw Materials and Fabrication of Glue, Gelatin*, etc., translated by Brann (Philadelphia, 1884); Standage, *Cements, Pastes, Glues, and Gums* (London, 1893). See also ISINGLASS; GLUE.

GELATIN PROCESS. Gelatin is used in many photographic and photo-mechanical processes as a vehicle for certain chemicals which either alone or in combination are sensitive to the action of light, and under its influence experience changes in their condition. The substitution of the gelatin film of the dry plate for the collodion surface of the wet plate was an important development in photography, while the fact that gelatin mixed with bichromate of potash becomes insoluble when acted upon by light furnishes the basis for many photographic processes. See PHOTOGRAPHY and PHOTO-ENGRAVING for a description of the more important uses of gelatin in photography and photo-mechanical printing processes.

GELCICH, gəl'kik, EUGEN (1854—). An Austrian scholar and author, born at Cattaro, Dalmatia. He was in the active marine service until 1878, became director of the naval school at Lussinopoccolo in 1881, and of that at Trieste in 1895. His writings include some interesting studies respecting Columbus and the discovery of the American continent, such as the *Kritische Studien zur Columbusgeschichte in the Zeitschrift der Berliner Gesellschaft für Erdkunde*; *La scoperta d'America e Cristoforo Colombo nella letteratura moderna* (1890); and *Die Instrumente und die wissenschaftlichen Hilfsmittel der Nautik zur Zeit der Entdeckung Amerikas* (in Neumeyer's *Festschrift* for the Hamburg-America festival, 1892).

GELDERLAND. An eastern province of the Netherlands, bounded by the Zuyder Zee and the Province of Overijssel on the north, Westphalia and the Rhine Province on the east and southeast, North Brabant on the south, and South Holland and Utrecht on the west. Area, 1965 square miles. The northern part is chiefly sandy and barren. It is only slightly cultivated. The southern portion between the Rhine and the Meuse is low and marshy, but very fertile and productive. The province is watered by the Rhine, Meuse, Berkel, Schipbeek, and a few smaller rivers. The chief occupations are agriculture and stock-raising. Their products are exported, notably cereals, fruits, flax, tobacco, and horses. The manufacturing industries are confined to the production of brick, cotton goods, paper, leather, footwear, and beer. The commerce is facilitated by a canal from Yssel to Zwolle. Population, in 1899, 566,549. Capital, Arnhem (q.v.).

HISTORY. Gelderland was, like other provinces of the Netherlands, a part of the Holy Roman Empire, and first appears in history clearly as the County of Gelre, under Otto of Nassau, who flourished about 1061. In 1339 it became a duchy, but soon thereafter the House of Nassau died out, and, after a long struggle, Gelderland, in 1379, was united to Jülich. Continual wars about the succession to the throne devastated the country, and from 1472 to 1477 Charles the Bold of Burgundy held the duchy, his claims passing to his daughter Mary, wife of Maximilian of Austria. The latter, however, was unable to conquer the country, and only in 1543 was Charles V. able to incorporate the country permanently with the rest of his vast empire. The larger portion, known as Lower Gelderland, shared the history of the rest of the Protestant Netherlands. (See NETHERLANDS.) Upper Gelderland remained with Spain, but was claimed by Frederick I. of Prussia as Duke of Cleves, and taken possession of during the War of the Spanish Succession (1701-13); but he could retain only a portion of it permanently, the rest going to Austria as a part of the Spanish Netherlands. Finally the Austrian portion fell to the independent Netherlands. During the French Revolution Upper Gelderland was united for a time to France. In 1815, by the Peace of Vienna, it was divided between Prussia (where it forms a part of Westphalia) and the Netherlands.

GELDNER, gəl'tnēr, KARL FRIEDRICH (1852—). A German Orientalist. He was born at Saalfeld, Saxe-Meiningen, the son of a clergyman, and studied at the University of Leipzig, and

especially under the famous Sanskritist Roth, in Tübingen. In 1887 he was called to the University of Halle, and thence in 1891 to Berlin as professor extraordinary in the Indo-Iranian languages. His more important publications are: *Ueber die Metrik des jüngeren Avesta* (1877); *Studien zum Avesta* (1882); *Drei Yasht aus dem Zendavesta* (1884); *Vedische Studien*, in collaboration with Pischel (1888, 1892); and a monumental edition of the Zoroastrian Scriptures, *Avesta: the Sacred Books of the Parsis* (Stuttgart, 1885-95).

GÈLE, zhél, ALPHONSO VAN (1849—). A Belgian explorer of Africa, born in Brussels. In 1882 he was sent to Africa, where he became administrator of the region near Stanley Falls. Three years later he revisited the Congo and explored its branches, subsequently tracing the Ubangi to longitude 23° E.

GELÉE, zhe-lá', CLAUDE (1600-82), generally called Claude Lorrain. A French landscape painter and etcher. He was born in the village of Chamagne, in Lorraine, in 1600. His parents were of humble origin, and he was the third son of five children. He became an orphan at twelve, and in consequence sought work for his own support, which led him to Rome about the age of sixteen. His talent and enthusiasm for art were aroused when he saw some landscape paintings of a Flemish painter, Godfrey Wals, then residing at Naples. He made the journey on foot to Naples to discover the master of his choice, and lived in the artist's family for two years, while he made special studies in architectural design and perspective. On his return to Rome he sought employment in the studio of Agostino Tassi, a pupil of Paul Bril, another landscape painter from Flanders. The subjects of Tassi's pictures were picturesque ruins, harbors crowded with fleets and throngs of men from all nations, which were reflected later in the works of Claude. In 1625 he visited Venice and several cities in Germany and France. On his return to Rome, where he lived for the rest of his life, he formed an intimacy with the painter Joachim Sandrart, to whom we owe his biography, and to whom Claude owed the incentive to study directly from nature. He enjoyed the patronage of Pope Urban VIII., for whom he painted two pictures, now in the Louvre, the "Village Fête" and a "Seaport at Sunset." Pope Clement IX. also conferred upon him many favors.

Thirty years of residence in Rome, studying the ancient buildings, made it possible for Claude to give to his pictures a true setting for the semi-pagan tastes of the ruling class. His popularity reached such a point that he found it difficult to supply the demand for pictures, and they brought such high prices that other artists plagiarized his style and name. In order to prevent the sale of fraudulent copies, he designed the *Liber Veritatis*, a book of two hundred sketches in pen and ink wash, which could be used to verify the original work. He worked up to the last year of his life, dying at eighty-two years of age, on November 25, 1682. His character was without reproach; one of his chief traits was thoughtfulness for others. His will gave instructions that his body should be buried in the Church of Santissima Trinità de' Monte. The French Government, in 1836, had the remains removed to the

Church of San Luigi de' Francesi, near the Pantheon.

The subjects of Claude's works are marines and landscapes, often with sylvan groves, and bits of classical architecture. His technique is smooth, but expressed with great simplicity. His color is warm and rich in quality, often glowing with a yellow tone, producing brilliant effects of light reflected in the sky, clouds, and water. One of the charms of his pictures is the unlimited space they present, always interpreted with poetic feeling. As a figure painter Claude failed, often employing another artist to paint in figures for him.

Salvator Rosa and the two Poussins were his contemporaries at Rome, and, although they were somewhat influenced by his style, yet in the works of Ruysdael, Hobbema, Cuyp, and Turner the influence is more evident, both in coloring and in atmospheric effects.

In 1630 he appeared as an etcher and engraver; on the forty-four etchings ascribed to him there are at least eighteen signatures, some in French, and others in Italian. The technique of his drawings is curious, combining lines and wash. The lines are used only to emphasize the shadows and to delineate the figures.

Most of his paintings are in England, but he is also represented in all the important galleries of Europe. In the National Gallery, London, are the "Embarkation of the Queen of Sheba," "Embarkation of Saint Ursula," and a Seaport; in Madrid, the "Finding of Moses," "Embarkation of Saint Paula," "Temptation of Saint Anthony"; in Munich, the "Expulsion of Hagar and Ishmael," "Hagar in the Desert"; in the Louvre, at Paris, the "Landing of Cleopatra at Tarsus," the "Village Dance," six marine views and two landscapes; in the Hermitage, Saint Petersburg, the "Meeting of Jacob and Rachel," the "Flight into Egypt," "Apollo and the Cumæan Sibyl." Consult: Sandrart, *Teutsche Academie der edlen Bau-, Bild- und Malereikünste* (Nuremberg, 1675-79); D'Argenville, *Abrégé de la vie des plus fameux peintres* (Paris, 1745); Pattison, *Claude Lorrain, sa vie et ses œuvres* (Paris, 1884); and Dullea, *Claude Gelée, le Lorrain* (London, 1887).

GELIMER, gél'ī-mēr or jél', or **GILIMER**, gil'ī-mēr or jil'. The last King of the Vandals in Africa. He was a great-grandson of Genseric, the conqueror of Carthage, and founder of the Vandal kingdom in Africa. After deposing his cousin, Hilderic, about 530, and occupying the throne, he was defeated three years later in the battles of Carthage and Bulla by the Byzantine army under Belisarius, and brought as a captive to Constantinople, where he figured in the triumphal procession of the conqueror. He afterwards retired to his domain in Galatia, which had been bestowed upon him by the Emperor Justinian. It is said that when he walked as a captive in the triumphal procession, he realized the futility of the pursuit of greatness, and constantly repeated aloud the words of Solomon: "Vanity of vanities; all is vanity."

GELL, gél, Sir WILLIAM (1777-1836). An antiquary and traveler, the younger son of Philip Gell, of Hopton, Derbyshire. He was educated at Jesus College, Cambridge, where he was graduated B.A. in 1798, and M.A. in 1804; he was for some time a fellow of Emmanuel College in that university. He devoted his time prin-

cipally to topographical and geographical studies, and published in London the following works, which, though not marked by profound scholarship, contain much material of value: *The Topography of Troy* (1804); *The Geography and Antiquities of Ithaca* (1807); *The Itinerary of Greece* (1810); *The Itinerary of the Morea* (1817; new ed. 1827); *Pompeiana: or, Observations upon the Topography, Edifices, and Ornaments of Pompeii*, in conjunction with J. P. Gandy, an interesting and beautiful work (1817-19; second series 1832); *Narrative of a Journey in the Morea* (1823); *The Topography of Rome and Its Vicinity* (1834; new edition by Bunbury, 1846); *Rome and Its Environs* (map, 1834). In August, 1814, on the departure for the Continent of Caroline, Princess of Wales, consort of George IV., she appointed him as one of her chamberlains. In that capacity he attended her in various parts of Italy, but, being attacked with the gout, was soon obliged to resign his situation. In 1820 he was examined as a witness at the bar of the House of Lords during the proceedings against her after she became Queen and had returned to England. Subsequently he resided in Italy, principally at Naples, having a house also at Rome, where he occasionally took up his abode. He died at Naples and was interred in the English burial-ground of that city. His original drawings, about 800 in number, were bequeathed to the British Museum.

GELLATLEY, gél'at-li, DAVID. A half-witted servant of the Baron of Bradwardine in Scott's *Waverley*.

GELLERT, gél'ért, CHRISTIAN FÜRCHTEGOTT (1715-69). The most important of the forerunners of the golden age of German literature that was ushered in by Lessing. He was born at Hainichen, Saxony, and studied theology at Leipzig, where he afterwards passed most of his life as tutor, teacher, and professor, and where he died. His didactic and religious poems, fables, and stories were in their day immensely popular, as were his lectures on morals and literature. His *Works* (10 vols., 1769-74 and 1867) are types of the innocuous and rationalistic. His *Fabeln und Erzählungen* (1746) and the religious poems are still often republished separately. His *Tagebuch* (1869) is the best available biography. Consult also his *Life* by Döring (Greiz, 1833).

GELLIUS, AULUS. A Latin author of the second century A.D. Little is known of his life. He is supposed to have been born at Rome, where, at all events, he studied rhetoric. Subsequently he proceeded to Athens to undergo a discipline in philosophy. On his return to Rome he entered upon a legal career, without, however, abandoning his literary pursuits. Gellius's well-known work, *The Attic Nights* (*Noctes Atticæ*), begun during the long nights of winter in a country house near Athens, and completed during the latter years of his life, is a collection of miscellaneous matter on language, antiquities, history, and literature, in twenty books, of which the eighth is wanting. It contains many extracts from Greek and Latin authors no longer extant. The work is destitute of any plan or arrangement, is disfigured by archaisms, and derives its value mainly from being a repository of curious knowledge. The *editio princeps* appeared at Rome in 1469; the earliest critical edition is that

of Gronovius (Leyden, 1706); the most important edition is that of Hertz (Berlin, 1883-85); there is also a smaller edition by the same author (Berlin, 1886); and a volume of selections, with notes and vocabulary, by Nall (London, 1888). There is an English translation by Beloe (London, 1795).

GELNHAUSEN, gél'n'hau-zen. An ancient town in the Prussian Province of Hesse-Nassau, situated on the River Kinzig, 27 miles northeast of Frankfort. It is surrounded by walls, and its most interesting buildings are the Church of Saint Mary, built in Transition style in the thirteenth century, and recently restored; the Rathaus; and a building dating from the time of Frederick I., and supposed to be a guild house. On a small islet in the Kinzig lie some well-preserved parts of an Imperial palace erected by Frederick I. in the twelfth century. The town has also a monument to Philip Reis, the alleged inventor of the telephone and a native of Gelnhausen. The town once had the rank of an Imperial city, and was the temporary residence of several emperors. Population, in 1900, 4589.

GELON (Lat., from Gk. Γέλων). Tyrant of Gela and Syracuse. He was the son of Dinomenes, and a native of Gela. His family was one of the oldest and most distinguished in the place. Gelon himself first figures in history as general of horse in the army of Hippocrates, Tyrant of Gela. On the death of the latter he contrived to obtain the supreme power, B.C. 491, and about B.C. 485 made himself master of Syracuse also, to which he transferred the seat of his government, and which he rendered the first Greek city in Sicily. All the inhabitants of Camarina, more than half of those of Gela, and many from other neighboring towns, he brought to Syracuse. His influence soon extended itself over a great part of the island. At the time of the invasion of Xerxes, Gelon refused to come to the aid of the Greeks, ostensibly because they would not make him commander-in-chief. He soon after came into collision with the Carthaginians, but defeated them in a decisive battle at Himera, in B.C. 480—on the same day, it is said, on which the battle of Salamis was fought. He thereafter ruled in peace. He is praised as a merciful and wise ruler, who was beloved by his people and hailed as their deliverer and sovereign. After his death, about B.C. 478, he was honored as a hero. His brother Hiero succeeded him.

GELSEMIUM (Neo-Lat., from It. *gelsomino*, jasmine, from Ar. *yasmin*, from Pers. *yâsmîn*, jasmine). A drug consisting of the rhizome and rootlets of *Gelsemium sempervirens*, a climbing shrub of the natural order Loganiaceæ, having a milky juice, opposite lanceolate, shining leaves, and axillary clusters of from one to five large, funnel-shaped, very fragrant yellow flowers. The fruit is composed of two separable jointed follicles, containing numerous flat-winged seeds. The stem often runs under ground for a considerable distance. The plant is a native of the United States, growing on rich clay soil by the side of streams near the coast, from Virginia to Florida and Texas. In the United States it is commonly known as the wild, yellow, or Carolina jessamine, although in no way related to the true jessamines, which belong to the Oleaceæ. The medicinal properties of the root were discovered by accident, the infusion having been administered

instead of that of some other root, with the result of curing the fever for which it was taken. It contains an alkaloid, gelsemine, and gelseminic acid. The physiological action of the drug has been carefully examined. It appears that it has a paralyzing action on the motor centres, affecting successively the third, fifth, and sixth nerves. Its fatal action is due, according to Bartholow, to its causing paralysis of the respiratory muscles, and thus producing death by asphyxia. Wood believes the action is upon the respiratory centre. In large doses it produces alarming symptoms, which have terminated fatally. These appear to vary in different cases, but the more prominent are pain in the forehead and in the eyeballs, giddiness, a feeling of muscular fatigue, lightness in the tongue, slurred pronunciation, labored respiration, ptosis, wide dilatation of the pupils, and impossibility of keeping an erect posture. The mind in most cases remains clear until shortly before death. The earliest and most prominent symptoms of a fatal or dangerous dose is the drooping of the eyelids, which indicates the immediate administration of stimulants; for when the paralysis of the tongue, which ensues, extends to the epiglottis, deglutition becomes impossible, and, unless the sufferer be placed in a forward position, the epiglottis is apt to flap back and close the windpipe. The antidotes which have been found most efficient are carbonate of ammonia, brandy, aromatic spirits of ammonia, and morphine. Gelsemium is used chiefly in the treatment of facial and other neuralgias, particularly the so-called trigeminal neuralgia, which involves branches of the fifth nerve. It has proved valuable in some cases of malarial fever, and is occasionally used as a cardiac depressant and in spasmodic affections, but is inferior for this purpose to other remedies.

GELSENKIRCHEN, gəl'sen-kīrk'en. A thriving industrial town in the Prussian Province of Westphalia, five miles north of Essen (Map: Prussia, B 3). It has extensive iron-works, soap-factories, and flour and saw mills. Its rapid growth is due to the large coal deposits discovered in 1855 in the vicinity. Population, in 1852, 844; in 1890, 28,057; in 1900, 36,935. Gelsenkirchen was made a city in 1875.

GEMARA, ge-mā'rā (Aram., complement). That portion of the two Talmuds, the Babylonian and the Jerusalem, containing the annotations, discussions, and amplifications of the Mishna, or Talmudical law, by the schools of Babylon and Palestine. The Babylonian Gemara is far more complete than the Jerusalem, as well as more lucid, and is a more highly valued authority. It was not completed till about A.D. 800. The Jerusalem Gemara belongs to the middle of the fourth century A.D. See MISHNA; TALMUD.

GEMBOUX, zhān'blōō'. A town of the Belgian Province of Namur, 24 miles southeast of Brussels (Map: Belgium, C 4). It is noted for its Benedictine abbey, founded at the beginning of the tenth century, and now occupied by the Royal Agricultural College. Gembloux is also noted as the scene of the defeat of the Dutch by the Spanish under Don John of Austria in 1578. Population, in 1900, 4216.

GEM'INI (Lat., twins). The third constellation of the zodiac, containing the two bright stars Castor and Pollux.

GEMINUS (Lat., from Gk. Γεμῖνος). A Greek writer, probably of the first half of the first century B.C. His birthplace is unknown, although Rhodes is often given. It is equally uncertain where he lived, the claim on behalf of Rome being insufficiently established. Of his works only one is extant, the *Introduction to Phenomena*, an astronomical work, published with Latin translation by Hilderic (Altorf, 1590), and by Petau, in his *Uranologian* (Paris, 1630), and with a French translation by Halma, in his *Chronologie de Ptolémée* (Paris, 1819). Of his best works, the *Arrangement of Mathematics*, comprising at least six books, was the most important. Fragments of this work have been preserved by Pappus, Eutocius, and especially by Proclus, and form one of the chief sources for the study of the early mathematical history of the Greeks.

GEMISTUS (Lat., from Gk. Γεμιστός), GEORGE, called GEORGIUS PLETHON, and more commonly GEMISTUS PLETHON. A Byzantine philosopher. The exact dates of his birth and death are uncertain, but he is known to have lived between 1350 and 1450. He was probably born at Constantinople, and the greater part of his life was passed in the Peloponnesus, where he probably died, almost a centenarian. He was one of the deputies sent by the Greek Church to the council which was held at Ferrara and Florence in 1438-39, for the purpose of arranging a union between the Latin and Greek churches. Gemistus was more celebrated as a philosopher than as a theologian. In his time the Aristotelian philosophy reigned supreme; but it had degenerated into a mere science of words, from the study of which Gemistus turned away disgusted, and applied himself to Plato. Plato's philosophy so charmed him that thenceforward he devoted himself to its propagation; and in furtherance of this view, when in Italy, induced Cosmo de' Medici to embrace it. Cosmo's example was followed by others in Florence, and thus a Platonic school was founded in the West which flourished for nearly 100 years afterwards. During the latter part of his life Gemistus was engaged in bitter conflicts with the most eminent of the Aristotelians, among whom George of Trebizond held a high position, and the discussion was carried on with unseemly violence. Consult: *Geschichte der Philosophie der Renaissance*, vol. i. (Jena, 1874); Fabricius, *Bibliotheca Græca*, vols. viii., xii.; Migne, *Patrologia Græca*, vol. cix.

GEMMÆ, jēm'mē (Lat., buds). Peculiar vegetative reproductive bodies which are formed upon the thallus of certain liverworts. See HEPATICÆ.

GEMMELLARO, jēm'mēl-lā'rō, GAETANO GIORGIO (1836-1904). A Sicilian naturalist, born at Catania. He was educated in that city and in Naples, and subsequently became professor and rector at the University of Palermo. His researches in archæology and volcanology are valuable; and the Monte Gemmellaro, a volcanic formation caused by the eruption of Mount Etna in 1886, was named after him. His works include: *Descrizione di alcune specie di minerali dei vulcani estinti di Patagonia* (1854-56); *Pesci fossili della Sicilia* (1858); *Studi paleontologici sulla fauna del calcare a Terebratula janitor* (1868-76); *La fauna dei calcari* (1887 et seq.); *I crostacei dei calcari* (1890).

GEMMI (gēm'ē) **PASS.** A mountain pass across the Alps in Switzerland, lying at an altitude ranging from 3900 to 7570 feet, and connecting the cantons of Bern and Valais (Map: Switzerland, B 2).

GEMMULE (from Lat. *gemma*, little bud, diminutive of *gemma*, bud). In biology, (1) a mass of cells cut off from the parent for reproduction; (2) a hypothetical self-multiplying particle upon which inheritance depends.

(1) Among animals, gemmules are found in the groups of sponges and Polyzoa. In sponges, as winter approaches, numbers of the migratory cells form an aggregation in which two layers are eventually distinguishable. The central cells are loaded with yolk; the cells of the outer layer become club-shaped and arrange themselves in a sort of high epithelium. This layer of cells secretes a cuticular membrane around the inner mass of cells, and forms a layer of dumbbell-shaped spicules close set in a radial fashion. The central cells are those from which the embryo is to arise next spring. The outer layer is protective. The gemmules thus constituted are set free when winter kills the sponge tissue. Next spring the inner cells grow and the bonds of the outer layer are broken. Such gemmules are found chiefly in fresh-water sponges, but within the last decade they have been found in marine sponges also. In the fresh-water Polyzoa the gemmules are of somewhat different character, and are called statoblasts. The statoblast arises in a special thread-like organ, the funiculus, that is composed of ectoderm within and of mesoderm without. The ectodermal core proliferates to form a hollow square, which later flattens and eventually produces the tough cuticula by which the statoblast is covered. The outer mesodermal layer thickens, stores food-material, and becomes enveloped by the ectoderm. In addition to the cuticula, which the ectodermal layer secretes, the statoblast is often provided with spines and a float which permits the statoblast to swim. In the spring the embryo develops within the brown cuticula, bursts open this shell, and emerges to lay the foundations of a new colony. Both of the foregoing gemmules are devices for enabling the species to outlast the winter.

(2) The hypothetical material basis of inheritance called *gemma* by Darwin has been recognized by one name or another by almost every philosophic writer in biology; other nearly or quite synonymous terms are the physiological units of Spencer, the bioblast of Beale, the pangene of De Vries, the plasome of Wiesner, the micella of Nägeli, the plastidule of Haeckel and Ellsberg, the biophore of Weismann, somacule of Foster, idioblast of Hertweg, idiosome of Whitman, biogen of Verworn, and *gemma* of Haacke. The hypothesis has arisen on account of the necessity of assuming a structure to protoplasm intermediate between the visible foam-work and granules and the invisible molecules. The line of argument is briefly this: The qualities of the adult are inherent in the egg, and also in each of the cleavage spheres; each quality is represented by material particles, which divide when the cell divides; the particles are not molecules, for it is hardly conceivable that a molecule stands for a somatic quality; therefore there must be some sort of unit groups of interacting and internally associated molecules. Darwin's

hypothesis (see PANGENESIS) was that each cell threw off one or more gemmules; they floated in the blood to the germ-cells and became lodged in these cells. Galton tested this theory by transplanting the blood of one species of hare into a second. The progeny of the second was not influenced by the blood of the first species. Weismann believed in no such migration of gemmules. The gemmules of the germ-cells receive no influx of gemmules from outside by which their characters might be changed; on the contrary, the composition of the germ-cells is unchanged, says Weismann, except as a result of crossing or internal spontaneous modifications. See EMBRYOLOGY.

GEMOTE, ge-mōt' (AS. *gemōt*, assembly): Among the Anglo-Saxons, the public assembly of freemen or men of noble rank for the purpose of legislative and judicial action. Besides the great council of the nation, the witenagemot (q.v.), there were among the Anglo-Saxons various minor motes or moots, which were local bodies dealing with local affairs. There was a *shire-gemot*, or county court which met usually twice a year; the *burg-gemot*, which met thrice annually; the *hundred-gemot* (see HUNDRED), which met every month, and an extraordinary meeting of which was held twice a year; and the *halle-gemot* or *court baron*. These institutions are regarded as being derived from the old Teutonic assemblies where every freeman had a voice, and where a clashing of arms betokened the approval, and a groan the rejection of a plan.

GEMS (from Lat. *gemma*, bud). While the term *gem* is ordinarily applied to jewels and other valuable and precious stones, it is used in archæology of cut or engraved stones of the precious kinds, and even small engraved portions of hard rocks set or worn as jewels.

Although the principal varieties of precious stones were known to the ancients, yet owing to the absence of scientific and chemical analysis, they appear to have distinguished precious and other stones only by color, specific gravity, and density. The different nomenclature, too, used by different authors, multiplied synonyms and caused confusion; so that it has become impossible to identify all the stones mentioned by Theophrastus, Pliny, and others. As a general rule, the ancients did not engrave such precious stones as the diamond, ruby, and sapphire, being content with those of less hardness and value. The principal stones used by engravers were: (1) The carnelian, and its more transparent variety the sard, *sardion*, in common use in the days of Plato (so called from Sardis in Lydia, but chiefly obtained from India and Babylonia); (2) the chalcedony, supposed to be the ancient calchedonion, used for seals and reliefs, of which two kinds have been found; (3) the *onyx* or nail-stone, variously described by Pliny and his predecessors, but distinguished by a white layer resembling the nail; (4) the *niccolo* or *Ægyptilla*, obtained from the onyx, a blue spot with a black zone encircling it; (5) the *sardonyx*, which was a variety of the onyx, having black, blue, white, and red colors, and particularly used for cameos and vases, by cutting down the lighter-colored layers to the darkest for a background to the figures; (6) the *agate* or *achates*, so named from a Sicilian river, embracing many varieties, as the *jaspachates*, *dendryachates*, but confounded with the *jasper*,

considered a charm against scorpions and spiders, used for whetstones, and as a talisman by athletes; it was obtained from Egypt, Greece, and Asia; (7) plasma or the *prasius*, root of emerald; its varieties were the *molochates* and *nilion*; (8) numerous varieties of the jasper, *iaspis*, green, blood-red, yellow, black, mottled or porcelain, and even blue, were employed for signets at the Roman period, and procured from India, Persia, and Cappadocia; (9) garnets, the *granatici* or red hyacinths of antiquity, which were principally in use in the latter days of the Roman Empire, and among the Oriental nations. With these may be classed: (10) The *carbunculus*, supposed, however, by some to be the name given by the ancients to the ruby, brought from India, Caramantia, Carchedon, and Anthemusia; (11) the *hyacinthus* or jacinth, a yellow variety of the garnet, used for signets, and imported from Ethiopia and Arabia; (12) the *lyncurium*, or *lychnis*, the ancient name of the true modern jacinth; (13) several varieties of the emerald or *smaragdus*, as the Bactrian or Scythian, supposed to be a green ruby, principally derived from the emerald mines at Zabora, in the neighborhood of Coptos; (14) the beryl or *beryllus*, obtained from India, cut in shape of a hexagonal pyramid, used at an early period, and for engraving; (15) the *amethyst*, brought from Arabia Petræa and Armenia Minor, used for intaglios at all periods; (16) the *sapphirus* of the ancients, supposed by some to be lapis lazuli, brought from Media, and in use among the Egyptians and Persians; (17) the *anthrax*, supposed to be the ruby; (18) the topaz, *topazon*, a name applied by the ancients to a green stone found by the Troglodytes in the island of Cytis, in the Red Sea, and first sent by Philemon to Berenice, out of which a statue of Arsinoë was made and placed in the so-called 'golden temple' by Ptolemy Philadelphus; (19) the *chrysolithus*; (20) chrysoprase, turquoise *callais*; (21) the *magnes*, or lodestone, used for cylinders and gems of a late period; (22) the green tourmaline, or *avanturine*, *sandaresus*; (23) the obsidian, *obsidianus*, four elephants made of which were dedicated by Augustus in the Temple of Concord; besides which we read of a statue of Menelaus, made of the same material, returned to the Heliopolitans by Tiberius; (24) the *opal opalites*, or *pæderos*, obtained from India, the largest of which then known was of the size of a hazel-nut; (25) the *adamas*, of which seven varieties were known to the ancients, used only for cutting other gems, or worn rough, but not engraved, or even faced. The list of Pliny, indeed, contains many other stones which have been either confounded with those already described, or else they are species of the same. Many of these had fanciful names, as (26) the *aromatites* of Arabia and Egypt, so called from its fragrance; (27) the *alectorius*, worn by the wrestler Milo, so called from being taken out of the gizzard of a fowl; (28) the *aspidates*, a fiery stone, said by Democritus to be found in the nest of the Arabian birds. In the selection of stones for engraving, the gem-engravers adapted the material to the subject. Bacchanalian subjects were often engraved on amethysts; marine, on beryls; martial, on carnelians, sards, and red jaspers; rural, on green jasper; celestial, on chalcédonies. Virtues were also superstitiously attributed to the different varieties of gems. Thus the amethyst was sup-

posed to protect from the influence of wine; according to Dioscorides, the jasper was particularly adapted for amulets; and Alexander of Tralles recommends the subject of Hercules, engraved on a Median stone, to be worn on the finger as a remedy against the colic. These superstitions were collected in various writings, like the *Physiologus*, some of them attributed to Saint Augustine.

The art of engraving precious stones at the earlier periods of the Egyptian monarchy was comparatively unknown, although beads were cut out of almost every known stone. For the purpose of seals, however, and for intaglia, steatite scarabæi were generally used, and engraved gems are either of the greatest rarity or of suspicious genuineness till the time of the Ptolemies. A very remarkable exception to this rule is a square signet of yellow jasper, engraved with the name and titles of Amenophis II. (about B.C. 1450) and his horse, in the British Museum. Figurines of deities and animals were, however, numerous, and were carved out of amethysts, emeralds, agates, sardonyx, carnelian, obsidian, hæmatite, lapis lazuli, etc. There are in museums numerous cats, lions, crocodiles, eagles, frogs, hippopotami, and other symbols. Under the Ptolemies and Romans, the Gnostic gems, called *abraxas*, generally of lapis lazuli, bloodstone, and jasper, begin to appear, but these are made by the same process as the Greek, from which they were derived. The Ethiopians, according to Herodotus, engraved signets. But the earliest engraved gems were those of the Babylonians, always, until a late period, in the form of cylinders from one to two inches long and about one-half or three-quarters of an inch thick, pierced through their long axis for a cord or pin, and used for impressing the sign-manual by rolling on soft clay. Their universal use multiplied them to such an extent that they form our main source of information as to the periods and themes of Babylonian sculpture; the favorite theme was the figures of the patron god and goddess being worshiped by the owners of the gem, and the figures are arranged in a single frieze-like row. There are also many scenes purely mythological, such as the legends of Gilgamesh, the Babylonian Hercules, of Merodach, of Samas, of Raman, and other deities. The seals of the ancient Kings Sargani (c. 3850 B.C.), Naramsin (c. 3800), and Ur-gur (c. 2800 B.C.) are of good art, as are those of Gilgamesh breaking the lion's back, of the captives of Erech, etc. In style there were many schools and periods, at opposite poles of art, but their history is obscure. There is a radical difference in the technique of Assyrian gem-cutting; the outlines are sharp instead of rounded and the details very clear, there is less use of the nude, and a narrower range of themes. It was the Assyrian style which most influenced the gem-cutting of Persia: the seal of Darius, with the King in his war-chariot, is only a puny copy of the corresponding spirited Assyrian scenes. In late Assyrian times the rolling cylinder was partly replaced by the conical signet with figures cut on the base. All the Orient had copied Babylonian models. The Phœnicians, Hittites, Syrians, and other races all used cylinders of similar style. A cruder style, with animals and heads, came into vogue under the Parthians, often accompanied with Pahlavi inscriptions, and these probably continued till the rise

of Mohammedanism in the East, when the art was confined to the engraving of Cufic legends on the most valuable of Oriental stones, often with a great degree of dexterity. Before this time there had been introduced a greater variety in the form of the cut gems, conical chalcedonies, and other stones, hemispherical agates, convex stones *en cabochon*, such as garnets, sards, carbuncles, engraved on their upper surface. In Judea the use of signets (see RING) prevailed, and the most important known instance is the Urim and Thummim, or breastplate of the High Priest, consisting of twelve precious stones, engraved with the names of the twelve tribes; but no Hebrew engraved stones earlier than the fifth or sixth century B.C. are known. Among the other Oriental nations, the Iranians and Hindus seem to have exercised the art of engraving on stones, although no works of great merit of these nations have been found. Of other nations of antiquity, the Chinese only had seals of crystal, soapstone, porcelain, and other substances, with devices in relief for using as stamps, the subjects being mottoes from poetical and other works.

Archæological research has shown that the Greeks cut gems at a very early date. The first or *Mycenæan* period used animals, flowers, and hunting scenes, fishes and marine plants; the second or *Oriental* period (c. 900-700 B.C.) introduced the human figure and mythological scenes more freely; the third or *Archaic* period (B.C. 700-500) shows the influence of large sculpture and coins; the fourth or *developed* period (500-320) produced certain great artists, like Athenades, Dexamenus, Phrygillus, Olympius, and Onatas, whose work corresponds on a small scale to the golden age of monumental sculpture. Finally the fifth or *Hellenistic* age, beginning with Pyrgoteles, privileged to work for Alexander the Great, was the age of high finish, dramatic style, and love of the grandiose, so that it fitly saw the use of the art of cameo-cutting, and the use of large heads and elaborate compositions. The Greeks, at the earliest period, are not supposed to have employed engraved stones for their signets, the earliest rings being of solid metal, such as the legendary ring of Minos; but at a later mythological period those of Helen, Ulysses, and Gyges are said to have had engraved stones. Orestes, in the tragedies, is also recognized as the son of Agamemnon by his engraved ring; and Mnesarchus, the father of Pythagoras, who lived about B.C. 600, was an engraver of gems. The earliest instance of an engraved gem is the emerald ring of Polycrates, set in gold or engraved by Theodorus of Samos about B.C. 540; while the laws of Solon against counterfeiting signets show that they had been in early use. At the period of the Persian wars they were by no means uncommon. Later, the writings of the Platonists and Stoics constantly allude to gems, and the flute-player Ismenias (B.C. 437) purchased an emerald engraved with the figure of Amyclone. One of the Ptolemies presented as a most precious gift his portrait engraved on an emerald to Lucullus; and Cleopatra had a gem with Bacchus. The style of engraving of this age is fine and noble, the hair indicated by fine wiry lines; the subjects are generally heroic, but busts and portraits of divine, regal, and historical personages appear. Sardes, amethysts, and jacinths were in use.

Contemporaneous with the Archaic Greek school

was the Etruscan, among whose products were scarabs entirely carved out of sard, carnelian, and agate, with engravings often of exquisite work, but generally harsh, and sometimes of severe style, with subjects derived from the earliest Hellenic myths, and occasional inscriptions in the Etruscan language, the names of the personages represented, seldom more than one figure appearing on the gem. The subject is surrounded with a guilloche or engrailed border, and the scarabs were pierced through their long axis, to set as rings or to wear as other objects of attire. The contents of Etruscan tombs show how the numerous imported gems, both Oriental and Greek, furnished the models to native artists. The imitation 'Island stones' and scarabs were sometimes of bone or composition. Similar scarabs, but of green jasper and of Phœnician workmanship, have been found in Sardinia. The Romans of the later Republic collected and copied Etruscan, and especially Greek, engraved gems, largely set as rings. The device of Scipio Africanus was a head of Syphax; that of Sulla, the submission of Jugurtha; of Pompey, a lion carrying a sword; and of Cæsar, Venus armed with a dart. So greatly had the passion for these charming little works of art increased that Scaurus, the stepson of Sulla, had a collection of gems, *dactyliotheca*. Pompey sent the collection of Mithridates as an offering to the Capitol; Cæsar, to outvie his great competitor, presented six such collections to the shrine of Venus Genetrix; and Marcellus, another to the cella of the Palatine Apollo. At the commencement of the Empire, the portraits follow the costume and art of the period; the hair is expressed by broad strokes, the compositions rarely contain more than two figures. Artists of great merit, as Dioscorides, Apollonides, and Chronius, flourished at this age.

The names of the artists who engraved the gems, and of the proprietors, are occasionally found upon them. After the Antonines, indeed, the art rapidly declined, and portraits after Severus are rare, although even that of Mauricius is said to occur. At the middle period of the Empire, the work is exceedingly rude, often merely scratched out by a diamond point in carnelians, jaspers, and garnets. The gems of this latter period are sometimes square, generally, however, the long or convex oval. The *camei*, or gems in relief, the ancient *ectypa sculptura*, appear prominently at the period of the Roman Empire. This term *camei*, of uncertain origin, is applied to engravings on stone of two or more layers, such as the onyx or sardonix, and niccolo, and is different from the relief gems cut out of stones of one color. Ancient *camei*, indeed, are of the greatest rarity. The smaller ones were used for rings; the larger, which are often perforated, are supposed to have been often attached to the dress as *phalæra*. They were worked out with the diamond point. Cameos are not supposed to be earlier than the Alexandrian period (c. 200 B.C.), though some carnelian scaraboids of Archaic Greek times, like several in the British Museum, are small premonitory specimens of what was to be developed into the most gorgeous branch of gem-carving, whose brilliant coloring and large size hardly accorded with the Hellenic simplicity of the Golden Age. The first great cameos are those of the Ptolemies, such as the great Naples

cameo of Zeus by Sosus, that of Ptolemy and Arsinoë in the Hermitage of Saint Petersburg, the onyx cap of Ptolemy at the Cabinet des Médailles in Paris, the famous Farnese cup, the vase of Saint Martin d'Agaune—all masterpieces, and serving as models for the artists of the Augustan age. To the early Roman Empire belong some superb pieces, such as the "Triumph of Augustus," a sardonyx in the Vienna collection, and the so-called "Apotheosis of Augustus" in the Bibliothèque Nationale in Paris, also a sardonyx. The composition in these Roman works is elaborate, and the figures numerous and sometimes in several rows. On the Vienna sardonyx Jupiter, Augustus, and Roma are enthroned above, in the middle row are Terra, Ocean, Abundance, Germanicus, Victory, and a triumphal chariot, while below are German and other captives. The cameo at Saint Petersburg is one foot long, and that in the Marlborough Collection, with the heads of Didius, Julianus, and Mantic Scantilla, is eight and one-half inches long by six inches high. Still larger carvings are in the form of vases, cups, boxes. These gems were principally worn as objects of attire, and Heliogabalus is even said to have placed intaglio in his shoes. The names of artists are rarely found upon camei; a celebrated one of the Marlborough Collection, indeed, has the name of Tryphon, but there is considerable doubt about the authenticity of the inscription.

The subjects of classic gems embrace the whole circle of ancient art, and follow the laws of its development, animal forms being succeeded by those of deities and subjects derived from the battles of Greeks and Amazons and centaurs, the exploits of Hercules and other heroes; then by scenes from tragedians and later myths; and finally by portraits, historical representations, and allegories. The inscriptions consist of the names of artists (generally forgeries), sometimes in the genitive case, but often accompanied with the verb *érolé*, made; addresses to individuals; gnomic or other sayings, indicating that the gems are amulets against demons, thieves, and various evils; or charms for procuring love; the names of the possessors, and sometimes addresses, occasionally even distichs of poetry, and various mottoes. These inscriptions were often added by subsequent possessors, and are not of the age of the gem itself. The number of artists, although very considerable, does not exceed 22 authentic names. The number of false antique stones produced by eminent engravers since the revival of the arts has rendered the diagnosis of gems so difficult that no branch of archæology requires greater judgment. All gems of high artistic merit and great finish are suspected, especially those with groups of many figures, regular edges, and polished faces, or too great a polish in the deep parts. Coarser imitations have been produced by backing pastes or colored glass (see GEMS, IMITATION) with stones, and mounting them in rings so as to pass for gems. The appearance of wear and friction has been produced by introducing them for a while into the gizzards of turkeys, or in pierced boxes plunged in the beds of rivers. The judgment upon gems can be matured, however, only by a careful study and familiarity with all branches of ancient art. The coarser imitations of pastes, the tongue, the file, and the graver will detect; but old gems reengraved, or new compositions invented, require the most care-

ful survey. The place or circumstances of discovery are no guarantee against deception, the commerce in false antiques being successfully plied upon the unwary even in the far East.

The chief implement used by the ancient engravers appears to have been made by splitting diamonds into splints by a heavy hammer, and then fixing these points like glaziers' diamonds into iron instruments, with which the work was executed by the hand. The drill was also extensively used for hollowing out the deeper and larger parts of the work, before the diamond-point was brought into operation, and finally, emery powder was used for polishing. The wheel, a minute disk of copper, secured to the end of a spindle, and moistened with olive oil, emery powder, or diamond-dust, and driven by a lathe, does not appear to have come into use till the Byzantine epoch. It has been conjectured that the artist used lenses of some kind, or globes filled with water, to execute his minute work; but the ancient, like the modern engraver, rather felt than saw his way. A more primitive method was that in which nothing but a copper tool was used, moistened as described. A still more primitive technique is that of many rude, early, or provincial Babylonian cylinders and proto-Hellenic 'Island stones' where the drill is the only instrument, and the forms are indicated either by larger or smaller hollows connected usually by straight lines. All these processes were not employed by the same artist, for besides the engraver (*sculptor cavarius, dactyliographus*), there was a polisher (*politor*), not to mention arrangers (*compositores gemmarum*), and merchants (*gemmarii, mangones gemmarum*).

The decadence in sculpture was very quickly felt in gem-cutting, which produced little and that of hardly any value, after the second century A.D. Even the small skill shown in Gnostic and Early Christian examples was lost, and the Merovingian and Carolingian monarchs, except in the case of monograms engraved on signet rings, were obliged to use antique gems, instead of those engraved by the artists of their day. Rock-crystals, however, were employed in a Byzantine style of art, with sacred subjects, in the ninth century; and a few other examples have been preserved in the Treasury of Saint Mark's at Venice, and in Paris (Bibliothèque Nationale). The art was all but lost in the West, except for a few pieces such as the Gothic rings of the Guerrazar treasury, the seal of Lothair at Aila-Chapelle, and the Crucifix of Conques. It was revived in the time of Lorenzo de' Medici, when Giovanni delle Corniole, at Florence, and Domenico dei Camei, at Milan, worked under his patronage. A subsequent school of gem-engravers originated with Pietro Maria da Pescia, who worked for Leo X.; the chief representatives of the school are Michelino, Matteo de' Benedetti, the celebrated painters Francia, M. A. Moretti, Caradossa of Milan, Leonardo da Vinci, J. Tagliacarne, Giovanni Bernardi of Castel Bolognese, celebrated for a Titus copied from Michelangelo. These were succeeded by Matteo del Nassaro of Verona, who worked for Francis I., and produced a crucifixion on heliotrope, so that the red spots seemed drops of blood issuing from the wounds of Christ; Caraglio, who flourished in Poland about 1570; Valerio dei Belli, who chiefly employed rock-crystal; Marmita, Domenico di Polo, Nanni, Anichini of Ferrara, and Alessandro Cesari, cele-

brated for a cameo head of Phocion; Dei Rossi, a Milanese, who engraved the largest cameo of modern times; Giacomo da Trezzo, celebrated for his portrait, who is said to have been the first to engrave on the diamond (in 1564), an honor disputed, however, by Birago, another Milanese, who made a portrait of Don Carlos and the arms of Spain on this gem.

The art, which had declined at the close of the sixteenth century in Italy, flourished in the seventeenth century in Germany under Rudolph II., for whom Lehmann engraved at Vienna; and in France, where Colderé worked for Henry IV. and Louis XIII. In the seventeenth century Sirletti, who died at Rome in 1737, excelled in portraits, and copied antique statues with great excellence. The two Costanzi were celebrated about 1790, one for the head of Nero on a diamond. Rega of Naples is said to have come nearest to the antique. Natter of Nuremberg, who died in 1763, is celebrated for his intaglia; Guay and Barrier were celebrated in the French school; and the English produced Reisen, who died in 1725; Claus, who died in 1739; Smart, celebrated for the rapidity of his works; and his pupil Seaton, a Scotchman, who engraved portraits of the great men of his day. The greatest artist of the age, however, was Natter. Of the subsequent Italian school, Ghinghi, Girometti, Cerbara, Bernini, and Putentati are much praised. The nineteenth century produced many good English engravers, as Marchant, Burch, Wray, and Tassie; while Pistrucci, celebrated for his charming cameo, Weigall, and Saulini, who made intaglia, complete the list of modern gem-engravers.

With respect to ancient gems in the Middle Ages, they were preserved in magnificent book-bindings—especially of manuscripts of the Bible—in reliquaries, ciboriums, shrines, chasses, and other ecclesiastical vessels, in which they were set. The collections of Saint Mark's, Venice, of Aix-la-Chapelle and other churches, the Bibliothèque Nationale at Paris, the cabinets of the museums of Florence, Vienna, Saint Petersburg, etc., show how this was done by Byzantine, Carolingian, Romanesque, and Gothic artists. The collecting of antique gems for their own sake, as examples of ancient art, commenced with Lorenzo de' Medici, who formed the Florentine collection, and had his name incised on his gems. The large camei of the European collections, however, appear to have been brought by the Crusaders from the East. The French collection dates from Charles IX., and was augmented by the successive Kings of France; it is very rich in gems of all kinds; that of Berlin, containing the united cabinets of the Elector of Brandenburg and the Margrave of Anspach, collected by Stosch, consists of nearly 5000 stones. The Vienna collection, far less numerous, is remarkable for its large camei. In England, the collection of the British Museum, collected originally by Townley, Hamilton, Payne, Knight, and Cracherode, consists of about 1500 stones, some of great beauty and merit, but is very poor in camei. The private collection of the Duke of Devonshire, formed in the last half-century, comprised upward of 500 intaglios and cameos, including some of the finest known. The Pulzky collection, now in Italy, contains many rare and choice intaglios. A celebrated collection, the Poniatowsky, formed upon the basis of the old collection of Stanislas, last King of Poland, was so filled with forgeries

by its last possessor, executed by Roman artists, with inscriptions by Diez, that it entirely lost its value on dispersion. The Hertz collection was remarkably rich in fine Etruscan scarabæi, and other intaglios. The Tyszkiewicz collection, recently dispersed, has enriched the Boston Museum with many fine pieces. The Morgan collection, in the American Museum of Natural History, New York, begun in 1890 and added to in 1901, is one of the largest modern collections of gems. There are probably about 10,000 gems reputed to be antique. Yet these are only a mere installment of those formerly existing. During the Renaissance very numerous and successful imitations of antique gems were made, and the signatures of Greek and Roman artists were manufactured. Such forgeries are still so frequent as to cast suspicion on the entire subject. The immense value placed by the ancients on their gems may be seen by the scabbard of Mithridates, valued at 400 talents, or \$37,860; the pearl given by Julius Cæsar to Servilia, worth \$24,000; that swallowed by Cleopatra, valued at \$25,000; and the pearls and emeralds worn by Lollia Paulina, wife of Caligula, valued at \$1,600,000—all the spoils of provinces and the heirlooms of her family. These, indeed, were probably not engraved, but in modern times great sums have been paid to celebrated engravers—as much as \$4000 for one cameo.

Although the acquisition of gems is too costly for most private individuals, impressions in glass called pastes (see GEMS, IMITATION), in sulphur, guttapercha, or plaster of Paris, can be easily obtained, and they answer almost all the purposes of study. Some ancient impressions in terracotta, indeed, exist, and the poorer classes of Greece and Rome were content with glass pastes. The principal writers of antiquity who treated of gems are Onomacritus or the Pseudo-Orpheus, Dionysius Perigetes, Theophrastus, and Pliny, whose chapter is compiled from antecedent Greek and Roman authors. Isidorus (A.D. 630) gives an account of the principal stones; so do Psellus and Marbodius in the eleventh century. The best general account is in Babelon, *Les gravures en pierres fines* (Paris, 1894); and King, *Handbook of Engraved Gems* (London, 1885), is still an authority. Middleton, *Engraved Gems of Classical Times* (Cambridge, 1891), is an excellent handbook, both technical and historical, for the Græco-Roman period. A pioneer for the Babylonian, Assyrian, Syrian, Phœnician, and Hittite schools is Ménant, *Les pierres gravées de la Haute Asie* (1883-86). Consult, also: Dana, *Manual of Mineralogy and Lithology* (3d ed., New York, 1878); Kunz, *Gems and Precious Stones of North America* (New York, 1890). The best catalogues of the large museum collections are: *Catalogue of Engraved Gems in the British Museum* (London, 1888); Babelon, *Le cabinet des antiques à la Bibliothèque Nationale* (Paris, 1889); id., *Catalogue des camées antiques et modernes de la Bibliothèque Nationale* (Paris, 1897).

GEMS, IMITATION AND ARTIFICIAL. The high appreciation in which gems were held by the ancients naturally led to the manufacture of imitations, and as early as the time of Pliny imitation opals and emeralds were well known. Seneca mentions that Democritus invented a

process for making imitation emeralds by giving a green color to rock crystal. According to Saint Thomas Aquinas, emerald, hyacinth, ruby, sapphire, and topaz were made in the twelfth century. The 'Sacro Catino' of the Cathedral of Genoa, and the celebrated table of Solomon taken by Vespasian from the Temple at Jerusalem, are known to have been imitations, and powder of crystal was largely used in the manufacture of imitation gems among the Romans, with the result that thousands of spurious gems accurately imitating the sapphire and the ruby were passed upon the uninitiated; indeed, modern examination shows that many of the famous gems of antiquity were made simply of glass.

IMITATION GEMS. Imitation gems may be divided into two classes—namely, mineral substitutes and doublets, and gems made from substances treated by chemical means. The first class includes quartz, white Brazilian topaz, and the colorless varieties of beryl, emerald, sapphire, and zircon, which have been sold as diamonds. Colored varieties of quartz are frequently substituted for other gems; thus, the yellow varieties, as cairngorm and citrine, are sold as topaz, and the purple varieties of quartz as the Oriental amethyst. The application of heat to certain gems, such as topaz and sapphire, frequently renders them colorless, and increases their brilliancy, in consequence of which they are cut and sold as imitation diamonds. Doublets are thin plates of a genuine gem attached to a valueless backing by means of a thin layer of gum mastic. Those imitation gems that are made by chemical processes are generally a special variety of glass known as *paste*, or *strass*, which consists of pure powdered quartz (preferably rock crystal) 38.2 parts, red lead 53.3 parts, and dry potassium carbonate 7.8 parts. These proportions admit of considerable variation, and arsenious oxide, borax, potassium nitrate, aluminum hydroxide, and calcium carbonate are also frequently added. The ingredients are powdered separately, carefully mixed, and heated in a sand crucible. The heat is gradually raised to fusion, and is maintained and carefully regulated at that temperature for about thirty hours, after which it is gradually lowered. The value of the product depends chiefly on the regularity of the temperature, the intimacy of the previous admixture, and the slowness of cooling, and is much increased by prolonged fusion.

This glass forms the basis of nearly all of the imitation gems, and the imitation diamonds are cut directly from it. The required tint for the colored gems is imparted by the solution in the paste of certain metallic oxides and other substances, as is shown in the following formulas: *Amethyst*, paste 1000 parts, glass of antimony 8 parts, cobalt oxide 5 parts, purple of Cassius 0.2 part; *beryl*, paste 1000 parts, glass of antimony, 7 parts, and cobalt oxide 0.4 part; *carbuncle*, paste 1000 parts, glass of antimony 500 parts, purple of Cassius 4 parts, and manganese dioxide 4 parts; *emerald*, paste 1000 parts, copper oxide 8 parts, and chromium oxide 0.2 part; *garnet*, paste 1000 parts, with variable proportions of purple of Cassius; *ruby*, paste 1000 parts, glass of antimony 40 parts, purple of Cassius 1 part, and gold 1 part; *sapphire*, paste 1000 parts, cobalt oxide 14 to 25 parts; *topaz*, paste 1000 parts, glass of antimony 40 parts,

and purple of Cassius 1 part. The temperature at which these mixtures are fused, and the time occupied in fusion, naturally affect the product, and the proportion of the colorless ingredients also varies considerably. The manufacture of these imitation gems is an important industry in Switzerland and in various parts of France and Germany. Agate, carnelian, chalcedony, and onyx, for making jewelry and for engraving, have been artificially stained at Oberstein and elsewhere in Germany. The stones are soaked in oil or other organic liquid, and then boiled in strong sulphuric acid. The organic matter absorbed by the stone is thus carbonized, and a black color is produced. A red color may be obtained by soaking the stone in a solution of ferrous sulphate, and a deep blue color results by afterwards soaking in a solution of potassium ferricyanide.

The manufacture of imitation pearls is an important industry. The pearls are made by coating the inner surfaces of glass beads with a preparation made from the scales of certain fishes. This extract is prepared as follows: Several pounds of scales are washed in fresh water to remove dirt, and they are then churned for several hours in cold fresh water, and the mass subjected to pressure in a linen bag. The silvery, lustrous runnings are caught and set aside, and the operation repeated until the scales have lost their silvery appearance. The runnings, to which a little ammonia has been added, are put aside to clarify, care being taken to prevent putrefaction. The sediment is washed repeatedly with fresh water and left to settle; when the washings are quite clear the lustrous sediment is bottled with its own volume of alcohol, shaken, and allowed to settle. The alcohol is then decanted off, and the operation repeated until the sediment has lost its water and is of the consistency of butter. For use, the preparation is mixed in small quantities with a hot aqueous solution of gelatin, to which a small quantity of alcohol has been added. In the manufacture of colored pearls the desired shade is obtained by the addition of some suitable coal-tar dyestuff.

ARTIFICIAL GEMS. In recent years the production of gems by artificial means has been attempted by chemists, and the literature of the manufacture of diamonds by heat is extensive; but as yet no large stones have been obtained. In 1880 Hanney, in some experiments made to produce diamonds artificially, obtained some hard particles which experts declared to be diamonds; but as the expense was five times the value of the natural stones, the process was not a commercial success. Later, by means of the electric furnace, Moissan (q.v.) not only succeeded in preparing minute diamonds, but also accomplished the synthesis of other gems by means of the high temperatures obtained by him. Sainte-Claire Deville and Caron, in 1858, described various processes by which they obtained small crystals of white and green corundum, rubies, sapphires, etc. Frémy and Feil, in 1877, were able to produce crystals that possessed the form of natural rubies and easily scratched topaz. By adding cobalt oxide before fusion, they obtained sapphires. In 1888 Frémy and Verneuil announced their successful preparation of artificial rubies by heating to redness a mixture of barium fluoride and alumina containing a trace of potas-

sium bichromate. Ebelmen, from the mixtures of oxides of aluminum and glucinum, using boracic acid as a solvent, succeeded in obtaining (at a very high temperature) artificial spinels and chrysoberyls. Hydrofluoric acid and silicon fluoride have also been used to induce combination between silica and other oxides. By this method topaz, which is a complex fluosilicate, has been made by the action of fluoride of silicon upon alumina. More recently the manufacture of artificial rubies has been successfully accomplished in Paris on a large scale, and gems having a pure transparency, with the rich red color of the pigeon's-blood ruby, have been produced and placed on the market. Crystals of over 40 carats in weight, valued as high as \$25,000 each, are said to have been recovered.

The electric furnace has yielded another product which, while strictly speaking it is not a synthetic gem, is nevertheless essentially an artificial gem. Imperfect rubies, chips, and small stones are fused in the furnace, together with a small amount of coloring oxide, such as that of chromium. The fused product is then cut and polished, and the result is a gem of good color and fairly large size. Emeralds and other colored stones have been made by this method, and so important has the industry become that the courts have been called upon to decide what constitutes an artificial gem. A decision which has applied to the rubies was obtained, in which it was decided that that word applied only to the red-colored corundum or anhydrous aluminum oxide that also occurs already formed in nature.

Consult: De Fontenelle and Malepeyre, *Glass, Artificial Stones, etc.* (Paris, 1854); Streeter, *Precious Stones and Gems* (London, 1879); Tassin, *Descriptive Catalogue of the Collections of Gems in the United States National Museum* (Washington, 1902).

GEMS'BOK (Dutch, chamois-buck). A large South and West African antelope (*Oryx gazella*), representing a group which contains the beisa (q.v.) and similar straight-horned antelopes of the North. (See Oryx.) It is a heavy,

HEAD AND HORNS OF GEMSBOCK.

stout animal, about four feet high, with rough, reversed hair on the neck and along the ridge of the back; large, pointed ears; and almost perfectly straight horns, sometimes over a yard long, in the plane of the forehead, little diverging, and ringed at the base. The colors are harshly contrasted, dark rusty-gray above, and white on the under parts, separated by a broad dark-brown or black band; the head white, with black traverse bands; the thighs black, and the legs white. The hoofs are remarkably long, and well adapted to the rocky mountainous districts which the animal frequents. It will thrive in utterly waterless and apparently barren deserts; goes about in pairs or small bands, and is by no means fleet of foot; but in lieu of speed for

escape is able to defend itself against even the lion with its spear-like horns, which are sought by the negroes to be converted into weapons. Its flesh and hide are highly esteemed.

The 'bastard gemsbok' of the Boers is the roan antelope (q.v.).

GEMS'HORN (Ger., chamois-horn). A well-known stop in German organs, the pipes of which are made of tin, and are conically shaped, being much narrower at the open end; while at the mouth (the broad end) there are ears on each to regulate the tuning. It has a peculiarly pleasing tone, of a different character from either an open cylinder pipe or a stopped pipe. The pitch of the gemshorn is generally an 8-foot tone, sometimes it is a 4-foot or a 2-foot, and in the pedal organ a 16-foot.

GEMÜNDER, ge-mūn'dēr, AUGUST (1814-95). A naturalized American violin-maker, born at Ingelfingen, Württemberg. With his brother George (q.v.) he learned his trade under the famous Baptiste Vuillaume, of Paris, but in 1846 he settled at Springfield, Mass., and established himself in business there. He speedily earned an international reputation, and in 1860 moved his business to New York. Several famous violinists used his instruments; but perhaps his greatest masterpiece was the celebrated copy of Sarasate's Amati, which that artist pronounced equal to the original. He died in New York.

GEMÜNDER, GEORGE (1816-99). A brother of August Gemünder (q.v.), born at Ingelfingen. He worked at violin-making in Germany and France, followed August to the New World in 1847, and settled in New York in 1852. His instruments took the first prize at the great English Exhibition of 1851. In 1873 his copy of a Guarnerius was pronounced by the jury of awards at the Vienna Exhibition to be a genuine instrument. He claimed as the secret of his success that he did not use chemicals in the preparation of his wood, but instead used it in its natural condition. His instruments were even finer than his brother's, and were beyond question the best violins ever made in the United States. He was the author of a book entitled *George Gemünder's Progress in Violin-Making* (Astoria, N. Y., 1881). His death occurred in New York.

GENALA, jā-nā'lā, FRANCESCO (1843-93). An Italian legislator, born at Soresina, Province of Cremona. He took a conspicuous part in regulating the finances of the city of Florence, and in 1883 was appointed Minister of Public Works in the Depretis Cabinet, to which position he was reappointed, under Giolitti, in 1892. The leasing of the Italian railroads to three great corporations in 1885 was due chiefly to him.

GENAZZANO, jā'nāt-sā'nō. A town in the Sabine Mountains, in Central Italy, 27 miles east of Rome, famous for the Chapel of the Madonna del Buon Consiglio. It is visited by crowds of pilgrims. Population of commune, in 1901, 4121.

GENDARMES, zhān'dārm' (Fr., men at arms). From 1445 to the time of the French Revolution, the most distinguished cavalry corps in the service of the French kings, to whom they formed a sort of bodyguard. Under existing arrangements, the gendarmes constitute a military police, and comprise both cavalry and infantry. The force consists principally of soldiers

taken from the army, generally on account of intelligence and good conduct. The men receive much higher pay than the rest of the army, of which, however, the corps is a part, liable in cases of emergency to be sent on active service. The gendarmes amount to about 21,000 men, and are intrusted with the execution of many of the most delicate details of government. They form a national police, embracing all the departments and colonies of France. In war they are employed for the maintenance of order in camp and on the march. Germany and Russia likewise possess a force of similar nature, combining the functions of soldier and national police officer. These are mostly employed on patrol duty in rural districts and on the border.

GENDER (OF. *gendre*, *genre*, Fr. *genre*, from Lat. *genus*, race, from *gignere*, to beget, Gk. *γίγνεται*, *gignesthai*, Skt. *jan*, to be born). A grammatical category, commonly regarded as indicating the sex of a noun. Gender is either grammatical or natural. In the former case there is no necessary coincidence of sex and gender. Thus Latin *femina*, woman, is both naturally and grammatically feminine, but Latin *mensa*, table, is naturally sexless and grammatically feminine. In natural gender, on the other hand, sex and gender must agree, as in English *man* (masculine), *woman* (feminine), *thing* (neuter). In the Indo-Germanic languages (q.v.) the inflectional group, as Greek, Russian, or German, have grammatical gender, while the analytic group, as English or Persian, have only natural gender, except in a few apparent instances, as English *ship*. Gender in all Indo-Germanic tongues is divided into three classes, masculine, feminine, and neuter. It was long supposed, according to a theory promulgated by Jakob Grimm (q.v.), that grammatical gender depended upon personification; that, in other words, a noun had sex ascribed to it on account of some attribute either real or fancied. Thus Latin *sol*, sun, was masculine because of its burning rays and the energy which it imparts to all human activity; *luna*, moon, was feminine as being gentle and calmly beneficent; *mare*, sea, was neuter from its obvious sexlessness. The faults of this theory in a wider study of language, for instance, the fact that *Sonne*, sun, is feminine in German, while *Mond*, moon, is masculine, led to a rejection of Grimm's theory, and the substitution of entirely new hypotheses. A study of gender, however, as of all primary linguistic categories, is incomplete if the Indo-Germanic languages alone are considered. Natural gender, the application of which is too obvious to require exemplification, is found in practically all languages, even the most primitive, many of which have no grammatical gender, as in Dinka Negro (*tine džonkor*, female horse, *muor adžid*, bull fowl), Melanesian and Polynesian (as in the dialect of the island of Viti, *a toa tainang*, of fowl male, *a toa alewa*, of fowl female), or Annamese (*kon-trai*, son-child, *kon-gai*, daughter-child). Other languages have a division into animate and inanimate, as Algonquin, Iroquois, and Cherokee, or the Dravidian high-caste and low-caste genders. More elaborate schemes are also found, as in certain languages of the North Caucasian group, which have six genders—for animate and inanimate, rational and irrational, masculine and feminine. (See GEOR-

GIAN OR IBERIAN LANGUAGE.) It seems safe, therefore, to conclude, on such analogies as these, that the most primitive form of the Pre-Indo-Germanic languages also had a natural rather than a grammatical gender. The question then arises as to the origin of grammatical gender. This problem, one of the most difficult of all those presented by linguistic science, has been answered in several ways; and all theories concerning it must be regarded, in the present state of linguistic knowledge, as merely tentative. Of the two most plausible, the first is the one defended by Brugmann (q.v.). The masculine-neuter must be set over against the feminine. In this all scholars of prominence are agreed. It is then to be noted that the nominative plural neuter and the so-called nominative singular feminine are identical in their termination, as Vedic Sanskrit *yugā*, yokes (Classical Sanskrit *yugani*), and *sēnā*, army (compare, with shortened final syllable, Greek *δῶρα*, gifts, with *χώρα*, land; Latin *oppida*, towns, with *animā*, soul, while Oscan and Old Church Slavic retain representatives of original *-ā* in the neuter plural, as Oscan *prūftū*, things proved, beside *viū*, way, and Old Church Slavic *roucha*, garments, beside *noga*, foot). Again, in Greek and Avesta a neuter plural subject takes a singular root, as *rā olkhuara ērezer*, the buildings fell, *yā varasaitē*, what things shall be done. In view of facts like these, the feminine singular is regarded as a collective, originally identical with the neuter plural. This has an interesting and suggestive analogue in Arabic, where the so-called broken plural, which is preeminently a collective word, takes its verb in the feminine singular, as *jā'a rajulun*, there came a man, but *jā'at riḡalun*, there came men. The termination of the broken plural is also often identical with that of the feminine singular, as *ikhwatun*, brothers, from *akhun*, brother (cf. *malikatum*, queen, from *malikun*, king). This theory, however, is not altogether adequate, and it has been supplemented by such scholars as Wheeler and Jacobi. They have pointed out the influence of the pronoun, whose declension was perhaps once entirely unrelated to that of the noun, upon the noun. Here the origin of grammatical gender seems to lie. It is true that the feminine singular was originally a collective noun, merely differentiated in meaning from the neuter plural, and that it was occasionally concretized to denote a female being, as in the case of the Greek *γυνή*, woman, Beotian *βάρη*, Sanskrit *gnā* (originally 'bearings' in the discrete, then 'bearing' in the abstract, finally 'she who bears' in the concrete). From such instances many words in *-ā* were termed feminine by analogy (q.v.). On the other hand, the pronoun in all languages expresses natural, not grammatical, gender, denoting male, female, and sexless. The feminine singular of the pronoun may have terminated originally in *-ā*, like its neuter plural, but independently of it, differing herein from the noun, as already stated. On account of the true feminine termination of the pronoun, the collective noun, which chanced to coincide with it in form, was regarded as feminine, and by analogical extension a numerous class of 'feminines,' some female and others sexless, was evolved. In this way the so-called feminine gender probably arose. The so-called masculine gender was similar in development. The neuter originally dif-

ferred from the masculine only in the nominative singular (as Latin *servus*, *servum*, slave, but *templum*, *templum*, temple), and its plural, except for the collective form in *-a* (the so-called nominative and accusative, as *templa*, temples), was merely an extension analogical with the masculine. The neuter seems to have been a passive noun, while the masculine was active, and it was thus originally identical with the so-called accusative or objective case (cf. Latin *servus currit*, the slave runs, but *servum cædit*, he kills the slave, with *templum cadit*, the temple falls, and *templum eruit*, he pulls down the temple). The principle of personification, on which Grimm laid such emphasis, was developed after, not before, grammatical gender. The original independence of natural gender is seen from the so-called epicene nouns, which have but one grammatical gender for both natural ones, as Latin *lepus*, hare (masculine), *vulpes*, fox (feminine), German *Hase*, hare (masculine), *Mause*, mouse (feminine), which leads to such apparent incongruities as *vulpes mascula*, male fox, *weiblicher Hase*, female hare. With the decay of the inflection grammatical gender is gradually disappearing, and the more primitive system of natural gender, so long superseded, is resuming its original position, so that the classification of nouns as masculine, feminine, or neuter is being based more and more on sex, and not gender.

In English, where grammatical gender does not exist, natural gender is indicated in three ways. The first and most common method is by distinctive terminations for the feminine, especially by *-ess* (of Romance origin), as *emperor*, *empress*; *lion*, *lioness*; and also by *-ix* (of Latin origin), as *executor*, *executrix*; *-ine* (of Latin-Romance origin, primarily an adjectival formation of relation, as Latin *regina*, queen, literally kingly woman), as *hero*, *heroine*; and other more sporadic terminations. The second method is by prefixing words denoting the sex, as *he-goat*, *she-goat*; *man servant*, *maid servant*, etc. The third method is the use of different words for the two sexes, as *king*, *queen*; *boy*, *girl*; *stag*, *hind*, and the like.

Consult: Delbrück, *Vergleichende Syntax der indogermanischen Sprachen*, i. (Strassburg, 1893); Brugmann, *Nature and Origin of the Noun Genders in the Indo-European Languages* (New York, 1897); Jacobi, *Compositum und Nebensatz* (Bonn, 1897); Wheeler, "Origin of Grammatical Gender," in *Journal of Germanic Philology*, ii. (Bloomington, Ind., 1898); Paul, *Prinzipien der Sprachgeschichte* (3d ed., Halle, 1898).

In the highly inflected languages, there are certain terminations distinctive of the different genders. It is probable, indeed, that originally every noun, substantive or adjective, had a suffix indicative of the sex, real or imaginary, of the object designated, although, like other inflections (q.v.), these suffixes of gender were in process of time mutilated beyond recognition, or in many cases altogether worn off. The terminations most characteristic of the three genders in Latin are masc. *us*; fem. *a*; neut. *um*; corresponding to the Greek *os*, *ē*, *on*. In a great majority of the adjectives in both those languages, the genders are thus marked. In English the gender of a noun affects only the personal pronoun substituted for it; in most other languages the ad-

jectives (including the articles) have different forms for the several genders—a useless complication, in the case of modern languages at least. See ADJECTIVE.

Of the terminations distinctive of gender observable in modern English, some are purely Latin, as in *executor*, *executrix*; the feminine *-ess*, as in *countess*, is borrowed from the French, and is also of classical origin. The prevalent feminine termination in German is *-in*, as in *Tänzerin*, a female dancer (Fr. *danseuse*); of this there are two instances in English, in the provincial *carlin*, the fem. of *carl*, and *vixen* = Ger. *Füchsin*, a female fox. This affix was already in use in Latin, as in *regina*, a queen (*reg(s)*, a king); and in this form it is used in Europe generally to feminize proper names; e.g. *Georgina*, *Wilhelmina*, *Caroline*.

In such pairs as *son—daughter*; *man—maid*; *horse—mare*; *cock—hen*, there is no etymological relation between the words; they are from distinct roots. But with regard to *hen*, e.g. the Anglo-Saxon had the two forms, *han* for the male, and *hen* for the female; and *mare* was originally applicable to both sexes, as *horse* still is (Fr. *maréchal*, originally an officer who had charge of the horses). The oldest known form of the Teutonic speech, the Gothic, had the two words *magus*, son, and *magaths*, daughter, both from the root *mag*, to beget, or to make. *Magaths* has become in Ger. *Magd*, in Eng. *maid*; *magus* has been lost in the Teutonic tongues, but it is represented by the Celtic *mac* (son), evidently from the same root. *King*, *queen*, were in Sans. *ganika*, father, and *goni*, mother, both from the root *gan*, to generate, produce. The masculine form appears in O. Ger. as *chunig*, in modern Ger. *könig*, in Eng. *king*; the feminine was represented by the Greek *γυνή*, a woman, as well as the Saxon *cwen*, Sw. *quinna*, Old Eng. *quene* or *quean* applied to a woman generally, and the modern *qucen*, the chief woman of the land. See GRAMMAR.

GENDRON, zhān'drōn', AUGUSTE (1818-81). A French painter, born in Paris. He was a pupil of Delaroche, and also studied in Italy. His most popular works are "The Nereids" and "The Willis," both fairy scenes depicted with much grace and action. They are frequently engraved. Less popular, but technically as good, are "Sunday at Florence in the Fifteenth Century" and "The Foolish Virgins." He also painted some decorations in the Louvre.

GENEALOGY (Lat. *genealogia*, Gk. *γενεαλογία*, pedigree, from *γενεαλόγος*, *genealogos*, one who draws up a pedigree, from *γενεά*, *genea*, family + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The science whereby the history of the origin and descent of a family or race may be ascertained. In recent years there has been a growing interest, especially in the United States, in matters pertaining to genealogical research, and although in itself it is not of sufficient importance to rank as an independent science, it forms a very important part of history. For the popular mind it has but small attraction, its literature being for the most part shut up in the archives of historical libraries, but that natural instinct which prompts one to love the place of his birth and the chief circumstances in the lives of his progenitors is gradually attracting the attention of the intelligent public.

From the earliest times, genealogy has always formed the basis of all true history. In the ancient records of Assyria, Egypt, and Arabia, the lineage of an individual was the thread upon which were strung the stirring events of centuries, and so important a place did its preservation occupy among the Jewish people that it was established as a positive obligation upon every Levite of the Temple. Nor was this genealogical form of history peculiar to Semitic races. The first Greek records were those of ancestry. The progress of civilization in States, and in particular the institution of corporations and guilds in the towns, afforded a wider scope for genealogy. But the absence of criticism and the desire to flatter the great were the causes of introducing the most ridiculous fables into genealogy. Ancestors were fabricated in the most impudently false manner, and families carried back in an unbroken line, not only to the age of Charlemagne, but even, in many cases, to the heroes of the Trojan War. The fact, however, is, that scarcely any family, however distinguished, can trace its ancestors even to the middle of the eleventh century.

GENÉE, zhe-ná', RICHARD (1823-95). A German opera composer and librettist, born at Danzig. Upon abandoning medicine for music, he became a pupil of Stahlknecht, in Berlin. He held many important appointments, principally as orchestra leader, in the following towns and cities: Riga, Reval, Cologne, Aix-la-Chapelle, Danzig, Düsseldorf, Mainz, Schwerin, Amsterdam, Prague, and Vienna. His operettas had considerable local success, but are little known abroad. They are as follows: *Der Geiger von Tirol* (1857); *Der Musikfeind*, *Die Generalprobe*, *Rosina*, *Am Runenstein* (1868); *Der Seekadett* (1876); *Der schwarze Prinz*, *Im Wunderlande der Pyramiden*, *Die letzten Mohikaner*, *Die Piraten*, *Nisida*, *Zwillinge*, *Die Dreizehn* (1887). He also wrote some of his own librettos, and others for Millöcker, Strauss, and Suppé. His death occurred at Baden, near Vienna.

GENÉE, RUDOLF (1824—). A German author and Shakespearean reader. He was born in Berlin, a son of Richard Genée, formerly stage-manager of the Königsstädtisches Theatre in that city. He at first devoted himself to wood-carving under Professor Gubitz, but later wrote several successful plays, of which the comedy entitled *Das Wunder*, performed at the Court Theatre, Berlin, in 1854, was particularly successful. For a time, as editor of the *Danziger Zeitung* and of the *Coburger Zeitung* (1861-64), he published his *Frauenkranz*, a series of readings on dramatic female figures in history. It was at Coburg that he began his public readings of Shakespeare, which he continued with marked success at Berlin, Dresden, Vienna, and other cities of Germany. His principal literary productions include: *Geschichte der Shakespeare'schen Dramen in Deutschland* (1870); *Shakespeares Leben und Werke* (2d ed. 1874); *Hundert Jahre des königlichen Schauspiels in Berlin* (1886); *Marienburg*, a novel (2d ed. 1886); *Bismarckjade* (1891); and *Zeiten und Menschen* (1897).

GENELLI, jâ-nel'le, BONAVENTURA (1798-1868). A German painter and designer, born in Berlin. He was the son of Janus Genelli, a

landscape painter. Bonaventura was a painter of biblical and mythological subjects, but more celebrated for his ingenious designs. He had the imagination of a poet, but in working rarely soared beyond contour and silhouettes. Everything was sacrificed to line. He essayed much in water-color and oil, but failed to express himself with success in those mediums. He was a pupil of the Berlin Academy, and also spent ten years in Rome, where he was especially influenced by Carstens, and also by Thorwaldsen. In 1836 he settled at Munich, where he lived in poverty, but executed his principal works. In 1859 he removed to Weimar, by invitation of the Grand Duke. Here his material cares ended, but also his important work. Among his best designs are the copper prints of the "Life of a Profligate" and the "Witch." In the Leipzig Museum is his water-color "Triumph of Bacchus and Ariadne." Among his numerous works are: "Jason and Medea Stealing the Golden Fleece;" "Hercules Playing the Lyre;" "Joseph and Potiphar's Wife;" "Abraham and the Angels." He died in Weimar. Consult: Pecht, *Deutsche Künstler des 19. Jahrhunderts* (2d series, Nördlingen, 1879); Muther, *History of Modern Painting* (London, 1896).

GENERAL (Lat. *generalis*, general, belonging to a race, from *genus*, family, from *gignere*, to beget). A military rank and title denoting an officer holding a general command, or a rank and grade equivalent thereto. In modern armies, practically every officer commanding an organization of troops larger than a regiment is a general officer. In the United States, the rank has the following grades: brigadier-general, major-general, and one lieutenant-general in supreme active command of the army as a whole. Officers of other ranks are sometimes given the temporary and relative rank of general, as inspector-general, judge advocate-general, quartermaster-general, etc. In European armies the rank of general is a step higher than that of lieutenant-general, and is the next in importance to field-marshal in England, and to marshal in the armies of Continental Europe. See RANK AND COMMAND.

The title is also applied in the Roman Catholic Church to the superior head, under the Pope, of a religious order. The governing authorities of the monastic orders may be arranged in three classes: (1) The superiors of individual convents or communities, called in different orders by the various names of abbot, prior, rector, guardian, etc.; (2) the provincials, who have authority over all the convents of an entire province, the provinces, in the monastic sense of the word, being usually coincident as to local limits with the several kingdoms in which the order is established; (3) the general, to whom not only each member of the order, but all the various officials of every rank, are absolutely subject. The general is usually elected by the general chapter of the order, which, in the majority of orders, consists properly of the provincials; with whom, however, are commonly associated the heads of the more important monasteries, as also the superiors of certain subdivisions of provinces. The office of general in most orders is held for three years. In that of the Jesuits it is for life: but in all, the election of the general chapter must be confirmed by the Pope. In most orders,

too, there is assigned to the general a consultor (*admonitor*) or associate (*socius*), who, however, is only entitled to advise, and has no authority to control the superior. The general also is supposed to consult with and to receive reports from the various local superiors. He sends, if necessary, a visitor to inquire into particular abuses, or to report upon such controversies as may arise, and he holds a general chapter of the order at stated times, which differ according to the usage of the several orders. The general is exempt from episcopal jurisdiction, being subject to the immediate jurisdiction of the Pope. He lives in Rome, where he has certain privileges, the most important being the right to sit and vote with the bishops in a general Church council.

GENERAL ASSEMBLY. See PRESBYTERIANISM.

GENERAL AVERAGE. See AVERAGE, IN MARITIME LAW.

GENERAL BAPTISTS. See BAPTISTS.

GENERAL CONFERENCE MENNONITES. See MENNONITES.

GENERALIFE, HÀ-NÀ-RÁ-L'É-FÁ (Ar. *jannat-al-drif*, Garden of the Architect). A summer palace of the Moorish kings, at Granada, east of the Alhambra, now the property of the Marquis of Campotejar. The extensive grounds are traversed by the waters of the Darro. The court contains cypresses dating from the thirteenth century, and communicates with a raised garden and belvedere, which affords an extensive view.

GENERAL ISSUE. In the English law of pleading, the form in which the defendant traverses or meets with a simple denial the whole allegation, or the principal fact on which the plaintiff relies in his declaration. Thus, in actions founded on wrongs the general issue is 'not guilty'; in actions of debt, that the defendant never was indebted; in actions on a deed or bond, *non est factum*, i.e. it is not the deed of the defendant. Under this issue, the defendant may prove that he never executed the deed, but not that it is bad in point of law.

In *criminal proceedings* the general issue is 'not guilty,' by which plea, without further form, every person not having the privilege of peerage, upon being arraigned upon any indictment for treason, felony, or piracy, is deemed to have put himself upon the country for trial. Where a prisoner refuses to plead, a plea of not guilty may be entered for him, 7 and 8 Geo. IV., c. 28. Under the plea of not guilty, the prisoner is entitled to give in evidence not only everything which negatives the charge, but also all matter of excuse or justification.

This form of plea survives and retains its principal characteristics even under the reformed systems of pleading which, in England and many of the United States, have supplanted the common-law system. See PLEA; PLEADING.

GENERALIZATION. See INDUCTION.

GENERAL LIEN. See LIEN, GENERAL.

GENERAL PAUSE. In music, a pause for all instruments or parts during a composition. The name is especially applied to rests of considerable duration, when so introduced as to break the rhythm and produce a striking effect. A 'hold' \odot over the rest-mark of a general pause indicates that its length is indeterminate,

VOL. VIII.—34.

and so destroys the rhythmic value of the rest by suspending the counts or beats. See HOLD.

GENERAL SERVICE AND STAFF COLLEGE. A military school for the further technical and professional education of military officers of the United States Army, situated at Fort Leavenworth, Kan. Subsequent to the declaration of war with Spain in 1898, there were appointed in the line of the army 1542 lieutenants, in addition to those appointed from the Military Academy. Of this number 616 had previously served as officers of volunteers; 414 were appointed from the ranks of the regular and volunteer regiments; and 512 were appointed from civil life. At the conclusion of hostilities Congress made provision for the reopening of the army schools for commissioned officers, which had of necessity been closed during the war, and at the same time enlarged and developed the Fort Leavenworth School into a general service and staff college. Every effort was put forth to bring the standard of technical and professional proficiency of the officers above mentioned up to that of the West Point graduate. The staff of the college detailed to assist the commandant, who is also the commanding officer of the post of Fort Leavenworth, consists of an assistant commandant, and the instructors in charge of departments. The instructors are detailed by the War Department, and there are four departments—tactics, engineering, military law, military sanitation and hygiene. The course of instruction covers one year of two terms, the first term beginning on the 1st of September, unless that date fall on Saturday or Sunday, in which case the course begins on the following Monday. It ends on the 21st of December, concluding with the semi-annual examinations. The second term embraces the period from the 4th of January to the 30th of June following, concluding with the final examinations. The students are all graded in one class, which is divided into sections of convenient size and adaptation. The staff of the college note the names of students who have shown marked proficiency in any branch, with a view to the student's professional employment in that particular branch. See MILITARY EDUCATION.

GENERAL SHIP. A ship which has been advertised by the owners to take goods from a particular port at a particular time, and which is not under any special contract to particular merchants. The owners, in this case, engage separately with each merchant who applies to them to convey his goods to the ship's destination. The contract between the owners, or the master acting in their behalf, and the proprietors of the goods, may in the case of general ship be established by parole evidence, and, indeed, there is rarely any other writing on the subject beyond the advertisement and the bill of lading. In a general ship, the master being intrusted by the owners with full power to contract for and take in goods, no agreement for freight which any one may have made with the owners, independently of him, will be effectual to secure room in the vessel. All such agreements must be intimated to the master, or those acting for him on board, before he has engaged freight for the whole vessel. By such intimation, a preference will be secured over the merchant who brings his goods to the ship's side on chance. If the owners of a

general ship have advertised her as bound for a particular port, they must give specific notice to every person who may ship goods on board of any alteration in her destination, and they will be liable for the consequences of neglecting to do so.

GENERAL STAFF. An organization of superior or selected officers, appointed to the staff of a general officer commanding, whose duties may be generally described as converting the ideas of their chief into orders, not only by conveying them to the troops, but by working out all necessary matters of detail. The general staff organization was originally peculiar to Germany, but is now being generally adopted throughout Continental Europe. The great general staff, *Grosser Generalstab*, as distinct from *Generalstab*, in the German Army of to-day, is a body of general staff officers who are not attached to any corps, intrusted with the duties of drawing up and preparing schemes for the strategical concentration of the army in certain particular directions by road and rail, with collecting and estimating the strength, etc., of the various European armies, with the study of theatres of war, and with the preparation of military maps. The work of the greater general staff is done under the immediate supervision of the chief of the general staff. See **STAFF**; and **ARMY ORGANIZATION**.

GENERAL THEOLOGICAL SEMINARY.

The leading seminary in the United States of the Protestant Episcopal Church. The seminary was established by order of the General Convention in 1817, and instruction was begun in New York City in 1819. In 1820 the seminary was removed to New Haven, but was reestablished in New York in 1822 on a part of the plot of land given in 1819 by Clement C. Moore. That land now forms the entire area between Twentieth and Twenty-first streets, Ninth Avenue and the North River. For many years the seminary suffered severely from financial deficiencies, and it was not until the administration of Eugene A. Hoffman, dean of the school from 1878 until his death in 1902, that it was placed upon an independent basis. Dean Hoffman's gifts alone amounted to \$1,000,000 or over, while in 1902 the total resources of the seminary were not less than \$4,000,000. The theological course proper extends over three years, and there is also a post-graduate course. The degrees of D.D. and B.D. are conferred; the former is both a higher academic and an honorary degree, while the latter is usually conferred in course on students holding prior academic degrees, who have completed the regular course in high standing. The control of the seminary is vested in a board of trustees composed of the bishops of the Church, twenty-five members elected by the General Convention, and certain other members elected by the various dioceses, principally that of New York. The student attendance is approximately 150. No tuition fee is charged, and many prizes of value are offered. Within twenty-five years the student body has largely increased, and extensive buildings have been erected, including the library, Hoffman Hall, the Chapel of the Good Shepherd, and nine dormitories.

GENERATION. See **REPRODUCTION**.

GENERATION (Lat. *generatio*, from *generare*, to beget, from *genus*, family). In mathematics, the formation of a magnitude or geometric figure by the movement of another magnitude or figure. E.g. a moving point describes a line; a moving line, in general, describes a surface; and a moving surface, in general, describes a geometric solid. An angle is said to be generated by revolving a line about a fixed point from an initial position. A figure called the generatrix, moving according to a fixed law, generates a particular figure called the generant; e.g. a straight line moving so as constantly to pass through a given curve, and to remain parallel to its original position, generates a cylindrical surface. The given curve is called the directrix. The volume of a ring generated by revolving a polygon about an axis not cutting the polygon is equal to the area of the polygon multiplied by the length of the path of the mean centre of the polygon. This proposition is known as Pappus's or Guldin's theorem.

GENERATION, ETERNAL. See **TRINITY, DOCTRINE OF THE**.

GENERATIONS, ALTERNATION OF. See **ALTERNATION OF GENERATIONS**.

GENERATIVE CELL. A very general term, but technically applied in seed-plants to the first cell which appears in the sperm series. In gymnosperms (pines and their allies) it is the cell which divides to form the stalk and body cells, the latter of which subsequently divides to form the male cells. In angiosperms (true flowering plants) it is a cell which is formed by the first division of the nucleus of the pollen-grain, and in turn by division immediately forms the male cells. See **SPERMATOPHYTE**.

GENERATRIX. See **GENERATION**.

GENESEE (jĕn'e-sĕ') RIVER (American Indian, pleasant valley). A stream rising in Potter County, Pa., and flowing northwest through New York, emptying into Lake Ontario, seven miles north of Rochester (Map: New York, C 2). It is about 135 miles long, courses through a very beautiful region, and is navigable for five miles by lake vessels. Near Portage it passes over three falls respectively 65, 90, and 110 feet high, furnishing great water-power; and in the city of Rochester there is a perpendicular fall of nearly 100 feet.

GENESEE SHALE. See **DEVONIAN SYSTEM**.

GEN'ESE'O. A village and the county-seat of Livingston County, N. Y., 30 miles south of Rochester, on the Genesee River, and on the Erie Railroad (Map: New York, C 3). It is the seat of a State normal school, and has the Wadsworth Public Library with about 13,000 volumes and an interesting collection of curios belonging to the County Historical Society. The village is in an agricultural region, and manufactures flour, gloves and mittens, machine-shop products, lumber, etc. Population, in 1890, 2286; in 1900, 2400.

GENESIS (Lat., from Gk. *γενεσις*, *genesis*, origin, from *γενεσθαι*, *gignesthai*, to become), **BOOK OF**, or more fully **GENESIS KOSMOU** (Gk. *γενεσις κόσμου*, origin, generation of the world). The name given by the Septuagint to the opening book of the Bible. In the Hebrew canon it is called *B'reshith* ('in beginning'), from the

initial word; in the Talmud it is sometimes referred to as 'the Book of Creation,' or 'the Book of Abraham, Isaac, and Jacob.' Its Masoretic division into 50 chapters, followed in the English Bible, or into 12 large and 43 small encyclical sections (*sedarim parashioth*), does not correspond to any logical division of the subject matter. The book seems of itself to fall most naturally into two totally distinct parts. The first extends from the beginning to the call of Abraham (chs. i.-xi.), and embraces the account of the creation; the fall; the generations between Adam and Noah, together with their religion, arts, settlements, and genealogy; the Deluge; the re-peopling of the earth; the Tower of Babel; the dispersion of the human race; and the generations between Noah and Abraham, thus forming an introduction to the second part (chs. xii.-l.), or the history of the patriarchs (Abraham, Lot, Ishmael, Isaac, Jacob, Esau, and Joseph), the whole concluding with the settlement of Jacob's family in Egypt. Another division seems indicated by the inscription *Toledoth* (origins, generations), which occurs ten times in the course of the book, introducing at each repetition a new cycle of the narrative, and which would thus split the whole (from ii. 4) into ten distinct sections of disproportionate length.

While the Jewish canon makes Genesis the first of a series of five books, which it comprises under the term *Torah* ('law'), according to the modern critical view Genesis is part of a comprehensive Hebrew history, beginning with creation and extending to the destruction of Jerusalem by Nebuchadnezzar, and comprising, therefore, besides the Pentateuch, the four books of Joshua, Judges, Samuel, and Kings. The book of Genesis, like the other books of the series, is held to be of a composite character. There are two great compilations underlying it, the one—the priestly history—forming a setting to the priestly code (see PENTATEUCH); the other a purely historical compilation, written, however, from the point of view of the prophets and commonly designated as JE. (See ELOHIST AND YAHWIST.) Of these, the latter, which again represents a combination of two documents—a Yahwistic and an Elohistic history—is the older, being the work of a Judean in the seventh century B.C., whereas the priestly history is post-exilic. In the combination of these two works, additions and changes have been introduced by a series of redactors, which, however, do not efface the independent character of each. The older combination JE is characterized by what may be called its popular character. The old stories and legends are charmingly told, and while the prophetic point of view is never absent, there is considerable interest felt in the stories as such. The priestly history, on the other hand, shows throughout the result of study and most decided theological and scholastic proclivities. The creation narrative is told as an illustration of the dogma of ethical monotheism, and the goal of God's work in creating the world is the establishment of the Sabbath as a day of rest; and so throughout, everything hinges upon the ritual, and the stories are made to lead up in some way to some definite point of the divine law.

This modern theory as to the composition of Genesis satisfactorily disposes of the difficulties which the old exegesis encountered. It explains the frequent double versions of one and the same

tale, the numerous inconsistencies in the statements found in the book itself, as well as the traces of events, such as the establishment of the kingdom, the erection of the Temple at Jerusalem, and even the Exile, which belong many centuries subsequent to the days of Moses, who became in tradition the author of the entire Pentateuch.

BIBLIOGRAPHY. Of the numerous commentaries on Genesis, those of Gunkel, Holzinger, Dillmann, Delitzsch, Ball, and Strack are to be recommended, as well as the introductions to the Old Testament by Kuenen, Driver, Cornill, Bleek-Wellhausen. Consult, also: Kalisch, *Commentary of Genesis* (London, 1859); Dods, *The Book of Genesis* (New York, 1888); Candlish, *The Book of Genesis* (London, 1884); Halévy, *Recherches bibliques* (Paris, 1895); Spurrell, *Notes on the Text of the Book of Genesis* (Oxford, 1896); Bacon, *The Genesis of Genesis* (New York, 1892); Fripp, *The Composition of the Book of Genesis* (London, 1892); Schurmann, *Die Wellhausensche Pentateuchtheorie dargestellt und geprüft* (Karlsruhe, 1892); Green, *The Unity of the Book of Genesis* (New York, 1896). For the meaning of the stories included in Genesis, see CREATION; ADAM; EVE; CAIN; ABEL; BABEL, TOWER OF; EDEN; DELUGE; NOAH; ABRAHAM; ISAAC; JACOB; JOSEPH.

GENET, jèn'èt, or **GENETTE** (Fr. *genette*, from Sp. *gineta*, from Ar. *jarnait*, genet). One of several species of small animals forming the genus *Genetta* of the family Viverridæ, and nearly allied to the true civets (q.v.), but having only a rudimentary odoriferous pouch, and claws perfectly retractile, as in the cats. The approximation to that family also appears in the vertical contraction of the pupil of the eye. The species are numerous; smaller and more slender animals than the civets, mostly natives of Africa and Southwestern Asia. One, the common genet (*Genetta vulgaris*), is found in the south of Europe, Western Asia, and Northern Africa. It is gray, with small round or oblong black or brown spots; the tail, which is as long as the body, ringed with black and white. It frequents the banks of brooks. Its fur is a considerable article of commerce. It is easily domesticated, and is kept in houses in Constantinople to catch mice. Of the other species two are South and East African, and one is restricted to West Central Africa.

The genet is sometimes met with in heraldry. There was an order of knighthood in France, which was said to have been founded by Charles Martel, called the Order of the Genet, but it has long ceased to exist.

GENET, or **GENEST**, zhá'ná', EDMOND CHARLES EDOUARD (1765-1834). A French diplomat, born at Versailles. His father was the chief of the Bureau of Correspondence of the Department of Foreign Affairs, and the youth, with the rank of captain of dragoons, was attached to the Bureau as interpreter in 1775. He early developed remarkable powers as a linguist, and at the age of twelve translated from the Swedish into French the *Histoire d'Eric XIV., roi de Suède* (1777), and *Recherches sur l'ancien peuple finnois* (1778). In 1779 and 1780 he was successively attached to the French embassies at Berlin and Vienna, and in 1781 succeeded his father in the Department of Foreign Affairs, which position he retained until 1788. In 1788 he accom-

panied the Comte de Ségur to Saint Petersburg, as secretary of the French Embassy, remaining in charge after Ségur's retirement until 1792, when he was given his passports at the demand of the Empress Catharine II. In Paris Genet allied himself to the Girondists, and in November, 1792, was named Ambassador to Holland, whence he was transferred in the following spring as 'Minister Plenipotentiary to the Congress of the United States.' His mission, it was expected, would induce the United States to declare war against Great Britain, and he came with the intention not only of accomplishing that purpose, but of raising a volunteer army to regain Louisiana from Spain and of commissioning privateers in American ports. He landed at Charleston, S. C., April 8, 1793. He was enthusiastically welcomed and fêted at Charleston and Philadelphia, and, encouraged by the expressions of sympathy and friendship for France which he heard on all sides, he immediately began to deal out commissions for privateers, and seek recruiting agents. Washington, however, by the unanimous advice of his Cabinet, had issued a proclamation of neutrality on April 22d, and on June 5th Jefferson, the Secretary of State, notified the French envoy that he must cease arming and equipping privateers in American ports. Genet replied that he was acting under the treaties of 1778, and continued to disregard Jefferson's warning. In the next few months eight privateers, commissioned by him, had, with the assistance of two French frigates, captured fifty British merchantmen, some of which had been taken within the jurisdiction of the United States. Genet asserted that these prizes could be condemned by French consuls in American ports, and demanded the right to enter the condemned goods duty free. His contention reached the height of absurdity when he declared that the United States Constitution did not give Washington the right to treat with him, and made the demand that an extra session of Congress be called for that purpose. These and subsequent imprudent criticisms and attacks upon Washington, and the continuance of his activities in fitting out privateers and raising recruits, lost him most of the allies he had at first possessed, and the arrest of two of his agents and the expulsion of the French consul at Boston were followed by a demand for his own recall, which was acceded to by the French Government in the following year. The fate of his fellow Girondists warned Genet not to return to France, and he became a naturalized American citizen, settling in New York, where he married a daughter of Governor George Clinton.

GENETHIALOGY (Gk. γενεθιαλογία, *genethialogia*, casting of nativities, from γενεθλή, *genethlē*, birthday, from γίγνεσθαι, *gignesthai*, to be born + -λογία, -logia, account, from λέγειν, *legein*, to say). A term sometimes used to describe astrology as used in calculating nativities or predicting future occurrences from the stars that preside at the birth of persons. See **ASTROLOGY**; **DIVINATION**.

GENETIC PSYCHOLOGY (from Gk. γένεσις *genesis*, origin, from γίγνεσθαι, *gignesthai*, to be born). Under this head are included all those branches of psychology which treat of the growth or development of mind, individual or social. Hence, like experimental psychology (q.v.), it is rather psychology as viewed from a particular

standpoint than a particular department of general psychology. It is customary to bracket together animal and child psychology (qq.v.) under the genetic heading; but while the child mind may be investigated as the immediate, and the animal mind as the more remote source of origin of the adult human mind, both the animal and the child may also be examined for themselves, without overt regard to their place in the evolutionary series. Ethnopsychology and social psychology, in the same way, may be treated either statically or genetically, though as a rule (especially in the discussion of the great mental products, myth, language, and custom) the genetic method is followed.

Modern science is so thoroughly dominated by the evolutionary idea that it may seem, at first thought, as if a scientific psychology must necessarily be genetic. And this is true, in the sense that the psychologist, in whatever field he may be working, must never forget the organic character of mind, the fact that our present consciousnesses are what they are by reason of the past history of mind as well as of current stimuli. Even when we attempt to analyze so apparently simple a process as perception, we are invariably referred to genesis for the explanation of certain of its features. At the same time, it would be impossible to-day to write a satisfactory genetic psychology, in the full meaning of the term. For (1) the most assured results of mental science lie in the domain of analysis, not of genesis. When we think of the development of mind, we think instinctively of the development of mental function. Now, a psychology of function tends to become a merely classificatory psychology (see **FACULTY**); and the writers who have escaped this tendency are not in agreement among themselves, some making will, and some feeling, and some an intellectual process, the root function of mind. It follows that the works on genetic psychology have a distinct personal flavor; it is as natural to speak of 'Spencer's psychology' as it is unnatural to speak of 'Kelvin's physics' or 'Liebig's chemistry.' Again, (2) while the belief is practically universal among psychologists that the human mind has grown out of the rudimentary consciousness of primitive organisms, it is still very difficult to envisage the course of development, to imagine what the primitive mind was and how—by what steps or stages, by what mechanism—it has developed. Some investigators (e.g. Romanes) write as if there were a simple superposition of function on function, faculty on faculty; others (e.g. Baldwin) give us rather a development of a motor than of a mental organism; others offer descriptions of special consciousnesses at various levels of development, without asking how the earlier become transformed and differentiated into the later.

A genetic psychology is, therefore, not so much an accomplished fact as the conscious and necessary ideal of psychological inquiry, itself the final term of a psychological development. As anatomy comes before physiology, so has the analysis of mental structure, furnished by experimental psychology, come before any accepted discrimination of mental functions.

Spencer, *Psychology* (New York, 1881); Romanes, *Mental Evolution: Man* (London, 1885); id., *Mental Evolution: Animals* (London, 1888).

GENEVA. The southwesternmost canton of Switzerland, bounded by the Canton of Vaud and Lake Geneva on the north, and by France on the east, south, and west (Map: Switzerland, A 2). Area, 108 square miles. The surface consists of low hills, watered chiefly by the Rhône. The soil is not naturally fruitful, but the careful industry of the inhabitants has rendered over 80 per cent. of the total area of the canton productive. Grain, wine, fruits, and vegetables are produced in considerable quantities, and domestic animals are raised. Industrially Geneva is one of the leading cantons of Switzerland, and is famous for its watch-manufacturing industry, which was introduced from France as early as 1587. The manufacture of music-boxes and jewelry was begun later, and at present the products of the canton include machines, mathematical instruments, and electric apparatus. The silk industry, formerly of great importance, is now in a state of decline. The commerce is greatly facilitated by the proximity to France, and the products of Geneva, especially watches, are exported to all parts of the world.

The Constitution of the canton, first adopted in 1847, and repeatedly modified, provides for a true democratic form of government. The legislative power is vested in the *Grosser Rat*, consisting of 100 elected members; the executive power, in a Council of State of 7 elected members. The referendum was introduced in 1880. Besides a number of higher and inferior courts, Geneva has also arbitration courts for the settlement of industrial disputes. Population, in 1888, 105,509; in 1900, 132,000. The inhabitants are divided about equally between Roman Catholics and Protestants, about 30 per cent. being foreigners and nearly 90 per cent. speaking French. Capital, Geneva (q.v.).

GENEVA. The capital of the Swiss canton of the same name, situated at the southwestern extremity of the Lake of Geneva, at the outlet of the river Rhône, which divides the city into two equal parts (Map: Switzerland, A 2); latitude 46° 13' N., longitude 6° 10' E. It is magnificently situated, in full view of the Alps (including Mont Blanc) and the Jura. The old city, on the left bank of the river, constitutes the business and financial quarter, and is irregularly laid out, with steep, crooked streets, except for the portion along the river, which has fine quays and broad avenues. On this side of the river is the section of the city called Eaux Vives. Nine bridges span the Rhône, one of which rests upon an islet called Rousseau's Island. On the right bank is the Quarter of Saint Gervais, which is chiefly residential, containing a great part of the laboring population. Here are also hotels for the accommodation of foreigners, who form a considerable colony in Geneva. There are numerous squares, parks, and gardens, most of them in the old city. The most notable are the Jardin Anglais, or Promenade du Lac, along the lake shore, and the Place Neuve, with the Promenade des Bastions, leading southward to the botanical gardens. The most important square in the Saint Gervais Quarter is the Place des Alpes, with a magnificent memorial cenotaph of the Duke Charles II. of Bruns-

wick, who left his fortune of \$4,000,000 to the city. Boulevards laid out on the site of the ancient walls extend around the city. The principal buildings are the Romanesque Cathedral of Saint Peter, built in the eleventh century; the sixteenth-century town hall, with the house near by in which Rousseau was born; the university (see GENEVA, UNIVERSITY OF); the Musée Fol, with archaeological collections; and the Musée Rath, an immense art collection given by the Russian General Rath to the city. Also noteworthy are the Anglican and American Episcopal churches and the new theatre. Besides the university, Geneva has the Collège de Genève, founded by Calvin in 1559; various industrial, technical, and commercial schools; academies of art and music; and a deaf and dumb institute. There are many learned and art associations, notably the Natural Science Association, the Geographical Society, and the Society of Artists.

Geneva has long been known as a manufacturing city, and especially as a clock and watch making centre. The value of the annual output of that industry averages \$4,000,000, while the output in jewelry and gold and silver ornaments rises as high as \$3,000,000 yearly. Besides these industries, the most important are enameling, diamond-cutting, and the production of music-boxes and scientific instruments. The town enjoys a favorable position for trade with France and the Mediterranean shore, exporting its own manufactures and those of the surrounding districts. It is the residence of a United States consul. The town is a railroad centre, and is traversed by horse-car lines and steam suburban railroads. The municipality's progressiveness has been particularly marked since 1847 by radical improvements throughout the city. Breakwaters, protecting the lake harbor; hydraulic works in the Rhône, supplying the city with water and furnishing power for factories; gas, electric-lighting, and power plants; markets, savings banks, industrial schools, theatre, opera house—all have been municipalized. The fire brigade, however, remains a volunteer organization. Population, in 1888, 52,043; in 1900, after the incorporation of various suburbs, 105,710.

At the time of Cæsar's campaign against the Helvetii Geneva belonged to the country of the Allobroges. It was afterwards included in the Roman *Provincia Maxima Sequanorum*, and was a place of some importance under the Burgundian kings. In the year 536 it came under the rule of the Franks, and toward the close of the ninth century became part of the new Kingdom of Transjurane Burgundy. It had been made a bishop's seat in the fifth century, and from the twelfth century continual feuds arose between the bishops and the counts of Savoy with regard to supremacy. The citizens profited by these dissensions to obtain fresh liberties and privileges for themselves. In 1531 the Genevese renewed their alliance with Fribourg and Bern, and thus Geneva became a member of the Swiss Confederation. The doctrines of the Reformation, boldly and enthusiastically preached by Guillaume Farel, met with general acceptance in Geneva. In conjunction with Bern, the citizens expelled the adherents of the dukes of Savoy—the so-called Mamelukes—from the town, and declared the bishopric vacant. In August, 1535, the Reformed religion was established by law, and in 1541 Calvin was

invited to take up his residence permanently in Geneva as public teacher of theology. It was he who chiefly impressed the stamp of rigid morality, not unalloyed with pedantry, on the minds of the citizens of Geneva, and awakened a taste for the exact sciences. The town, which had hitherto been merely a place of trade, thus acquired an important influence over the spiritual life of Europe, and became the centre of education for the Protestant youth of Great Britain, France, Germany, and Spain. In 1602 the last attempt of the dukes of Savoy to recover the town was frustrated by the energy and resolution of the citizens. During the eighteenth century Geneva was distracted by a continued feud between the aristocratic and popular parties, until in 1782 Bern, Sardinia, and, in particular, France interfered in favor of the aristocracy. The French Revolution led to a new crisis; the Government was overthrown in July, 1794, equality in the eye of the law was established, a National Convention appointed, and a Reign of Terror commenced. In 1798 Geneva with its territory was annexed to France, under the name of the Département du Léman. After the overthrow of Napoleon Geneva recovered its independence, and the Congress of Vienna increased its territory considerably. From 1841 to 1878 its history was one of political struggles between clerical, conservative, radical, and independent factions, which resulted in the separation of Church and State and the triumph of the progressive parties. Consult: Pictet de Serigny, *Genève, origine, etc.* (Geneva, 1843-47), and *Genève ressuscitée* (Geneva, 1869); Cherbuliez, *Genève, ses institutions, etc.* (Geneva, 1868); Galiffe, *Genève historique et archéologique* (Geneva, 1869); Blavignac, *Etudes sur Genève* (Geneva, 1872-74).

GENEVA. A city and the county-seat of Kane County, Ill., 35 miles west of Chicago; on the Fox River, and on the Chicago and Northwestern and the Chicago, Burlington and Quincy railroads (Map: Illinois, D 2). It is popular as a residential place for Chicago business men, has a public library and one of the finest court-houses in Illinois, and is the seat of the State Reformatory for Female Juvenile Offenders. There are manufactures of glucose, windmills, sadirons, boxes, flour, etc. Settled about 1833, Geneva was incorporated in 1835 as a village, and as a city in 1887. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 1692; in 1900, 2446.

GENEVA. A city and the county-seat of Fillmore County, Neb., 60 miles west by south of Lincoln; on the Burlington and Missouri River and the Fremont, Elkhorn and Missouri Valley railroads (Map: Nebraska, G 3). It is the seat of the State Industrial School for Girls. The principal industries are farming and stock-raising. Population, in 1890, 1580; in 1900, 1534.

GENEVA. A city in Ontario County, N. Y., 52 miles southeast of Rochester; on Seneca Lake, the Seneca and Cayuga Canal, and the New York Central, the Lehigh Valley, and other railroads (Map: New York, C 3). It commands a magnificent view of the lake and surrounding country, and is the seat of Hobart College (Protestant Episcopal), opened in 1822, and of the State Agricultural Experiment Station. The

city is noted for its extensive nurseries, and has manufactures of stoves, steam boilers, optical supplies, cereals, canned goods, etc. Geneva was chartered as a city in 1898, and is governed by a mayor, chosen every two years, who controls appointments to most of the municipal offices, and a unicameral council. The city owns and operates its water-works. Near Geneva stood the Indian village, Kanadesaga, destroyed by Gen. James Clinton in 1779. Population, in 1890, 7557; in 1900, 10,433.

GENEVA (from OF. *genevre*, Fr. *genièvre*, It. *ginepro*, juniper, from Lat. *juniperus*, juniper; corrupted by popular etymology with *Geneva*, a city of Switzerland). One of the names of the juniper-berry, but also often applied to the spirit distilled from grain and flavored with juniper-berries, and manufactured in Holland, and hence called Hollands or Holland gin. The word gin is itself a corruption of Geneva.

GENEVA, LAKE (Fr. *Lac Léman*, the *Lacus Lemanus* of the Romans). A crescent-shaped lake, the largest in Switzerland, extending around the northern part of the French Département of Haute-Savoie, and with its west, north, and east shores bordering the cantons of Geneva, Vaud, and Valais (Map: Switzerland, A 2). It has an area of 224 square miles. It is 45 miles long, and attains a maximum breadth of 8½ miles between Morges and Amphion; its greatest depth is 1015 feet, between Evian and Ouchy. At the Strait of Promenthoux, 2 miles wide, it is divided into the Great Lake, about 39 miles long, with an average breadth of 6 miles, and the Little Lake, 6 miles long and 2 miles broad. The river Rhône, turbid and yellow, enters the lake at the northeastern end, and leaves it at the southwest, through the city of Geneva, perfectly clear and of a deep-blue tint. The deposits of this river at the northeastern end have contracted considerably the area of the lake, former towns and villages on its shores in some cases now being miles inland. About twenty other streams, all insignificant, flow into the lake, which is 1230 feet above the sea; with the melting of the mountain snow in summer the lake rises from 6 to 8 feet above its usual level. It is subject to the phenomena known as *seiches*, caused by alterations in the atmospheric pressure, which frequently occasion a rise and fall of from 2 to 5 feet in the course of half an hour. The *seiches longitudinales* traverse the lake from one end to the other, the highest on record being over 6 feet high; the *seiches transversales* cross from the Swiss to the French side in ten minutes. The lake is never entirely frozen over. It abounds in trout, lake salmon, perch, pike, and carp.

The beauties of Lake Geneva have been celebrated for centuries, and annually attract thousands of tourists; its shores have been favorite residential resorts of numerous celebrities. The shore on the side of the Pays de Vaud is celebrated for the magnificence of its scenery; the southern French shore rises solemn and stern, with the mountains of Savoy in the background. From the Lake of Geneva Mont Blanc is visible, and, although 40 miles distant, is often reflected in its intensely blue waters. The principal places on Lake Geneva are: Geneva, Coppet, Nyon, Morges, Lausanne (with its port, Ouchy), Vevey, Montreux, Evian-les-Bains, and Thonon.

GENEVA, UNIVERSITY OF. A Swiss university, known under its present name only since 1873, but the outgrowth of one of the oldest and most famous of Protestant institutions of learning, the Academy of Geneva, founded by the Genevan Republic in 1559. The academy had the usual faculties of philosophy, science, law, and theology; but the last named, under the direct oversight of Calvin and Beza, was the most renowned. The institution soon became the leading resort of Protestant scholars and students of all nations, and lent much lustre to a city already famous for its curious theocratic republican form of government. After the Huguenot persecutions Geneva became more than ever the centre of French Protestant culture and influence, a characteristic maintained throughout the eighteenth century. The names of Scaliger, Casaubon, De Saussure, and De Candolle have given the university distinction. It is still a place of educational importance. Its 1100 students, many of them from abroad, are mainly in the faculties of medicine and philosophy. Women are admitted on the same conditions as men.

GENEVA ARBITRATION. The international adjudication of the controversies between the United States and Great Britain growing out of the depredations of the *Alabama* and other Confederate cruisers upon the commerce of the former country during the Civil War. The arbitration tribunal was instituted as the result of the Treaty of Washington, signed February, 1871, by the joint commission which had met at Washington to settle those controversies. For the nature of the differences thus adjudicated and the constitution of the tribunal and the results of the arbitration, see **ARBITRATION, INTERNATIONAL**; **ALABAMA CLAIMS**.

GENEVA BIBLE. See **BIBLE**.

GENEVA CATECHISMS. A smaller and a larger French catechism by Calvin, published in 1536 and 1541, the second of which was afterwards translated and adopted as the formulary of the Reformed churches of Switzerland, France, and Hungary.

GENEVA CONVENTION. An agreement concluded at an international conference which was held at Geneva, 1864, under the presidency of General Dufour, the Swiss Plenipotentiary, for the purpose of ameliorating the condition of the sick and wounded in time of war. The credit of originating this conference belongs to two citizens of Geneva, Dunant, a physician, who published a startling account of what he had witnessed in two military hospitals on the field of Solferino, and his friend Moynier, chairman of the Society of Public Utility, who took up the idea of 'neutralizing the sick-wagons,' formed associations for its agitation, and at length pressed it upon the governments of Europe, most of which sent representatives to the conference. The convention was drawn up and signed by them on August 22d, and since then it has received the adherence of every European power, and one Asiatic (viz. Persia). The convention consists of ten articles, of which the last two are formal. The others provide: (1) for the neutrality of ambulances and military hospitals as long as they contain any sick; (2) for that of the staff; (3) that the neutrality of these persons shall

continue after occupation of their hospitals by the enemy, so that they may stay or depart, as they choose; (4) that if they depart, they can only take their private property with them except in case of ambulances, which they may remove entire; (5) that a sick soldier in a house shall be counted a protection to it, and entitle its occupants to exemption from the quartering of troops and from part of the war requisitions; (6) that wounded men shall, when cured, be sent back to their own country on condition of not bearing arms during the rest of the war; (7) that hospitals and ambulances shall carry, in addition to the flag of their nation, a distinctive and uniform flag bearing a red cross on a white ground, and that their staff shall wear an arm-badage of the same colors; (8) that the details shall be left to the commanders.

A second conference was held at Geneva on the same subject in 1868, and a supplementary convention drawn up. It consists partly of interpretations of the former convention, and partly of an application of its principles to maritime wars. Its main provisions are these: That when a person engaged in an ambulance or hospital occupied by the enemy desires to depart, the commander-in-chief shall fix the time for his departure, and when he desires to remain, that he be paid his full salary; that account shall be taken in exacting war requisitions not only of the actual lodging of wounded men, but of any display of charity toward them; that the rule which permits cured soldiers to return home on condition of not serving again shall not apply to officers, for their knowledge might be useful; that hospital ships, merchantmen having wounded on board, and boats picking up wounded and wrecked men shall be neutral; that they shall carry the red-cross flag, and their men the red-cross armlet; that hospital ships belonging to the Government shall be painted white with a green strake; those of aid societies white with a red strake; that in naval wars, any strong presumption that the convention is being abused by one of the belligerents shall give the other the right of suspending it toward that power till the contrary is proved, and, if the presumption becomes a certainty, of suspending it to the end of the war. See **RED CROSS SOCIETIES**; **WAR**.

GENEVIEVE, jèn'e-vêv'. The heroine of a poem by Coleridge, which is sometimes known by the same name, but more frequently by that of "Love." It was added to the second edition of the *Lyrical Ballads* (1800).

GENEVIEVE, zhèn'vyáv', SAINT (Lat. *Genovefa*) (c.422-512). The patron saint of Paris, and the subject of many popular and highly poetical legends. She was born about 422, in the village of Nanterre, near Paris, where, as a mere child, she attracted the notice of Saint Germanus of Auxerre (q.v.), who passed a night at Nanterre on his way to Britain, about 430, and who is said to have marked her out as specially destined to a life of holiness and purity. She devoted herself to a life of virginity and conventual seclusion. On the death of her parents she removed to Paris; and her active charity, and the extraordinary reputation for sanctity which she acquired, both there and in other cities of France which she visited on missions of Christian benevolence, won for her the admiring veneration, not alone of her own people, but even of

the heathen or half converted. The Frankish rulers Childeric and Clovis set prisoners free at her intercession. When, about 450, it was proposed to abandon Paris in alarm at the approach of Attila and the Huns, Geneviève, assembling the matrons and consecrated virgins in one of the churches, exhorted them to avert, by prayer and fasting, the threatened calamity. The unexpected alteration of the direction of Attila's march added still more to her reputation and to her influence. Later, when Clovis besieged the city, Geneviève, with her sisters in religion, set out on an expedition for the relief of the starving people, and successfully conveyed to Paris a supply of provisions. She died in Paris, January 3, 512. Under her patronage, and with her name, a religious congregation of priests—The Canons of Saint Geneviève—was founded in the eleventh century, which, with some vicissitudes, continued until the Revolution (1789). A religious congregation of women, under the name of 'Sisters of Saint Geneviève,' was established in 1636 for the purpose of caring for the sick and the education of girls. An edifice built in her honor, and upon the supposed site of her tomb, in 1764-90, which is now called the Pantheon, contains the famous mural painting of the saint by Puvis de Chavannes. Adjoining is the Library of Saint Geneviève, containing 200,000 volumes, and near by is a relic of the Abbey of Saint Geneviève. Consult her life by Vidian (Paris, 1883).

GENEVIEVE DE BRABANT, de brá'bân'. According to the legend, daughter of a duke of Brabant, and wife of Siegfried, Count Palatine of Treves in the first half of the eighth century. During Siegfried's absence with Charles Martel against the Saracens, she was criminally solicited by Golo, a knight in whose charge her husband had left her. When he returned, finding that his wife had given birth to a child (which in reality was his own), he ordered both mother and child to be killed. But their lives were preserved, and many years later the repentant Siegfried found them out and acknowledged the injustice of his suspicions. Consult Sauerborn, *Geschichte der Pfalzgräfin Genoveva und der Kapelle Frauenkirchen* (Regensburg, 1856).

GENGA, jën'gá, GIROLAMO (c.1476-1551). An Italian painter, architect, and sculptor, born at Urbino. He received instruction from Luca Signorelli, whom he assisted in the frescoes in the Chapel of the Virgin at Orvieto, and afterwards became the pupil of Perugino, in whose company he met Raphael. The frescoes he painted in the Petrucci Palace at Siena (1508) are destroyed. Four years afterwards he went to Urbino, and did some decorations at the command of the Duke Guidobaldo II. Soon after this he went to Rome, where he executed what is probably his best picture, "The Resurrection," in the Church of Saint Catharine of Siena at Rome. Recalled to Urbino, he worked for the Duke, in company with Timoteo Viti, and after his patron's deposition went with him to Mantua, and returned with him in triumph to Urbino. From that time on his work was architectural. He restored the Palace of Castel Durante at Urbino, and built Monte Imperiale, near Pesaro; the Church of San Giovanni Battista, at Pesaro; and Santa Maria delle Grazie, at Sinigaglia, and the cloister of the Zoccolanti, at Monte Baroccio.

GENGHIS, JENGHIS, or ZINGIS KHAN, jën'gis kán (1162-1227). A celebrated conqueror, originally known as Temujin, the title Genghis Khan merely signifying Great Khan or Ruler. He was born at Deylun Yeldak, near the northern bend of the Hwang-ho, in Mongolia, being the son of Yesuka Bahadur, a Mongol chief who ruled over the tribe of Neyrun, dwelling between the Amur and the Great Wall of China, and paying tribute to the Khan of East Tartary. On his father's death Temujin assumed the reins of government, though only thirteen years of age. Some of the subject tribes, however, refused to obey him, and chose another chief belonging to the same family. A war of several years' duration was the result, at the termination of which the young ruler was compelled to retire to Kara-korum, the capital of Toghrukh Khan, Khan of the Keraites and place himself under that monarch's protection. Ugh Khan gave him his daughter in marriage, and appointed him to the command of the army, in which capacity Temujin gave proof of great military talent, conquering the Mekreit, Tanjut, Jellaier, and other neighboring tribes. His growing reputation aroused the jealousy of his master, who ordered him to be assassinated; but Temujin fled to his own country, where he arrived after many hairbreadth escapes at the head of 5000 cavalry. Raising an army, he marched against his father-in-law; and Toghrukh, vanquished in battle in 1203, sought refuge among the Naymans, but was slain by the guards situated on the frontiers. Temujin immediately seized upon Toghrukh's dominions. In the following year a number of Tatar tribes, alarmed at his increasing power, formed a powerful league against him. The command was given to Tai Ugh Khan, chief of the Naymans; but in a battle fought on the banks of the Amur Temujin routed his enemies, slew their leader, and became at once master of almost all Mongolia. Grand views of conquest seemed now opened up before him. In the year 1206 he convoked a general assembly on the banks of the Onon, a tributary of the Amur, flowing through his native land. This meeting was attended by deputies from the subjugated hordes of Tartary, and the astute monarch contrived to obtain a religious confirmation of his designs. Up to this period he had borne the name of Temujin; but a renowned magician or priest, surnamed Bout-Tangri ('Son of Heaven'), venerated by all the Mongols, now came forward and pronounced him Genghis Khan—i.e. Greatest of Khans, or Khan of Khans, declaring that he should rule over the whole earth. The deputies were duly impressed. About this time the Uigurs, an agricultural and civilized people, inhabiting the country at the sources of the Hwang-ho and Yang-tse-kiang, voluntarily submitted to his sway. From this people, who professed Buddhism, the Mongols appear to have acquired a knowledge of writing. They adopted the Uigur alphabet, but preserved their own language, and Genghis selected one of the tribe to instruct his children.

The most important incident in the career of Genghis was the conquest of the northern part of China or Khatai. The immediate cause of the war between him and the Emperor of China, Tchong-Hei, was the refusal of the former to recognize the latter as his suzerain or liege lord. Most of the Tatar tribes which Genghis had subdued were really vassals of the Chinese Empire; and Tchong-

Hei, though he had not interfered to prevent the conquests of the Mongols, now called upon Genghis to acknowledge his superiority by paying tribute. Genghis immediately prepared for war, scaled the Great Wall in 1211, and after a series of bloody and protracted campaigns succeeded in taking Peking in 1215. Meanwhile Genghis had quelled an insurrection, headed by the Naymans, and conquered the Gur-Khan of Kara-Khatai. These tribes were nearly exterminated in a great fight which took place near the sources of the Yenisei. Pressing westward, the Mongols at length reached the Sihun, the northeastern boundary of the Empire of Khwarezm or Khorasmia, whose ruler, Ala-ed-Din Mohammed, was one of the most powerful sovereigns in Asia. The dynasty to which he belonged had risen into power through the weakness of the Seljuk sultans; and its sway now extended from the borders of Syria to the River Indus, and from the River Sihun to the Persian Gulf. The murder of some Mongol merchants at Otrar, a town on the Sihun, afforded Genghis a pretext for invasion. In 1219 an army of 700,000 men, according to the Eastern chroniclers, commanded by Juji, the son of Genghis Khan, entered Khwarezm. Samarkand, Bokhara, and all the other important cities of the country were captured. In 1221 Genghis Khan assumed personal command. The Mongols in three separate divisions now scoured and ravaged Khwarezm in all directions. In the course of five or six years they overran Persia, subdued the inhabitants of the Caucasus, crossed into Russia, and plundered the land between the Volga and the Dnieper. They swept over the whole of Southern Asia, as far as the Sutlej in Northern India, but the exhaustion of the Mongol hordes compelled Genghis to return to Karakorum, the capital of his empire, in 1224. During his absence his generals had been prosecuting the Chinese war with the greatest success. Genghis had still the old thirst of conquest; and, having recruited his forces, he led them across the great desert of Gobi to the Kingdom of Tanjout, in the northwest of China, the capital of which, Nin-hai, he besieged. Disheartened by the loss of the greater part of his army, the King of Tanjout promised to capitulate at the end of a month; but in the interval Genghis died, August 24, 1227, on the hill Liou-pai, worn out with years and toils. He is said to have had five hundred wives and concubines, and to have left a great number of children, among three of whom he divided his enormous possessions. The third son, Ogotai, was appointed Grand Khan, and received for his share the region now called Mongolia, with Khatai or Northern China as far north as the mouth of the Amur. The second son, Tcheghatai, received Turkestan north of the Amur. Juji, for his share, obtained Kiptchak (q.v.) and all the country west and north of Turkestan, an immense tract extending from the Caspian Sea almost to the Arctic Ocean. Sanguinary and barbarous though he was, Genghis showed many statesmanlike qualities and many virtues. He was a strict monotheist, but tolerated all religions; exempted from taxes and military service physicians and priests; made obligatory the practice of hospitality; established severe laws against adultery, theft, and homicide; organized a system of communication throughout his dominions, mainly no doubt for military purposes; and so

thoroughly organized what may be called the police or civil authority, that it was said that one might travel without fear or danger from one end of his empire to the other. He would appear to have respected men of learning, and to have retained several of such about his person. The only memorial of Genghis now known to exist is a granite tablet, with a Mongol inscription deciphered by Schmidt of Saint Petersburg, discovered among the ruins of Nertchinsk. This tablet had been erected by Genghis in commemoration of his conquest of the Kingdom of Kara-Khatai. Consult: Howorth, *History of the Mongols* (London, 1876-88); Erdmann, *Temudschin der Unerschütterliche* (Leipzig, 1862); Douglas, *Life of Genghis Khan* (London, 1877).

GENGLER, gēng'lēr, HEINRICH GOTTFRIED (1817-1901). A German jurist. He was born at Bamberg, and educated at Würzburg and Heidelberg. For more than fifty years he occupied the chair of law at the University of Erlangen. His works on German law include: *Das deutsche Privatrecht in seinen Grundzügen für Studierende* (4th ed. 1892); *Germanische Rechtsdenkmäler*, with a glossary (1875); *Des Schwabenspiegels Landrechtsbuch* (2d ed. 1875).

GÉNIE DU CHRISTIANISME, zhá'né' du krēs'tyá'né's'm (Fr., Genius of Christianity). A celebrated work by Chateaubriand (1802), a defense of Christianity on purely æsthetic and emotional grounds, avoiding all frank discussion of dogma. In it the author's purpose was to demonstrate "that of all the religions that have ever existed, the Christian religion is the most poetic, the most human, the most favorable to liberty, to the arts, and to literature, and that there is nothing more divine than its system of morals." The work gathers together illustrations of the sublime in Christian dogma, poetry, art, and literature, and besides its religious importance, had a distinct influence on the literary tendency of the nineteenth century.

GENII, jē'nī (Lat., guardian spirits). Spirits supposed to protect human beings, or tutelary divinities who presided over places and things. The classical nations believed that there were orders of spirits whose function it was to take in charge the infant at birth, to watch over the person day and night during the whole life, to point out to him the right and fortunate thing to do, to warn him of danger and wrongdoing, and thus to guide him safely throughout his life. The genii had access to their wards at all times, and could change themselves into any desired form. The demon (Gk. *δαίμων*) of Socrates is often mentioned as an example of a guardian spirit. In his case, however, the philosopher seemed to have believed not so much in an ever-present genius prompting him, as in a friendly hand holding him back from danger and wrongdoing. But, according to the classical belief, not only persons were thus cared for, but also there were special spirits in whose keeping the protection of the land itself was believed to be placed. Rome, for example, had its tutelary genii, and the Lares and Penates were looked upon as household gods embodying the spirit of the hearth and home. As such, the various genii received honors and divine worship in ancient Italy and Greece.

It is an easy step from this belief in guardian spirits to that in evil, misleading, tempting spirits, who are sent either to test the virtues

of the good or to guide the evil mortal in ways of wrongdoing. (See DEMONOLOGY.) The Greeks had *kakodaimones* as well as *agathodaimones*. The Romans came to believe in evil *genii* as well as good. It will be readily understood that the early Christians seized upon these ideas, and out of them grew the belief in guardian angels, ministering spirits, and evil *genii* or spirits.

In classical art the *genii* are sometimes represented in the form of a youth with wings, sometimes as closely wrapped in a mantle and holding within the hand some emblem of their office; and the *genius loci* or guardian spirit of a place is often pictured as a serpent partaking of some offering on an altar. Under Christian influence the good *genius* is frequently represented as an angel; the bad *genius* under some evil guise.

The idea of such spirits is a belief widely spread and by no means confined to the classical nations or ancient peoples or uncivilized races. The same sort of a conception prevailed in ancient and modern India, and the Zoroastrian doctrine of the *fravashis* in the Avesta as heavenly spirits presiding over man and over the house, village, tribe, and country shows how old this notion was in Persia. The Eskimo recognize the same idea in the spirit of the person after whom one is named acting as his guardian *genius*. Among the Mohammedans there is a kindred belief in the existence of *jinn*s, spirits of good and spirits of evil, who could assume any form.

The rôle played by the *jinn*s in the *Arabian Nights*, or by the *afrits*, or evil *genii*, in Arabic stories, is familiar to every reader of Oriental literature or of Eastern folk-lore. With the Arabic *jinn*, the Latin *genius* became entangled in the popular mind through the influence of the *Arabian Nights*, although there was no etymological connection between the two. The Greek word *dæmon*, which was originally used in the general sense of spirit, as explained above, has become degraded to mean *demon* in Christian theology. The question of the belief in *genii* lies near the inquiry into the origin of religion itself, but it is not difficult to trace backward all such beings to the primitive, childish faith which endows everything with human traits and capabilities. The shadow, the dream-self, the physiological hallucination all helped to give substantiality to the creatures of the imagination. See ANGELS; MAN, SCIENCE OF; APPARITIONS; DEMONOLOGY; JINN; RELIGION, COMPARATIVE.

GEN'IPAP (from *genipapo*, the native name). A much-esteemed fruit of the West Indies and warm parts of South America. The tree which yields it is *Genipa Americana*, of the order Rubiaceæ. The fruit is a two-celled berry, containing many seeds, about as large as an orange, of a whitish-green color, with a dark-purple juice of an agreeable, vinous taste. The species resembles the popular hothouse shrubs of the genus *Gardenia*, of which genus the Cape jasmine (*Gardenia jasminoides*) is perhaps the best-known species.

GENIPI, jèn'î-pè. See ACHILLEA.

GENIS'TA. A genus of low shrubs of the natural order Leguminosæ. The species, of which there are about eighty, natives of the Old World, have small deciduous or almost evergreen leaves, terminal racemes, or clusters of handsome yellow flowers, borne in great abundance in spring or

summer, and little pods. None of the species are perfectly hardy in cold climates, and only *Genista tinctoria*, *Genista Angelica*, and *Genista Germanica* can withstand the winters when protected by straw or other covering. They succeed best on sandy or rocky, well-drained soils in sunny places. The so-called *genista* that the florists usually bring into blossom about Easter time is a species of *Cytisus*.

GENITIVE (Lat. *genitivus*, relating to birth, from *gignere*, to produce). The name of one of the 'cases' in grammar. (See DECLENSION.) In such an expression as (Latin) *regis filius*, (English) the *king's son*, the form *regis* or *king's* is called the genitive case; and according to the usual explanation, this name was given it because it indicates the source or origin of the thing joined with it. In reality, however, the terms of grammar were originally applied, not to the parts of speech, but to the elements of thought; they were logical terms before they were grammatical. The Greek writers on dialectics, in analyzing the different parts of an expressed thought, had distinguished the principal notion, the subject or nominative as it is called, from secondary or dependent notions; the dependency of the latter they expressed by the word *πρῶσις* (Lat. *casus*), a fall or leaning of one thing upon another; and in such a proposition as 'The king's son is dead,' they indicated the exact nature of the dependence by calling it the *γενική πρῶσις*,—i.e. the case showing the genus, kind, or class, the generic case; for while the name 'son' is applicable to every man having parents, 'king's son' is limited to the class of sons having kings for their fathers. The names thus applied to ideas were transferred to the words expressing them by the Greek grammarians of Alexandria, and were afterwards translated into their Latin equivalents by the Greek grammarians who taught their language to the youth of Rome. But by this time the terms had become strictly technical, and their original significance little thought of; and this may account for the Greek *γενική*, the Latin equivalent for which is *genialis*, being rendered by *genitivus*, generating or producing, which would have been expressed in Greek by *γεννητική*.

In English the genitive is the only case or relation among nouns expressed by a difference of termination, and even it is often expressed by the preposition *of*: as the *river's* brink, or the brink *of the river*. From the frequency with which the form in 's indicates that one thing belongs to another, it is often called the *possessive* case. But this name is little applicable in such expressions as a *day's* journey; still less in many cases where the genitive is used in the ancient languages—e.g. *fons lactis*, a fountain of milk. The *generic* case, however, meaning that which limits the other noun to a class or kind, will be found to express the real relation in every conceivable combination.

The termination 's was often erroneously supposed to be a contraction for *his*, as if 'the king's son' = 'the king his son'; but it is a genuine relic of the inflections (q.v.) common at an early stage to all the Indo-Germanic languages. *s* was one of the prevalent endings of the genitive singular in the Anglo-Saxon. With the ordinary plural termination in *s*, and sometimes in the singular when the noun ends in *s*, the additional

s of the genitive is omitted, for the sake of the sound, as kings' sons, Francis' store.

GENIUS, jên'yūs (Lat., tutelary godling, from *gignere*, Gk. *γεννέω*, *gignesthai*, Skt. *jan*, to be born). The name given by the ancients to the lesser divinities, good and bad, to whose charge are committed the destinies of the individual human being. This usage is still retained, metaphorically, in such phrases as 'his good (or evil) genius prompted him.' Hence arises, further, the employment of the term for a special aptitude or characteristic; as when we speak of the bent of a man's genius, or of the genius of nineteenth-century thought. The current meaning of the word, however, which naturally suggests itself in the absence of a limiting context, is that of 'an ability that is exceptionally high, and at the same time inborn' (Galton). That man is possessed of genius—or is a genius—whose natural abilities are of an unusually high order and display themselves in creation or construction; while that man is talented whose natural abilities, though far above the average, depend for their realization upon education and training, and whose superiority is displayed rather in acquisition or in artistic execution than in invention. "The man of talent," says Galton, "is one in four thousand; the man of genius is one in a million."

Many attempts have been made to define genius. Carlyle remarks that it means, first of all, "the transcendent capacity of taking trouble"; and when we think of the leaders in science, or of great military geniuses, we shall admit the measure of truth in his statement. Lowell, on the contrary, declares that 'talent is that which is in a man's power; genius is that in whose power a man is'—an account that seems to contradict Carlyle's definition outright, but one whose justice we shall concede when we think e.g. of a poet like Shelley. This contrariety of description shows how foolish is the attempt to put a technical interpretation upon the word 'genius,' or to characterize a 'typical' genius. There is a popular belief that the man of genius is a puny and unhealthy being, all brain and no muscle; and the work of Lombroso has given new vogue to the old idea that genius is closely related to insanity.

Now, there can be no doubt that men of extraordinary gifts have often had poor constitutions; we have only to think of the philosopher Kant as an example. But the rule is to the reverse effect: a "collection of living magnets in various branches of intellectual achievement" is good to see, writes Galton, for the reason that they are "such massive, vigorous, capable-looking individuals." For the second belief there seems, unfortunately, to be better evidence. We are not called upon to suspect insanity wherever we find an unusually high intelligence: this position is negated by the remark just quoted. But high intelligence implies a finely wrought and peculiarly excitable brain; and these characteristics of the nervous system, balanced in the case of the genius by preservative conditions, may appear in his near relatives, without the required checks and preservatives, as some form of eccentricity, if not of mental derangement. Consult: Galton, *Hereditary Genius* (London, 1892); Lombroso, *The Man of Genius* (New York, 1891); Baldwin, *Mental Development* (New York, 1897); Nordau, *Degeneration* (New York, 1895).

GENLIS, zhân'lé, STÉPHANIE FÉLICITÉ DUCREST DE SAINT-AUBIN, Countess de (1746-1830). A French novelist, dramatist, and memoir writer, born at the Château of Champeéri, near Autun. She afterwards became preceptress (1781) of the sons of the Duke of Chartres, known later as Philippe Egalité. Among these was the future King Louis Philippe, for whom she wrote several educational books. During the Revolution she lived in Switzerland, in Berlin, and in Hamburg. Napoleon recalled and pensioned her. She continued to write voluminously during the Revolution, and seems to have enjoyed the literary quarrels roused by her cleverly sarcastic *Diners du baron d'Holbach*, witty persiflage of the intolerant fanaticism of eighteenth-century philosophy. Her *Mémoires inédits sur le XVIIIème siècle et la révolution française* (10 vols., 1825), and a novel, *Mlle. de Clermont* (1802), are other noteworthy works among her 90 volumes, many of which were translated into English. She died in Paris. Consult: Sainte-Beuve, *Causeries*, vol. iii. (Paris, 1857); Bonhomme, *Madame de Genlis* (Paris, 1885); and Carotte, *Madame la comtesse de Genlis* (Paris, 1893).

GENNADIUS (Lat., from Gk. Γεννάδιος). A learned Greek, Patriarch of Constantinople, c.1453-59. His lay name was Georgius Scholarius. But little is known of his life, and it has even been thought that there were two writers of the same name living at the same period. The first appears in history in 1439, when he accompanied the Emperor John Palæologus to Florence, whither the Council of Ferrara had been adjourned, and where an effort was made to unite the Eastern and Western churches. (See FERRARA-FLORENCE, COUNCIL OF; EUGENIUS IV.) Scholarius, at this time a layman, played a politic and cautious part, admitting the necessity of union, and trying to draw up a form which, from vagueness and ambiguity, might be accepted by both parties. After his return to Constantinople he became a monk, and took a position with respect to the union highly unacceptable to the Roman party. He next appears in 1453, after the capture of Constantinople by the Turks. The conqueror Mohammed, finding that the patriarchal chair had been vacant for some time, chose the monk Gennadius for the office. At the request of Mohammed he drew up a symbol or confession of faith, which is valuable as an expression of the belief of the Greek Church. After four or five years he resigned his episcopal dignity and retired to a monastery. Gennadius was a prolific writer; many of his extant works have never been edited. He was an able champion of the Aristotelians in the contest between Platonism and Aristotelianism which marked the transition from mediæval to modern thought.

GENNARI, jên-nâ'rè. A family of Italian painters of the sixteenth and seventeenth centuries.—BENEDETTO (1550-1610), called The Old, born at Cento, near Bologna, was the most celebrated. He was the master of Guercino.—BENEDETTO (1633-1715), called The Young, also was born at Cento. He traveled in France and England, and painted for Louis XIV. and James II. He is best known as an excellent copyist and imitator of Guercino.

GENNESARET, jên-nēs'sâ-rèt, LAKE OF. A body of water in Palestine, through which flows the River Jordan. The old Hebrew name was Chinnereth or Chinneroth (see Num. xxxiv. 11;

Joshua xii. 3, xiii. 27), also used of a city (Joshua xix. 35), and of a district (I. Kings xv. 20), both in the neighborhood of the lake. The name Gennesaret, or, more correctly, Gennesar, from the 'Land of Gennesaret' (q.v.) on the northwest shore of the lake, was in use certainly as early as the first century B.C. (I. Macc. xi. 67). This is the name used almost without exception in Josephus. In the Gospels 'Sea of Galilee' is the usual designation. After Herod Antipas built the city of Tiberias on its shore it became known as the Sea of Tiberias, which is the basis of the modern name Bahr Tabariyeh. The lake is 13 miles long by 7 miles wide, irregularly oval in shape, widest at the northern end. It lies in a deep basin in the great cleft which extends from the Lebanon to the Red Sea. The surface is 680 feet below the level of the Mediterranean. Its greatest depth is not over 200 feet. It is completely encircled by a beach, the surrounding hills in no case touching the water's edge. Along the eastern shore the beach is but a narrow strip about half a mile wide, beyond which the hills rise abruptly to a height of nearly 2000 feet above the lake. To the south is the low, rapidly descending Jordan Valley, as wide as the lake itself. From the exit of the Jordan to Tiberias, on the west, a mile or so from the water, lies a black and barren ridge of the Galilean hills, while north of this, extending nearly to the entrance of the Jordan, is the broad and fertile plain of Gennesaret. The water of the lake is sweet, except in the neighborhood of the hot springs near Tiberias, and somewhat warm. The hot springs are evidence that the volcanic activity, which in ages past wrought such great changes in this locality, has not entirely ceased. The surface of the plateau east of the lake is the overflow of volcanoes once active in the Hauran. Shut in by high hills except to the south, the lake is subject to sudden and severe winds which, rushing down the ravines, often lash the waters into dangerous fury (cf. Mark iv. 37; Luke viii. 23). The neighborhood of the lake once teemed with population. Several of the great trade routes of Southwestern Asia converged here. Communication with the whole world was frequent and easy. The waters abounded in fish and were covered with sailing craft, many of which were used in the extensive fishing industry. The fertile western shore was highly cultivated and yielded its products through all the months of the year. Around this small sheet of water were clustered some nine or ten flourishing cities, each, it is said, with not less than 15,000 inhabitants: Chorazin, on the slopes west of the Jordan's entrance; Capernaum and Magdala in the plain of Gennesaret; on the western shore, Tiberias with its famous and popular baths, and Tarichæa with its great fish-curing industry, whence the fish of Galilee were exported throughout the Roman world; Hippos and Gamala on the eastern plateau, with Gadara a few miles southeast; Bethsaida at the entrance of the Jordan, and Sinnabris at its exit; and Homonaa two miles down the valley. At present all these, except Tiberias, have passed away, the sites of some cannot be identified, the soil is cultivated in but few spots, boats are rarely seen, and the hills are treeless and deserted.

It was about the northern part of this sea that Jesus passed the greater part of His public ministry. Four of the first disciples were Galilean fishermen (Matt. iv. 18-22; Mark i. 16-20),

and the miracles of the walking on the water (Matt. xiv. 22-33), the miraculous draught of fishes (Luke v. 4-7), the stilling of the tempest (Matt. viii. 23-27; Mark iv. 35-41; Luke viii. 22-25), the feeding of the multitude (Matt. xiv. 13-21; xv. 29-39; Mark vi. 31-44; viii. 4-9; Luke ix. 10-17; John vi. 1-14), and many other miracles and events in the life of Jesus are closely associated with the lake. Consult: Merrill, *Galilee in the Time of Christ* (New York, 1891); id., *East of the Jordan* (New York, 1881); George Adam Smith, *Historical Geography of the Holy Land* (London, 1894).

GENNESARET, LAND OF. A district northwest of the Lake of Gennesaret (or Sea of Galilee), from which the lake took its name. The meaning of the word (more properly Gennesar, Gk. Γεννησαρ) is disputed. The Jewish doctors thought it a corruption of the word Chinnereth. (See GENNESARET, LAKE OF.) More probably it was made up of *gan* (garden), or *gai* (valley), and a second element no longer discernible. The modern name is Ghuweir, i.e. Little Ghor, the large Ghor being the Jordan Valley. The classic description of the locality is that of Josephus (*Jewish War*, iii. 10, 8), who speaks of it as "wonderful in nature and beauty," not "denied any plant because of its fertility," where walnuts, figs, olives, sycamores and royal grapes vied with each other in luxuriance and abundance, where all climes and seasons seemed to harmonize, and which, in addition to its balmy air "was irrigated by a most fertilizing spring called Capharnaum." It was between three and four miles long and two-thirds of a mile wide, extending from a spot about three miles west of where the Jordan enters the lake as far as Mejdal (the ancient Magdala?), where the hills approach within half a mile of the water. There are a number of springs in the locality, that of which Josephus speaks being probably the one known as Ain-et-Tabijeb, whence an aqueduct brought the water to the plain. Capernaum, Jesus' 'own city,' was in Gennesaret, probably on the site of the modern Khan Minyeh. For literature, see GENNESARET, LAKE OF.

GENOA, jèn'ô-à (It. *Genova*, Genoese, *Zèna*, Fr. *Gènes*). A fortified seaport of Italy, capital of the Province of Genoa, in the Compartimento of Liguria, formerly the capital of the Republic of Genoa, situated on the Gulf of Genoa and the Bisagno River, in latitude 44° 24' N. and longitude 8° 54' E. (Map: Italy, C 3). It is the first port and most important commercial centre of Italy. The mean temperature is 61° Fahr., 9 degrees above that of Turin in the interior, 100 miles northwest. At Genoa the January temperature averages 46° and seldom falls below 23°, but the changes are sudden, and the winter winds from the surrounding Ligurian Apennines are raw. The average temperature at Genoa in July is 76°.

Seen from the sea, the city justifies its title of 'la superba' (the proud). In a nine-mile circuit it rises like an amphitheatre of churches, palaces, and houses. Picturesqueness is added to the panorama by terraced gardens, and by bridges, the most remarkable of which is the Ponte Carignano, that leads over seven-story buildings to the Church of Carignano and was built in 1718 by the Sauli family. It is 361

feet long, 17 feet wide, and 112 feet high. The old town is a network of steep, narrow streets lined with high buildings; but the modern encircling and radiating boulevards are broad and magnificent. Among these avenues are the imposing Via di Circonvallazione a Mare, on the site of the exterior fortifications, and the Via di Circonvallazione a Monte, stretching superbly along the heights back of the city. One of the most characteristic streets in the business section is the Via Garibaldi, with stately palaces. The Piazza Deferrari, with its large equestrian statue of Garibaldi, is the converging point of the extensive system of electric street railways (31 miles in 1899). There are also three lines of cable cars.

The harbor, with an area of over 500 acres, consists of the Porto, or old harbor, with 19 feet of water, the Porto Nuovo, with 32 feet of water, and the Avamporto for war vessels, with 45 feet of water. The Porto is partially inclosed by the Molo Vecchio, said to have been built in the twelfth century, and by the eighteenth-century Molo Nuovo. The additions to the Porto were made (1877-95) at an expense of over \$12,000,000, of which the Duke of Galliera contributed \$4,000,000. The harbor now has five miles of quays, a steel floating dock 282 feet long, and two stone dry docks, 588 and 722 feet long respectively. To the west, on rocky Cape Faro, stands the lighthouse (La Lanterna), 384 feet high, with a magnificent view of the sea, harbor, city, Riviera, and mountains. Modern batteries and forts render the city a sea and land fortress of great strength. The rowing and bathing in and about the harbor form one of the attractions of the city.

Genoa is famous for the number of marble palaces in the style of the best period of the Renaissance. It is also unique for its many noble staircases. It accordingly presents a proud and grand appearance, and is the least agreeable and *sympathique* of the great Italian towns. The most splendid palaces it owes to the designs of Galeazzo Alessi (died 1572) and his successors Bianco (1604-56), Tagliafico (1729-1812), and Cantoni (1736-1818), who interpreted Alessi in the spirit of Michelangelo. The oldest of the 82 churches is the Cathedral of San Lorenzo, founded in 985, rebuilt in the Romanesque style about 1100, restored in Gothic in 1307, and given a Renaissance dome in 1567. The choir was modernized in 1617, and in 1896 the interior was properly restored. In it are statues, paintings, vestments, relics, of which perhaps the most interesting is the Sacro Catino, in which tradition says that Joseph of Arimathea caught drops of the blood of his crucified Saviour. There are excellent altarpieces by Baroccio and Battista. The most magnificent church in Genoa is the Santissima Annunziata, the most beautiful is the sixteenth-century Santa Maria di Carignano. The Annunziata dates from the sixteenth century, and is a basilica with a dome, the vaulting being borne by fluted and inlaid shafts of marble. Services are held in English at the Episcopal Church, at the Presbyterian Church, and at the Sailor's Missions.

Genoa, so rich in architecture, is poor in masterpieces of painting and sculpture. The principal picture galleries are in the Palazzi Rosso and Bianco, presented to the city by the Duchess of Galliera, in the seventeenth-century

Palazzo Balbi-Senarega (private), and in the Palazzo Durazzo-Pallavicini, which also contains a library with examples of early printing. The Rosso collection embraces meritorious paintings by Paris Bordone, Bassano, and Van Dyck. The Bianco contains letters by Columbus, majolica, coins, miniatures, tapestries, Oriental vases, and noteworthy paintings by Rubens and David. The Balbi-Senarega Palace is perhaps the most pleasing one in the city, owing to its Doric court with colonnades set off by an orangery. Among the good paintings here are works by Rubens, Titian, and portraits by Van Dyck. The city owns the Villetta di Negro, with its artistic pleasure gardens and fountains. It contains the municipal museum and zoölogical gardens. The Palazzo Doria was presented in 1522 to Andrea Doria (q.v.), 'father of his country,' and, as the Latin inscription on the building says, admiral of the Papal, Imperial, French, and Genoese fleets. The building was remodeled in 1529 by Montorsoli after plans suggested by Doria, and was at that time decorated with frescoes by Perino del Vaga, a pupil of Raphael. The interior of the little thirteenth-century Gothic Church of San Matteo was also remodeled by Montorsoli. The façade of the church bears inscriptions in honor of the Doria family; the sword of Andrea Doria hangs over the high altar, and his tomb is in the chapel. The thirteenth-century Palazzo Ducale, remodeled in the sixteenth century, and, after a fire, modernized in 1777, was once the residence of the doges; now it is given over to judges and police commissioners. The seventeenth-century Palazzo Reale acquired by the royal family in 1815, and restored in 1842, is magnificently furnished. In the Church of Santo Stefano is a celebrated painting by Giulio Romano, the "Stoning of Stephen."

In the Piazza Acquaverde, before the railway station, there is a marble statue of Columbus, who was born near or in Genoa. This monument, sculptured in 1862 by Canzio, has four allegorical figures—Religion, Science, Strength, and Wisdom. At the foot kneels a figure representing America. On the pediment of the Palazzo Faragiana, opposite, are scenes from the life of Columbus in marble relief. In the sixteenth-century Palazzo Municipale (City Hall) is a mosaic portrait of him, and in the pedestal of his bust are preserved the originals of some of his letters. There are also memorials of him in the Palazzo Bianco. He is said to have been baptized in the architecturally interesting Church of Santo Stefano. The Municipale possesses also Paganini's famous violin (Guarneri). Among the many monuments which enrich the spacious piazzas and corsos of Genoa are those of Victor Emmanuel and Mazzini, who was born here, and an immense bronze monument to the Duke of Galliera. The modern Campo Santo (cemetery) is beautifully laid out on the north bank of the Bisagno. It contains many splendid monuments, and is famous for its imposing appearance, crowning rotunda, and galleries with their striking variety of sculptured monuments. In the environs are several lordly and celebrated villas, and gorgeous views of sea and shore abound on every hand, as in the city itself.

The finest court and stairway in Genoa are in the Palazzo dell' Università, which was begun as a Jesuit College in 1623, and transformed into a university by Napoleon in 1812. The university

in 1900 counted 127 instructors (including docents) and 1330 students. Among the principal libraries are that of the university, the city library (in the Academy of Fine Arts), that in the Palazzo Rosso, the Missioni Urbane, and the Franconia. Genoa has two royal gymnasia, two royal lyceums, a theological seminary, a royal school of shipbuilding, a commercial school of university rank, five technical schools, three royal normal schools, two technical evening schools, a school of technical design, and the industrial school Duchessa Galliera. Genoa is not important in the realms of literature, music, and the theatre.

Among the splendidly equipped institutions of charity, to which the city grants over \$100,000 a year, are the Pammatone Hospital, with beds for 700, founded in 1420 by Bartolommeo Bosco; the poor-house, founded in 1655, and enlarged in 1835, with accommodation for 1400; the hospital for the incurable; the Sant' Andrea Hospital; the asylum for the deaf and dumb; the orphan asylum, with accommodation for 600 girls; the insane asylum; the asylum for the blind; the Protestant Hospital; and the children's hospital.

Of the seven principal theatres the most important—one of the largest in Italy—is the Teatro Carlo Felice, built in 1828, with 3000 seats. There are excellent electric-lighting, gas, telephone, water, and sewerage systems, and the death-rate has declined appreciably during the past generation. There is a paid fire department, with a per capita annual expenditure of over ten cents. The city government has a high reputation for efficiency. The administration consists of sixty municipal councilors elected by the citizens, forty lira of taxes entitling a citizen to a vote, and to nomination as a councilor. A giunta or administrative committee of twelve members is elected from among themselves by the council, and from this administrative committee the King appoints the syndic or mayor. Genoa is the seat of an archbishop.

There is regular communication by steamship with the principal Mediterranean ports; with Germany and the British Isles; with New York (weekly); and with Asia and Australia. The headquarters of the Navigazione Generale Italiana, and of other steamship companies, are here.

As a commercial centre Genoa is advancing rapidly, with the prospect of becoming before long the first port on the Mediterranean. The connections by rail with the Saint Gothard Tunnel, 200 miles north, render it the principal port on the Mediterranean for Switzerland and Germany. The East railway station in the city is connected with the main or West station by a subway a mile and a half long, which has a branch diverging to the harbor station. The harbor station is connected with the various docks by rail.

In 1900 the imports amounted to 3,075,790 tons (metric), and were valued at 519,079,519 lira (about \$100,000,000); the exports amounted to 232,300 tons, valued at 240,106,592 lira (about \$47,000,000). The principal article imported is coal from England; in 1900, 1,855,857 tons, which is more English coal than is imported by any other port in the world. In 1891 the value of the imports was about \$78,000,000, of the exports about \$18,000,000; in 1877 the imports were valued at \$58,000,000, exports at about \$9,500,000. The weight of the goods that passed through Genoa in bond in 1900 was 367,534 tons;

their value 155,564,373 lira (about \$30,000,000). The number of vessels entering and clearing in 1900 was 13,602 (7292 steamships), with registered tonnage of 9,727,545. In nationality, 9770 were Italian, 1398 English, 453 German, 426 French. The number of vessels entering and clearing in 1891 was 12,256, with registered tonnage of only 6,421,637. Of these only 5973 were steamships. In the seventies the number of vessels entering and clearing averaged only 5000, with tonnage of about 2,000,000. In point of tonnage Genoa is by far the first of Italian cities, though in 1900 it was still surpassed by Naples in number of vessels entering and clearing. The principal imports besides coal are grain (in 1900 about \$16,000,000), cotton (about \$16,000,000), silk (about \$7,000,000); the principal exports are silk goods (in 1900 about \$15,000,000), cotton goods (about \$8,000,000), spirits, wine and oil (about \$4,000,000). American cottonseed oil is mixed here in large quantities with olive oil, and exported. The industrial interests are also important.

The manufactures are velvet and silk fabrics, woolen goods, cotton goods, ribbons, damask, embroidery, artificial flowers, hats, paper, leather and leather goods, furniture, objects in gold, silver, ivory, marble, alabaster, and coral, essences, soap, preserved fruits, chocolate, macaroni, and vermicelli. San Pier d'Arena (q.v.), the most important suburb of Genoa, is a manufacturing centre. Population, in 1881, 179,515; in 1901, 234,710.

In ancient, as well as in mediæval times, Genoa was an important seaport. It was conquered by the Romans in B.C. 222 and made part of Gallia Cisalpina. At the time of Augustus Genoa was, according to Strabo, "a flourishing town and the chief emporium of the Ligurians." During the Dark Ages Genoa, with different barbarian overlords, maintained in greater part its municipal organization. In 936 it was plundered by the Saracens, against whom it had been a bulwark of defense for the whole of Liguria. Then Genoa and Pisa formed an alliance to expel the Saracens from the strongholds of Corsica and Sardinia. This being effected, the Genoese obtained, by Papal arbitration, the grant of Corsica, while Sardinia was assigned to the Pisans. For the next two centuries the two cities were almost continually at war, until in 1284 in the naval battle of Meloria the Genoese broke the power of Pisa. Meanwhile the Genoese had vigorously co-operated in the Crusades, and as material reward, had obtained important commercial privileges in the Holy Land. The city had also established settlements at Constantinople, in the Crimea, in Syria, Cyprus, Tunis, and Majorca, and rose to such a height of maritime power throughout the Mediterranean that the natural sequence was a 140-year struggle with Venice, which terminated in the Peace of Turin (1381), decidedly disadvantageous to Genoa.

During both the Pisan and the Venetian wars, internal dissensions had weakened the city and occasioned changes in the form of government. In 1190 the consuls were superseded by a podestà (q.v.), an office which lasted till 1270, when two of the great Guelph leaders of the State resolved to subvert the popular authorities, and, under the title of 'captains of liberty,' assumed irresponsible authority, which for twenty-one years they contrived to retain. During their sway civil feuds

continued to rage. Various other modifications of the government preceded the election of the first Genoese Doge in 1339. This supreme magisterial office, which was held for life, and from which nobles were excluded, continued for two centuries.

The ambitious contentions of four leading democratic families—viz. the Adorni, the Fregosi, the Guarci, and the Montaldi—succeeding those of the patrician houses of Doria, Spinola, Grimaldi, and Fieschi, engendered such disastrous civil strife under the early doges that, in 1396, the citizens invoked the protection of the French King Charles VI., and finally submitted to the rule of the Visconti (q.v.), the lords of Milan, in 1464. After the invasion of Louis XII., in 1499, Genoa was subject to the French till 1528, when the genius and resolution of a great citizen, Andrea Doria (q.v.), freed his country from foreign invaders, and restored to Genoa republican institutions. But the power of Genoa was on the wane. The Turks seized her Oriental possessions, the French bombarded the city in 1684, and the Imperial troops occupied it for a brief time in 1746. In 1736 the Corsicans, who had for seven years been in rebellion, chose a Westphalian nobleman named Neuhoof (q.v.) as their King. He was soon expelled by the Genoese with the aid of the French, who in 1768 bought the island. During the French Revolution, when the French swept over Italy, Genoa sought to remain neutral, but, being threatened by the English under Nelson, finally joined France, and made a money contribution of 2,000,000 francs. Then a democratic uprising favored by Napoleon put an end to the sway of the nobility. In 1797 a democratic constitution was adopted, and the Ligurian Republic established. In 1800 the French general Masséna was besieged in Genoa by the Austrians and English and forced to capitulate. In 1805 Napoleon annexed the Ligurian Republic to the French Empire. After the fall of Napoleon, Genoa was, against her will, awarded by the Congress of Vienna to the Kingdom of Sardinia (q.v.). Consult Malleon, *Studies from Genoese History* (London, 1875).

GENOA, GULF OF. The portion of the Mediterranean, near the Italian city of Genoa, which is partially inclosed by the coast that winds from Spezia west to Oneglia (Map: Italy, C 3).

GENOUDE, zhá'nōd', ANTOINE EUGÈNE (1792-1849). A French publicist, born at Montélimar (Drôme). At first a student of eighteenth-century philosophy, he became an ardent Catholic, and threw himself into all the controversies of the period, hailing the return of the Bourbons with enthusiasm. He was, with Lamennais, the founder of *Le Défenseur* (1820), which was replaced by *L'Etoile* (1821), the Government organ, and revived the old *Gazette de France* (1825). After the Revolution of July (1830) he attacked the new party with much vigor. In 1835, the year following the death of his wife, he took orders. His active career ended in 1848. His works include: *Voyage dans la Vendée et dans le midi de la France* (1820); *La raison du christianisme* (1834-35); and *Les pères de l'église des trois premiers siècles* (1837-43).

GENOUILLERE, zhá'nō'yár' (Fr. knee-piece). A term in fortification (q.v.), denoting that part of the interior slope of the parapet which serves as a cover for the lower part of a gun-carriage. The term itself is derived from one

of the articulated pieces of metal used in suits of armor. In the thirteenth century it was a knee-piece of beaten metal (iron) held in place by a leather bandage or strap; but subsequent improvements made it much more pliable, and added (in the fourteenth century) large rings which projected rearward on each side of the knee-joint.

GENOVESI, já'nô-vá'sé, ANTONIO (1712-69). An Italian writer on philosophy and political economy. At an early age he was destined by his father for the Church, and began the study of theology in a monastery. He took orders and was appointed to the chair of rhetoric in the theological seminary of Salerno. He now read with eagerness the works of the chief modern philosophers, and was particularly attracted by Locke. Dissatisfied with ecclesiastical life, Genovesi resigned his post at Salerno, and proceeded to Rome, where he undertook the study of law, and qualified as an advocate. The details of legal practice, however, proved as distasteful as theology, and for some years he gave himself up entirely to the study of philosophy, attending most of the distinguished lectures at the university at Naples. At this place, after having obtained the appointment of professor extraordinary of philosophy, he opened a seminary or private college for students. His reputation as a teacher was increased by the publication in 1743 of the first volume of his *Elements of Metaphysics* and in 1741 of his *Logic*. Both works are imbued with the spirit and principles of the Empirical School of philosophy. On account of the accusation of infidelity and heresy excited by his discussions of metaphysical principles, he had some difficulty in obtaining the professorship of moral philosophy, and failed in his effort to be appointed to the chair of theology. He published a continuation of his *Elements of Metaphysics*; but with every new volume he experienced fresh opposition from the partisans of scholastic routine. In spite of this Genovesi obtained the approbation of Pope Benedict XIV., of several cardinals, and of most of the learned men of Italy. Among them was Intieri, a Florentine, who founded, at his own expense, in the university at Naples, the first Italian chair of political economy, under three conditions, namely: that the lectures should be in Italian, that Genovesi should be the first professor, and that, after his death, no ecclesiastic should succeed him. He was one of the first in Italy who dared to write upon philosophy in the common language of the country. His *Opere scelte* were published in 4 vols. (Milan, 1835).

GENRE, zhǎn'r' (Fr., sort) **PAINTING.** A term used in art to denote that class of subjects which portray the intimate and every-day life of any people. This draws the line sharply between this class of subjects and historical painting, which depicts more or less great moments of national life. This class of painting is characteristic of the Dutch school by which it was first largely practiced. Its chief masters in that school were Terburg, Brower, Ostade, Rembrandt, the younger Teniers, Metz, Gerard Dow, Frans Hals, and others. Their subjects were the familiar life of the family; street scenes and sports; festivals and picnics, tavern scenes—all that goes to make up the occupations of a people. These might be comic, serious, or pathetic, but

genre painting, strictly speaking, always includes as a dominant note the human element. Pictures of this class are usually of small dimensions, but they are always valuable and interesting records of contemporary life. In British art Wilkie and Hogarth are prominent examples of genre painters. Hogarth was probably the greatest master in English genre painting and his pictures portraying the weaknesses and follies of the life of his time are powerful parables, and full of artistic strength. Genre work was done in Spain by Velazquez and Murillo, and in France, during the eighteenth century, by Watteau, Greuze, and others. There was a general revival of this kind of subject during the nineteenth century, and among the many painters of all nations who have practiced it we need only mention such names as Meissonier in France, Fortuny in Spain, Kraus, Defregger, and Grützner in Germany. See DEFREGGER; GRÜTZNER; MEISSONIER.

GENS (Lat., race). A word sometimes used by the Romans to designate a whole community, the members of which were not necessarily connected by any known ties of blood, though some such connection was probably always taken for granted. In this sense we hear of the *gens Lattiorum*, *Campanorum*, etc. But it had a far more definite meaning than this in the constitutional law of Rome. According to Scævola, the pontifex, those alone belonged to the same *gens*, or were 'gentiles,' who satisfied the four following conditions: (1) Who bore the same name; (2) who were born of freemen; (3) who had no slave among their ancestors; and (4) who had suffered no *capitis diminutio* (reduction from a superior to an inferior condition). In the identity of name, some sort of approach to a common origin seems to be implied. The *gens* thus consisted of many families, but all these families were supposed to be more or less nearly allied by blood.

The Roman form of organization is found among all races and in every part of the world, and is now known generically, by the common consent of ethnologists, as the clan (q.v.), although in literature and in history *gens* is the familiar term. The clan is a body of kindred wider than a family or household, and narrower than a tribe (q.v.), and recognizing relationship, together with the right to names and to property, in one line of descent only, through the mother, but not through the father, or through the father, but not through the mother. The primitive clan, found in savagery and the lower stages of barbarism, is a totemic group (see TOTEMISM), or 'totem kin.' Its members hold sacred some species or variety of plant or animal, regarded as female in sex, and claim to be descended from it. Such are in many cases the clans of the Australian aborigines and of the North American Indians. Clans thus tracing descent through the mother are called matrilineal; while the clans found in a higher stage of social evolution, as among the Arabs, the Greeks, and Romans, and the Slavs, Celts, and Teutons at the dawn of European history, in which descent is reckoned through fathers, are called patrilineal. The Greek *génos*, and its equivalent form the Roman *gens*, were highly developed patrilineal clans. The discovery that the totemic organization of the North American Indians was in all essentials like

the Roman *gens*, except in being matrilineal, was made by Lewis H. Morgan. From this discovery to that of the practical universality of the clan as the characteristic social form of tribal communities was but a step, and the wider generalization was offered by Morgan in his *Systems of Consanguinity and Affinity*. The functions of this clan are economic, religious, and juristic. It usually holds common property, and a burial-place. It regulates marriages; in the primitive clan the clansman may not marry his own clanswoman. This restriction was breaking down in the Roman *gens* at the beginning of the authentic historic period. All clansmen were bound to defend one another, and to redress one another's injuries. In Morgan's writings the word *gens* is everywhere used for clan, and his use of *gentile* to distinguish tribal from civil society has been usually followed.

GENSAN, gèn'sân'. See WON-SAN.

GEN'SERIC (?-477). King of the Vandals. He was an illegitimate son of Godigisidus, who led the Vandals into Spain. After the death of his brother Gonderic, Genseric became sole ruler. In the year 429 he invaded Africa, on the invitation of Boniface, Count of Africa, the viceroy of Valentinian III., Emperor of the West, who had been goaded on to rebellion through the machinations of his rival Aëtius. Genseric's army at first amounted to 50,000 warriors. As they swept through Mauritania, the Kabyle mountaineers and the Donatist heretics swelled the horde, and more than equalled their associates in acts of cruelty and bloodthirstiness. The friends of Boniface, astonished that the hero who alone had maintained the cause of the Emperor and his mother Placidia during their exile and distress should have been guilty of such a crime, attempted, with ultimate success, to bring about an interview between the Count of Africa and an agent of the Empress. The army he hurriedly collected to oppose the Vandals was twice defeated by Genseric, and he was compelled to retire to Italy, where he was soon afterwards slain by Aëtius. All Africa west of Carthage fell into the hands of Genseric, who shortly after seized that city itself, and made it, A.D. 439, the capital of his new dominions. He also took possession of part of Sicily, Sardinia, and Corsica. In the year 451 he encouraged Attila to undertake his great expedition against Gaul. Tradition states that, at the request of Eudoxia, the widow of Valentinian, who was eager for revenge upon her husband's murderer, Maximus, Genseric in the year 455 marched against Rome, which he took, and abandoned to his soldiers for fourteen days. On leaving the city he carried with him the Empress and her two daughters, one of whom became the wife of his son Huneric. The Empire twice endeavored to avenge the indignities it had suffered, but without success. First the Western Emperor, Majorian, fitted out a fleet against the Vandals in 457, which was destroyed by Genseric in the bay of Carthage; second, the Eastern Emperor, Leo, sent an expedition under the command of Heraclius and others in 468, which was also destroyed off the city of Bona. Genseric died in 477, in the possession of all his conquests, leaving behind him the reputation of being the greatest of the Vandal kings. He seems to have regarded himself as a 'scourge of God.' In creed Genseric was a fierce Arian, and in-

flicted the severest persecutions upon the orthodox or Catholic party.

GENSFLEISCH, gän's'flish. See GUTENBERG, JOHANNES.

GENSICHEN, gën'sik-en, OTTO FRANZ (1847—). A German author, born at Driesen, Prussia, and educated at Berlin. After an association as dramaturgist with the Wallner Theatre, in Berlin (1874-78), he devoted himself exclusively to literary work. His principal publications include: *Gedichte* (2d ed. 1871); *Vom Deutschen Kaiser*, 12 poems (4th ed. 1871); *Felicia*, an epic (16th ed. 1882); and several novels in verse and prose. He also published the memoirs entitled *Aus Marie Seebachs Leben* (1900).

GENSONNÉ, zhän'só'ná', ARMAND (1758-93). A French legislator, born at Bordeaux. He was the author of the law of December 31, 1791, whereby the brothers of the King and several members of the aristocracy were publicly accused. The decree of confiscation against the property of the emigrants (February 9, 1792) was also drawn up by him. He subsequently was made president of the National Convention, but afterwards was accused of treason (October 3, 1793) and was executed with his associates. He was a man of high character and a highly effective speaker.

GENTH, gënt, FREDERICK AUGUSTUS (1820-93). An American analytical chemist and mineralogist, born at Wächtersbach, Hesse. He was educated at Heidelberg, at Giessen under Liebig, and at Marburg under Gerling in physics, and in chemistry under Bunsen, whose assistant he was from 1845 to 1848, when he went to Philadelphia and set up an analytical laboratory. In 1872 he was appointed to the chair of chemistry in the University of Pennsylvania, but resigned in 1888, and again opened his laboratory. He established twenty-three new minerals; wrote one hundred and two articles, mostly on chemistry and mineralogy; and was best known for his *Researches on the Ammonia-Cobalt Bases*, with Wolcott Gibbs (1856); for his studies of "Corundum" (in *American Philosophical Society Proceedings*, 1873); for his reports, as chemist and mineralogist to the Geological Survey of Pennsylvania, on the mineralogy of the State; and for his analyses for the State Board of Agriculture. He was a member of the American Philosophical Society (1854-93), one of the founders of the American Chemical Society, and its president in 1880, a member of the National Academy of Sciences and a fellow of the Boston Academy of Arts and Sciences.

GENTIAN, jën'shan (Lat. *gentiana*, Gk. γέντιανη, *gentianē*, said to have been named after an Illyrian king, defeated by the Romans about B.C. 160, *Gentius*, Gk. Γέντιος, who first discovered the properties of the plant). A genus of plants of the order Gentianaceæ. The species are numerous, natives of temperate and boreal parts of Europe, Asia, North and South America, and New Zealand, many of them growing in high mountain pastures and meadows, which they adorn by their beautiful blue or yellow flowers. The common gentian or yellow gentian (*Gentiana lutea*) is abundant in the meadows of the Alps and Pyrenees at elevations of 3000 to 6000 feet. It has a stem three or four feet high,

ovate-oblong leaves, and numerous whorls of yellow flowers. The part employed in medicine is the root, which is cylindrical, ringed and more or less branched, and which appears in commerce in a dried state, in pieces varying from a few inches to more than a foot in length, and from half an inch to two inches in thickness. It is collected by the peasants of the Alps. Although gentian-root has been examined by various chemists, its constituents are not very clearly known; it contains, however, gentiopicrotin, gentisic acid, pectin, fixed oil, and sugar. As much as 14 per cent. of the last is present, and in consequence of it an infusion is capable of undergoing fermentation and of forming the 'bitter snaps' or 'Enziangeist' which is much employed by the peasants on the Swiss Alps. Gentian is a highly valued medicine, a simple tonic, bitter without astringency, and is much used in diseases of the digestive organs, and sometimes as an anthelmintic. The bitter principle on which its virtue depends exists in other species of this genus, probably in all, and appears to be common to many plants of the same order. The roots of inferior quality of the species *Gentiana purpurea*, *Gentiana punctata*, and *Gentiana pannonica* are often mixed with the gentian of commerce. Among the most common European species are *Gentiana campestris* and *Gentiana Amarella*, plants of a few inches in height, with small flowers, both of which are in use as tonics in domestic medicine. *Gentiana Saponaria*, a North American species, is extensively used in its native country as a substitute for common gentian, and *Gentiana Kurroo* is employed in the same way in the Himalayas. Several species of gentian are common ornaments of gardens, particularly *Gentiana acaulis*, a small species with large blue flowers, a native of the countries of Europe and of Siberia, often planted as an edging for flower borders. *Gentiana Andreuxii* and *Gentiana puberula*, American species, the former known as closed gentian or bottle gentian from the non-opening of the flowers, and the latter with blue, funnel-shaped flowers, are common in American gardens. Of the fringed gentian species *Gentiana crinita* is particularly celebrated for the beauty of its flowers, which are large, blue, and fringed on the margins. It has a branched stem and grows in wet ground. The brilliancy of the flowers of the small Alpine species has led to many attempts to cultivate them, which have generally proved unsuccessful, apparently from the difficulty of imitating the climatic and soil conditions of their native heights. The horse-gentian is *Triosteum perfoliatum*. See FEVERWORT, and Colored Plate of MOUNTAIN PLANTS.

GENTIANACEÆ, jën'shan-ä'sé-ë (Neo-Lat. nom. pl., from Lat. *gentiana*, gentian), the gentian family. An order of dicotyledonous plants, most of which are herbaceous, though a few are small shrubs. Many of the herbaceous species are perennial from a rhizome. The leaves are, for the most part, opposite, and without stipules. The inflorescence is some form of cyme, and the flowers are usually regular. The calyx is 5, sometimes 4, 6, 8, or 10 parted. The corolla, which is hypogynous, has the same number of lobes as the calyx. The stamens are of the same number as the corolla-lobes and the ovary, which consists of two carpels, and contains numerous small seeds. The family embraces about 60

genera and more than 700 species. Species of this order are found in nearly every part of the globe, and in all sorts of situations. Some are arctic and alpine plants, some are saprophytes, some grow in dry situations, others in marshes, while the species of one genus are aquatic in habit. The flowers of many are of great beauty both as to color and form, and some are cultivated as ornamentals. Medicinal properties are attributed to some. The genera of this order have been variously grouped dependent upon the characters used, one of the latest classifications being based upon pollen characters. The chief genera are: *Gentiana*, *Erythraea*, *Chlora*, *Swertia*, *Menyanthes*, *Limnanthemum*, and *Voyria*. See BUCKBEAN; GENTIAN; CENTAURY.

GENTILE DA FABRIANO, jën-tê'lâ dâ fâ'brê-â'nô (c.1360-c.1428). An Italian painter, called Fabriano from his birthplace (Fabriano, in the March of Ancona). He belongs to the early Umbrian and Sienese schools, was the pupil of Allegretto Nuzi, and has also been called the pupil of Fra Angelico, but this is not probable. He painted in Brescia, Siena, but chiefly in Florence (1421-25), and then went to Orvieto. In 1426 he executed paintings for Pope Martin V. in the Church of San Giovanni in Rome, and other works, all of which have been destroyed. His extant pictures include a "Coronation of the Virgin," portions of which are at the Brera in Milan; and the centre panel at Fabriano, the "Adoration of the Magi," his masterpiece, most of which is in the Accademia di Belle Arti at Florence, the remainder, a "Presentation," in the Louvre, Paris. There are also a "Holy Family" in the Louvre; some scenes from the life of Christ in the Berlin Museum; and a "Crucifixion" in San Agostino de Bari. His beautifully studied pictures sparkle with gold and colors like jewels. His figures are always animated and his faces smiling, wherever they appear. He belongs to the transition period of the fifteenth century. Although he clung to primitive methods of painting, in technical knowledge he went beyond the artists of his time. Jacopo Bellini was the pupil of Fabriano, and worked with him in Florence.

GENTILES (Lat. *gentilis*, belonging to a clan, or family, from *gens*, tribe, family). A term often used in the Bible, especially in the New Testament, to designate the non-Israelitic peoples. It represents the Hebrew *goyim* (pl. of *goi*), 'nations.' The peculiar significance of the term Gentile in Jewish and early Christian usage simply marks the crystallization of a long previous process of doctrinal development.

Prior to the conquest of Canaan, Israel's life was of a strictly tribal character, and in accordance with the common Semitic ideas the tribes constituting Israel probably felt that they differed from other tribes or peoples only in the fact that they worshiped their God, Yahweh, while the other peoples worshiped their particular deities. Hence in the old stories of the patriarchal age there is manifest no special hostility or attitude of superiority toward the surrounding nations.

The occupancy of Canaan and the development of a vigorous Hebrew nationality after a long struggle with the old inhabitants and with outside nations led to a new and more positive national consciousness. Israel was now a people (Heb. *'am*), Yahweh's people, one of the *goyim*

of the earth, ready to assert its peculiar rights and privileges.

The historical narrative pointed out how Israel was specially called of Yahweh to be His own peculiar people, and the legislation defined the legal status of foreigners residing in the borders of Israel. The early Hebrew law distinguished two classes of such non-Israelites—the *ger*, i.e. sojourner, a permanent resident and in sympathy with Israel's life, and the *zar* or *nokri*, i.e. the stranger or foreigner, who was not looked upon so favorably. As to the *ger*, the law required of him obedience to the Sabbath law, and provided that he was not to be vexed or oppressed. He could also present an offering to the priests, which was not allowed to the *nokri* (Lev. xxii. 25).

In the prophetic teaching (c.750 B.C. to the Exile) the contrast between Israel and the nations (*goyim*) is most forcibly expressed. Israel's place is unique, and while Yahweh's gracious attitude toward other nations is fully asserted, still it is through Israel that such blessings are to come to them. With this advocacy of Israel's peculiarly exalted position the prophets also insisted on the open-hearted favorable treatment of the sojourners in Israel required by the older laws.

The legislation in Deuteronomy, influenced by prophetic thought and the teachings of Ezekiel, and the later priestly legislation of the Pentateuch reveal the growth of the tendency to draw the lines more rigidly between the Israelites and the foreigners. As a result we have such teachings as these: The *ger* and *nokri* may eat that which dies of itself (Deut. xiv. 21); the *nokri* is not entitled to the privilege of the year of release (xv. 3); no *nokri* has a right to the throne of Israel (xvii. 15); one may lend on interest to the *nokri* (xxiii. 20). Furthermore, not only could no *nokri* make an offering, but he also could not enter the sanctuary (Ezek. xlv. 7, 9), nor eat of the Passover (Ex. xii. 43). If a *ger* desired to eat of the Passover, he must be circumcised, and thus become legally a full Israelite (Ex. xii. 48).

Such principles as these, which were the fundamental law of the Jewish communities of exilic and post-exilic time, show how at last the conviction became deeply rooted and clearly expressed that Israel was, theoretically, a holy entity, a people by itself, altogether unique among the peoples of the earth. The other peoples, the *goyim*, were *per se* profane. The Israelite could not meet them as equals. The work of Ezra and Nehemiah was of great influence in this respect. Henceforth the attitude toward the non-Israelite manifested two marked phases. On the one hand was the insistence on the idea of separation, of exclusiveness, under all circumstances, so that the Jew, not only in Palestine, but also in the Dispersion, scattered among the Gentiles, was ever a Jew, holding himself aloof from intimate familiar intercourse with the non-Israelite, with a lofty contempt for Gentile ideas and customs. These feelings were the more intensified by the bitter struggles of the Maccabean times, and were shared by the great majority of Jews, even of the humble classes, in New Testament times (cf. Acts x. 28). Practically, violations of these principles were constantly occurring. There were certain limits,

however, which no Gentile could ever overstep, e.g. the prohibition in the Temple of Herod marking off the court of the Gentiles from the precincts in which Israelites were allowed, reading as follows: "No foreigner may enter within the railing and fence about the sanctuary. Whoever is caught so doing renders himself guilty, for death follows."

On the other hand, the early and prophetic teachings, and the legal sentences recommending kindness to the *ger* and emphasizing Yahweh's care for the nations, coupled with the conviction that as a Jew he possessed in his Scriptures the only satisfactory all-sufficient revelation, all combined to make the Jew willing, even anxious, to win over the foreigners with whom he was in contact, to adhesion to Judaism. Hence arose the practice of proselyting. In later Jewish usage the word for proselyte was the old word *ger*, which indicated the most favorable status of the foreigner. The Maccabean princes compelled conquered peoples—the Idumæans, for example—to become Jews, i.e. be circumcised. But more usually these efforts were carried on privately and with astonishing success, when we remember the almost universal contempt for Jews among the cultivated Greeks and Romans. Strictly speaking, there was but one class of proselytes—those who fully accepted Judaism, and, if males, became circumcised. These were called in later rabbinical literature 'proselytes of righteousness.' Others, who did not fully embrace Judaism, but were favorably disposed toward it, and accepted many of its doctrines and practices, were held in high esteem in the Jewish communities.

In the early Church the relation of the Gentiles to Christianity became a most important question—were they to be received mediately, through Judaism, and thus become Christian Jews, or immediately accepted into the Christian brotherhood without being required to be circumcised and obligated to keep the Jewish law? While many early Christians took the former position, Paul advocated the latter, and thus broke down the barrier between the religion of Yahweh and the Gentile world.

GENTILESCHI, jën'të-lës'kë. A family of Italian painters. ORAZIO (1563-1647), the father, was born at Pisa. He was also called Lomi, being a pupil of his half-brother and uncle by that name. At Rome, in conjunction with Agostino Tassi, a landscape painter, he decorated the interiors of a number of palaces. In 1621 he went to Genoa, where he painted "David after the Death of Goliath" in the Palazzo Doria. He visited England in 1626, where he secured the patronage of Charles I. and was himself painted by Van Dyck in his series of portraits of illustrious men. Among his best works are "Saints Cecilia and Valerian" in the Palazzo Borghese, Rome; "Joseph and Potiphar's Wife" at Hampton Court; "Moses Saved from the Waters" in the Madrid Museum. He died in London.

His son FRANCESCO assisted his father in England, but of his work little is known.—ARTEMISIA GENTILESCHI, the daughter of Orazio, born at Rome, in 1590, studied under her father and Guido Reni. She accompanied her father to England and, in the opinion of Horace Walpole, excelled her parent in portraiture. Her "Judith and Holofernes," a subject which she often re-

peated, is in the Florence Gallery. Among her other works are "Women Caressing Pigeons," in the Madrid Museum; portrait of herself in Hampton Court, and in the New York Historical Society is her painting "Christ Among the Doctors."

GENTILESSE, jën'ti-lës'. A poem of Chaucer's which has been preserved as the fifteenth to seventeenth stanzas of "a morale balade of Henry Scogan, Squyer." The latter has been printed *in toto* in all editions of Chaucer's works from Caxton to Skeat, but the interpolation was pointed out long ago by John Shirley, the fifteenth-century copyist. Skeat was the first to print Chaucer's part of the poem separately. The poem was originally addressed to 'the Lordes and Gentilmen of the Kinges house.' Scogan was an admiring fellow-poet and disciple of Chaucer's.

GENTILI, jën-të'lé, ALBERICO (1552-1608). An Italian-English jurist, born at Sangenesio (Ancona). He received the degree of doctor of law from the University of Perugia. Because of his Protestant views he was forced to leave his native town and to flee to Carniola, and finally to England, where he was appointed lecturer on Roman law at Oxford, and afterwards regius professor of civil law there. So great was his reputation that he was consulted by the Government when Mendoza, the Spanish ambassador, was found to be plotting against Elizabeth (1584). His book *De Legationibus Libri Tres* (1584) discusses this subject. He also wrote *De Jure Belli Libri Tres* (1598), a collection of disputations on the law of war. In 1605 he was made standing counsel for the King of Spain. The notes he made while acting in this capacity were published posthumously, under the title *Hispanice Advocacionis Libri Duo* (1613). Gentili is considered to have rendered valuable services to international law, and Grotius is said to be indebted to him for much that is valuable in his own writings.

GENTILLY, zhän'të'yé'. A town of France, situated in the metropolitan Department of Seine, about two and one-half miles south of Paris (Map: France, C 7). The great bastioned wall of Paris passes through the town, separating it into two portions, called Great and Little Gentilly. The parish church dates from the thirteenth century. There are extensive chemical works, potteries, and tanneries. Population, in 1901, 7433.

GENTLE. A maggot. See FLESH-FLY.

GENTLEMAN (OF., Fr. *gentilhomme*, ML. *gentilis homo*, man of breeding, from Lat. *gentilis*, relating to a family, from *gens*, family, and *homo*, man). Originally, a person whose kindred was known and acknowledged; which is the sense in which it is still employed when it is not intended to make any reference to the moral and social qualities of the particular individual. One who was *sine gente*, on the other hand, was one whom no *gens* acknowledged, and who might thus be said to be ignobly born.

The term gentleman is often confounded with esquire (q.v.), but they are not equivalent, and the former seems in England, from a very early time, to have been a mere social epithet. But even in the beginning of the seventeenth century the word was still held to have a stricter mean-

ing, in which it was more nearly synonymous with the French *gentilhomme*, as denoting those whose blood and race were noble and known. Even here, however, it scarcely seems that any connection with a titled family was considered necessary to confer the character, for it is described as corresponding, not to nobility, in the English sense, but to *nobilitas*, in the Roman sense, and as resting on "old riches or powers remaining in one stock." There can be no doubt that, in still earlier times, patents of gentility were granted by the King of England. There is one still in existence by Richard II. to John de Kingston, and another by Henry VI. to Bernard Angevin, of Bordeaux. These patents corresponded to the modern patents of arms which are issued by the heralds' colleges in England and Ireland, and by the Lyon office in Scotland, and were probably given on the payment of fees. A patent of arms confers the rank of esquire, and there probably is no other legal mode by which an untitled person can acquire it, unless he be the holder of a dignified office. The phrase, however, is loosely applied to all persons who have not themselves 'risen from the ranks,' or in a still less limited sense to those who, whatever their origin, display the qualities associated with 'gentle' birth.

GENTLEMAN DANCING-MASTER, THE. A comedy by Wycherley (1671). The plot is chiefly concerned with the schemes of a daughter and her lover—disguised as a dancing-master—to escape the vigilance of her father, a city merchant who affects the Spanish Don.

GENTLEMAN GEORGE. A sobriquet of George IV. of England. It was also used of Senator George H. Pendleton of Ohio, because of his courtesy in debate.

GENTLEMAN USHER, THE. A comedy by Chapman. It appeared in 1606, and contains several passages of much beauty and refinement.

GENTLEMEN-AT-ARMS. One of the body-guard of the British sovereign. Its full title is "His Majesty's Bodyguard of the Honorable Corps of Gentlemen-at-Arms." Instituted in 1509 by Henry VIII., and called "Gentlemen Pensioners," it received its present name in 1834. With the exception of the Yeomen of the Guard, it is the oldest corps in the British service. It is composed of a captaincy, the Gold Stick, value £1200 a year; a lieutenantcy, the first Silver Stick, £500; a standard-bearership, the second Silver Stick, £310; a clerkship of the check, £120; an adjutancy, a sub-officership, and forty memberships, £70 each. The corps does duty only at drawing-rooms, levees, and on important State occasions. The appointments are Crown gifts on the commander-in-chief's recommendation, and are given to military officers of service and distinction on half pay or retired full pay. The captaincy is vacated with each Ministry.

GENTLE SHEPHERD, THE. A pastoral drama by Allan Ramsay (1725). It concerns itself with the sentimental conversations of the peasants on a Scottish estate. The slim plot is furnished by the return in disguise of their long absent master, and by the loves of Roger and Patie. The play was elaborated from a poem of the author's called *Patie and Roger*, published four years earlier.

GENTLE SHEPHERD, THE. A nickname of George Grenville originating from a satirical aside of Pitt's during debate in the House. In considering the advisability of an additional duty on cider, Grenville bewailed in languid utterance the increase of taxes after the late war, and demanded *where* they could now be laid. Not receiving an answer, he repeated the inquiry; and Pitt responded softly in the words of the old song: "Gentle Shepherd, tell me where."

GENTOO'. A corruption of the Portuguese *gentio* (gentile, heathen), formerly used to designate various Hindu and Dravidian-Kolarian peoples of India, the Telugu, or Telingas, in particular.

GENTRY, MEREDITH POINDEXTER (1809-66). An American statesman. He was born in Rockingham County, N. C., and was chiefly self-taught. With a natural aptitude for oratory, he soon became widely known as a public speaker, and in 1839 was sent by his Whig constituents to the twenty-sixth Congress. Here he became distinguished for his frank and straightforward attitude in regard to the slavery question, his advocacy of the policy of receiving petitions for the abolition of slavery, and his strong speech favoring the restoration of exclusive patronage. He subsequently served in Congress as Representative from Tennessee from 1841 to 1843, from 1845 to 1847, and from 1847 to 1853. In 1862 and again in 1863 he was a member of the Confederate Congress, where, however, he was noted for his moderate policy. He was accounted one of the best informed men of his day on political history. One of his notable oratorical feats was an extempore eulogy of Henry Clay, which Alexander H. Stephens characterizes as 'apt, powerful, and pathetic.'

GENTZ, gents, FRIEDRICH VON (1764-1832). A German publicist, born at Breslau. He studied law at Frankfort and Königsberg, became in 1786 Secretary of the General Directory in the Prussian service, and in 1793 was made a Prussian war counselor. A disciple of Kant and of Rousseau, he at first looked with favor upon the revolutionary movement in France; but was converted by the course of the extremists, and by the influence of Burke, whose essay on the French Revolution Gentz translated in 1794, together with the writings of Mallet du Pan and Mounier (1794-95). He spent some time in England, and became a strong advocate of the English constitutional system. He founded two reviews, *Neue Deutsche Monatschrift* (1795-98), and the *Historisches Journal* (1799-1800). His presentation of his constitutional views in a letter to Frederick William III. on the latter's accession to the Prussian throne not being favorably received, Gentz entered the Austrian service as an Imperial counselor (1802). He was a bitter opponent of Napoleon, and advocated the coalition with England against France. In 1804 he wrote *Fragmente aus der Geschichte des politischen Gleichgewichts von Europa*, and he was the author of several of the proclamations directed against the French. After the Peace of Vienna, in 1809, Gentz dropped his liberalism, and became the facile instrument of Metternich's reactionary policy. He brought out, in 1818, a reactionary review, the *Wiener Jahrbücher der Litteratur*, and was the secretary of the Austrian plen-

potentaries at the Congresses of Vienna (1815), Aix-la-Chapelle (1818), Troppau, Laibach, and Verona (1820-22). For these services he received large pecuniary rewards, which he squandered in dissipation. He was a political thinker of some ability, and his classic and vigorous literary style made his services sought for; but he was always mercenary, and wholly lacking in fixed principles. He died at Vienna, June 9, 1832. His more important writings are contained in the collection edited by Weickz: *Ausgewählte Schriften* (5 vols., Stuttgart, 1836-38); in the *Kleine Schriften*, edited by Schlesier (5 vols., Mannheim, 1838-40); and in the *Mémoires et lettres* edited by Prokesch-Osten (4 vols., Vienna, 1873-74); also *Briefwechsel zwischen Friedrich Gentz und Adam Müller, 1800-29* (Stuttgart, 1857); and *Dépêches inédites du Chevalier de Gentz aux hospodars de Valachie 1819-28* (Paris, 1876). For his biography, consult: Schmidt-Weissenfels (Prague, 1859); Mendelssohn-Bartholdy (Leipzig, 1867); and Fournier, *Gentz und Cobenzl* (Vienna, 1880).

GENTZ, WILHELM (1822-90). A German genre and landscape painter, noted for his delineations of Oriental life and scenery. Born at Neu-Ruppin, Brandenburg, he turned from his studies at the University of Berlin to take up painting at the Academy and in the studio of Kloeber, then frequented the Academy of Antwerp, and from 1846 to 1852 studied with interruptions in Paris, first under Gleyre, later under Couture (1848 and 1853). In the meanwhile, he had traveled in Spain, Morocco, and Egypt, which he subsequently revisited five times, attracted magically by that Oriental world and scenery which he afterwards depicted with such consummate skill and brilliancy. Trips to Nubia, Asia Minor, Turkey, and Algeria followed later, after he had settled in Berlin in 1858, and begun the long series of his remarkable delineations of life in the Orient. His early pictures, biblical subjects with life-size figures, such as "Christ Among the Pharisees and Publicans" (1857, Chemnitz Museum), met with scant appreciation, and even his Oriental scenes worked their way to success only gradually, as their realistic treatment did not at first appeal to minds in which an ideal conception of the Eastern fairy world was deeply rooted. But the true merit of his faithful characterizations once understood, his fame grew apace with the appearance of each new picture, and he was deservedly ranked on a par with the foremost French artists in that line. Among his numerous paintings, in which figures and landscape are treated with equal mastery, the most prominent are: "Transportation of Slaves Through the Desert" (1860, Stettin Museum); "Prayer of Mecca Caravan" (1868); "Evening on the Nile" (1869); "Funeral Rites near Cairo" (1872, Dresden Gallery); "Meeting of Two Caravans in the Desert" (1873); "Entry of the Crown Prince of Prussia into Jerusalem, 1869" (1876, National Gallery, Berlin), one of his masterpieces, for which he made special studies in Palestine in 1873; "Market Scene in Algiers" (1879); "Memorial Service at Rabbi's Grave in Algiers" (1881, Leipzig Museum); "Palm Sunday in Early Christian Times" (1886); and "Evening on the Cataracts of the Nile" (1887). He also contributed illustrations to Ebers's *Egypt* and to some of his novels. He

was professor at the Berlin Academy, and since 1877 member of its senate.

GENUFLEXION (ML. *genuflexio*, from Lat. *genus*, to bend the knee, from *genu*, knee + *flexere*, to bend). The act of kneeling or bending the knees in worship. As an act of adoration, or reverence, there are frequent allusions to genuflexion in the Old and in the New Testaments; as Gen. xvii. 3, 17; Num. xvi. 22; Luke xxii. 41; Acts vii. 60; ix. 40; Phil. ii. 10. That the use continued among the early Christians is plain from the *Shepherd* of Hermas, from Eusebius's *History*, and from numberless other authorities; and especially from the solemn proclamation made by the deacon to the people in all the liturgies—"Flectamus genua" (Let us bend our knees); whereupon the people knelt, till, at the close of the prayer, they received a corresponding summons—"Levate" (Arise). It is worthy of remark, however, that in celebration of Christ's rising from the dead, the practice of kneeling at prayer, as early as the age of Tertullian, was discontinued throughout the Easter-time, and on all Sundays through the year. The kneeling posture was especially assigned as the attitude of penance, and one of the classes of public penitents in the early Church took their name, *genusflectentes*, from this circumstance. In the modern Roman Catholic Church the act of genuflexion implies the highest form of worship, and is frequently employed during the mass, as well as whenever persons enter or leave the church or pass in front of the altar on which the Blessed Sacrament is reserved; if it is publicly exposed, the genuflexion is made on both knees. In the Anglican Church the rubric prescribes the kneeling posture in many parts of the service; and this, as well as the practice of bowing the head at the name of Jesus, was the subject of much controversy with the Puritans.

GENUS (in biology). See CLASSIFICATION OF ANIMALS.

GENUS (in logic). See PREDICABLES.

GE'OCENTRIC (from Gk. γῆ, *gê*, earth + κέντρον, *kentron*, centre). A term used in astronomy to describe the motions and positions of the heavenly bodies such as they would appear to an observer at the earth's centre. See HELIOCENTRIC.

GE'ODES (Lat. *geodes*, sort of gem, from Gk. γεώδης, earthlike, from γῆ, *gê*, earth + εἶδος, *eidos*, form). Rounded hollow concretions, or indurated nodules, either empty or containing a more or less solid and free nucleus, and having the cavity frequently lined with crystals. They are sometimes called 'potato stones,' on account of their size and shape. The name seems to have been given them because they are occasionally found filled with a soft earthy ochre.

GEOD'ESY (from Gk. γεωδαισία, *geôdaisia*, art of mensuration, from γῆ, *gê*, earth + δαίειν, *daiein*, to divide). The science of the earth, its size, shape, and figure. The operations of the geodesist are primarily a mere extension of ordinary surveying (q.v.), so as to cover a greater extent of territory, and to increase the precision of observations. Furthermore, the geodesist makes use of astronomical methods to determine the latitudes and longitudes of various important points in his survey, in

order that maps and charts may be provided with their necessary reference lines. We may, therefore, define the objects of a geodetic survey thus: to determine accurately the relative positions of widely separated points on the earth's surface and the directions and lengths of the lines joining them, and to determine astronomically the absolute positions of widely separated points on the earth's surface. In the first case, the work simply supplies a skeleton of exact distances and directions on which to base a more detailed survey of the intervening country, as described under Topographic Surveying (see SURVEYING); in the second, the results furnish the data for computing the shape and size of the earth, in addition to their use in making more detailed surveys. In both cases the points determined form the vertices of a series of triangles joining all points of the system. One or more lines in this system of triangles and all of the angles are very carefully measured, and the lengths of all the other lines in the system are computed. The azimuths of certain lines are also determined, and, if desired, the latitudes and longitudes of all the points in the system and the lengths and azimuths of all the connecting lines. The work as a whole is denominated *triangulation*.

DIAGRAM OF A GEODETIC SURVEY.

Triangulation systems are of all degrees of magnitude up to the large primary systems covering entire continents, the single lines in which

are sometimes over 100 miles long. In making a triangulation survey, the first task is to select and measure a base line. This base should be located on nearly level ground, and its situation should be selected with special reference to the location of the triangles of the system. It is measured with extreme care by means of steel tapes and metal bars, careful allowances being made for temperature, sag, pull, etc., and the measurement being repeated several times to eliminate error. By these means it is common practice to reduce the error to from 1 in 100,000 to 1 in 1,000,000; measurements have been made in which the probable error was reduced to 1 in 2,000,000. In primary triangulation the length of base line employed is usually from three to ten miles; it is from two to three miles long for secondary triangulation, and from one-half to one mile long in testing triangulation. The base line, as ab in the figure, having been measured, a point c is selected upon some distant elevation which is visible from both its ends, and here a 'station' is erected which consists of a pole or target mounted on a tower to serve as an object on which to 'sight.' A theodolite is then set up first at a and then at b , and the angles at these points are measured by sighting on the station at c . From a , a sight is also secured on d , enabling the angle $c a d$ to be measured. The theodolite is then removed to c , back sights are secured on a and b , and fore sights on d , f , and e . Movement of the instrument is then made to d , e , f , etc., in succession and the angles measured. The first triangle abc , after the instrumental readings have been completed at each apex, is a triangle in which one side, the base line ab , and all the angles are known. From these known data the lengths of the two remaining sides ac and bc are easily calculated. The side ac being calculated gives the length of one side of the second triangle acd , of which the angles are determined by instrumental readings at the apices a , c , and d . Calculation gives the length of the side dc , which is also one side of the third triangle. By repetitions of the same process triangles IV to XI, inclusive, are calculated. Generally after the system of triangles has covered a distance, as from a to m , of from 200 to 600 miles, a second base line, as km , is measured and the survey is checked up by its means.

In primary triangulation the lengths of the sides of the triangles are so great that they cannot be used as a basis for a detached survey of a small tract within one of the triangles. For this reason the primary triangles I, II, III, etc., are subdivided by a system of secondary triangulation, and these secondary triangles are again divided into tertiary triangles. The specific methods of triangulation used by the United States Government Surveys are described under Topographical Surveys, in the article SURVEYING. It may be mentioned further here that the three great surveying organizations of the Government, the Coast and Geodetic Survey, the Engineer Corps of the Army and its allied commissions, and the Geological Survey, are all engaged in extending systems of primary triangulation upon which to base their detached surveys. The Coast and Geodetic Survey has already carried a chain of triangulation around the entire coastline of the United States as a base for its charts. It has also extended a system of triangulation of the greatest geodetic refinement into several

coastal States and a great belt of transcontinental triangulation connecting the Atlantic and Pacific coasts. The Engineer Corps has extended a system of triangulation around the entire shoreline of the Great Lakes and throughout the lengths of the Missouri and Mississippi rivers. The Geological Survey has extended the work of the Coast Survey and the Engineer Corps into the interior of a considerable portion of the country. Several of the States, and particularly New York and Massachusetts, have triangulated much of the area within their boundaries.

The important general problems of geodesy relating to the earth's figure are also receiving much attention. The civilized governments of the world have formed an International Geodetic Association which meets annually. Delegates attend from the geodetic departments of the several nations, and their joint deliberations make possible a concerted attack upon large problems, and give the benefits of coöperation. At the same time duplication of work can be avoided.

Some important works on geodesy are: Clarke, *Geodesy* (London, 1888); Hagford, *Geodetic Astronomy* (New York, 1898); Merriman, *Geodesy* (New York, 1899); Wright, *Adjustment of Observations* (New York, 1884); Jordan, *Handbuch der Vermessungskunde* (Stuttgart, 1857); Helmert, *Theorien der Geodäsie* (Leipzig, 1880-84); United States Coast and Geodetic Survey annual publications; similar publications are issued by most European governments.

GEOFFREY (jəf'ri) **CRAY'ON, GENT.** See **CRAYON.**

GEOFFREY OF MONMOUTH, mōn'múth (c.1100-c.1154). A Welsh chronicler, born at Monmouth, Wales. He was consecrated Bishop of Saint Asaph in 1152, and died probably in 1154. He is the author of a famous book in Latin called *Historia Regum Britanniae* (History of the Kings of Britain), which was in circulation as early as 1139, and assumed its final shape probably a few years later. The book purports to be a translation from an ancient Kymric chronicle, which Walter, Archdeacon of Oxford, brought over from Brittany, and communicated to Geoffrey. As to how much truth there may be in the statement scholars do not agree. It has been shown that some parts are merely amplifications of the *Historia Britonum*, attributed, in its earliest form, to a certain Nennius (fl. 796). But for other parts no sources have been discovered. The book can hardly be regarded as a fabrication by Geoffrey, for it undoubtedly rests upon a mass of Kymric traditions which may have already assumed the form of a saga. Geoffrey gives the history of the kings of Britain from Brutus, the great-grandson of Æneas, down to Cadwallader, who at length, defeated by the Saxons, flees to Armorica, and then to Rome, where he dies. In the line of kings are Gorboduc, Cymbeline, and Lear. The story of the latter is related at large. Geoffrey's history is also one of the main sources (though not the only source) of the Arthur legend; and, as such, it is of the highest interest and value. Arthur indeed had been mentioned earlier; in Nennius he appears as a leader of the Britons (*dux bellorum*) in twelve great battles against the Saxons; and in William of Malmesbury's *Gesta Regum Anglorum* (1125) there are allusions to fables concerning Arthur. But in Geof-

frey first appears the Arthur legend somewhat as we now know it. Under the title of *Brut* (1155), Geoffrey's *History* was translated, with additions, into French verse by an Anglo-Norman poet named Wace. This version was rendered into English, with other additions, by Layamon in a poem also entitled *Brut* (about 1200). Geoffrey's book was first printed at Paris in 1508. The critical edition is by San Marta (Halle, 1854). For English translation, consult Thompson, *Geoffrey of Monmouth*, ed. by Giles (London, 1842). See **ARTHUR.**

GEOFFREY OF VILLEHARDOUIN, vā-lār'dwān' (c.1155-1213). A French chronicler of noble birth, born near Troyes. In 1199, while discharging the duties of Marshal at the Court of Thibaut of Champagne, he enlisted in the Fourth Crusade. He was sent as leader of an embassy to Dandolo, Doge of Venice, asking for transports for the Crusaders. Upon going to Constantinople, he was sent to Emperor Alexius to aid in settling difficulties which had arisen. He played a brilliant part in the conquest of Constantinople, and received from Baldwin I. (q.v.) lands in Macedonia and the title of Marshal of Rumania. After the defeat of Baldwin by the Bulgarians, he served Baldwin's brother Henry faithfully. He died in Thessaly. His history of the conquest of Constantinople is the earliest known historical work in the vernacular French. It is a brilliant but prejudiced account of the Fourth Crusade, in which Villehardouin seeks throughout to apologize for the misdeeds of the Christian leaders. This history was printed for the first time in 1573. The best modern edition is by De Wailly (Paris, 1872), which gives the original text of the thirteenth century, and a translation into modern French. For other editions of his writings and for secondary works, consult: Potthast, *Bibliotheca Historica Medii Ævi*, vol. ii. (Berlin, 1896); Masson, *Early Chroniclers of Europe: France* (London, n.d.).

GEOFFRIN, zhō'frān', MARIE THÉRÈSE (1699-1777). A wealthy patroness of letters, daughter of a valet-de-chambre, born in Paris. Her hospitality and liberality to men of letters earned her eulogies from D'Alembert, Thomas, and Morellet (*Eloges sur Mme. de Geoffrin*, Paris, 1812). To the *Encyclopédie* of D'Alembert and Diderot (q.v.) she contributed 100,000 francs. She died in Paris. Consult Ségur, *Le royaume de la rue Saint-Honoré, Mme. Geoffrin et sa cour* (Paris, 1897).

GEOFFROY, zhō'frwā', JEAN (1853-). A French painter, born at Marennes (Charente-Inférieure). He studied under Levasseur and Eugène Adan, and first exhibited in 1874. His paintings and illustrations chiefly depict childhood and poverty. His works in this class include "The Unfortunates," in the Luxembourg, and "The Prayer of the Humble," both sympathetically painted in a low key. He received a second-class medal in 1886.

GEOFFROY, JULIEN LOUIS (1743-1814). A French dramatic critic, born at Rennes. He studied to join the Order of the Jesuits, but upon its suppression became a teacher. He was the editor of several Royalist papers, such as the *Journal de Monsieur*, and *L'Ami du Roi*, and during the Revolution he was obliged to live in retirement. In 1806 he began his connection with the *Journal des Débats* as dramatic critic. He

was the vigorous opponent of eighteenth-century ideas, and its high priest, Voltaire, was his especial detestation; but, despite his narrowness and inordinate love of the classic, he had solid learning and a powerful pen. His daily criticisms have been collected under the title *Cours de littérature dramatique* (1819-20). He also wrote, among other volumes, *Discours sur la critique* (1779).

GEOFFROY DE VINSauf, de vān'sōf'. See VINSauf.

GEOFFROY SAINT-HILAIRE, sān'tē'la'r', ETIENNE (1772-1844). A French zoölogist, born at Etampes, France. He studied with Brissot, Haüy, and Daubenton. In 1793, when only twenty-one years old, he became professor of vertebrate zoölogy in the newly instituted Museum at Paris, and began to make the famous collection of animals in the Jardin des Plantes. In 1794 he invited Cuvier to Paris, and the two men became thenceforth associates in the field of natural history. In 1798 Geoffroy accompanied Bonaparte to Egypt, where he remained three years. In 1807 he became a member of the Académie des Sciences, and in 1809 professor of zoölogy in the Faculté des Sciences. Geoffroy Saint-Hilaire was by nature a philosopher, and by education an anatomist, and in his speculations held that a single plan of structure prevails throughout the animal kingdom. In this he was violently opposed by Cuvier, who was an empiricist and not a philosopher, and who maintained that four distinctively different types of structure were present. The two naturalists differed also in their conception of the mutability of species, Geoffroy arguing for it, and Cuvier against it. He raised teratology, or the study of monstrosities, to the rank of a science. Of his many works we may mention: *Philosophie anatomique* (1818-20); *Sur l'unité de composition organique* (1828); *Principe de philosophie zoölogique* (1830); *Etudes progressives d'un naturaliste* (1835); *Notions synthétiques, historiques et physiologiques de philosophie naturelle* (1838). For his views on species, and the relation he bore to Lamarck and the agitation leading toward the announcement of the hypothesis of evolution, consult: Packard, *Lamarck, His Life and Work* (New York, 1901); *Life of Geoffroy*, by his son (Paris, 1847).

GEOFFROY SAINT-HILAIRE, ISIDORE (1805-61). Son of Etienne. A French zoölogist. He was born in Paris, became assistant at the Museum of Natural History in 1824, and received a medical degree in 1829. He became professor of zoölogy in the Museum in 1841, and in the Faculté des Sciences in 1854, and in the same year he founded the Société d'Acclimatation. He wrote a life of his father, and also *Histoire générale et particulière des anomalies de l'organisation chez l'homme et les animaux* (1832-37) and *Histoire naturelle* (1854-62).

GEOG'NOSY (from Gk. γῆ, gē, earth + γνῶσις, gnōsis, knowledge). A study of the materials of which our planet consists. The term is not synonymous with geology, which concerns itself not only with the materials of the earth, but with theories as to their arrangement, succession, and development. As applied to rocks, the term geognosy is now superseded by petrography. See GEOLOGY.

GEOGRAPHICAL BOTANY. See DISTRIBUTION OF PLANTS.

GEOGRAPHICAL DISTRIBUTION OF ANIMALS. See DISTRIBUTION OF ANIMALS.

GEOGRAPHICAL NAMES, UNITED STATES BOARD ON. An organization for the purpose of introducing uniformity in the orthography and pronunciation of geographical names, instituted in 1890 by President Harrison, at the instance of a number of the Government departments, engaged in publishing maps, charts, and surveys. The arbitrary manner in which geographic names were spelled and pronounced prior to that time resulted in considerable confusion, particularly in the Post-Office Department, where names were often assigned to stations not at all in accord with common usage. The transliteration of Indian names and the Russian nomenclature in Alaska were also found to be misleading. To remedy these evils this board, at first a voluntary organization, was instituted with power to make final decision, binding upon all departments of the United States Government in cases where there existed a divergence in the spelling or pronunciation of geographic terms. The Board consists of twelve members, representing the Treasury, Navy, War, Interior, Agriculture, Post-Office departments, Smithsonian Institution, and the Government Printing Office. The Board aims, as a rule, to follow local usage, and to simplify names by dropping unnecessary letters, syllables, and the combination of compounds. In 1898 the Board was called to decide upon an extensive list of geographic names in the Philippines. The Board's reports have been published by direction of Congress.

GEOGRAPHICAL SOCIETY, AMERICAN. An association founded in New York City in 1852 to encourage geographical exploration and discovery. It seeks to diffuse geographical information, and for this purpose, coöperates with foreign consuls, missionaries, and nearly two hundred foreign scientific societies. It maintains a large library housed in a building valued at over \$300,000. There are 30,000 volumes, a large collection of charts, maps, atlases, all so indexed as to give specific information with the least possible amount of research. A journal called the *Bulletin*, giving the transactions of the society and much geographical information, is published five times a year. The society has given financial support to nearly all the Arctic explorations of the last half-century. Judge Charles P. Daly, president of the society for many years, left \$50,000 to it by bequest. In 1902 the society had 1300 members.

GEOGRAPHICAL SOCIETY, ROYAL. An association for the advancement and diffusion of geographical science, and for the encouragement of exploration, founded at London in 1830 and chartered in 1859. It had its inception with members of the Raleigh Dining Club, an organization of travelers, who desired to establish a society to aid scientific research in geography. It began its career under very favorable auspices, 460 fellows having enrolled the first year, among them the King, the Duke of Wellington, prominent army and navy officers, and leading scientists, whose number had increased by 1901 to over 4000. In 1832 it began to publish annually the results of investigations, together with its proceedings in the *Royal Geographical*

Journal; but the gradual increase in the contributions necessitated the reorganization of the publication, and accordingly in its place was substituted in 1880 a monthly magazine, entitled *The Proceedings of the Royal Geographical Society and Monthly Record*, which name was in 1893 changed to *The Geographical Journal*. In addition to the *Journal* the society also issues the *Year Book and Hints to Travelers*. It expends considerable sums every year for the encouragement of research and exploration. At the instance of the society Oxford appointed in 1888 a reader in geography, and in the same year Cambridge appointed a lecturer in geography, the society paying two-thirds of his salary. Since 1879 courses of instruction in the use of astronomical and surveying instruments have been offered under the auspices of the society to travelers, with the result that many of them have contributed to the library original charts and maps. The library of the society contains about 34,000 volumes, and a large collection of charts, maps, and globes.

GEOGRAPHICAL SOCIETY OF BALTIMORE. A society organized in 1902 for the purpose of promoting an interest in geographical science by public lectures and other meetings and by the encouragement of investigation. Daniel C. Gilman was elected first president of the society, which has nearly 1000 members on its rolls.

GEOGRAPHICAL SOCIETY OF PHILADELPHIA. The Geographical Society of Philadelphia had its inception in 1891. Two years later a charter was granted to the Geographical Club of Philadelphia, of which Angelo Heilprin was first president. In 1897 the society assumed its present title. It has contributed materially to the extension of geographical knowledge by supplying funds to exploring expeditions, by issuing a bulletin at intervals during the year, and through its library. The society confers annually a gold medal—known as the Elisha Kent Kane Medal—as a reward for eminent geographical work. It has been awarded in turn to Dr. A. Donaldson Smith and Commander R. E. Peary, U.S.N. The membership numbered 430 in 1902. In addition to its monthly stated meetings, the society has aimed to foster a local interest in geography by organizing courses of lectures of an educational character, and by offering prizes to public school scholars for essays on geographical subjects.

GEOGRAPHIC SOCIETY, NATIONAL. An organization with headquarters at Washington, in the District of Columbia, formed in 1888 to increase and diffuse geographic science. It offers annual courses of lectures in Washington upon popular geographical subjects, and publishes monthly the *National Geographic Magazine*. Its membership has increased rapidly and now numbers about 3000.

GEOGRAPHY (Lat. *geographia*, Gk. *γεωγραφία*, from *γεωγράφος*, *geographos*, geographer, from *γη*, earth + *γράφειν*, *graphein*, to write). Until recent years the science of this science, if it could be called science, has been confined, in the main, to a bald description of the earth, its phenomena, its countries, and its inhabitants. It has comprised little more than a collection of facts. In recent times, however, in common with

other branches of science, it has advanced greatly, especially in the study of the causes of phenomena. As its scope is now recognized, it may be defined as the science which concerns the earth's surface, including the areal distribution of all phenomena pertaining thereto, with the causes therefor. It may be divided into mathematical, physical, political, and economic geography.

Mathematical geography treats of the form, size, and movements of the earth, and herein is connected closely with astronomy; of parallels, meridians, latitudes, longitudes, projections, and methods of delineating the earth's surface, and hence includes geodesy, surveying, and cartography.

Physical geography treats of climate, including atmospheric pressure, temperature, and rainfall, which is the areal application of meteorology; of hydrography, including waves, tides, and currents of the sea, and the physics of the rivers and lakes of the earth; of physiography, or the study of the land forms of the earth, mountains, valleys, and plains, with their genesis, and here it touches closely upon the domain of geology; and of the distribution of life, vegetable and animal, as well as the distribution of minerals, thus applying the sciences of biology and mineralogy.

Political geography treats of man's institutions in their distribution over the earth, of countries, governments, cities, etc. It is closely related to the next and last group.

Economic geography treats of man's industries and products, of agriculture, mining, and fisheries, which yield raw materials, of manufactures, by which their forms are changed, and of trade and transportation or commerce, by which commodities are exchanged. The basis of much of this branch of geography is furnished by statistics. See GEOGRAPHY, ECONOMIC.

MATHEMATICAL GEOGRAPHY.

The form of the earth is spherical, with a slight flattening at the poles. Its equatorial diameter is 7926 and its polar diameter 7900 miles, the difference between them, 26 miles, measuring the eccentricity. This flattening of the earth at the poles is a necessary consequence of the earth's rotation about its axis. See EARTH.

The chief method employed in the determination of the size and form of the earth may be explained in general terms, without going into details. The latitudes and longitudes of two points, widely separated, are determined by astronomical means, and the direct distance between them is measured by geodetic methods. A comparison of the two methods gives the length of a degree or series of degrees of latitude and of longitude. Such arcs have been measured in various parts of the earth, from Northern Africa northward across Europe, in India, in the Andes of South America, across the United States from east to west, and southwest from New England to the Gulf coast.

Latitude is distance north or south of the equator expressed in terms of the angle subtended at the earth's centre. It is determined by measuring the angle of elevation of the sun or of any star whose position is known, when crossing the meridian of the place of observation; or most accurately, by measuring the difference between the zenith distances of two stars, whose position is known, such measurement being made by zenith

telescope. See LATITUDE AND LONGITUDE; DEGREE OF LATITUDE.

Longitude is distance east or west of a selected meridian, expressed in terms of the angle subtended at the earth's axis. The meridian of the observatory at Greenwich, England, has been almost universally adopted as the initial point for the statement of longitudes. Difference of longitude is difference of time. Since the earth revolves on its axis, i.e. turns 360° , once in 24 hours, an hour corresponds to 15° of longitude. Hence, in order to determine the difference of longitude between two places it is only necessary to determine and compare the local sidereal times of those two places. The determination of time is made by observing, with a transit instrument and chronometer, the passage of stars, whose position is known, across the meridian. The observed sidereal times of their passage, or transit, compared with their right ascensions, gives the error of the chronometer, and hence the true sidereal time. Local sidereal time of the two places is compared by the use of the telegraph. See LATITUDE AND LONGITUDE; DEGREE OF LONGITUDE.

Measurements of distance on the earth's surface are commonly made by triangulation. A base line, two to five miles long, is first measured directly, using steel wire, or tape, or bars. Angles are measured at each end of the base, between the other end and certain signals erected to the right and left, and from these signals the third angle of each triangle is measured. Then with the angles and one side known in each triangle the other sides may be computed, and these in turn become the bases for other triangles, as the work is extended. See ASTRONOMY; GEODESY.

The plane of the earth's orbit about the sun, known as the ecliptic, is inclined to the earth's equator at an angle of $23^\circ 28'$. Hence, in the course of the year the sun apparently moves north and south through an angle of $46^\circ 56'$, the equator being in the middle. The sun reaches its most northern position, which is known as the Tropic of Cancer, about June 21st, and its most southern point, the Tropic of Capricorn, about December 21st, passing the equator about March 21st and September 21st. This apparent movement of the sun causes the change of seasons.

There is an area about each of the poles of the earth where, in midwinter, the sun fails to rise above the horizon, even at midday, and where in midsummer it does not sink below the horizon, even at midnight. The circles bounding these areas are the polar circles, and the areas are the polar zones, distinguished as the Arctic and Antarctic. The areas lying between the polar circles and the tropics are the temperate zones, and that lying within the tropics the torrid zone.

Maps are representations, commonly upon flat surfaces, of all or parts of the earth's surface. The scale of a map is the relation which distances on the map bear to distances upon the area represented. They may be expressed in terms of miles or kilometers on the ground to an inch on the map, or by a fraction, as $\frac{1}{100,000}$ or 1:100,000 in which the numerator refers to the distance on the map, and the denominator to that on the ground, both being expressed in the same units, as feet, meters, or miles. A third method is by the 'bar scale,' in which actual measurements are drawn on the map, and marked with the distances which they represent in nature.

Maps may be classified in accordance with the kind of information which they present. Thus there are geological, climatic, and statistical maps. The maps considered here, however, are those only which represent the topographical features proper, the streams and other bodies of water, the relief of the country, its mountains, valleys, and plains, and the culture or the works of man, the cities, roads, railroads, boundaries, etc. Restricted to this definition, maps may be classified as: (1) Plans, which are upon large scales and represent limited areas, such as a city or township; (2) topographic maps, upon smaller scales, say from one to eight miles to an inch and covering much larger areas; and (3) geographic maps, upon smaller scales, and representing areas of States, countries, or continents. The distinction between them cannot be sharply drawn, although mainly one of scale, but it is a useful one. Another distinction may be made in maps, between the original maps, made directly from surveys, which are known as mother maps, and those derived or compiled from them.

The earth having a spherical surface and the map a plane surface, it is obvious that no map can be a strictly accurate reproduction, since there must always be error in the transfer. Various methods of projection, from the spherical to the plane surface, are in use, some applicable to one form of map, some to another. Among them are the following:

The orthographic, which is often used in the projection of a hemisphere, on a very small scale. Here the points on the hemisphere are supposed to be projected by means of parallel lines at right angles to the plane of projection, which is that of the great circle bounding the hemisphere. Here the eye is supposed to be at an infinite distance above the plane of projection.

In the stereographic projection the eye is supposed to be at the earth's surface opposite the area to be projected, the plane of projection being that of a great circle midway between them. The intersection of lines with this plane, drawn from the view-point to points to be reproduced, gives their positions. This also is used only for maps on small scales.

A third projection, also used only with small scales, is the globular projection. Here the view-point is placed on a perpendicular to the plane of projection, and at a distance outside the earth equal to the radius $\alpha 1/\sqrt{2}$, the plane of projection being similarly a great circle.

The projections in common use for geographic maps upon the larger scales and for topographic maps are the various forms of conical projections, and especially the polyconic, upon which the mother maps of nearly all nations are being made. The simple conical projection is made by assuming that the portion of the earth to be represented is wrapped in a cone, tangent to the earth at the mid-latitude of the area, its axis being the earth's axis, and its apex being on the prolonged axis. On this cone are projected by radial lines points on the sphere, and when the cone is unrolled they will appear on the flat surface. This projection is correct only on the middle parallel, and the distortion increases rapidly as the area increases. By combining many such cones, the distortion is greatly reduced, and the polyconic or many-cone projection is that in most general use for topographic maps.

A modification of the conical projection, known as the secant cone, is sometimes employed. Here the elements of the cone, instead of being tangent to the earth, cut it at two points, the cone being partly within and partly without the earth.

Mercator's projection, which is universally used in sailing charts, is supposed to be constructed on a cylinder, circumscribing the earth at the equator. Points on the earth are projected on the cylinder by radial lines from the earth's centre, and the cylinder then unrolled. Here the meridians are drawn as straight lines, parallel to one another, instead of converging as on the earth, and the spaces between the parallels are increased in the same proportion as are those between the meridians. Thus the scale of the chart increases from the equator toward the poles in the ratio of the tangent of the latitude. Because the meridians and parallels are represented as parallel straight lines, sailing courses are also represented by straight lines, a fact which renders the projection of special value to mariners.

The contents of topographic maps are commonly classed in three groups: Hydrography, including streams, lakes, and other water bodies; relief, the mountains, valleys, plains, etc.; and culture, or works of man, boundaries, cities, roads, railways, etc. The first of these groups is often represented in blue ink, the second in brown, and the last in black. These are the colors employed by the United States Geological Survey on its mother maps.

The relief has been represented on maps in various ways, but upon modern maps only two methods are employed, which may be characterized as the pictorial method and the contour method. In the first, a pictorial effect of hill shading is produced, either by the artistic use of crayon or water-color, or by drawing fine lines, parallel to the direction of slope of the ground, closest and heaviest where the slopes are steepest. When well done this hachure method produces fine pictorial effects, but it is expensive, and crayon is more commonly used at present.

The most modern method of representing relief and that which is growing into the widest use is the contour method. Here relief is shown by lines of equal altitude above the sea. These lines are drawn at right angles to the slope, and each line being everywhere at a certain height, the map shows the altitude of all parts of the region represented. Thus a contour map is a map of three dimensions, while other maps are of two dimensions only. Upon steep slopes the contours are, of course, near one another, and upon gentle slopes are far apart, and thus contours produce an effect like that of shading, but much inferior pictorially to that produced by hachures or crayon. See MAP.

PHYSICAL GEOGRAPHY.

The surface of the earth is divided between land and water in the proportions of 72 per cent. of water to 28 per cent. of land; or, in terms of area, the surface of the earth being about 197,000,000 square miles, 142,000,000 square miles are covered by water, and 55,000,000 square miles are land. Over all is spread the atmosphere, densest at the surface, and gradually becoming rarer above.

CLIMATOLOGY. This branch of physical geography is concerned with the general distribution of the phenomena of the atmosphere. The height

of the atmosphere is unknown, but from the rate at which its density diminishes with altitude above the earth's surface, it is clear that in a few miles it becomes extremely rare, so rare that its effects may be neglected. The pressure of the atmosphere at sea-level has an average value over the earth of 14 pounds per square inch, equivalent to about 30 inches of the mercurial column. In equatorial regions the pressure is slightly below and in temperate regions slightly above this average. See AIR; ATMOSPHERE; BAROMETER.

Heat is produced by the absorption of the sun's rays by the earth. The more nearly overhead the sun is, the more heat is received per unit of area, and the higher is the temperature, other things being equal. The degree of temperature at the earth's surface is, however, affected by other conditions, chief among which is the relative moisture of the air, since a moist air absorbs much of the heat before the rays reach the earth. Hence very high temperatures are not observed in moist equatorial regions, while in desert regions extraordinarily high temperatures have been observed. On the whole, however, the equatorial regions receive the greatest amount of heat, and the polar regions the least. Hence the air over the equator rises, being forced upward by the pressure of air on the north and south. This produces a flow of air toward the equator from both sides, a flow which would be directly south and north were it not for the rotation of the earth, which deflects the currents to the westward, and thus produces the well-known uniform trade winds. (See WIND.) The land absorbs heat rapidly, and is as rapidly cooled; the sea, on the contrary, absorbs heat slowly, and gives it out slowly. Moreover, by means of its waves, tides, and currents the waters of the sea circulate freely, and thus tend to establish a uniformity of temperature in its various parts. Hence it is that the sea is on an average throughout the year warmer in the north and south and cooler in the tropics than is the land in the same latitude. Moreover, the sea is cooler in summer and warmer in winter than is the land. The difference in the attitude of land and sea toward temperature produces monsoons and land and sea breezes. The latter are diurnal and strictly local. The land being heated during the day, the air over it rises, and thus induces an inward draught of air from the sea. At night, the air over the land being cooled, a reverse current is set up. The monsoon (q.v.) is a similar land and sea wind, but on a much greater scale, and is induced by differences of temperature between land and sea in summer and winter. There is a monsoon tendency on the margins of all continents, but in most cases it has little influence upon the more general movements of the atmosphere. The cooling of the land surface, and consequently of the surface atmosphere, after nightfall induces a local circulation of air in the interior of continents. This air, being cooled and consequently heavier, flows down slopes, and collects in the valleys. Hence in mountainous regions there is a wind at night down the canyons, and the air in the depressions is cooler than on the slopes above. Frosts occur in the valleys, while the slopes above may be exempt from them.

A fall of rain or snow requires the coexistence of two conditions, an atmosphere partly or wholly saturated with moisture, and the chilling of this atmosphere below the saturation point, which

may be brought about by forcing the air-currents up to an elevation, to a higher latitude, or by mixture with colder air. The trade winds of the Atlantic bring to the Amazon basin and the eastern slope of the Andes an atmosphere loaded with moisture, which, as the land is, during most of the year, cooler than the air, is deposited freely, giving this region a profuse rainfall, while the summit and western slope of the Andes within the tropics are mainly desert. The southwest monsoons of India and Southern China bring vast stores of moisture from the Indian Ocean, which are deposited freely upon the colder land. The west coast of the United States and Canada, under the influence of the prevailing westerlies from the Pacific, receives in winter, when the land is cold, a profuse rainfall, while in summer, when the land is warmer, these moist air-currents carry much of this moisture over into the Rocky Mountain region. Hence in Colorado, Arizona, and New Mexico the summer is the rainy season. The same westerly winds supply moisture from the Atlantic to Western Europe, and here, since there are no great mountain ranges to intercept it all at once, the rainfall is more generally distributed than in North America, being greatest on the coast, and diminishing gradually eastward, so that it is only in the far interior of Asia that desert conditions prevail. The southern part of South America lies within the region of the prevailing westerly winds, and here the western slopes of the Andes have an ample rainfall, while over the pampas of Argentina these winds, drained of most of their moisture in the passage over the Andes, blow as dry winds. See METEOROLOGY.

HYDROGRAPHY. The sea, including the Pacific, Atlantic, Indian, Arctic, and Antarctic oceans, with many great gulfs and bays, covers 72 per cent. of the earth's surface. Of these the Pacific is far the largest, comprising much more than half the water surface of the globe. The average depth of the sea is about two and a half miles, or 13,200 feet. The greatest depth yet measured in the Atlantic, at a point north of the West Indies, is 1660 fathoms. This depth is considerably exceeded in the Pacific, where, east of the Kermadec Islands, a sounding of 5147 fathoms, or 30,882 feet, has been obtained. See OCEAN; ATLANTIC OCEAN; etc.

The water of the ocean is strongly saline, being supplied constantly by streams whose waters contain saline material in solution in greater or less amount. Even if the amount be trifling, since there is no outlet save evaporation, its degree of salinity is merely a question of time. The salinity of certain land-locked seas, situated in hot regions, such as the Red Sea and the Mediterranean, is greater than that of the open ocean, owing to excessive evaporation from their surfaces.

The temperature of the surface water ranges from the freezing-point in Arctic regions to 90° in land-locked seas, in the tropics, such as the Red and Caribbean seas. The annual range of temperature at the surface is small, except in localities where currents change their positions with the seasons. At moderate depths there is no change of temperature throughout the year, and at great depths the temperature in all parts of the sea is very nearly the same, being but little above the freezing-point.

The surface waters of the sea are disturbed by waves and tides, and moved about by currents and drifts. Waves are set in motion by the wind, but have little movement of translation, consisting mainly of vertical oscillations. They are rarely one-fourth of a mile in length from crest to crest, and fifty feet in height. The tides (q.v.) are oscillations in the sea surface, occurring twice a day, one of them following the passage of the moon across the meridian, the other nearly twelve hours later. They are slight in the open sea, being not more than two or three feet, but upon the seacoast they are commonly much higher, and at the heads of funnel-shaped bays are, in many cases, very high. The tides are due to the difference in the force of attraction, mainly of the moon, upon the surface of the earth and its centre, owing to their difference in distance from it. Drifts are surface water transported by the wind. The movement is commonly very slow, and changes in direction with the wind. When driven by constant winds, such drifts do, in some cases, develop into currents. (See OCEAN CURRENTS.) The great ocean currents, such as the equatorial currents, the Gulf Stream (q.v.), and the Japan current, thus originate. The constant trade winds, blowing from the northeast and the southeast diagonally toward the equator, induce great drifts in these directions. These, meeting near the equator, flow westward across the oceans. See HYDROGRAPHY.

PHYSIOGRAPHY. The study of the land forms of the earth, with their present distribution and their mode of origin, is a comparatively new branch of science.

The volume of the land above sea-level is much less proportionally than the volume of the sea; the average level of the solid crust of the earth is estimated at 7500 feet below sea-level. The average altitude of the land lying above sea-level is estimated at 2250 feet, the extreme height being Mount Everest, in the Himalayas, 29,000 feet. See CONTINENT; AMERICA; EUROPE; etc.

The forms of relief of the earth, as they exist to-day, are the resultant of two opposing operations, upbuilding and leveling. Chief among the former are earth movements, whose visible results are folds and faults, uplifted ridges and blocks of land. Rivers, glaciers, and winds also act as constructive agents, in depositing sand, gravel, and other detritus. Strains in the earth's crust, produced perhaps by shrinking of the interior on cooling, result in folds and breaks in the crusts. These may be of small extent, producing mountain ridges, or they may involve large parts of the earth, resulting in raising continents above the sea. They may be low and flat, or they may be high and sharp, even to so great an extent that the sides of the fold pass beyond the vertical. (See FAULT; ANTICLINE; SYNCLINE.) Lava flows out from vents, and spreads over great areas, or it may be forced in between beds of stratified rock, or, in a plastic state, be forced up through such beds.

No sooner has a region been uplifted than the agencies of erosion, always at work, attack it with renewed activity. Water percolates into the seams and crevices of the rocks, and freezing, splits them into fragments by its expansion. Water, often with acids in solution, dissolves the soluble portions of the rocks, and thus disintegrates them. Flowing water, glacial ice, and the

wind wear the rock away. The rock waste thus produced is transported, always downward, by the winds, streams, glaciers, and its own weight, most of it having the sea bottom as its ultimate destination. On the way, however, some of it is deposited, as in dunes, moraines, and deltas, and thus the agencies of destruction are also constructive agents. Thus there is a constant movement downward, from the land to the sea. Unless this is offset by elevation movements in the crust of the land, it results eventually in the reduction of the land to a low plain. Furthermore, if the limits of sea and land remain constant, there is a vast accumulation of sediment on the sea bottom, and a corresponding thinning of the solid crust over the land. See **PHYSIOGRAPHY; GEOLOGY.**

THE DISTRIBUTION OF LIFE. The distribution of plants and animals is determined by a number of factors, which are more or less interdependent. The chief of these are the physical characteristics, the climate, topography, etc., of the region, with which should be coupled the characteristics of plant and animal life. Closely related to these are the changes in climate, topography, etc., and the adaptability of various species. Other factors are the means of dispersal of forms of life, and the results of the competitive struggle for existence among them. Under the last should be included the results of man's interference with the adjustment of life conditions which prevailed upon his advent.

The play of the above agencies has resulted in a somewhat complex distribution, some of whose features are not yet easy to explain. In some cases widely separated regions have fauna and flora remarkably similar, like the British Isles and those of Northern Japan. The physical conditions are quite similar, but the areas are separated by almost the semi-circumference of the globe. On the other hand, adjacent regions, with similar physical conditions, often differ widely in fauna and flora, as in the case of Australia and New Zealand. Regions with very different fauna and flora are, in some cases, connected by transition zones, through which the change is made gradually, while in other cases the change is a sudden and violent one. Certain well-marked types occur in scattered localities, in various parts of the earth, without apparent connection one with another.

Although much study has been devoted to the subject, no satisfactory classification of the earth's surface with respect to its life has yet been evolved.

In polar regions, such as the northern parts of North America, Europe, and Asia, the soil is permanently frozen below, thawing only at the surface in summer, thus forming the well-known tundra, whose chief vegetation is reindeer-moss, among which bloom in summer many bright-colored flowers. This tundra passes in less cold regions into moors and heaths.

Desert regions are characterized by a scanty growth of yucca, and many species of thorny shrubs; where desert conditions are less intense, various species of *Artemisia* abound. The great plains of North America, the pampas of Argentina, and the Siberian steppes, which may be characterized as sub-humid regions, are clothed with grasses, and these pass, by insensible degrees, through prairie regions, of mingled grasses and woods, to forested regions. These differ

widely in character in different parts of the earth. In the colder regions coniferous forests prevail; in the more temperate regions conifers and broad-leaved trees are mingled, while the forests of tropical regions are commonly of the latter class, with dense undergrowth. The greatest and densest forests are, as a rule, found in regions of heaviest rainfall. Thus the broader distinctions in the character of the vegetation are in great part controlled by temperature and rainfall. See **DISTRIBUTION OF PLANTS.**

The faunas of the earth are less dependent upon climate than the floras, since animals can migrate somewhat freely, and have, in greater or less degree, the ability to protect themselves from its adverse elements. Still, each climatic zone has a fauna of its own, differing markedly from neighboring ones; the polar from the temperate, and the temperate from the tropic zone. The musk-ox, polar bear, and Arctic foxes, blue and white, are confined to regions of ice and snow. In temperate regions their nearest relatives are the bison, the black and grizzly bears, and the red fox, who range with the wapiti, antelope, and many species of deer. The tropic fauna is probably less closely related to that of temperate regions. It is characterized by large mammals, the elephant, rhinoceros, hippopotamus, camel, lion, tiger, leopard, many species of marsupials (in Australia), monkeys, etc. The fauna of the desert differs widely from that of well-watered regions in amount, variety, and species, which is due, in great part, of course, to the difference in plant food-supply. In the same latitudes and similar climates there are both close agreements and wide differences. Thus the faunas of Europe and North America do not differ materially, but between Australia, Africa, and South America there are wide, even radical differences. Australia, with its marsupial fauna, resembles no other region on earth, and at few points are there resemblances between Africa and South America. The great carnivora of the former continent have few representatives in South America. See **DISTRIBUTION OF ANIMALS.**

Of all forms of life, man is the most cosmopolitan. He is found from the frozen regions to the equator. His ability to protect himself from hostile climatic conditions enables him to survive even under those most adverse, but certain conditions seem to be the most favorable to his development. Arctic conditions, where besides a hostile climate the economic conditions are severe, are not conducive to his development. On the other hand, the languid climate of the tropics, with the ease of living, seems equally unfitted for the development of civilization. It is in temperate climates, which stimulate exertion, and where effort meets with adequate reward, that man has reached the highest level.

The races of mankind are commonly classified according to color and other characteristics as fair-complexioned or Caucasian, yellow or Asiatic, brown or East Indian, red or American Indian, and black or negro. The Caucasians (including all the Indo-European peoples, the Semites and the Hamites, the last-named being dark-skinned) inhabit Europe, a large part of Asia (mainly in the south and southwest), Northern Africa, North America, South America (in parts of which they are outnumbered by the red race), and Australia, and are scattered, in

greater or less numbers, over other parts of the earth. The yellow race comprises the Chinese, Japanese, Koreans, Tibetans, and various peoples of Central and Southeastern Asia. The brown peoples are those of the Malay Peninsula, the East India Islands, and Polynesia. The American Indians inhabited the entire continent from Bering Strait to Cape Horn, but in Central and South America they have become much mixed in blood with their Spanish conquerors. The black race, whose home is Africa, have been subjected to forced migrations, under slavery, and many millions of them are now found in the United States, the West India Islands, and Brazil. See MAN, SCIENCE OF.

POLITICAL GEOGRAPHY.

The migrations of man over the earth's surface, his present location, and the stage of civilization which he has reached, are, in the last analysis, the results of geographical environment, whatever the immediate cause may be. Great Britain has become, because of her insular position, and her limited farming area, a great commercial nation. New England, by reason of the destructive competition of Western farms, has changed her industries from agriculture to manufactures. Thus the climate, soil, and surface determine in great measure the products and leading industries of a region, subject, of course, to the degree of civilization of the inhabitants.

The leading industries of mankind—pastoral pursuits, mining, fishing, agriculture, manufactures, and commerce—require different forms of distribution of the inhabitants. Pastoral pursuits imply a very sparse population scantily distributed, since cattle and sheep require large areas for their sustenance. In agriculture, a much smaller area to a family suffices, implying a much denser population, while manufacturing and commerce require that people be closely grouped in towns and cities. Hence in the history of the settlement of a region, we may often trace a direct connection between the principal vocations of the people and the average density of population. In early stages of settlement, when the people are few in number and widely separated, pastoral pursuits are the principal ones. As population increases, the herders are crowded out by the farmers, and still later cities spring up and grow, and manufactures and commerce become the dominant industries.

Cities have been located from a great variety of considerations. Anciently a common cause of their location was protection from enemies, and hence they were placed in easily defensible positions. As wars have become less frequent, and as private property has become more exempt from danger, they have been placed in industrially strategical positions, commercial cities on harbors, manufacturing cities at sites of water-power, etc. Often, however, through changes in industrial methods, such locations cease to be advantageous, yet, through sheer inertia, the cities remain and grow.

The form of land-holdings is significant of the degree of civilization, and often, on the other hand, may hasten or retard its progress. Among savage and barbarous peoples, and even those possessing some degree of civilization, such as the Russian peasantry, land is held in common by communities. Among most highly civilized peoples individual ownership is well-nigh uni-

versal, and such a form of ownership undoubtedly conduces to a high development of the race, as it carries with it a sense of proprietorship and responsibility.

The people of the earth are organized into communities, various in form, size, and character, for governmental purposes. Savages are grouped in clans and tribes, civilized man into empires, kingdoms, and republics. With primitive man the functions of government are few, and are mainly confined to war, offensive and defensive, and the organization is feeble and often short-lived. With advance in civilization comes an increase in the strength of the government, and an extension of its functions. From being only an offensive and defensive league, the government of a civilized nation defends the rights of its citizens against one another, protects them in person and property, in many cases educates them, and maintains public utilities, such as surveys, means of communication, water-supply, lighting, etc. Indeed, there is a perceptible tendency to go much further in the direction of socialism, so as to endanger the self-dependence of the individual, as is shown in recent developments in Germany and the experiments in New Zealand.

The form of government, whether known as empire, monarchy, kingdom, or republic, differs widely in the degree of power centralized in the hands of the chief executive and that retained by the representatives of the people. As a rule, the more highly civilized the people, the greater the share which they have in the government, and the lower the degree of civilization, the more absolute is the sovereign. The names by which governments are known are in many cases not descriptive. Most of the countries of Western Europe which possess a high degree of civilization are of the type which may be called constitutional monarchies. The executive power is in the hands of hereditary monarchs, and ministers of their choosing, while the laws are made by legislative bodies elected, in the main at least, by the people. Thus are governed the United Kingdom, Germany, the Netherlands, Belgium, Italy, Greece, Spain, Portugal, Austria-Hungary, Norway and Sweden, Denmark, Rumania, Servia, and Bulgaria. France and Switzerland, as well as the United States, are republics, in which the executive head of the Government and the legislative bodies are elected by the people. The other independent governments of America are nominally republics. Japan has recently been transformed into a constitutional monarchy. Russia, Turkey, Morocco, Persia, and Korea are absolute monarchies, in which the people have little or no voice. In the Chinese Empire the central authority is limited by the great measure of independence enjoyed by the individual provinces.

The relations of colonies to the mother country are various in form. Certain colonies of the United Kingdom—Canada, Australia, New Zealand, Cape Colony, and Natal—are practically independent in local matters, the mother country being represented only by a Governor-General, who is nominally the administrative head, as the representative of the Crown. In India, the entire government is carried on by Englishmen, except in the native States, where British influence is exerted by a resident. Other colonies

of the United Kingdom are governed by the home country, as are most of the colonies of France and the Netherlands.

Boundaries between nations and States differ widely in character. Some follow defined parallels, or meridians, others the mid-channel or bank of a stream, others the summit of a mountain range, while many follow a series of arbitrary lines, and are, it may be, the result of many adjustments. The boundaries of the older countries of Europe are in most cases of this last class. In any case, if the boundary has been surveyed and marked, the marks become the boundary whether they conform to the treaty or law or not.

HISTORY OF GEOGRAPHY.

The history of geography falls naturally into two divisions, the first of which records the development of ideas regarding the shape and size of the earth, while the second deals with the gradual increase of definite information about the actual facts of land and water distribution. The conception of the earth as a flat surface, probably encircled by water, is common to all primitive peoples. This idea, which is still held by many savage tribes, was gradually discarded as the mathematical sciences and philosophical speculation in general developed, and the Greeks finally succeeded in proving that the world is a globe. Aristotle is ordinarily credited with this discovery, though the Pythagoreans taught the doctrine of the rotundity of the earth long before his time. Aristotle estimated the circumference of the globe at about 40,000 miles.

The earliest map representing the known portion of the earth is that of the Greek Anaximander, who lived B.C. 610 to 546. Hecataeus, also a Greek, who lived between B.C. 550 and 475, and who had traveled extensively in Egypt, Persia, Libya, Spain, and Italy, wrote a book describing these countries, and made a map improving and extending that of Anaximander. Thales, a Greek of Miletus, who flourished about B.C. 600, divided the earth into five climatic zones, much as they are recognized to-day, and introduced the

equator and meridians. He discovered that the plane of the ecliptic is inclined to that of the equator, and made a rough measurement of the inclination.

The real founder of scientific geography was Eratosthenes, librarian of Alexandria (c.276-195 B.C.). He made accurate measurements of the length of the sun's shadow at Alexandria, and at the first cataract of the Nile, assuming that they were on the same meridian, and thus calculated the earth's circumference as about 25,000 miles, which is surprisingly near the actual figure.

Strabo, who was born about B.C. 60, was the first to attempt a work on general geography. His treatise consists of seventeen volumes, two of which are devoted to the world at large as an introduction, ten volumes to Europe, four to Asia, and the remaining one to Africa.

The great work of Ptolemy, the Alexandrian, who lived in the second century of our era, marked an epoch in early geographical science, and was for many centuries the paramount authority on the subject of the earth, and his map was that universally used. Still, the map contained several serious errors, which had far-reaching results. He fell into the error of adopting the result given by Posidonius for the earth's circumference, and this, together with an error in the longitude of the Canaries, which marked his initial meridian, resulted in bringing the west coast of Europe and Africa within 9000 miles of the east coast of Asia. It was this which induced Columbus, thirteen and a half centuries later, to voyage westward to reach the Indies. The map is constructed on a reticule of parallels and meridians, and though its errors of position and form in detail are many, it shows in comparison with earlier maps, especially that of Hecataeus, a vast extension of the known world. The advances in knowledge thus made were largely lost during the Middle Ages, when the scholastics developed the older plane-surface theory of a world, with Jerusalem as the centre of the universe. The most elaborate treatise embodying these ideas is that of Cosmas Indicopleustes, who lived in the sixth century (a translation has been published by the Hakluyt Society, London, 1899). Many specimens of mediæval cartographs, embodying these ideas, have survived, the most important of which have been reproduced by Prof. Konrad Miller of Stuttgart. Bunbury, *History of Ancient Geography* (London, 1879); Tozer, *Ancient Geography* (London, 1897); and Beazley, *Dawn of Modern Geography* (London, 1897), are important works upon this phase of the subject. The modern development of ideas concerning the form and magnitude of the earth is treated in the articles on **ASTRONOMY** and **NAVIGATION**.

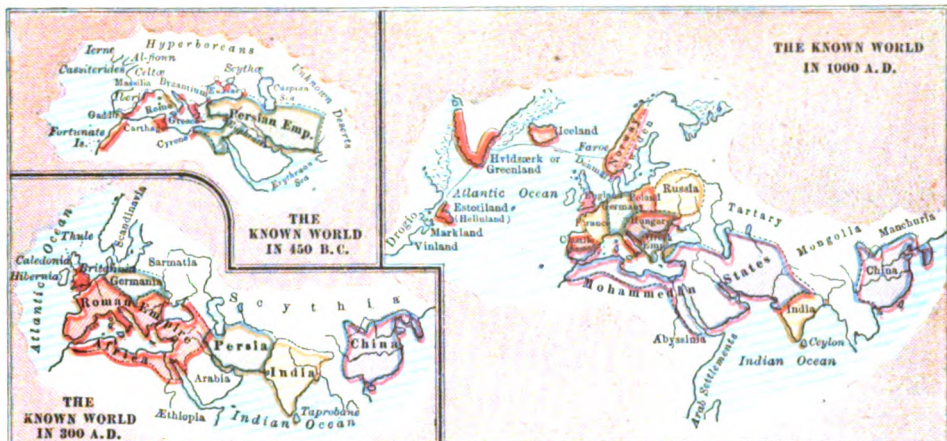

EXPLORATION, ANCIENT. The legend of the Argonauts undoubtedly grew up around the story of actual voyages made by the early Greeks to the Far East. The Phœnicians were the first nation of discoverers, and, like most of their successors, they were animated by the desire of gain. Tyre and Sidon became great commercial centres, from which ships sailed to all the Mediterranean waters, and to which traders came from India and from the lands beyond the Red Sea a thousand years before the Christian Era. By the time of Herodotus (c.484-424 B.C.) Phœnician voyagers

had passed through the Straits of Gibraltar, the ancient Pillars of Hercules, establishing settlements along the northwestern African coast, or coasting across the Bay of Biscay to the tin-mines of Cornwall. The Phœnicians made valuable contributions to the exact knowledge of geography in their *peripli* or itineraries. The names of two famous sea captains are associated with the furthestmost extension of Phœnician exploration: that of Hanno (about B.C. 450), who led a party of several thousand colonists down the African coast to the neighborhood of Sierra Leone, and that of Himilco (about B.C. 500), who sailed beyond Cornwall to Ierne or Ireland. Another famous voyage was made somewhat previous to this time by an Egyptian fleet dispatched by the Pharaoh Necho, which started from the Red Sea and, as it is reported, returned through the Straits of Gibraltar after a voyage around Africa lasting several years. About B.C. 320 Pytheas, a Carthaginian navigator, set out from Marseilles, and sailed past the coast of Spain and Gaul as far as 'Ultima Thule,' probably the Shetland Islands. The conquests of Alexander the Great added little to the limits of exploration, but proved of inestimable service in bringing Europe and Asia together, and giving the West some knowledge of the countries and characteristics of the East. Rome continued the work of increasing and unifying the geographical knowledge of the world, and brought Britain, Germany, and many other border regions within the circle of civilized nations. Much of this knowledge was wiped out in Europe by the irruptions of the Germanic and Tatar tribes, but much, too, was fortunately saved by the Arabians, who rose to power after 630. Science and learning, driven out of Europe, flourished at Bagdad, Damascus, and Cordova, and other capitals of Islam. After 800 the study of the Ptolemaic cosmography was assiduously carried on, and important geographical treatises were composed by Abu Jaafra Mohammed, who wrote between 813 and 833; Al Masudi, who, between 943 and 947, traveled extensively in Southern Europe and Asia, going as far as China; and Idrisi, whose comprehensive *Geographer's Garden of Delight* appeared in 1154. The greatest of the Mohammedan travelers was Ibn Batuta (c.1304-78), a Moor of Tangiers in Morocco, who traversed Northern Africa, Asia Minor, India, China, and the steppes of Southern Russia and Central Asia, covering nearly 75,000 miles. When the Renaissance came in Europe much of the older geographical learning was recovered from Arabic books and scholars. During the mediæval period the journeys of Benjamin of Tudela (1160-1173), Friar John of Piano Carpini in 1245, William of Ruysbroeck in 1255, and the Franciscan Friar Odoric (1316-1330), served to keep Europe in touch with what was happening in Asia. Much more important were the travels of Marco Polo of Venice, because the spirited account of his adventures and observations, written after his return in 1295, acted greatly toward the revival of active exploration.

EXPLORATION, MODERN. This revival is associated with the name of Prince Henry of Portugal, known as 'the Navigator.' Prince Henry devoted all his time and resources, from 1418 until his death in 1460, to fostering maritime exploration, with the results detailed in the article on **AFRICA**, under **History**. Of the Mediterranean nations, Italy especially furnished a remarkable succes-

sion of navigators, who, sailing under other flags, doubled the extent of the known world during the century following the death of Prince Henry. Columbus in 1492 proved the possibility of crossing the Atlantic, and discovered the New World, which he took to be the Indies; John Cabot in 1497 landed on the coast of North America; Vespucci between 1497 and 1501 established the continental character of the southwestern Atlantic shores; and Verrazano gave France her claim to the northern continent in 1524. Before the advent of these Italians Bartholomeu Dias in 1488 rounded the southern point of Africa. In 1497-98 Vasco da Gama made the sea voyage to the real Indies by way of the Cape of Good Hope. For the next hundred years discoveries followed close upon each other, until all the main features of sea and land upon the globe had been determined. Serrão reached the Moluccas or Spice Islands by way of India in 1512, and in 1520-21 Magellan found the way to them across the Pacific. Magellan perished in the Philippines; but his ship, the *Victoria*, kept on her voyage westward to Spain, completing the first circumnavigation of the globe. Cartier in 1534 entered the Saint Lawrence, and with the exploration of that river basin began the work which was continued by Champlain, Joliet, and the Jesuit fathers in the seventeenth century, and completed by La Salle, who reached the mouth of the Mississippi in 1682, thus establishing the general character of the interior of North America. In 1542 Antonio de Mota reached Japan, and in the same year Gaetano discovered the Sandwich or Hawaiian Islands. In 1553 and 1556 Sir Hugh Willoughby, Richard Chancellor, and Stephen Burrough sailed around Northern Scandinavia to Archangel, sighting Nova Zembla. Chancellor and Jenkinson proceeded to Moscow, and thence the latter went on to Bokhara, bringing back to Europe much information about the interior of Russia. Frobisher began the long record of English explorations in the Northwest in 1576, and the next year Drake started on the second circumnavigation of the globe. Australia was discovered by Torres and the Dutch sailors of the *Duyfken* in 1606, although it is possible that it had been seen a few years before by the Portuguese. In 1642 Tasman completed the delineation of the main outlines of this continent, and established the character of the lands beyond it to the south and east. For a century and a half the tide of discovery slackened while the nations of Europe were busy with the task of occupying and exploiting the vast areas newly brought to their knowledge. Then came the work of Bering, who in 1728 established the boundary between Asia and America at the strait which had been reached in 1648 by Deshnev (and which received the name of Bering Strait), and that of Captain Cook, who between 1768 and 1779 completed the survey of the water world, proving that there was no large habitable land mass undiscovered in the Southern Hemisphere. The work of Cook was perfected by La Pérouse, who finished the delimitation of the oceans in 1788.

Meanwhile the scientific exploration of the interior of the continents had begun. In 1740 Varenne de la Véranderye reached the Rocky Mountains of North America, and in 1771 Hearne penetrated to the Arctic shores of the same continent by way of the Coppermine River. In 1768-72 Bruce began the century-long task of opening

COPYRIGHT, 1903, BY DODD, MEAD & COMPANY.

up the interior of Africa by his journey to the headwaters of the Blue Nile. In 1789 Mackenzie discovered the great river to which his name is given. Lewis and Clark (1803-06) and Pike (1805-07) filled in many of the important features of the Western United States. From 1799 to 1804 Humboldt traveled in the West Indies, Mexico, and South America, and by the accurate and comprehensive reports of his observations set a new standard which has increased immensely the value and trustworthiness of most of the geographical work done since his time. Mungo Park had reached the Niger in 1796. Through his explorations and those of Clapperton, Denham, and Lander, the problem of the source of the Niger was solved by 1830. In the course of their journeys, Clapperton and Denham reached Lake Chad in 1823. In 1828 René Caillié visited Timbuktu, where Laing had been killed in 1826. Livingstone crossed South Africa, tracing the course of the Zambezi, between 1849 and 1856, and in 1859 he discovered Lake Nyassa. While Livingstone was traveling in the region of the Zambezi, the German traveler Barth was engaged in a remarkable series of explorations in Western Sudan. Burton and Speke found the way to Tanganyika and Victoria Nyanza in 1858, and within the next six years Grant, Speke, and Baker approximately solved the problem of the real sources of the Nile. Lake Albert Nyanza was reached by Baker in 1864. Stanley in 1876-77 traced the course of the Congo, the principal affluents of which were observed by Wissmann during his two journeys across Africa between 1881 and 1887. In 1887 Stanley set out on the Emin Pasha relief expedition, in the course of which he discovered the Mountains of the Moon of Ptolemy. Asia, largely because it has been in parts longest known, remained for a time least known to Europeans. Between 1785 and 1794 Billings surveyed Eastern Siberia. Somewhat earlier, in 1761-67, Niebuhr had explored parts of Arabia, a work which was supplemented by Palgrave in 1862-63. In 1856-57 the brothers Schlagintweit crossed the Himalayas and Tibet. In 1868 Richthofen entered upon his career as a Chinese explorer, and about the same time Ney Elias traversed Central China. The arid wastes of Central Asia included within the Chinese Empire were visited four times between 1871 and 1888 by Priezevalsky. Valikhanoff reached Yarkand in 1859, and in 1870 Fedtchenko penetrated into the country north of Pamir. The course of the Yang-tse, Pekong, and Brahmaputra rivers was traced by the Pundit Krishna between 1878 and 1882. Younghusband traveled from Peking to Kashmir in 1887. Among other recent explorers of Central Asia have been Sosnovski, Potanin, Pyetsov, and other distinguished Russian travelers, Bell, Carey, Rockhill, Bonvalot, Henry of Orleans, Littledale, and Sven Hedin, who spent the years from 1893 to 1900 in exploring Chinese Turkestan, Tibet, and Mongolia.

Among the great Arctic explorers of the first half of the nineteenth century were Parry, the two Rosses, and Sir John Franklin. See **POLAR RESEARCH**.

Final proof of the fact that the oceans encircle the continents was supplied by McClure's achievement of the northwest passage (1850-54), and by Nordenskjöld's voyage from Norway along the Siberian coast and out through Bering Strait in 1878-79. In 1892 Peary established the insular

character of Greenland. Nansen's voyage in the *Fram* (1893-96) determined the problem of the Arctic ice motion, and proved that there can be no large land division at the North Pole. Borchgrevink visited the Antarctic regions in 1894-95, and again in 1898-1900, and his observations are now being extended by the cooperating expeditions from England, Germany, and Norway.

The first geographical atlas was prepared by Claudius Ptolemy at Alexandria about A.D. 150. This gave the location of places on the earth's surface, and continued to be the best compendium for fourteen hundred years. It was printed many times during the fifteenth and sixteenth centuries, usually with the addition of maps embodying the results of contemporary travel and observation. It was finally superseded by the *Atlas of Ortelius*, published in 1570, and this in turn gave place in 1595 to that of Mercator, who had devised, about 1539, the principle of the projection known by his name, a scheme for representing a spherical surface on a plane, which is still most commonly used for practical working charts and maps. Ramusio and Hakluyt, contemporaries of Mercator, published the first two great collections of travels in the less-known parts of the world, thereby providing the data for succeeding efforts to enlarge geographical knowledge. Atlases making notable contributions to general knowledge were published by Blaeu in 1638, Sanson in 1645, Delisle in 1700, D'Anville, 1745-71, and Stieler in 1817. Malte-Brun began the publication of his great *Géographie universelle* at Paris in 1810. One of the most distinguished names in the history of geographical literature is that of Karl Ritter, who died in the same year with Alexander Humboldt (1859). The publications of the Royal Geographical Society, founded in 1830, and *Petermann's Mittheilungen*, begun in 1845, are the most important sources of information on all matters of geographical interest. Jomard, *Monuments de la Géographie* (Paris, 1842-62), and Nordenskjöld, *Facsimile Atlas* (Stockholm, 1889), and *Periplus* (Stockholm, 1897), are the principal sources of the study of early cartography. A monumental work on general geography is Reclus, *Nouvelle géographie universelle* (19 vols., Paris, 1875-94). The most valuable and comprehensive encyclopædia of geography is the *Dictionnaire de géographie universelle* of Vivien de Saint-Martin (Paris, 1877-90; supplement, 1895-1900). Consult: Cooley, *History of Maritime and Inland Discoveries* (London, 1831); Vivien de Saint-Martin, *Histoire de la géographie* (Paris, 1873); Lelewel, *Géographie du moyen âge* (Brussels, 1852). German treatises on the age of discovery, "Das Zeitalter der Entdeckungen," are those of Peschel (Munich, 1858 and 1865), Ruge (Berlin, 1881 and 1892), Kretschmer (Berlin, 1892), and Günther (Berlin, 1892). Of special works the most important are those of Harris and Winsor on America; Grimm and Calvert on Australia; and Kiepert, Brown, and Scott-Keltie on Africa.

GEOGRAPHY, ECONOMIC. A new phrase, peculiar to the United States, although a result of the development of geography as a science in Germany. As yet it is loosely used, and indicates an appreciation on the part of American geographers of the work done in the Old World to connect economic facts with geographical conditions. It is apt to take the form of a mere

compilation of facts, especially concerning commercial products. An American geographer, Professor Keasbey (q.v.), in sympathy with European studies, has recently presented a logical classification of the principles and subject matter of geography. He defines economic geography as "a descriptive study of the natural resources of the earth and their application through processes of production, distribution, and exchange to the satisfaction of human wants."

To appreciate Dr. Keasbey's classification it is necessary to indicate briefly the development of departments in geographical study. While Humboldt first recognized geography as a science, it was due to Ritter that geography took a definite place in the curriculums of German universities. Berghaus, Peschel, and Richthofen laid greater emphasis upon physical geography, but Richthofen distinguished three departments: (1) Physical geography; (2) zoögeography and phytogeography; (3) anthropogeography. With Ratzel and his contemporaries interest has returned to the human influence—the connection between politics and geography. The present classification includes: (1) Mathematical geography, which is dependent upon astronomy, dealing with the earth as a whole and its place in the solar system; (2) physical geography, which draws its conclusions from geology, physics, oceanography, and meteorology, and describes "the superficial properties of the globe, the rigid lithosphere, the mobile hydrosphere, and the circumambient atmosphere;" (3) biogeography, dependent on biology, dealing with the distribution of species, and recognizing the world as adapted to the support of life; its divisions are: (a) botanical geography or phytogeography; (b) zoögeography; and (c) anthropogeography. At this point a co-ordinating principle for the classification of the facts which show the effect of geographical conditions upon civilization has not been definitely accepted. Some geographers extend the meaning of anthropogeography and include all human activities under it. Political and commercial geography are the usual European classifications. In their treatment they ordinarily recognize an economic basis for the facts.

Dr. Keasbey's classification follows out the previous principle of relating each department of geography to some science. Following biogeography should come economic geography, dependent upon the science of economics. Later may be developed commercial geography, dependent upon commerce, and political geography, dependent upon politics. The whole classification he further coördinates by showing that mathematical geography, dealing with universal phenomena, and physical geography, dealing with organic phenomena, are cosmic in their purpose; that biogeography deals with organic phenomena, whose principle is physiological, and its purpose vital, based on heredity and adaptation to environment; and economic geography treats of super-organic phenomena, whose principle is psychic rather than physical, and its purpose utilitarian. Heretofore, biogeography and economic geography have not been adequately distinguished, and many facts due to economics are still explained by biology. By use of the terms 'organic' and 'super-organic' an advantageous distinction is made. Organic evolution means the survival of the fittest species, the adaptation to environment by a passive process which pre-

serves the species and provides for its propagation, and which is dependent on the tendency to variability. The subject matter of organic evolution is the influence of environment upon the physiological evolution. Super-organic evolution is quite different. Its object is the success of the most efficient institutions and depends upon the use of goods. Its subject matter is the effect of environment upon utilization, but it is an active process in which man adapts nature to his needs. The science of economics supplies the principle of utility to explain the satisfaction of human wants, while geography shows the process of utilization. The supply of goods is, to a certain extent, limited. Human wants are, however, quantitatively satiable, but qualitatively insatiable. The efforts of man to supply his wants bring him in contact with the conditions of his environment. As different environments give different potential utilities, there result differences in methods of production and manner of consumption, and in the resulting customs, standards, and degrees of civilization. When the economic law of diminishing returns sets in, economic ingenuity devises new ways of using the environment. Life must be recognized as a constant struggle of man with outer nature and a competition with his fellow men—a struggle necessarily directed by geographic conditions.

Economic geography does not merely locate mountains and rivers, or describe products, but shows their effect upon civilization. Nevertheless, full and adequate descriptions are required. The following plan is suggested: (1) General topography, giving boundaries and the natural divisions of a country into economic units, not political divisions; (2) orography, a study of highlands and lowlands and their effects upon climate and products; (3) hydrography, the sea-coast, rivers, and lakes, with their facilities for commerce; (4) meteorology or climate; (5) oromatology, including (a) minerals, (b) flora, and (c) fauna; finally, an historical and contemporaneous description of the country, showing how the people have adjusted themselves to this environment, and what institutions have been developed. In this way the backwardness of Africa, the locations of early civilizations, or the quick development of New Zealand or America by civilized immigrants can be explained.

The claims made for the study of economic geography are that it makes economics an exact and concrete science, and serves the cause of education by giving a knowledge of the resources of the earth in their historical application to human wants, by indicating the actual economic evolution, and by making possible the application of abstract economic principles.

The material for study is found in periodicals, scientific and Government reports, compendiums, accounts of travelers, and existing geographies.

GEOGRAPHY, COMMERCIAL. This subject is a branch of economic geography from which, as indicated above, it cannot be completely differentiated. The phases of economic geography that as yet are most commonly taught in the schools of the Old World and the New are usually presented under the name of commercial geography. All the text-books written in English, German, French, and Italian, dealing largely with the relations between economics and geography and used in the commercial schools, are called commercial geographies. All authors dealing with

commercial geography assert, in the language of one of them, that it "treats of the many influences operating all over the world which promote or retard the production, transportation, or exchange of the commodities, natural or manufactured, which man consumes or utilizes," a definition which the most voluminous writer on this subject says is an expression of the scope of the topic that could hardly be improved. It has to do with the world-wide distribution of the economic factors that affect commerce, whether these factors relate to production, to transportation, or to supply and demand.

This is the province of commercial geography, accepted under that name in the five distinct grades of commercial schools in Germany, where commercial education is most highly developed: primary commercial schools (*Kaufmännische Fortbildungsschulen*); commercial schools (*Handelsschulen*); advanced commercial schools (*Höhere Handelsschulen*); classified commercial courses (*Handelsfachklassen*); and commercial universities (Leipzig and Cologne). The reports collected by the British Foreign Office on the provisions made for the technical training of boys and young men destined for a commercial career in all countries show that commercial geography, with text-books of that name, is a part of the commercial courses also in France, Great Britain, Austria, Belgium, Switzerland, Holland, Italy, Denmark, Sweden, Norway, the United States, and Japan. The business colleges of the United States have given some instruction in this subject for many years, but it is only since the recent introduction of commercial courses in the public schools that widespread attention has been directed to commercial geography. The study has been introduced into a large number of the high schools and into the highest grade of the grammar schools, the idea being that it is not wise to neglect commerce and industry in the public educational systems. The subject is also studied in the Commercial High School of Philadelphia, and is to be introduced into the Commercial High School (building, 1903) of New York City. The special need in the United States, as yet, is a sufficient number of teachers who are well trained in commercial geography. This lack will, in time, be supplied by such institutions as the universities of New York, California, Pennsylvania, Michigan, Wisconsin, and Chicago, which are giving to commercial geography its due importance in their schools of commerce, that are designed to supply the technical training required by teachers in the lower schools.

GEOGRAPHY, MEDICAL. See **DISTRIBUTION OF DISEASES.**

GEOLOGICAL SOCIETY OF AMERICA. An organization for the promotion of the science of geology in North America, formed in 1888 as

an outgrowth of the geological section of the American Association for the Advancement of Science. The society is almost strictly professional, with a membership of about 300. The organization issues the *Bulletin of the Geological Society of America*.

GEOLOGICAL SURVEY, UNITED STATES.

The United States Geological Survey, a bureau of the Department of the Interior, is charged with the investigation of the geological structure and mineral resources of the country. The bureau was organized in 1879 as a consolidation of the independent surveys that had been active for several years in exploring the Western States and Territories. In 1867 Clarence King organized a geological expedition for the examination of a belt of country including the fortieth parallel, and extending across the Rocky Mountains from Wyoming to California. In the same year the General Government commissioned F. V. Hayden, who had previously been attached as scientist to exploring parties in the West, to make a survey of Nebraska. The exploration of territory west of the one hundredth meridian and of the Colorado basin was provided for by the Government in 1871, and the expeditions were placed under the direction of George W. Wheeler and J. W. Powell. The four organizations, popularly known as the King, Hayden, Wheeler, and Powell surveys, fulfilled an important mission in the scientific investigation of a vast and little known territory. As the scope of operations was extended, however, it became evident that the work could be conducted to better advantage under a uniform system. A plan for unifying the service was proposed by the National Academy of Sciences and finally adopted by Congress in 1879, when the independent surveys were discontinued. The control of the new organization, known as the Geological Survey, was placed in the hands of a director, who was required to submit an annual report of plans and operations of the Survey to the Secretary of the Interior.

The functions of the Geological Survey, as originally outlined by law of Congress, with subsequent modifications, include the preparation of a topographic map of the United States; the investigation and mapping of the areal geology; the examination of mineral deposits; the collection of mineral statistics; the study of hydrography with reference to water-power and the irrigation of arid regions; and the classification of public lands. The preparation of the topographic map, a necessary preliminary to the geologic and hydrographic work, is carried on by the topographic branch of the Survey. At the beginning of 1902 a total area of 895,673 square miles, or 29 per cent. of the entire area, exclusive of Alaska, had been surveyed upon scales of one, two, and four miles to the inch, varying with the importance of the different regions. When completed the topographic map will give an accurate presentation of the surface features of the country. The geologic branch of the Survey investigates and maps the geological formations. The map, as rapidly as completed, is issued in folios; it shows the areal distribution of the various rocks, their geological structure, and the location of mineral resources. For the purpose of conducting special investigations of scientific or economic value, the geologic branch is organized in divisions, each of which covers a particular field.

The divisions are here given as illustrating the general scope of this work: Areal geology; Pleistocene geology; pre-Cambrian and metamorphic geology; metalliferous ores; non-metalliferous products; paleontology; mining and mineral resources; physical and chemical research. The results of the work along these varied lines have been the accumulation of much new information relative to geological science and the furthering of the material interests of the country. The publications issued by the Geological Survey for general distribution include the director's report (annual), monographs, bulletins, and special papers. Consult Walcott, *The United States Geological Survey* (Washington, 1895).

GEOLOGY (from Gk. γῆ, *gê*, earth + -λογία, -logia, account, from λέγειν, *legein*, to say). Geology is the science which investigates the history of the earth. The rocks of the earth's crust contain the records of this history. Many of the pages of the rock book are lost, others are obscured through partial destruction, and many, like the hieroglyphics on ancient monuments, require great care, patience, and intelligence to decipher; yet, in spite of these difficulties, we are already in possession of a vast fund of information concerning the history of the earth.

Geological study shows that forces similar to those of the present have been operating in the past. Therefore to interpret properly the past history presupposes a knowledge of the forces working at the present time to modify the earth. One class of forces, depending upon energy from within the earth, causes the earth's surface to rise and fall, volcanoes to erupt, and the rocks to be disturbed; another, deriving its energy from without the earth, and mainly from the sun, sets in operation winds, waves, rain, rivers, glaciers, and tides, which wear away the surface of the land and distribute the waste in the oceans. The effect of life on the globe is another geological factor. Many geological changes are influenced by animals and plants. It is of great importance, therefore, that in many instances the layers of rock forming the crust contain remains of animals and plants of past ages. The study of these original remains has given much information concerning past life and the conditions amid which the life existed. Moreover, since life has developed in ordinary succession, the study of the fossils of animals and plants has given a basis for the division of the earth's history into periods, or ages.

Although geology stands as a distinct science, with numerous subdivisions, to master it thoroughly requires a broad knowledge of several allied sciences. Botany and zoölogy are indispensable to the student of fossils; physics and chemistry, to the student of rocks; and astronomy and geography, to all who would broadly grasp the subject of geological history. Each of these sciences furnishes tools with which the geologist works out the varied and complex earth history.

FUNDAMENTAL PRINCIPLES OF GEOLOGY. Geological work is so slow, and the evidence of vast changes in the past so clear, that, so long as it was held that the age of the earth was to be reckoned in a period of a few thousand years, no other conclusion was possible than that the changes observed had been rapidly made as a result of stupendous catastrophes. Thus the early literature of geology deals largely with

imagined deluges, sudden upliftings of the crust to form mountains, destructive invasions of the land by ocean water, and similar catastrophes. When, however, it was made clear by Hutton and his successors that the recorded facts indicated slow changes, it began to appear possible that the age of the earth was great. The promulgation of the doctrine of evolution, and the increased knowledge of past life, as recorded by the fossils, brought further evidence of the great age of the earth. In consequence of these advances in science, the interpretation of the former history of the earth by modern geology rests upon two principles that may be considered established: one that *the age of the earth is very great*; the other, that *in the processes in operation at present, we may look for illustrations of most of the changes of the past*. These two principles were formulated in the doctrine of uniformitarianism (q.v.) which was proposed as a substitute for the older theory of catastrophism (q.v.). By this doctrine the past may be investigated in the light of the present. Given time enough, even the slow processes operating at present, which produce no perceptible change in one's surroundings in a lifetime, will accomplish the stupendous results so clearly proved by geological study.

AGE OF THE EARTH. The evidence from geology all points toward an age for the earth to be reckoned in millions of years. One line of evidence upon which this conclusion is based may be illustrated as follows: there are, in some places, great accumulations of rock layers which were deposited in the ocean. These layers are known to reach a depth of many thousands of feet, in some instances over 40,000 feet. A study of these beds indicates that they were accumulated slowly, as similar beds of limestone, clay, sand, and gravel are now being accumulated in the sea. If anything like the present rate prevailed, the time required for their formation is very great, probably not less than 100,000,000 years. This estimate is, of course, open to doubt because of the question whether the past and the present have been so closely alike; but even if this doubt is warranted, the deduction must still be made that the age of the earth is very great. From a study of the wearing away of the land, and the planing down of mountains, a similar conclusion may be reached. A second class of evidence pointing to a great age for the earth is supplied from a study of the fossils preserved in the rocks. The evolution of plant and animal life seems, in general, to have been gradual, as it is in the present time; and this conclusion harmonizes with the evidence from the rocks themselves.

Physicists have also estimated the age of the earth in several ways. One of these estimates is based on the rate of cooling of the heated interior of the earth. Another estimate is based on the effect of the tides in retarding the rotation of the earth by the friction of the tide wave. Still a third line of argument is based upon the rate of cooling of the sun, whose light, according to Lord Kelvin, will not last more than five or six million years longer. The facts concerning the earth's heat, the sun's heat, and the earth's form, together with the rate of cooling of the sun and the earth and the effect of tidal friction, have led Lord Kelvin and other physicists to the conclusion that the age of the earth is not greater

than 20,000,000 years. Great though this estimate of time is, it is not great enough to satisfy geologists; for the evidence from geology seems to point to a far longer history for the earth.

From what has been said, it is evident that we are not in a position to state even approximately the age of the earth in years; but all lines of evidence agree in pointing to the conclusion that geological time is to be reckoned in millions of years; and geologists are practically unanimous in the belief that the time since the oldest stratified rocks were deposited cannot be much less than 100,000,000 years.

THE BRANCHES OF GEOLOGY. Investigation of the earth's history may be carried on along various lines; in fact, geology is so complex a subject that it is now no longer possible for one man to claim to have a thorough knowledge of the entire subject. Consequently, it has come to be the custom to subdivide geology into several branches. Some of these branches are quite universally recognized; in the case of others there is difference in usage.

(1) **COSMICAL GEOLOGY.** In this branch are included investigations in the borderland between astronomy and geology. It is a consideration of the relations of the earth to the other members of the solar system and to other bodies in space. As archaeology is related to history, so is this phase of cosmical study related to geology proper.

(2) **GEOGNOSY.** This division of geology includes a study of the materials of which the earth is formed—air, water, minerals, and rocks of the crust—and of the condition of the earth's interior. The study of minerals to determine their composition, crystal form, and other characteristics is the province of the science of mineralogy, which has chemical and physical, as well as geological, relationships. The study of rocks forms the science of petrology or lithology. Petrography, a branch of geology recently developed, is concerned with a study of rocks from the standpoint of their composition, characteristics, and geological relations.

(3) **DYNAMIC GEOLOGY.** Under this heading is included a study of the operation and effects of the forces that are and have been at work to modify the earth.

(4) **STRUCTURAL GEOLOGY.** This division of geology is concerned with a study of the architecture of the earth. That is to say, structural geology investigates the actual arrangement of the materials that are included under geognosy as they have been placed by the forces of dynamic geology. Using the parallel of architecture, the crude materials are included under geognosy; the arrangement and position of these materials, and their relation to one another, are included under structural geology; the forces that have formed the materials and arranged them, and the way in which they have operated to do it, form the theme of dynamic geology.

(5) **PHYSIOGRAPHIC GEOLOGY.** This division deals with the forms assumed by the surface of the land as a result of the operation of the dynamic forces upon the materials and structure of the earth. Extending the parallel of architecture to this division, it is to geology what the finished building is to architecture. This division of geology is coming to be considered a separate science of physiography or geomorphology.

(6) **STRATIGRAPHIC GEOLOGY.** Historical geology is a term often applied to this division, because it is more intimately connected with a study of past histories than any other of the divisions. By a study of the life record inclosed as fossils in the strata, and by a study of the rocks themselves and their structural relations, stratigraphic geology tells of many of the great events in earth history. One of the most important phases of this line of study relates exclusively to the investigation of the life record. This may be called paleontological geology. But now the broader students of stratigraphic geology make use not only of paleontology, but of dynamic, structural, and physiographic geology to determine not merely the life record, but also the physiography of past ages. Thus considered, it is one of the broadest divisions of the science.

(7) **GLACIAL GEOLOGY.** One of the latest events of stratigraphic geology was the general glaciation of different parts of the world. The study of the events of this time, which necessarily includes a study of existing glaciers, has attracted a large number of geologists, so that glacial geology has come to be recognized as a distinct branch of the science.

(8) **ECONOMIC GEOLOGY.** The geological processes have resulted in the accumulation of many useful materials—soils, clays, building-stones, and metallic minerals. The study of these from the standpoint of their occurrence and origin constitutes economic geology.

COSMICAL GEOLOGY.

A full treatment of this phase of geology is out of place in a brief general article. Moreover, much of it belongs to astronomy. Studies of the shape of the earth, and the resemblances between the earth and other bodies in space, both in form and composition, are undertaken by physicists and astronomers. These studies, however, throw light upon the earliest phases of earth history, pointing to the conclusion that the earth, like other bodies in space, was once a molten sphere which has cooled on the outside, forming a solid, cold crust. Of the original crust geological investigation has as yet found no sign. It is to the continued cooling of this once molten sphere that we owe some of our most important geological events. The forces, having their seat in the heated interior, may be considered as *terrestrial* or *hypogene forces*. The passage of light and heat to the earth, the great movements of rotation and revolution, and the pull exerted by the sun and moon, constitute the *extra-terrestrial* or *epigene forces*, which, aided by gravity, and acting through the medium of air and ocean, set in motion another series of geological agencies. Dynamic geology is concerned in a study of the operations of these two sets of forces whose origin is cosmical.

Other phenomena of the earth having an influence on geological history are the precession of the equinoxes and the variations in the eccentricity of the earth's orbit. These two astronomical changes have influenced the amount and distribution of heat on the earth's surface in past times, but to what extent is an unsolved problem. There are still other obscure questions in cosmical geology; for example, the possible changes of the earth's axis and centre of gravity. Being on the borderland of two or three sciences, and dealing with subjects on which it is difficult

to gather facts, these are among the great scientific problems awaiting solution.

GEOGNOSY.

The earth consists of three quite different sections, the solid earth itself, or the lithosphere; a partial water cover, or the hydrosphere; and a gaseous envelope, the atmosphere. Each of these has its geological bearings.

THE ATMOSPHERE. The atmosphere consists of a mixture of gases, of which the most important are oxygen and nitrogen in the proportion of 21 per cent. of oxygen to about 79 per cent. of nitrogen, argon, and other similar elements recently discovered. The nitrogen is inert, the oxygen very active, not only in its influence on life, but also in its effect on rocks. A minute percentage of carbon dioxide, about 0.03 per cent., is of basal importance to plant life. A variation in the percentages of these three constituents would produce a very great difference in the effect of the air. Water vapor is present in variable quantities in the air, and its condensation causes the rain upon which springs, rivers, and lakes depend. There are also minute solids, called dust particles, and very small quantities of a large number of other substances, as salt, nitric acid, ammonia, etc. (See **ATMOSPHERE**.) By its influence on life the air is of the highest geological importance. It also affects rocks directly, causing them to oxidize and disintegrate; and the movements of the air, in the form of wind, produce direct geological results, as well as indirect ones by the agency of waves and currents which are wind-driven. A consideration of the geological effects of the air forms part of dynamic geology.

THE OCEAN. Filling the depressions between the continent upfolds are the oceans, reaching a depth in some places of five or six miles. Altogether, about three-fourths of the earth's surface is covered with ocean water, with an average depth of over two miles. This great hydrosphere is disturbed by tidal waves, ocean currents, and wind-waves, which are important agents of dynamic geology. As a modifier of climate, and as the source of the water vapor in the air, it is also of geological importance. In the ocean water many substances are held in solution, the dissolved solids constituting about three and one-half parts to every one hundred parts of water. Of these dissolved substances, over three-fourths are common salt and one-tenth is chloride of magnesium. A minute proportion of carbonate of lime is the basis for the limey shells and tests which have so often accumulated to form beds of limestone. As the home of shell-building animals whose remains form rock beds, and as the seat of deposit of waste from the land, the ocean is of the very highest geological importance. See **OCEAN**.

THE CRUST OF THE EARTH. The cold, outer portion of the earth is composed of rocks, some derived from beneath the surface, whence they have risen in molten condition, others formed by the reasortment of the materials obtained from the disintegration of other rocks. These rocks have been subjected to movements, as a result of which the earth's surface has been made irregular. The cause of these movements of the crust depends upon the heated condition of the earth's interior: the results have been to make great downfolds where the ocean basins are situated and

upfolds where the continents are located, with numerous minor uplifts and downsinkings along narrow lines, both in the sea and on the land, forming mountain ranges. (See **CRUST OF THE EARTH**.) By far the greater part of the earth's surface is fairly level. Most of the ocean bottom is a vast series of submarine plains with occasional mountain ranges and volcanic peaks rising above them. On the land much more than half the surface is also plain or plateau, some of the plateaus rising to elevations of 10,000 to 15,000 feet. See **CONTINENT**.

In the ocean the deposit of waste from the land, and the accumulation of the solid parts of animal remains, has the general tendency to level the sea floor. Agents of erosion are in general ineffective excepting at the contact between land and sea; and consequently the only forces operating to make the sea floor irregular are those of uplift or downsinking of the crust. On the land, on the other hand, the action of the forces of denudation carves the mountains, plains, and plateaus, making the surface more irregular. And along the coast-line the work of the waves and tides is added to the dynamic processes by which the land is being irregularly denuded. Thus the land portion of the earth's crust is often deeply scarred and cut, revealing the internal structure of the superficial portions of the crust.

INTERIOR OF THE LITHOSPHERE. Early geologists considered the interior of the earth to be molten, basing their conclusion upon a number of facts pointing to a high temperature for the interior. The numerous hot springs indicate heated conditions below the surface; all deep borings and mines show a rise in the temperature with increasing depth; and volcanoes actually bring melted rock to the surface. The movements of the crust also may be accounted for by assuming a heated interior, which upon cooling and shrinking allows the cold, solid crust to settle on it and wrinkle. If the observed increase in temperature in mines and borings, which averages one degree for every 50 to 60 feet of descent, is continued far into the earth, temperatures must eventually be encountered which are above the melting-point of rocks at the surface.

Astronomers and terrestrial physicists have shown, however, that the earth cannot be a molten sphere with a thin crust. In its behavior toward other members of the solar system the earth acts like a solid body, and one as rigid as steel. If there is a solid crust it must be at least 2500 miles thick. The evidences for this conclusion are obtained not only from the behavior of the earth toward other members of the solar system, but also from the absence of tides which would be present in a molten interior, and from the fact that the average density of the earth is far greater than that of the rocks at the surface, indicating a very dense, heavy interior.

Geological facts also point toward the conclusion that the earth's interior is not molten. Consequently geologists have long accepted the hypothesis of a solid heated interior, so hot that it would be molten under normal conditions, but kept from melting by the enormous load of the crust, since the melting-point of rocks is raised with an increase in pressure. Whether there is a zone of molten rock between the solid cold crust

and the solid heated interior is not known. Many believe that the rock of the interior is molten only where the pressure is relieved by the uparching of the crust under mountain folds. The condition in which the heated rock exists in the interior is one of the fundamental problems of geology still awaiting solution.

ELEMENTS AND MINERALS OF THE EARTH'S CRUST. Relatively few of the seventy or more elements form an important percentage of the crust. Oxygen, the most abundant element of the outer portion of the earth, constitutes 86 per cent. of the ocean, 21 per cent. of the air, and 47 per cent. of the crust. Nitrogen, though forming about three-quarters of the air, is of little importance in the ocean or the rocks. Silicon forms 27 per cent. of the crust, and aluminum 8 per cent., so that the three elements oxygen, silicon, and aluminum together constitute 82 per cent. of the crust. Next in importance are the following: iron, 5; calcium, 4; sodium, potassium, and magnesium, each about 2.5; carbon, 0.22; hydrogen, 0.21; phosphorus, 0.1; sulphur, 0.03; and chlorine, 0.01 per cent.

These elements, combined according to definite chemical laws, form minerals. A great variety of different combinations are known, making, in all, over 2000 mineral species. Most of these are rare, and only a very few form prominent contributions to the crust. Of these common minerals, by far the most abundant is quartz, made of the two common elements silicon and oxygen. Its hardness and indestructibility make it a factor of strength in rocks. Probably next in abundance is the group of feldspars, of which a number of different kinds are recognized. Although hard minerals, the feldspars disintegrate in the weather, forming clay and certain soluble substances. Calcite is a third common mineral, composed of calcium, carbon, and oxygen. Being both soft and easily dissolved, calcite is an element of weakness in rocks. Dolomite, the magnesium carbonate of lime, has similar characteristics to calcite. Other common rock-forming minerals are the micas, amphiboles, and pyroxenes, all complex silicates of aluminum with potassium, magnesium, iron, etc. Gypsum, the hydrous sulphate of lime, and the several oxides of iron—limonite, hematite, magnetite—the carbonate of iron, siderite, and the sulphide of iron, pyrite, are other common minerals. Of these or their decayed products the great part of the rocks of the crust are made. These minerals are of high geological importance; the others are of interest especially to the mineralogist and the petrographer. See MINERALOGY; QUARTZ; FELDSPAR, etc.

ROCKS OF THE EARTH'S CRUST. Minerals, combined in various ways, form rocks. Sometimes the combinations are according to definite chemical laws; but rocks are usually mere aggregates of several minerals. A three-fold division of the rocks may be made as follows: *igneous*, or those derived from a molten condition; *sedimentary*, mainly sediments in water; and *metamorphic*, or those due to the alteration of other rocks by heat and pressure.

The igneous rocks vary among themselves in two characteristics, one chemical composition, the other texture, and the classification now generally recognized is based upon this double variation. From different volcanic vents, the lava differs chemically, in the one extreme being very

acid, that is, with much silica; in the other being very basic, that is, with a small percentage of silica and a large percentage of the basic elements, iron, magnesium, potassium, sodium, etc. These chemical differences give rise to different classes of minerals—quartz and feldspar prevailing in the acid rocks, micas, amphiboles, pyroxenes, and iron oxides in the basic. According to the conditions of cooling, the igneous rocks vary in texture. Some are blown out by violent explosive expansion of steam, and, cooling quickly, form glassy, porous pumice and volcanic ash. In other cases flowing lava cools so rapidly that it sets without the formation of individual minerals, forming natural glass, or obsidian. More commonly the lava becomes crystalline, and is either fine-grained or has a fine ground mass inclosing large porphyritic crystals. Many igneous masses do not reach the surface, but cool in the vent of the volcano, or, being intruded into the rocks, cool in the crust. These cool so slowly that the elements crystallize into good-sized individuals, producing coarse-grained rocks like granite, syenite, etc.

The term *sedimentary* for the second class of rocks is not perfectly satisfactory, since not all the rocks included are sediments. The group comprises mechanical deposits, such as conglomerate, sandstone, and clay, which are derived from preëxisting rocks by the processes of disintegration and erosion, and are removed and deposited by air, water, or ice; chemical deposits, accumulated by the precipitation of materials held in solution, and including rock salt, gypsum, calcareous tufa, etc.; organic deposits, such as limestone, chalk, marl, coal, and bog iron ore, which are formed by the growth and decay of animal and plant organisms.

Either igneous or sedimentary rocks, under the action of heat and pressure, are subjected to changes which in some cases go so far as to remake the rock entirely. This alteration, or metamorphism, sometimes takes the form of crushing, accompanied by the development of new minerals; in other cases there is a development of new minerals without noticeable crushing. This formation of new minerals may go so far as to destroy entirely all evidence of the original characteristics of the rock, as in many schists and gneisses. The new minerals naturally develop with their long axes along the lines of least resistance, thus giving to the rocks a parallel structure; and it is due to this feature that slates split readily in one direction, namely, parallel to the cleavage planes of the micaceous minerals. By metamorphism, also, limestone is often changed from amorphous carbonate of lime to crystalline calcite, forming marble. Sandstone is changed to dense quartzite by the deposit of silica around the grains. Coal is changed to anthracite by the expulsion of volatile substances, causing the concentration of carbon; and in some cases this metamorphism has gone so far as to produce crystalline graphite, which is pure carbon. For details as to origin, composition, and classification of rocks, see the articles on PETROLOGY and ROCK.

DYNAMIC GEOLOGY.

Dynamic geology is a conflict between the hypogene and epigene forces. The hypogene forces raise some parts of the earth's surface into the air and lower other parts beneath the ocean;

the epigene forces attack the parts thus raised and tend to spread over the sea floor the materials derived. The epigene forces may be grouped under the general heading of denudation. So far the forces of uplift have been more potent than those of denudation, and the land surface is battered and scarred by the conflict; but should the forces of uplift cease, or so lose in effectiveness that denudation was more rapid than uplift, the land would slowly lose in ruggedness, and the surface would be reduced by denudation to a more and more level condition. In discussing the scope and principles of dynamic geology we will first consider the hypogene forces.

CHANGES IN THE LEVEL OF THE LAND. Among the most far-reaching results of geological study is the proof that the earth's surface is not stable at the present time, and that a similar condition has existed in all periods of the past. Again and again stratigraphic geology tells of changes in land-level of stupendous nature; and studies in dynamic geology have proved that similar changes are now in progress in many parts of the world. In some places the movement is an uprising of the land, in others a down sinking; and these movements in some cases affect broad areas of the crust in a slow uprising or down sinking, while in other cases the movement is localized and spasmodic. These latter movements are usually associated with mountain growth, earthquakes, or volcanic eruptions, and over a limited area the level of the land may change several inches, or even feet, in a few minutes. The movements affecting large areas are so slow that careful study is necessary to prove their existence.

Many instances of land movement now in progress might be given. The coast-line of New Jersey is sinking at the rate of about two feet a century; the coast of Labrador is rising at an unknown rate; the coast of West Greenland is sinking; in Sweden, records of 150 years show that the region south of Stockholm is sinking, while to the north the land is rising, in one place having risen seven feet in that period. Local rapid movements of the land were observed in Japan during the earthquake of 1891; changes of level, both uprising and down sinking, have occurred in the Bay of Naples; the coast of Chile has been uplifted during earthquakes in the last century. Evidence of changes of level in past ages is furnished by elevated beaches, raised beaches that are no longer horizontal, and submerged forests. The irregular coast-line of parts of continents, as in Northeastern America, is interpreted as a drowned coast, where, by land sinking, sea-water has been allowed to enter the valleys, forming floods. In some cases the continuation of the land valleys may be traced along the sea bottom, as in the case of the Hudson River (q.v.).

The question has naturally been raised as to whether these changes are due to land movement or to changes in sea-level. Some of them, as in Sweden, where the movement is differential, and the spasmodic movements in limited areas, are certainly due to land movement. With regard to others, the conclusion is not so certain, though the geological evidence all points toward a change in the land rather than of the sea.

The cause for the instability in the crust is believed to be the heated condition of the earth's interior. Various hypotheses have been proposed to account for the exact manner in which this

heated condition causes change in level. The most currently accepted hypothesis is that of contraction, by which it is held that, through loss of heat, the interior is shrinking, and the crust, in accommodating itself to the shrinking interior, is caused to move. Another hypothesis is that of isostasy. This explains crust movement by assuming that variations in the load on the crust cause movements. The reduction of load by denudation of the land and the increase of load in places of sedimentation necessitate an isostatic readjustment, causing sinking in one place and rising in another, as there would be in a pile of wax of irregular height. This hypothesis assumes a plasticity for the earth which many geologists are not willing to accept. Other hypotheses have also been proposed, but space forbids their discussion here.

MOUNTAIN FORMATION. The stresses brought about in the earth's crust through the energy which is causing change in level, whether this be due to contraction, isostasy, or other cause, throw the surface into a series of folds, the largest forming the continental uplifts and ocean depressions, the smaller forming mountain chains. According to the contractional hypothesis the general movement of the crust is a down sinking, but locally portions are uplifted because the solid crust cannot accommodate itself to the shrinking interior without wrinkling. The great pressure thus applied to the rocks, operating through long periods of time, causes them to bend or break. Where the rocks which are subjected to these stresses are deeply buried, and hence under great pressure, they bend, even though they are brittle rocks. When the strain is more quickly applied, or when the rocks are nearer the surface, faulting is common; and thick beds of brittle rocks, like sandstone or limestone, are more liable to break than thin-bedded rocks such as shales. See **FAULT**.

All evidence points to the conclusion that the formation of mountains in the past has been slowly accomplished. Indeed, some mountain chains, such as the Andes and those of the East Indies, the Philippines, and Japan, are now growing and apparently little if any more slowly than the mountain growth of the past. It is found by a study of the structure of mountains that in most cases their growth has been intermittent; that is, periods of freedom from uplift have occurred. Many of the mountain chains are along lines of crust weakness established in the early periods of geological history. Along these lines the stresses have relieved themselves at various times so that these regions have remained mountainous throughout geological time. On the other hand, many parts of the crust have been marked by entire freedom from mountain-folding. The zones of mountain growth extend in a general north and south direction in many parts of the earth, as in Western North and South America, Eastern North America, and Eastern Australia. A belt of shorter ranges, with east and west axes, extends across the Old World in the north temperate zone. Many efforts have been made to find a system in the arrangement of the mountains of the globe and to account for their distribution, but no thoroughly satisfactory theory has been evolved. See **CONTINENT**; **MOUNTAIN**, etc.

VOLCANIC ACTION. Molten lava, rising from within the earth toward the surface, sometimes

reaches the surface, but often rises into the crust and remains there. Small masses filling cracks in the rocks are called dikes; masses thrust in between the layers of the strata form sills or intruded sheets, like the Palisades of the Hudson; still larger masses, which lift the rock and form great wells of lava, are called laccoliths; and huge masses, with irregular boundaries, common in the cores of mountains, are known as bosses. Instances of each of these classes of igneous rock have been revealed by the denudation which has stripped off the overlying strata.

Where the molten rock reaches the surface it usually rises through a fissure; and when the volcanic energy is vigorous, as it was during the formation of the mountains of the Western United States, the lava may well out through these fissures, and form vast floods which inundate great areas on either side of the fissure. Hundreds of thousands of square miles in the West are covered by these ancient lava floods. In no part of the world is this form of fissure eruption well developed at the present day, though the volcanoes of Iceland approach this type.

The geological effects of volcanic eruptions are of very great importance. The heat of intruded masses causes change in the rocks with which they come in contact. By the outflowing of the lava extensive changes are made in the topography, and highly important, though usually destructive effects, are produced on life. Much rock material is added to the crust, mostly near the volcanoes, in the form of ash and lava flows, but partly as intrusions into the crust and partly as deposits, on the land and in the sea, derived from ash drifted about by the air and water currents. See VOLCANO; LACCOLITE.

EARTHQUAKES. The eruption of volcanoes is frequently accompanied by a shaking of the earth; and the rising of lava into the crust and the movements of the lava before an eruption also cause earth jars. Likewise, a breaking of the rocks, or a movement of the strata along a fault plane, causes earthquakes. Indeed, any jar to the rocks, even the explosion of gunpowder or the falling of a cavern, will produce an earth-

quake from this centre. Irregularities of rock texture and structure interfere with the regularity of these variations. The propagation of the earthquake wave is shown in the accompanying diagram, where E represents the epicentrum and A B coseismal curves.

Among the geological effects of earthquakes the destruction of life is best known; but the shaking of the ground sometimes changes the topography, shaking loose earth about, and opening fissures in the ground and rocks. When the earthquake originates under the sea a great water-wave is raised. This, advancing on neighboring shelving coasts, so increases in height as to wash over the lower land with highly destructive effects. These earthquake water-waves have an important influence on sedimentation in certain places; and the jarring of the sea floor and the ocean water sometimes causes a great destruction of life, which aids in the formation and preservation of fossils. If the jarring is too frequent, however, the tendency is toward extinction of life in the region subjected to the jarring. See EARTHQUAKE.

HOT SPRINGS AND GEYSERS. Water is everywhere percolating through the upper layers of the crust. Reaching fissures, it often rises to the surface, forming large and permanent springs. This water is frequently heated in its passage, sometimes through the influence of heat-producing chemical changes in the rock; sometimes deriving its heat from rocks whose temperature has been raised by the friction caused by slipping along fault planes; sometimes being warmed by the presence of intruded masses of lava. The time required for the cooling of great masses of intruded melted rock is so great that hot springs and geysers might be caused by them for many centuries.

The heated waters take many mineral substances into solution in their passage through the rocks. On reaching the surface this is often evident in the deposits made near the outlet as the water cools. For example, the geysers of the Yellowstone precipitate silica, the hot springs carbonate of lime. Many hot springs have medicinal properties because of the minerals in solution. A great variety of mineral matter is carried by the hot water and even veins of precious metal are formed by it. See GEYSER; THERMAL SPRING.

FORMATION OF ORE DEPOSITS. Heated water under pressure in the rocks is a potent chemical reagent. It soon becomes alkaline or acidic from substances derived from the rocks, and in this condition dissolves and changes minerals in a complex way. As it circulates through the crust the condition of this water is constantly changing; growing warmer or cooler; receiving accessions of water from different sources; and obtaining various substances from the rocks through which it passes. Under these changing conditions mineral substances may be dissolved in one place only to be subsequently deposited elsewhere. Nor is the activity confined to highly heated water. The surface waters descending through the rocks also dissolve and deposit, as is illustrated especially well in certain deposits of iron ores. However, the conditions most favoring the formation of mineral veins are the presence of heated water and of cavities in which the deposit can be made. Of cavities the most important are fault planes and

EARTHQUAKE WAVE.

quake shock. The jar, originating at a point, or along a plane, is transmitted through the rocks as a series of waves moving outward in spherical form from the centre, or focus. At the epicentrum, directly above the focus, the wave movement is upward; on all sides from the epicentrum it reaches the surface at an angle, departing more and more from the vertical as distance from the epicentrum increases. The violence and the time of appearance of the shock vary in all directions

fiissures. Since these are most abundant in the mountain regions, and since mountains most commonly have associated igneous phenomena by which the water is heated, such regions are especially favorable for mineral deposit. In addition, the igneous rocks contain the greatest store of the metallic elements, and hence their presence is important as a source of supply of the metals. All these conditions prevail in the mountainous sections of the Western United States, one of the great mineral regions of the world. See ORE DEPOSITS.

METAMORPHISM. The phenomena of mountain building and igneous activity are favorable to that alteration of rocks which is included under the term metamorphism. Heat, heated water, and great pressure are effective in changing the character of rocks. This alteration may be local, through contact with intruded masses of igneous rock, when it is called contact metamorphism; or it may be widespread, through intense and extensive mountain-building, when it is known as regional metamorphism. In each case the resulting changes are similar, though the alteration is usually carried to a far greater degree in regional than in contact metamorphism. Metamorphism has also been subdivided, according to the agency which has predominated, into hydrometamorphism, thermometamorphism, and dynamometamorphism.

All rocks in a region of metamorphism are involved, and the resulting changes are independent of the origin of rock, being determined by the nature of the metamorphism and the composition of the rock subjected to the change. Sometimes the alteration is so complete that no trace is left to tell the original character of the rock, not even the general class to which it belonged; and there are some geologists who believe that in some cases metamorphism has been carried to the extreme of actual melting, or, at least, to the reduction of the rock to a plastic condition. On the other extreme, some rocks are so slightly altered that their original condition is easily recognized; for example, pebbles of conglomerate, elongated and stretched out of shape, are sometimes found; bedding planes in some of the slate are still observable crossing the planes of cleavage; distorted fossils may be present; and beds of marble may be traced to their origin from limestone strata, or quartzite to a previous condition of sandstone. The genesis of even the highly metamorphosed schists and gneisses may at times be traced by following along the beds to some less intensely metamorphosed section containing fossils, or other indications of their origin. Thus it is known that some of the highly altered beds of metamorphic rocks in the Alps were deposited in the Tertiary sea and metamorphosed during the building of the Alps in late Tertiary time. See METAMORPHISM.

WEATHERING. Of an entirely opposite character to metamorphism is that change in rocks which results from contact with the air. In the processes of metamorphism the materials of rocks are rearranged, and in most cases bound more closely together; in the processes of weathering the materials are weakened and the rock caused to disintegrate and fall apart. Weathering, like other geological processes, is a complex phenomenon resulting from a cooperation of various agencies. Most of the agencies of weathering operate both chemically and mechanically.

Air aids in the weathering of rocks by supplying oxygen, carbon dioxide, and other substances for chemical changes. Through the wind it performs mechanical work. Heat and cold, by causing contraction and expansion, aid in the breaking up of the rocks. Percolating waters cause many chemical changes, especially by the aid of oxygen from the air, carbon dioxide from air and decaying vegetation, and organic acids, derived from plant decay. Mechanically, water is important when the rain-drop strikes the ground; and when frost is formed in soil and rocks, the expansive force rends the materials apart with great effect. Plants are also important, both chemically and mechanically. Chemically they work by obtaining plant food from the earth, mechanically by the intrusion of their roots in soil and rock. Burrowing animals are likewise effective agents of weathering, especially the ants and earthworms, which bring fresh materials to the surface, and make the soil more porous.

The effectiveness of the agencies of weathering varies with the nature and situation of the rock. All rocks are entered by water; but some are far more porous than others. Some minerals are easily soluble, some insoluble; some decay with ease, others are quite indestructible. But even the densest rock, made of the most indestructible of minerals, will crumble, though slowly, in the weather. On steep slopes, as on mountain tops and cliffs, the bare rock is exposed to the weather by the aid of gravity which removes the fragments as they fall; but on more level ground some of the weathered material remains as a blanket, protecting the rock from some of the agencies of weathering. Arid lands are unfavorable places for weathering, because of the general absence of water. A forested country is protected by the forest cover, and it is probable that this protective effect is of more importance than its destructive effect. In damp tropical regions rock decay is of most importance; in cold climates frost is one of the most important agencies.

Of the effects of weathering, by far the most important is the disintegration of the rock to form soil. Whenever the slope is not too steep the

RESIDUAL SOIL.

disintegrated fragments accumulate as soil cover. Such a soil of rock decay is called a residual soil, because it is a residuum of mineral decay after all the easily soluble portions have been removed. By far the greater part of the land has a soil cover of this origin. A second highly important effect of weathering is the preparation of rock for transportation, and were it not for weathering the geological history would have been far different. The rock waste falls or is washed into the streams which use it as tools for carving valleys, as the material for building flood-plains and deltas, and as contributions to

the deposits of sediment which are made in the sea.

WIND WORK. As an agent of geological change the importance of the wind is not fully recognized by dwellers in humid regions. Aside from its influence in weathering mentioned above, the wind does effective work in two classes of regions, namely, in arid lands and on seacoasts. In both places the protective covering of vegetation is absent; and in both places fine-grained rock fragments are dried and exposed to the wind. In these positions the sand is borne about by the wind and piled into irregular hills or dunes. The friction of the sand particles over one another grinds them down; and, when blown against rocks and cliffs, a natural sand-blast is in operation, with the result that the rocks are worn away. An additional effect of wind action is the construction of land in the sea. Where sand-bars are thrown up by the waves, or where coral beaches are built on coral reefs, the wind completes the construction of land by building dunes of the fragments washed ashore. The blowing of sand and dust out to sea adds to the sediments gathering there. The distribution of volcanic ash over wide areas is another important geological effect of the wind. Indirectly the wind is exceedingly potent as the transporter of vapor for rain, and as the force which causes the waves and currents in the ocean. See **WIND**; **DUNE**; **LOESS**.

WORK OF UNDERGROUND WATER. Water is ever percolating through the rocks of the crust, and this underground water is an effective agency of

SPRING ALONG FAULT PLANE.

dynamic geology. Much of this water returns to the surface after a short journey, and it is this which with rain keeps the rivers supplied. Wells show its general presence in the surface rocks, and springs are places where favorable condi-

SPRING ON HILLSIDE.

P, porous rock; I, impervious strata.

tions have conspired to direct quantities of it back to the air. Among these favorable conditions are fault joint planes and relatively impervious layers. The percolation of water along such lay-

ers when they rest in unstable positions is an important cause of landslides. Where rocks, such as limestone, are made of minerals that are soluble, the passage of water usually dissolves out underground channel ways. Along the joint and bedding planes the rock is slowly dissolved away, the water entering from sink-holes at the

FORMATION OF CAVE IN LIMESTONE.

surface and emerging as springs on some valley side into which the underground water is draining. These caverns are often ornamented with stalactites and stalagmites, caused by the deposit of carbonate of lime which the water must precipitate on emerging from the rock into the cave air. See **CAVE**.

RIVER WORK. In draining from the land the water carries a load of mineral matter in solution and in suspension. The former is mainly supplied from the underground water, though some is obtained from the river bed. The suspended material is in part derived from the inwash of soil by the rains, in part from materials obtained by weathering of the valley sides, and in part by the direct work of the rivers, using the rock materials as tools of excavation. There is a great variation in the work which rivers are doing. Some have such a rock load, on so gentle a slope, that they cannot cut, but must build up their beds. Others are rapidly excavating their beds and have cut deep gorges and canyons, which they are still deepening. Their rate of work varies with the volume of water, the slope, the nature of the rock, and the amount and nature of the load of rock waste being transported. Since the rate of work varies with the kind of rock which is being excavated, rivers that are engaged in deepening their valleys are liable to have falls and rapids because of variations in rock texture.

One of the great geological results of this river work is the formation of valleys. Where a stream is rapidly cutting, its valley is narrow and steep-sided. Even in this case the valley is broader than the stream, partly because, by its meandering course, the river undercuts its bank, and partly because weathering is broadening the valley. Weathering continues even after the stream has ceased its down-cutting, and therefore the valley continues to grow broader and broader, the stream removing the materials which this weathering supplies. Thus as a transporting agent rivers, in coöperation with weathering, which prepares and supplies the materials, are important factors long after they have ceased to cut directly into the rock.

In the transfer of the waste of the land to the sea some of the material halts on the way. Even the most rapid of streams, bearing the coarsest of fragments, furnish illustrations of this in their beds, in bars, and in narrow strips of deposit on their margins. The larger streams, especially near their mouths, are often bordered

by flood-plains in which sediment is laid aside in flood time and in which, as the stream slowly changes its course by meandering, portions are being taken up on the side of cutting while other portions of the river load are being deposited on the opposite side. Such flood-plain deposits are built of fine-grained fragments, making a very fertile soil. See **EROSION**; **VALLEY**; **FLOOD-PLAIN**; **DELTA**; etc.

THE WORK OF LAKES. Lakes are formed by some interference with drainage, usually a dam across some stream course, as the growth of a mountain barrier, a lava flow, or a dam of glacial deposit. The lake waves work on the coast-line; cliffs are cut, beaches are formed, and on these the fragments are ground finer. The rivers which enter the lake add still more to the deposit accumulated, forming deltas where they enter, but giving the finer material to the currents for transportation off into the lake. Weathering adds to the supply of sediment, and the wind drifts more rock fragments to the water. In the quiet lake waters, even the finest of this sediment in time settles to the bottom. Given time, then, the fate of lakes is to be filled; and the truth of this has been graphically stated in the remark that "rivers are the mortal enemies of lakes." But rivers are not allowed to do the entire work of lake destruction, as has been shown. Aside from the agencies of lake-filling mentioned, the influence of organisms is effective. The shells of animals and the accumulations of plant remains are also factors of importance. In the last stages of lake destruction water-loving plants—the reeds, rushes, and sphagnum mosses—are effective, both by their own accumulation, and by their interference with waves and currents, thus aiding in the deposit of rock fragments. Many filled lakes have been transformed by plant growth to bogs in the northern climates, where the sphagnum moss grows readily. By the processes of lake-filling important accumulations of sedimentary rocks are made; and in some countries, as the Western United States, where large lakes were formed behind mountain dams in recent geological periods, there are extensive areas occupied by lake-formed strata. Coal-beds, representing the stages of organic influence, are a part of these lake beds. In arid climates, where evaporation exceeds the rainfall, the lake waters are lowered below the outlet; then, year by year, the mineral substances brought in solution by the incoming water, and left behind in the lake as the water is evaporated, become more and more concentrated. Such lakes become salt, and, if the process continues, deposit layers of salt, gypsum, and other substances. Before this stage is reached, however, the precipitation of carbonate of lime takes place because salt water dissolves this substance less easily than fresh water. Beds of these precipitated rocks are common in the West, where they have been recently formed, and, in fact, are in some cases still forming; they are also found among the strata of earlier ages when similar conditions existed. See **LAKE**.

GLACIER WORK. Glacier action at present is confined to high mountains and high latitudes. There are two classes, valley, or alpine, and continental. Of the latter Greenland and the Antarctic furnish illustrations; and during the Glacial period (q.v.) continental glaciers covered Northwestern Europe and Northeastern America.

Hence glacial action assumes wider importance than it would if considered solely from the standpoint of the work of present glaciers. The erosive action of glaciers seems to be very great where the ice movement is free along valleys. The weight of the ice, pressing its grinding tools on the under rock and slowly dragging over it, grooves and polishes the rock and deepens as well as broadens the valleys. The results of this work are readily seen in a region from which vigorous ice action has disappeared. The material dragged along by the ice is a mixture of large and small rock fragments in various stages of reduction by the grinding process. At the ice front, or when the ice melts away, this material is released and, falling to the ground, accumulates as an unsorted mixture of materials, because the ice carried large and small fragments with equal facility. This glacier deposit is known as till or boulder clay. If the ice front stands long enough along a single line the accumulation of ice-borne debris forms a moraine. The melting of the ice releases much water along the front and this water assort a portion of the till, causing clay deposits in one place, sand and gravel in other places. By the glacier-borne floods large quantities of rock fragments are carried far away from the ice front and deposited in the river valleys, and even borne to sea. Where glaciers enter the sea there is a direct contribution of material to the ocean; and by means of the icebergs which break from the glaciers some of the rock fragments are carried far to sea. The deposits made directly by the ice, and by water supplied by ice melting, cover Northeastern America and Northwestern Europe, forming the soil of those regions. These glacial deposits vary greatly in form and in texture according to the exact nature of the formation; and they vary also in depth. Many important effects have been produced by these deposits, especially on the drainage. The great number of lakes in Europe and America are mostly due to some form of glacial interference with drainage; and the gorges and waterfalls are due to the turning aside of streams by glacial deposits. See **GLACIER**; **BOULDER CLAY**; etc.

OCEAN WORK. The most powerful agent of erosion in the ocean is the wind-wave. By its direct blow, and by hurling and grinding rock fragments together, waves are wearing coast-lines back. From the cliffs thus formed much material is supplied by weathering, which is assisted by the influence of the salt and other soluble substances with which the rock is sprinkled by the ocean spray. The waves, approaching the coast diagonally, drift the rock fragments along the coast, and this movement is further aided by the wind and wave-formed currents. These fragments often find lodgment in embayments, forming beaches. Such beaches are mills in which the rock fragments are further ground down. The finer fragments obtained by the waves, added to those brought by the rivers, the wind and weathering agencies, are in part drifted out to sea by the undertow, the wind-formed currents, and the tidal currents. Rarely the tides have an erosive influence; but with ocean currents and ocean drifts they are important transporting agents. The currents and drifts are also geological factors in modifying climate, and in bringing food to sea-animals. The materials derived from the land by the various agencies are strewn

over the sea bottom near the land, the coarsest near the coast, the finest out to sea. Sometimes the sediment comes to the sea in greater quantities than the agencies of the ocean are able to remove. Then they accumulate as bars along the coast and the waves expend their energies on the bars, leaving the protected coast behind the bars untouched. If the sea bottom is sinking, great beds of conglomerate, sand, and clay may be accumulated; if it is rising, the beds previously formed are added to the land, as along the Eastern United States south of New York. More than half of the rocks of all the continents were formed on subsiding sea beds near land areas and made of the land waste. Later they were elevated to form parts of the continents and they have often been built into great mountains, such as the Alps, Appalachian, and Rocky mountains.

In the sediments accumulating on the sea floor animal remains are always present; and as the distance from the coast increases these become of increasing importance because of the diminution of the supply of rock waste. Far from the coasts, in the open ocean, the contributions of land waste are so slight that the sea-floor deposit is made almost exclusively of animal remains, especially of the tests of minute surface animalculæ which have dropped to the sea floor. This forms an ooze, variously named from the animal forms predominating. Of these the most numerous are usually the Globigerina, low forms of Foraminifera. Chalk beds are made of Globigerina ooze, raised to the surface and consolidated. In the very deepest oceans only the insoluble residue of these shells continues to the bottom, forming a red clay deposit. In this clay are found also volcanic dust, meteoric iron, and the ear-bones of whales, indicating its extremely slow accumulation. About one-third of the sea floor is covered by red clay, and one-third by ooze; yet red clay is not found on the continents, and ooze rarely. This seems to indicate a permanency of the deep ocean basins, and that the ocean-formed rocks of the land were mostly made in those shallow parts of the ocean which bordered the continent areas.

Organic influences are not confined to the deposits of the deep sea. Grass-like plants, and, in tropical regions, mangrove trees, are effective in aiding deposit on many coasts, especially in protected spots. Shell-building animals also form deposits in addition to contributing to the elastic sediments. But far the most important of the coastal organic influences are those of the corals, which build reefs along the coasts, and islands on shoals in the sea. The coral fragments are built into islands by uplift, by waves and winds; and coral ooze is strewn over the sea floor near the reefs by the grinding of the waves and transportation by the currents. By these means beds of limestone are being accumulated. See OCEAN; DEEP-SEA EXPLORATION; CORAL ISLAND.

WORK OF LIFE. As a geological agent life is important in many respects, and reference to life has already been frequently made. It helps to disintegrate rocks, to transport fragments, and to make deposits of rock materials. All forms of life have geological influence; and man, the highest and most powerful of the animals, has come to be one of the most important of the geological agents. By modifying and destroying animals and plants; by removing the forests; by interfering with rivers, lakes, and oceans; by excavations

in the ground; and by many other actions, man is aiding in geological change, and in a way more varied and effective than any other organic agency.

DENUDATION. The land uplifted by continent movements, mountain-building, and volcanic activity is being attacked by the agents of denudation. The rocks are dissected, the land made irregular, and the fragments carried to the sea. Mountains are planed down, volcanoes removed to their very roots, coast-lines cut back, and the structure of the upper parts of the crust revealed. Thousands of feet have been removed from all of the continents and new land has been made of the fragments deposited in the sea and then lifted to the air by the forces from within the earth. The work of destruction by the agencies of denudation is partly repaired by uplift. A study of the form of land resulting from this interaction of uplifting and down-cutting belongs to physiography (q.v.).

STRUCTURAL GEOLOGY.

The rocks of the crust, considered under the three headings of sedimentary, igneous, and metamorphic, present certain characteristic structural features. When in the form of flows the igneous rocks are arranged in layers, and they are often covered with beds of sedimentary strata.

INTRUDED SHEET OF IGNEOUS ROCK.

Sheet-like intrusions of lava are also in beds. But dikes, bosses, and laccoliths are more irregular. These igneous rocks vary in texture, as has been already stated. Joint planes are commonly present, being due to contraction of the cooling masses which results in a breaking of the rocks. These joints at times assume almost mathematical regularity, as in the hexagonal columnar jointing of Fingal's Cave and the Giant's Causeway. Many of the metamorphic rocks inherit some of the characteristics of the rock from which they were derived. But when highly metamorphosed they become massive and crystalline, resembling in this respect the igneous rocks.

BOSS OF INTRUDED ROCK (B).

However, owing to the influence of pressure, the metamorphosed rocks are characterized by a banding, often very marked. Veins are common in the metamorphic rocks, and the layers are often highly contorted under the strain of the tremendous pressure to which they have been subjected. Joint planes of later origin are also present. The sedimentary strata are character-

ized by arrangement in layers due to the assorting action of the agencies which have caused their accumulation. This assortment is found both on a very small scale, represented by lami-

LACCOLITE.

næ, and on a large scale, represented by changes in the nature of the material. For example, a series of shales, with many laminæ, may grade downward to a sandstone and upward to a limestone. The minor variations represent the influence of slight variations in the force or direction of currents or in the nature of material supplied; the larger changes indicate more extensive changes, such as uplift or depression, which completely alter the conditions under which the sedimentation is taking place. A shallowing means coarser fragments, a deepening finer fragments, because of change in the position of the coast-line. The sedimentary beds are lens-shaped because they die out in all directions; but the beds of coarser fragments, having less extent, are more lens-shaped than those made of finer fragments.

The structure of sedimentary rocks often reveals the manner of origin. Coarseness indicates nearness to shore; limestone indicates abundant life; and the presence of currents, varying in velocity and direction, is indicated by cross, or current, bedding, in which the layers vary greatly in coarseness and in the direction and angle of inclination. This form of bedding is caused by river, wave, and wind currents. Ripple-marks, rain-prints, footprints of land animals, and mud-cracks, formed by the cracking open of mud exposed to the sun, are also commonly found, indicating shallow-water origin for the deposits. From such evidence a remarkably large proportion of the sedimentary beds are known to have been formed in shallow water. While most of the rocks included in the sedimentary group are deposited as fragments, and hence are at first unconsolidated, the sedimentary strata of the land are mainly consolidated. This consolidation is usually the result of the deposit of some kind of cement by percolating water. Carbonate of lime, some sort of iron, and silica are the common cements. The presence of cementing materials in the ground water is illustrated by the replacement of woody matter by silica, forming petrified wood. At times this cementing material gathers around centres, such as grains of sand or fossils, forming concretions.

Aside from the bedding planes, the sedimentary rocks, as well as the other groups, are crossed by joint planes, which, with the bedding planes, cause the rock to break naturally into rhombic or cubical blocks, greatly aiding in quarrying operations. Most of the jointing in sedimentary strata, and much of that in the igneous and metamorphic rocks, seems to be due to disturbances in the rock, which cause strains. Under violent strains the rocks are often folded and faulted, especially among mountains. This folding is

sometimes very complex and amounts to real contortion. A single fold, with a dip in but one direction, is called a monocline; the ordinary up-arching of rocks is known as an anticline, and the downfolding as a syncline. These may be symmetrical or unsymmetrical, and in some cases

FAULT.

A B, Fault Plane; D E, Throw; U, Upthrow; Dt, Downthrow.

are even overturned or recumbent. Under favorable conditions the rock under strain breaks in place of bending, forming faults. Some of the

OVERTHRUST FAULT.

faults are dislocations of only a few inches, some of thousands of feet. Ordinarily the plane of faulting is approximately vertical, but in some cases, as when folds are overturned and the fold-

UNCONFORMITY.

A B, Between two series of horizontal sedimentary rocks.

ing continues to the point of breakage, faults are developed with nearly horizontal planes. Such faults are called overthrust faults, and the plane a thrust plane, because the rocks on the upper side are thrust over those on the lower side.

Ordinarily the sedimentary strata are horizontally deposited in the sea; and when lifted to form a part of the land they are usually still approximately horizontal. With mountain disturbance, however, the rock layers are thrown into inclined positions. In plains and plateaus, on the other hand, the rocks are prevailingly

GEOLOGY

ANTICLINAL FOLD, CHESAPEAKE & OHIO CANAL, NEAR HANCOCK, WEST VIRGINIA (UPPER)
JOINT-PLANES IN ROCKS NEAR ITHACA, N. Y. (LOWER)

horizontal and there is little disturbance. Owing to the volcanic activity accompanying mountain formation, and to the great pressure under which the strata are placed in folding, both volcanic and metamorphic rocks are common among mountains, but are rarely found in plains. By reason of the instability of the earth's crust, land is often lowered below sea-level subsequent to a period of denudation. Then sedimentary deposits are laid down on the submerged surface, after which the area may be raised once more into land. The plane between the new deposit and the old land marks an unconformity, and the upper rocks are said to rest unconformably upon the lower. An unconformity thus represents a gap in rock formation and in the life record, and

UNCONFORMITY,

A B, between sedimentary rocks and a series of folded rocks.

is often of great use in interpreting geological history. See JOINTS; ANTICLINE; SYNCLINE; DIKE; FAULT; etc.

PHYSIOGRAPHIC GEOLOGY.

This branch of geology is specifically treated under the heading of **PHYSIOGRAPHY**, so that only the general principles will be here stated. Physiography is concerned with a study of the forms assumed by the surface of the crust and the origin of these forms. Both on the ocean bottom and on the continents, plains, mountains, and volcanoes have been built, and each of these crust forms has a history. This history may start with the origin—the plain is an old lake bed, or a raised sea bottom, or a lava plain, etc. After its origin changes of one kind or another have occurred, giving it its present modified characteristics. For example, rivers may have developed upon it, or the agencies of the sea may be at work upon it, or glaciers may have passed over it. It is a question of physiographic geology to decide what has happened since the origin of a given land form.

In recent years, largely as a result of the work done by Professor Davis, it has been found that land forms normally pass through a life history which can be stated in terms of youth, maturity, and old age. The characteristics of a newly formed coast-line, a young stream valley, or a mature plain are readily seen. These aspects of physiography may be considered briefly by a few examples. A young stream has steep sides, because there has not been time enough for weathering to broaden them; it is certain to have falls or rapids, if the rock texture is irregular, because it has not yet established a grade, and is therefore busily cutting in its bed and discovering rock

irregularities; it may have lakes, because there has not been time enough for the rivers to fill them; and its tributaries are liable to be few and its divides poorly developed, for want of time. A mature stream has lost these characteristics. It has many tributaries and well-defined divides, but no waterfalls, excepting possibly in the head-water regions. Lakes are absent, and the valley is broad and its side slopes moderate. This is the normal development; but accidents may occur to interfere with this development. For example, lava floods may cross the valley or fill it; glacial deposits may be laid down to embarrass the stream; and the land may be raised or depressed. A mountain or a plain, or any other land feature, when newly formed, and hence young, will have, therefore, certain characteristics; but with increasing age these will be changed. For example, drainage, at first vigorous, will dissect the land form, making it more irregular. A plain may then become a hilly region, and a mountain chain will become very rugged. Weathering and erosion will later reduce the irregularities, causing the mountain to become more level and the plain once more to approach a level condition. See **PHYSIOGRAPHY**.

STRATIGRAPHIC GEOLOGY.

The fossil organisms, whose study forms the basis of paleontology or biogeology, in connection with a study of the rocks themselves, are useful in telling of past changes in climate and physical geography. But perhaps their most important service to the geologist is as factors in the determination of the geological age of the rocks. Their use in this respect depends upon two important principles—one that the strata are normally found in the order of their deposition, the oldest below, the highest above. This is known as the law of superposition of strata. The second principle is that, in the evolution of life on the globe, there has been a general upward progression. A knowledge of the nature of this progression, therefore, makes it possible, by a study of the fossils of given strata, to tell in what stage of life development they lived, and to assign an age to the strata in which they are found. The use of the term age in this connection naturally does not mean years. A term like the Devonian period might be considered to represent in geological history what the term Bronze Age means when applied to human history. It refers to a stage of life development.

Prior to the enunciation of these principles by William Smith about a century ago, there had been various attempts to classify the strata. An early attempt employed the three terms Primary, Secondary, and Alluvial. A later attempt elaborated this time division as follows: Primitive, Transition, Secondary, Tertiary, and Alluvial. In the classification at present widely in use, the term Tertiary is still employed, and Secondary is occasionally met in the writings of geologists of a few years ago. At one period lithological data were used in classifying the strata, on the assumption that at certain periods widespread conditions permitted the general deposit of rocks with certain lithological characteristics. Thus there was a Carboniferous period or age of coal; an Old and a New Red Sandstone period; a Cretaceous, or Chalk period; an Oolitic period, etc. Several of these inherited terms are still in use even now that it is known that lithological char-

acteristics were not universal. With the introduction of the life record it was found possible to define periods of geological history with more definiteness, often placing their boundaries at unconformities which marked a break in the preservation of the life record, thus making a good dividing line. This study has led to the necessity for the introduction of new names and the abandonment of some of the old ones. Very commonly the new names are geographic—Devonian, from Devonshire, England, and Permian, from Perm, Russia, for example—being adopted from the region where the study necessitating the new name was made. The use of fossils has also made it possible to subdivide the larger divisions of geologic history, and the names thus introduced are usually geographical and of local significance. Thus, those of Texas differ from those of New York, California, India, or England. But the large divisions are of world-wide application. The following table gives the names commonly in use in America for the main divisions:

DIVISIONS OF GEOLOGICAL TIME

Cenozoic.....	{	Quaternary	{ Recent. Pleistocene. (Glacial period.)
		Tertiary.....	{ Pliocene. Miocene. Oligocene. Eocene.
Mesozoic.....	{	Cretaceous	{ Upper Cretaceous. Lower Cretaceous.
		Jurassic.	
		Triassic.	
Paleozoic.....	{	Carboniferous	{ Permian. Coal Measures. Sub-Carboniferous.
		Devonian.....	{ Upper Devonian. Middle Devonian. Lower Devonian.
		Upper Silurian or Silurian.....	{ Lower Helderberg. Onondaga. Niagara.
		Lower Silurian or Ordovician.....	{ Trenton. Canadian.
	{	Cambrian.....	{ Upper Cambrian. Middle Cambrian. Lower Cambrian.
Archaean.....	{	Huronian (Algonkian, United States Geological Survey).	
		Laurentian (Fundamental Complex, United States Geological Survey).	

In a given region a broad statement of the stratigraphic geology would start with the oldest rocks, perhaps the Archaean, and continue down to the present. It would treat of the fossils, their characteristics, variations, and associations, and it would include a study of the structure, position, and relations of the rocks themselves. These studies would be applied to an interpretation of the history of the region, both in general and in detail: The evolution of life; the climate and its variations; the relation of sea and land, and their variations in relation; the nature of sedimentation and the conditions accompanying it; the geographic conditions and the changes in past geography, with causes; periods of volcanic activity and their effects; the growth of mountains and their reduction; in a word, all the many and complex changes and interactions and interrelations of conditions which have helped to make the geological history. It is such a complicated subject that no adequate abstract is possible in an article of this scope. In fact, stratigraphic geology, being a history of the past,

differs for each locality, and can be properly discussed only in treatises on geology. Much on stratigraphic geology is, however, given in various articles on specific topics. See PALEONTOLOGY; PALEOBOTANY; ARCHÆAN SYSTEM; CAMBRIAN SYSTEM; SILURIAN SYSTEM; etc.

GLACIAL GEOLOGY.

One of the last great episodes in geological history was the advent of great ice sheets from northern lands, invading and overwhelming Northeastern America and Northwestern Europe. Because of its recency (in the Pleistocene period), the record of this invasion is clear. It lowered the hills, deepened the valleys, scoured, grooved, and polished the rocks, and transported soil and boulders in its onward march, leaving them in complex deposits when it melted back. These deposits clogged the valleys, turning streams aside and causing them to carve new valleys, which are now gorges with rapids and falls, and by making dams across the streams many lakes were ponded back in the stream valleys. In its advance the ice sheet drove out both animal and plant life, and many interesting effects on life were produced. A study of these records, and an interpretation of the events which they record, is the province of glacial geology.

The time of coming, the length of duration of the ice invasion, and the length of time since its withdrawal, are not known in years. From 5000 to 30,000 years is the estimated time since the withdrawal of the ice—probably nearer the former than the latter. The duration of the ice invasion was many times the length of the Post-Glacial period, and was great enough for a large amount of work to be performed. The beginning and the end of the Glacial period are included in the Pleistocene, so that even the time of coming is a recent geological event, being post-Tertiary. There is increasing evidence that the Glacial period was complex, consisting of several ice advances, with intermediate periods of deglaciation, or interglacial epochs.

Much discussion has arisen on the question of the cause of the Glacial period, without, however, arriving at definite results. That the land in the glaciated regions at the beginning of the Glacial period was higher than now is demonstrated; and it seems certain that, could the land be once more raised to that elevation, glaciation would again set in. The land is now rising again in the glaciated region, and the query may well be raised: Are we living in an interglacial period? See GLACIAL PERIOD.

ECONOMIC GEOLOGY.

A great number of geological products have economic value, and our industrial development of the present time is dependent upon these products. The investigation of these from the standpoint of their occurrence, origin, and uses belongs to the economic geologist. Of the topics of economic geology, undoubtedly the most important is the soil. Its origin, distribution, variations in texture and chemical composition, and the means of bettering it and of properly utilizing it, are questions of high importance. Building products—the building-stones, cement materials, and clays—form a second important group; mineral fuels, including coal, natural gas, and petroleum, a third group; and metallic

products, including both the precious and baser metals, form a fourth group. Besides these, there are many lesser products—the precious stones, abrasive materials, salt, gypsum, fertilizers, etc. The number of industries dependent upon this varied list of geological products, and the vital relation of several of them to modern civilization, show the value of a thorough and scientific knowledge of the nature and cause of their occurrence. It is the importance of this economic aspect of geology that has led governments, both State and national, to support expensive geological surveys. For a scientific study of economic geology, other aspects of geology must also be considered; consequently the whole field of geology has profited from the need of study of the economic aspect. See ORE DEPOSITS; MINING.

THE HISTORY OF GEOLOGY.

Geology ranks as one of the youngest of the sciences. In the latter part of the eighteenth century the discussion was being waged with warmth by Hutton and his followers on the one hand, and Werner and his followers on the other hand, as to whether any but the most recent igneous rocks were to be ascribed to other than aqueous agencies, as Werner affirmed. Catastrophism was rampant, and articles on that phase of natural philosophy which dealt with the earth history were mainly philosophical polemics defending some hypothesis. The clergy took a share in the discussions, opposing any theory of earth history which seemed at variance with the then existing dogmas of theology. It had not yet come to be the custom in the natural sciences to gather facts patiently, weigh them carefully, and endeavor to draw logical conclusions from them. Rather it seems to have been the custom to take such facts as appeared, philosophize upon them, and defend the conclusions with vigor against all comers and all fact.

James Hutton, in 1785, sounded the first note of the new geology when he said that he saw "no traces of a beginning, no prospect of an end." This generalization, now a foundation stone of the geological structure, was based upon a wide and thoughtful study and upon many carefully gathered facts. In Playfair's *Illustrations of the Huttonian Theory* are to be found many of the principles of modern geology. A second great epoch in the history of geology was the work of William Smith, at the close of the eighteenth century. As has been stated above, his work made possible the division of the geological record into ages based upon scientific principles. His work, therefore, stands as the foundation of stratigraphic geology. The work of Hutton and Smith made it possible for others to follow, and quickly facts began to accumulate and conclusions to be drawn which gave to geology the right to be considered as a separate science. Sir Charles Lyell, sometimes called the founder of modern geology, gathered these results and added to them his own, putting them together as a system in his *Principles of Geology*, still a geological classic. He vigorously promulgated his system, and was, without doubt, the greatest and most effective of geological teachers.

In these earliest days of geology as a science Americans had but little share; but before the middle of the century James Hall, James D.

Dana, and others were vigorously at work on the geology of the North American continent. State geological surveys were established in many of the States; Government geological expeditions and surveys were started; and, finally, the present United States Geological Survey was organized. Another event of great importance in the history of geology was the announcement of Agassiz's glacial hypothesis. Prior to his announcement floods, and then floods with icebergs, relics of the earlier days of catastrophic geology, were appealed to in explanation of the phenomena of the drift. Aside from its importance for the science of glacial geology, which it originated, Agassiz's doctrine of a glacial period was important as the destroyer of the last remnant of catastrophism from geological science. Henceforward uniformitarianism was accepted, and, for a while, perhaps too thoroughly accepted and too blindly followed, as a result of Lyell's energetic advocacy. No longer was there any belief in the performance of geological work in a limited period of time; but moderate uniformity and great lapse of time were firmly established principles. Perhaps to Darwin's doctrine of evolution, which Agassiz did not accept, is due the final establishment of the principle of a great lapse of geological time. Be this as it may, the promulgation of the doctrine of evolution was an event of great importance to geology, which made advance in certain phases of geology possible. This theory was based in part on paleontological evidence, and geologists took a large share in its establishment. The discussion which followed its announcement resembled in some respects the discussion on geological philosophy at the end of the preceding century.

Out of the old natural philosophy have come several sciences, and out of each of these have developed several divisions, or subspecies, some of which may be classed as distinct sciences. The field of geology is so large, and its problems are so varied, that, as the body of fact gathered by the army of workers has increased, it has become necessary to subdivide; and, as in all sciences, the tendency is ever toward narrower and narrower specialization. The generation of geologists now passing away could be familiar with the whole field, as their teachers could be naturalists, and theirs natural philosophers. In one sense this is unfortunate, but in others it is for the best, because with specialization the details of knowledge are best gathered. Some day a geological Darwin will appear with large enough grasp of the subject to arrange the facts patiently gathered in the various fields, and to see their bearing on the great and still unsolved problems of geology.

York, 1893); Winchell, *Geological Studies* (New York, 1886); Geikie, *Outlines of Field Geology* (3d ed., London, 1883).—COSMICAL GEOLOGY: Croll, *Climate and Time* (Edinburgh, 1885); Fisher, *Physics of the Earth's Crust* (London, 1881); Ball, *The Earth's Beginning* (London, 1901); Green, *Vestiges of a Molten Globe* (London, 1887).—MINERALOGY AND PETROGRAPHY: Dana, *Manual of Mineralogy* (3d ed., New York, 1878); Moses and Parsons, *Mineralogy, Crystallography and Blowpipe Analysis* (New York, 1895); Rosenbusch, *Mikroskopische Physiographie der Mineralien und Gesteine* (Stuttgart, 1885-87); Zirkel, *Lehrbuch der Petrographie* (Leipzig, 1893-95).—DYNAMIC AND STRUCTURAL GEOLOGY: Suess, *Das Antlitz der Erde* (Prague, 1883-88); Daubrée, *Etudes synthétiques de géologie expérimentale* (Paris, 1879); Merrill, *Rocks, Rock-Weathering and Soils* (New York, 1897); Geikie, *Earth Sculpture* (London, 1898); Shaler, *Aspects of the Earth* (New York, 1890); Reade, *The Origin of Mountains* (London, 1886); Dana, *Characteristics of Volcanoes* (New York, 1890); Bonney, *Volcanoes* (London, 1898); Russell, *Volcanoes of North America* (New York, 1897); Geikie, *Ancient Volcanoes of Great Britain* (London, 1897); Hull, *Volcanoes, Past and Present* (London, 1892); Judd, *Volcanoes* (New York, 1881); Milne, *Earthquakes* (New York, 1886); Powell, *Canyons of the Colorado* (Meadville, Pa., 1895); Russell, *Rivers of North America* (New York, 1898); Russell, *Lakes of North America* (Boston, 1894); Hovey, *Celebrated American Caverns* (Cincinnati, 1882); Darwin, *Coral Reefs* (London, 1891); Dana, *Corals and Coral Islands* (New York, 1890).—PHYSIOGRAPHIC GEOLOGY: Gilbert, *Geology of the Henry Mountains* (Washington, 1877); Davis, *Physical Geography* (Boston, 1900); Tarr, *Elementary Physical Geography* (New York, 1895); Geikie, *The Scenery of Scotland* (London, 1887); Avebury (Lubbock), *Scenery of Switzerland* (London, 1896).—STRATIGRAPHICAL GEOLOGY AND PALEONTOLOGY: Zittel-Eastman, *Text-book of Paleontology* (London, 1900); Keyser-Lake, *Text-book of Comparative Geology* (Stuttgart, 1893); Nicholson and Lydekker, *Manual of Paleontology* (London, 1889).—GLACIAL GEOLOGY: Geikie, *The Great Ice Age* (New York, 1895); Wright, *The Ice Age in North America* (New York, 1890); Russell, *Glaciers of North America* (Boston, 1897); Bonney, *Ice Work* (New York, 1896).—ECONOMIC GEOLOGY: Phillips, *Treatise on Ore Deposits* (London, 1896); Kemp, *Ore Deposits of the United States and Canada* (3d ed., New York, 1901); Tarr, *Economic Geology of the United States* (New York, 1894).—HISTORY OF GEOLOGY: Geikie, *The Founders of Geology* (London, 1897). GEOLOGICAL REPORTS AND PERIODICALS: The governments in both America and Europe have geological bureaus which are actively engaged in the investigation of geological problems. In the United States this bureau, known as the United States Geological Survey, publishes reports, bulletins, and monographs of great value. There are also geological surveys in operation in the different States. Among the leading geological journals in America may be mentioned: *Journal of Geology* (Chicago); *American Geologist* (Minneapolis); *American Journal of Science* (New Haven); *Bulletin of the Geological Society of America* (Rochester). In England the leading journals are the *Geologist* (London), and *Quar-*

terly Journal of the Geological Society (London). The leading German periodicals are: *Neues Jahrbuch für Geologie, Mineralogie und Paläontologie* (Stuttgart), and *Zeitschrift für praktische Geologie* (Stuttgart).

GE'OMAN'CY. See SUPERSTITION.

GEOMETRICAL OPTICS. See LIGHT.

GEOMETRIC MEAN. If three quantities, a , b , c , are in geometric progression, b is called the geometric mean between a and c ; e.g. 2, 4, 8 are three such numbers, 4 being the rate, and 2 is the geometric mean. From the nature of the series

$$\frac{a}{b} = \frac{b}{c}, \text{ or } b^2 = ac, \text{ and } b = \sqrt{ac}.$$

The positive value of the square root is usually, but not necessarily, taken as the geometric mean when a and c are positive, the negative value being taken when a and c are negative—e.g. the geometric mean between 2, 8 is $\sqrt{16} = +4$, but between $-2, -8$, it is $\sqrt{16} = -4$. The several terms of a geometric series which lie between two numbers, as a , l , are called the geometric means between a , l . The geometric mean of n positive real quantities is the positive value of the n th root of their product—e.g. the geometric mean of 8, 27, 64 is $\sqrt[3]{8 \cdot 27 \cdot 64} = 24$.

GEOMETRIC PROGRESSION. See SERIES.

GEOM'ETRID MOTH. A moth of the family Geometridæ, whose caterpillars are called inch-worms, loopers, measuring worms, or spanworms. The family name ('ground-measurer') refers to the peculiar method of locomotion of these caterpillars. The geometrids form one of the largest divisions of the Lepidoptera, scattered over all parts of the world, characterized by slenderness of body and the absence of tufts or crests on the thorax; the wings are usually light-colored, with intricately variegated markings, but some species are distinctly marked with bright colors. They are of medium or small size. For an account of the caterpillars, see MEASURING WORM.

The caterpillars of the geometrids are among the most destructive pests of tree foliage and garden plants, as is described in the accounts of such species as the canker-worm, gooseberry-worm, raspberry-worm, etc. A magnificent monograph of the American geometrids, by Dr. A. S. Packard, was issued as volume x. of its quarto publications by the United States Geological Survey in 1876; it contains thirteen colored plates and gives all American species then known.

GEOM'ETRY (Lat. *geometria*, from Gk. *γεωμετρία*, *geometria*, from *γεωμετρῆς*, *geōmetrēs*, geometer, from *γῆ*, *gē*, earth + *μέτρον*, *metron*, measure). The science of form. Geometric concepts arise from the consideration of forms of actual objects, just as numerical concepts arise from the consideration of collections of objects. E.g. the idea of a cube results from observing that the corresponding physical object, as a die occupies a certain part of space. This implies the first geometric assumption, viz. that space is divisible. In this case it is divided into two parts, that within the cube and that outside of it. Geometry considers only the former, the space occupied by a substance. This space is

called a geometric solid or simply a solid. The boundary between the space and that outside of it is a surface. A surface, being itself an element of space, is also divisible, and the boundary between two parts of it is called a line. A line, in turn, is divisible by a point. The number, comparative size, and position of these elements unite to make the concept cube. With accurate ideas of point, line, surface, solid, it is easy to imagine a world of geometric figures formed by their combinations. It is then only necessary to add concise definitions and axioms (q.v.) to found a system of geometry. But the validity of these assumed premises must determine the validity and scope of the resulting science—a fact forcibly exemplified in the case of Euclidean geometry.

Geometry was developed by the ancients, especially by the Greeks, to a high degree. But their constructions and solutions in elementary geometry were generally effected by the use only of the straight edge and compasses (instruments corresponding to the geometric elements, straight line and circle). Their achievements were, therefore, limited, and such problems as the trisection of an angle, the duplication of a cube, and all those which cannot be expressed by equations of the first or second degree, remained unsolved until the introduction of other instruments. The word 'geometry' signifies land-measure, and Herodotus attributes the origin of this science to the necessity of resurveying the Egyptian fields following each inundation of the Nile. He refers to the plan of taxation enforced by Sesostris (Rameses II.), which required a survey of the land. Proclus also confirms the Egyptian origin of geometry by saying that Thales introduced this art from that country into Greece. The greatest among the disciples of Thales was Pythagoras, who formulated deductive geometry, and discovered many important propositions. Among the illustrious successors of Pythagoras were Anaxagoras, Anaximander, Bryson, Antiphon, Hippocrates of Chios (who duplicated the cube, but not by elementary geometry), Zenodorus, Democritus, and Theodorus. To this list should be added the name of Plato, who introduced a new epoch in the science by formulating the method of geometric analysis, and emphasizing the necessity of accurate definition. Menæchmus, a contemporary of Plato, discovered the conic sections. Among those who studied at the Academy of Plato were Eudoxus, the inventor of proportion, exhaustions, and many theorems found in Euclid's *Elements*, and Aristotle, who improved many geometric definitions. The name of Euclid marks another epoch in the history of geometry. Euclid's work is remarkable not for its originality, but for its simplicity and perfection as a logical system, based as it was on the discoveries of his predecessors. This work of fifteen books, called the *Elements*, has for over two thousand years formed the basis of elementary instruction in geometry wherever the science has been taught. For the development of the geometry of conic sections we are indebted to Apollonius of Perga, and to Archimedes. The later Greeks also cultivated geometry enthusiastically, as is attested by Nicomedes and Hipparchus, and in the Christian Era by Ptolemy and Pappus.

The elementary plane geometry ordinarily studied in our schools is based directly, or indirectly through the work of Legendre, upon

Euclid's *Elements*. Of this classic work, the first four and the sixth 'books' are devoted to plane geometry, that is, geometry in which the figures can all be imagined in one plane, even though, for purposes of superposition, they may be imagined as taken out of that plane in the course of the discussion. Euclid's treatment of solid geometry, in which the figures are imagined as occupying three dimensions, was so meagre that the elementary treatment of the subject to-day differs quite radically from that in the *Elements*. One of the principles of Euclid's work now most often violated is the attempt to avoid hypothetical constructions. For Euclid seeks to show how to construct each of the figures needed before he makes use of it. Thus, since it is impossible to trisect a general angle by the use of the compasses and the unmarked straight edge, Euclid would have been estopped from asking such a question as, Do the arms of an angle, and the two lines which trisect the angle, trisect a transversal of these lines? At present it is more common to assume that the necessary figures can be constructed, and see what propositions can be proved from certain assumed postulates and axioms. Later, the question of the figures admitting of construction by the compasses and straight edge is considered by itself. Euclid's work is still used as a text-book in the schools of England and her colonies; but it has long since given way to a more modern treatment in most other countries.

The basis of ancient geometry as set forth in the *Elements* went practically unchallenged until the nineteenth century. The renewed interest in the science, growing out of the Renaissance, inspired the investigation of Euclid's assumptions, and led mathematicians to seek to demonstrate the fifth postulate or twelfth axiom (given by Brill as the eleventh), viz. that two unlimited straight lines intersect on that side of a transversal on which the sum of the interior angles is less than a straight angle. Among the eminent mathematicians who sought to show the dependence of this proposition upon those preceding it were Legendre and Gauss. Lobatchevsky and Bolyai were the first to construct a geometry independent of Euclid's assumption, and thus to found the so-called non-Euclidean geometry. Then at once followed a great advance toward exploring the new field, and from the researches of Riemann, Helmholtz, and Beltrami, it is concluded that ten of the Euclidean assumptions are valid for all geometry, but that the one just mentioned and "two straight lines (or, more generally, two geodesic lines) include no space," are limited to the properties of particular space. Riemann and Helmholtz formulated assumptions for a geometry in space of n -ply manifoldness and with constant curvature, and observed that on the sphere, whose curvature is constant and positive, the sum of the angles of a triangle is less than a straight angle, this characterizing the space of the geometry of Bolyai and Lobatchevsky. Klein has designated these three geometries respectively, the elliptic, parabolic, and hyperbolic. Starting with this broader view, many of the leading mathematicians of the last quarter of a century, including Cayley, Lie, Klein, Pasch, Killing, Fiedler, and Mansion, have given much attention and made valuable contributions to the subject of geometry.

Without questioning the validity of Euclidean

geometry, there have grown out of it in modern times two great systems—an analytic, or coördinate (see ANALYTIC GEOMETRY), and a synthetic, or 'modern' geometry. The latter embraces descriptive and projective geometry, although systems of coördinates have been introduced also in the latter.

DESCRIPTIVE GEOMETRY. This has for its object the representation of solids upon two planes at right angles to each other, these planes then being, for convenience, flattened out into a single plane. This may be done in a variety of ways, but the original method is that of parallel rays perpendicular to the planes, and known as the orthographic or orthogonal projection. These projections are commonly made, one on a horizontal plane (called the plane of the figure), and one on a vertical plane (called the elevation); e.g. take

a circle as the given figure, and let HV be the planes of projection intersecting in XX' . Draw PP_1 , $P'P_1$, perpendicular to H , PP_2 , $P'P_2$, perpendicular to V . The rays from P determine the plane perpendicular to XX' at P' , and those from P' determine a plane \perp to XX' at P'_2 . Continuing in this way, the circle is projected into an ellipse on H , and into an ellipse on V . The plane V may now be revolved about XX' through 90° , causing the projection P_2, P'_2 to form P_2, P'_2 , and thus representing two projections of the circle in the same plane. This process is entirely reversible, from which it is clear that a figure may be constructed from its projections. Descriptive geometry is a powerful agent in solving the problems of mechanics and the constructive arts; e.g. in the planning of machinery, arches, and conduits.

PROJECTIVE GEOMETRY. As the name suggests, this investigates the properties of figures by means of projections. The fundamental idea is that of

transforming a plane figure into a plane figure by means of projective pencils, or three-dimensional figures into three-dimensional figures by means of a sheaf of rays. In the broader sense, projective geometry also includes the study of the corresponding forms of various dimensions; e.g.

the axial pencil (planes with a common axis) corresponds to the pencil of rays (lines with a common point). If two ranges of points, as A, B, C, \dots and A', B', C', \dots , or as A, B, C, \dots and A'', B'', C'', \dots in the accompanying figure, are such that the lines which join corresponding points concur, as at S , the two ranges are said to be in perspective; but A, B, C and A'', B'', C'' are said to be projective. The anharmonic ratio (see ANHARMONIC RATIO) of projective ranges is constant, i.e. $(A'' B'' C'' D'') = (ABCD)$. This property forms the basis of the general definition of projective plane figures, which may be stated thus: Any two plane figures in which for every point of the one there is a point in the other, and for every line in the one there is a line in the other, and so related that the anharmonic ratio of any corresponding ranges of four points or corresponding pencils of four lines are equal, are said to be projective.

HYPER-GEOMETRY. Generalization has led geometers to imagine other spaces than that in which we live, and to seek the properties of figures existing in space of more than three dimensions. The result has been the building up of a geometry of hyper-space or of n dimensions. Reasoning in this geometry is possible only by the use of symbols. Since a line segment, i.e. a figure of one dimension, is represented by an algebraic quantity of degree 1, such as a ; since a square having two dimensions is represented by the algebraic expression a^2 ; and, finally, since a cube, having three dimensions, is represented by the algebraic expression a^3 —the idea naturally suggests itself that some figure of four dimensions corresponds to the symbol a^4 , and that, in general, some figure of n dimensions corresponds to the symbol a^n . The fact that four dimensions cannot be represented in the three-dimensional space in which we live has little bearing upon the idea itself; a three-dimensional figure (a solid) cannot completely be represented on a plane, and yet mathematical thought involving the concept of three-dimensional space would remain logical and useful even if all actual figures were only two-dimensional.

The idea of the fourth dimension thrusts itself upon the mind even more prominently in studying rectangular coördinates in analytic geometry; $ax = b$ represents a point, one axis being necessary; $ax + by = c$ represents a line, two axes being necessary; and $ax + by + cz = d$ represents a plane, three axes being necessary. This suggests that $ax + by + cz + dw = e$ may represent a three-dimensional figure in a four-dimensional space. It is evident that just as we can draw in a plane the nets of the five regular bodies, we ought to be able, by analogy, to model in three-dimensional space the solid nets of all the six structures of four-dimensional space corresponding to the five regular bodies. This has been done by Schlegel, the models being made by Brill of Darmstadt. The figure corresponding to the square and cube may be described as follows: It is bounded by 8 cubes, just as the cube is bounded by 6 squares; it has 16 corners, 24 squares, and 32 edges, so that from every corner 4 edges, 6 squares, and 4 cubes proceed, and from every edge 3 squares and 3 cubes. Thus, reasoning by analogies, mathematicians have gradually developed higher geometric systems, and have succeeded in greatly extending the scope of geometry. The idea of higher dimensions has been brought

somewhat into disrepute owing to the efforts of the followers of Professor Zöllner, of Leipzig, to explain the phenomena of spiritualism by making the fourth-dimensional world the abode of spirits. Nevertheless, mathematicians agree as to the great practical value of the idea, inasmuch as it leads to important simplifications of mathematical language, and especially inasmuch as by its perfect generality it gives remarkable clearness to the concepts of real geometry. A reasonable mathematical treatment of the subject may be found in Schubert's essay on the "Fourth Dimension," in his *Mathematical Essays and Recreations* (Chicago, 1898).

The phases of modern geometry are closely interwoven in their historic as well as in their logical development. Monge, the father of modern geometry, published his *Géométrie descriptive* in 1800, five years after the work of his pupil, Lacroix, appeared. Following his works were those of Hachette (1812, 1818, 1821), and later Leroy (1842), Olivier (1845), de la Gournerie (1860). In Germany leading contributors have been Ziegler (1843), Anger (1858), Fiedler (3d ed. 1883-88), and Wiener (1884-87). Monge did not confine his labors to descriptive geometry; he set forth the fundamental theorem of reciprocal polars, though not in modern language, gave some treatment of ruled surfaces, and extended the theory of polars to quadrics. Monge and his school concerned themselves especially with the theory of form, but Desargues, Pascal, and Carnot treated chiefly the metrical relations of figures. Carnot investigated those relations in particular connected with the theory of transversals; in his works, *Géométrie de position* (1803), *Théorie des transversales* (1806). The present geometry of position (*Geometrie der Lage*) has little in common with Carnot's *Géométrie de position*.

Although Newton had discovered that all curves of the third order can be derived by central projection from five fundamental types, the origin of projective geometry is generally attributed to Poncelet (1822). He first made prominent the power of the projective relations, and the principle of continuity in research. Möbius followed Poncelet, making much use of anharmonic ratios in his *Barycentrischer Calcul* (1827). The anharmonic point and line properties of conics have been further elaborated by Brianchon, Chasles, Steiner, and Von Staudt. Plücker applied the theory of transversals to curves, and Salmon discovered the so-called circular points at infinity. Brianchon (1806) extended the application of Desargues's theory of polars. To Gergonne (1825-26) is due the principle of duality, the most important after that of continuity in modern geometry. Gergonne was the first to use the word 'class,' and explicitly defined class and degree (order), showing their dual relation. He and Chasles were the first to study scientifically surfaces of higher order. Steiner (1832) gave the first complete discussion of the projective relations between ranges and pencils, and laid the foundation for modern pure geometry. In 1848 Steiner showed that the theory of polars can serve as a foundation for the study of plane curves, independent of the use of coordinates. He introduced the noteworthy curves which now bear the names of himself, Hesse, and Cayley. Chasles, in his *Aperçu historique* (1837), popularized the new geometry

and introduced the name homographic, and extended the homographic theory. Von Staudt (1847, 1856-60) set forth a complete pure geometric system in which metric geometry finds no place. Cremona (1862, 1875), Townsend (1863), and Clifford did much to extend the knowledge of modern geometry.

A few of the more important works of reference are: Reye, *Geometrie der Lage* (Leipzig, 1882-86; English, by Holgate, New York, 1898); Wiener, *Geschichte der darstellenden Geometrie* (Leipzig, 1884); Cremona, *Projective Geometry*, translated by Leudesdorf (2d ed., Oxford, 1893); Russell, *Essay on the Foundations of Geometry* (Cambridge, 1897); Chasles, *Aperçu historique* (3d ed., Paris, 1889); Smith, "History of Modern Mathematics," in Merriman and Woodward, *Higher Mathematics* (New York, 1896); Chasles, *Rapport sur les progrès de la géométrie* (Paris, 1870); Tannery, *La géométrie grecque* (Paris, 1887); Casey, *Sequel to Euclid* (5th ed., Dublin, 1888); Rouché et Comberousse, *Traité de géométrie* (7th ed., Paris, 1900); Henrici and Treutlein, *Lehrbuch der Elementar-Geometrie* (3d ed., Leipzig, 1901); Hilbert, *Foundations of Geometry*, trans. by Townsend (Chicago, 1902); Klein, *Famous Problems of Elementary Geometry* (English ed., Boston, 1896). Concerning the methods of geometric reasoning, see ANALYSIS.

GEOPH'AGY (from Gk. γῆ, gē, earth + φαγεῖν, phagein, to eat), or EARTH-EATING. The habit of eating clay or other earthy substances is widespread, having been noticed among the Indians of Bolivia and Peru, the Javanese, Persians, Hindus, Europeans, Africans, and certain inhabitants along the southern Appalachians in the United States. This habit is susceptible of a number of explanations. The Hopi Indians of Arizona, for instance, prepare the small tubers of the wild potato (*Solanum Jamesii*) for eating by mixing them with clay, the object being to reduce the acidity of the root. The Dyaks take along with them in their canoes a supply of red ochre and oleaginous clay to eke out their rations, just as the Veddahs of Ceylon in time of famine eat decayed wood mixed with honey, in these cases the bulk of the food appeasing hunger by giving a sensation of fullness to the stomach.

Other earth-eaters allege that clay improves the complexion; it undoubtedly imparts the ghastly sallowness declaring a clay-eater. Deniker explains geophagy as perhaps due to the necessity of supplying the need of mineral substances which induces the eating of salt. It is probable that in the majority of cases the habit is due to morbid or nervous conditions, such as cause biting of the finger-nails, chewing slate pencils, etc. The habit of geophagy is fatal, causing death by dysentery or dropsy.

GEOPHILOUS (jē-ōf'ī-lūs) **PLANT.** See GEOPHYTE.

GE'OPHYTE (from Gk. γῆ, gē, earth + φυτόν, phytōn, plant). A plant whose perennial organs live under or close to the ground. The term geophilous has also been applied to such plants. The majority of geophytes have two distinct life aspects, corresponding to the periods of greater and lesser physiological activity. In the so-called growth period (summer in the higher latitudes, the rainy season in arid low latitudes), geophytes are conspicuous landscape features, by reason of

aërial organs of various kinds, such as aërial stems, leaves, flowers; in the so-called resting period, however (winter in the higher latitudes, the dry season in arid low latitudes), they are in-

clover; in these and in similar plants the perennating organs are close to the soil rather than beneath it. Biennials, such as mullein and evening primrose, have rosettes closely appressed to the soil in the winter or dry period, while in the growing period erect stems are sent up into the air. In most geophytes reserve foods are stored in the underground parts, and in many cases these parts are greatly enlarged; ordinary bulbs, roots like turnips and beets, and potato tubers illustrate this habit. The chief advantage of the geophytic habit in high latitudes is doubtless the attainment of protection from excessive cold and injuries consequent thereon; in arid regions, protection from excessive transpiration is secured by a sojourn in the soil.

GE'OPONTIKA (Gk. γεωπονικά, nom. pl. of γεωπονικός, *geōponikos*, relating to agriculture). A Greek treatise on agriculture. It was given its present form in the tenth century by an unknown hand at the request of the Emperor Constantine VII. (Porphyrogenitus), to whom it is dedicated. The basis of this work was a compilation made in the sixth or early seventh century by a certain Scholiasticus Cassianus Bassus, from the earlier works of Vindarius Anatolius of Berytus, and Didymus, of the fourth or fifth century. The names of some of the earlier authors to whom reference is made are Africanus, Apuleius, Damogeron, Democritus, Diophanes, Florentinus, Leontinus, Pamphilus, Paxamus, the Quintilii, Varro, and Zoroastres. The twenty parts into which the treatise is divided contain a mass of rules and directions bearing on the daily life of the husbandman. The best edition is that of Beckh (Leipzig, 1895). Consult Krumbacher, *Byzantinische Literaturgeschichte* (Munich, 1897), pp. 261ff., and the works there referred to.

GEORGE I. (GEORGE LOUIS) (1660-1727). The first Hanoverian King of Great Britain and Ireland (1714-27). He was the son of Ernest Augustus, first Elector of Hanover, and Sophia, granddaughter of James I. of England, and was born at Hanover on March 28, 1660. Entering the army at the age of fifteen, he distinguished himself in many campaigns by his bravery. His morals, however, were as loose as those of his contemporaries of equal rank; intrigues and mistresses made his marriage with his cousin, Sophia Dorothea, unfortunate. When his mother, at an advanced age, was declared heiress to the throne of England by the Act of Settlement of 1701, George drew near to Marlborough and the Whigs, on whom he relied for the support of his claim. After the death of Queen Anne, accordingly, he succeeded to the crown without difficulty, and reached England August 18, 1714. Unlike William III., who had aimed to reconcile opponents by calling men of both parties to the Ministry, George, a far inferior man, employed Whigs only as advisers. Utterly ignorant of English character, and even of the language, and lacking sympathy with his new subjects, he aimed to exploit England for the benefit of his German electorate. Another ground for his unpopularity was the greed of his favorites and mistresses, who sold offices, great and small. George had little to do personally with the Government, which was carried on by his ministers, at first by Stanhope and Townshend, and later by Walpole. The Jacobite insurrection of 1715 was easily suppressed, the leaders were put to death, and about

GEOPHYTE.

A spring beauty (*Claytonia*), showing the underground corm; the other (aërial) portions are present only a small part of the year.

conspicuous by reason of the relative absence of aërial organs. The most extreme geophytes are those whose organs are entirely beneath the soil during periods of lesser activity; examples of this class are bulbous plants (such as onions and lilies), plants with corms (such as Indian turnip and spring beauty), and rootstock plants (such as sweet-flag and bracken-fern). In the cases cited, the entire plant is often hidden from ordinary view during the resting season. One may also include in this category plants (like the carrot and dock) whose stems die down to the root at the close of a season of active growth; such plants usually have prominent roots. The geophytic habit is also shown, though to a less extreme degree, by ordinary lawn grasses and by

a thousand rebels were transported to the plantations. After this event George's frequent visits to Hanover made him still more unpopular, and even while he was in England he rarely attended the Cabinet, as he could not understand the discussions. For these reasons the power came rapidly into the hands of Walpole. In one of the absences (1720), the South Sea bubble burst, and the misfortune was naturally laid at the King's door; the company was alleged to have paid great bribes to the Duchess of Kendall, his favorite mistress. Thereupon some advised George to abdicate in favor of the Prince of Wales; others urged him to seize absolute control of the Government. Without permitting him to resort to either expedient, Walpole, supported by Townshend, brought the Government safely through the crisis. Some time afterwards the demand of Spain for the restoration of Gibraltar and of Minorca (1725) led to a short war with that country. Admiral Hosier commanded an unsuccessful expedition to the Spanish possessions in America (1726), but in 1727 peace was signed. The King died of apoplexy on a journey to Hanover on June 11, 1727. He had two legitimate children—George, who succeeded him, and Sophia Dorothea. Commonplace in ability as well as in personal appearance, George nevertheless gave England a wise foreign policy, and though he was by nature autocratic, the circumstances of his reign favored the growth of constitutional principles.

(Vienna, 1881-88); Stanhope, *History of England* (7 vols., London, 1836-54); Ranke, *History of England* (6 vols., Oxford, 1875); Coxe, *Life of Walpole* (London, 1808); Wright, *England Under the House of Hanover* (London, 1848); Thackeray, *The Four Georges* (New York, 1860), which describes the manners, morals, etc., of the time; *English Historical Review* (London, 1886).

GEORGE II. (1683-1760). King of Great Britain and Ireland, Elector of Hanover, 1727-60. The son of the preceding, he was born at Herrenhausen, Hanover, November 10 (new style) 1683. After his mother's divorce in 1694, he lived with his grandparents, who superintended his education. On September 2, 1705, he married the Margrave of Anspach's daughter, Carolina Wilhelmina. His code of morals was on a par with his father's, but his wife gained considerable influence over him by condoning his infidelities; and her death, in 1737, which was considered a national loss, he genuinely deplored. In 1708 he joined Marlborough's army, and showed conspicuous bravery at Oudenarde, where he narrowly escaped death. At his father's accession to the throne he was created Prince of Wales. Owing to his affection for his mother, he had never been on good terms with his father, who connived at a plot for his forcible disappearance. Their mutual repugnance increased when the King, during his visits to Hanover, was averse to appointing the Prince guardian of the realm. The Prince supported the opposition party, but at his father's death in 1727 was persuaded by the Queen to retain Walpole in power. Walpole's Administra-

tion was distinguished by the preservation of peace, and his unwillingness to declare war with Spain led to his resignation in 1742. He was succeeded by Carteret, who favored a war policy. Anxious for the safety of Hanover, the King made an alliance with Maria Theresa of Austria in the Silesian Wars, and at Dettingen, in 1743, commanded the victorious army in person. The Young Pretender's rebellion in 1745-46 was suppressed at Culloden by the Duke of Cumberland, the King's second son. England joined Prussia in the Seven Years' War, which brought about the downfall of the colonial power of France. In 1757, by the victory of Plassey, Clive laid the foundations of the Indian Empire, and in 1759 Wolfe's victory on the heights above Quebec achieved the conquest of Canada. In 1749 the funds rose above par, and Pelham effected an appreciable reduction of the national debt by reducing the interest from 4 to 3 per cent. George II., although a mediocrity, and possessed of an obstinate temper, was always sagacious enough to perceive the superior wisdom and prudence in the counsels offered by his ministers, and acceded to their advice, to the material benefit and industrial progress of the country. At the end of his reign Pitt conducted the affairs of the nation. George II. died suddenly from rupture of the heart, October 25, 1760, at Kensington. Consult: Hervey, *Memoirs of the Reign of George II.* (London, 1854); Walpole, *Memoirs of the Last Ten Years of the Reign of George II.* (London, 1822, 1846); Schmucker, *History of the Four Georges* (New York, 1860); Thackeray, *Four Georges* (London, 1861); McCarthy, *History of the Four Georges and William IV.* (London, 1884-1901); Jesse, *Memoirs of the Court of England from the Revolution of 1688 to the Death of George II.* (London, 1843); Coxe, *Memoirs of the Life and Administration of Sir Robert Walpole* (London, 1798); id., *Memoirs of Horatio, Lord Walpole* (London, 1802).

GEORGE III. (1738-1820). King of Great Britain and Ireland, 1760-1820. He was born on June 4, 1738, and succeeded his grandfather, George II. His father was Frederick Louis, Prince of Wales, and his mother was Augusta, daughter of the Duke of Saxe-Gotha. His early education was the occasion of much quarreling between his father and grandfather, and suffered in consequence. His governor and preceptors were often changed, in accordance with their supposed political influence on his character. He grew up with a limited education; he spoke French and German, but knew little Latin and less Greek. His English was poor in conversation, and worse in writing. He spelled badly, and had no taste for literature. Nevertheless, he began the famous collection of books and manuscripts which, under the name of King's Library, is one of the greatest treasures of the British Museum, and he had a genuine appreciation of music.

George III. had but average ability, but more than average obstinacy. Although a great stickler for formalities and royal dignity, he was simple and economical in his tastes, which were emphatically those of the middle class. He had a taste for farming, and was fond of petty mechanical contrivances, and was often derisively called 'Farmer George' and 'the royal button-maker.' He was sincerely pious, and, unlike his

immediate predecessors and successors, was highly moral. He married in 1701 the Princess Charlotte Sophia, daughter of the Duke of Mecklenburg, and became the father of fifteen children. He was a man of great courage, and in moments of danger preserved the greatest dignity. At the time of the Lord George Gordon riots his was the only clear head in the Council, and it was due to his advice that the riots were suppressed.

George III. was perhaps the most important figure in the British constitutional development of the eighteenth century. In his boyhood his mother had instilled exalted notions of the royal prerogative into his mind. The Earl of Bute, his chief instructor later, by his influence emphasized these tendencies. His plan was to do away with the party system as it then existed, and to resume the powers of the Crown which had been appropriated by the Cabinet Ministry. From the time of the accession of the House of Hanover the Whig oligarchy had controlled Parliament, and by their chosen Ministers ruled the King. George III. designed to break up this oligarchy, and to make himself the ruler. He differed from the Stuarts in that he proposed to rule constitutionally, with the consent of Parliament; and from the Pitts in that he wished to overthrow the oligarchy by exercise of the royal power, instead of appealing to public sentiment. He re-assumed the Crown patronage which had passed into the hands of the Cabinet, and by it organized a group of politicians upon whom he could depend. The 'King's friends' thus became an important factor in politics. He did not hesitate to use corruption to gain his ends, both in general elections and in securing Parliamentary votes, according to the custom of his age. Although at times the nation disapproved of his policy, yet in the main it supported his measures, and the Whig oligarchy was finally broken.

The history of the reign of George III. is a description of the struggle he made to put his political theories into practice. After the fall of Pitt, under whom England had entered upon a brilliant career of victory and conquest in the Seven Years' War, he succeeded in 1761 in introducing some of his own friends into the Whig Ministry of Newcastle, and on the retirement of the latter in the following year he made Bute, his favorite, Prime Minister. But there was great prejudice against Bute, on account of his Scotch nationality and well-known opinions on the royal prerogative. He was not a man of sufficient ability to overcome this prejudice, and, recognizing his failure, resigned in 1763. Meanwhile the Whig Party had broken up into three factions, and the King invited George Grenville, the leader of those whose opinions differed least from his own, to form a new Cabinet. He approved of the prosecution and exile of the Radical leader Wilkes by Grenville, and the Stamp Act (1765) taxing the American colonies. But being unable to tolerate Grenville's rudeness and dictatorial attitude, he dismissed him, and reluctantly admitted the Rockingham Ministry, which represented the most liberal of the Whig factions, and the only English party that made no use of Parliamentary corruption. Their liberal measures, notably the repeal of the Stamp Act, displeased the King, and in 1766 he invited Pitt, whom he made Earl of Chatham, to form a Cabinet. Pitt's Cabinet was formed, but the King's plans

were frustrated by the failure of the Prime Minister's health. During the Ministry of Grafton that followed, the King approved of Townshend's import duties levied on America in 1767, and also of the exclusion of Wilkes from the House of Commons, although the attitude of the House was in opposition to the best political and legal thought of the day. On the resignation of Grafton he at last found in Lord North a Minister after his own heart. North honestly agreed with the King's ideas, and tried to carry them out. He was firm and able, seldom gave offense, and had great tact for managing Parliamentary majorities. During his long Ministry (1770-82) the King virtually directed political affairs, as his correspondence with Lord North shows (ed. by W. B. Doane, London, 1867). Throughout the American War, of which he was strongly in favor, his wishes controlled the Ministry, the Commons being a mere instrument in his hands. After the French-American alliance he alone wished to continue the war, refusing to allow Lord North to resign. When at last the inevitable resignation came, he contrived to break up the second Rockingham Ministry, through the influence of Shelburne. On the downfall of the Shelburne Ministry he defeated by his personal efforts the combination Ministry of Fox and North. In the face of a hostile majority he appointed the younger Pitt as Prime Minister, and the electors signified their approval by returning a Tory majority to Parliament.

Although Pitt was by no means subservient, there was no friction between him and the King, who approved most of his measures. George was strongly in favor of the long and ruinous war with France, and of the union which Pitt forced upon Ireland in 1801. He was opposed, however, to Pitt's attempted Parliamentary reform in 1785, and to the impeachment of Warren Hastings, which measures were after all defeated. He refused to allow the Cabinet to appoint the bishops, as had become the custom, and in the case of Archbishop Sutton of Canterbury took the appointment directly out of Pitt's hands. He refused positively to grant Catholic emancipation, which he conceived to be contrary to his coronation oath, and in 1801 forced Pitt to resign rather than allow his promise of emancipation to the Irish Catholics to be fulfilled. In 1804 he dismissed the entire Addington Ministry because its members refused to pledge themselves never during his life to advocate Catholic emancipation. His dislike of Fox, who he supposed had a bad influence on the Prince of Wales, is well known. He repeatedly refused to allow him to enter the Ministry (1781, 1782, 1803, 1804, 1806), "even at the hazard of a civil war." This dislike he lived to overcome, and he much regretted the death of Fox.

The King's last years were darkened by many troubles, keenest of which was the conduct of his brothers and of his children, particularly the Prince of Wales, whose immoral and undutiful behavior embittered his life. He had to bear the brunt of popular ill feeling occasioned by the economic misery the French War brought to England. He was also afflicted by sickness. In 1805 he had trouble with his eyes, and by 1809 he became blind. As early as 1765 he was mentally deranged for a short time. In 1788 there was a recurrence of the same trouble, and the

first Regency Bill was passed, but he speedily recovered. In 1811 he finally became hopelessly insane, and his son (afterwards George IV.) acted as Regent until the King's death, on January 29, 1820.

Padington (Rolls Series, London, 1878), which will be followed by the foreign and Colonial series, is the most important source. Among the private correspondence, consult: *Grenville Papers*, ed. W. J. Smith (London, 1852); and *the Correspondence of John, Duke of Bedford*, ed. Lord J. Russell (London, 1842); that of *William Pitt*, ed. by Taylor and Ringle (London, 1840); of Lord Harris Malmesbury (London, 1844); of Lord Charles Cornwallis, ed. by Ross (London, 1859); and especially *The Works and Correspondence of Edmund Burke*, Bohn Library (London, 1857). Among contemporary memoirs, consult: Walpole, *Memoirs of the Reign of George III.* (London, 1894); *Memoirs of the Marquis of Rockingham and His Contemporaries*, ed. by Thomas (London, 1852). Especially important politically are the *Letters of Junius* (London, 1806; also published in the Bohn Library), usually ascribed to Sir Philip Francis.

HISTORIES. Adolphus, *History of England from the Accession to the Decease of George III.* (London, 1840); Massey, *History of England During the Reign of George III.* (London, 1855); Lecky, *History of England in the Eighteenth Century*, vols. iii.-vi. (London, 1878-90); May, *Constitutional History* (New York, 1865), begins with this reign.

GEORGE IV. (GEORGE AUGUSTUS FREDERICK) (1762-1830). King of Great Britain and Ireland, 1820-30. The eldest son of George III., he was born in Saint James's Palace, August 12, 1762, and was created Prince of Wales five days afterwards. He received a careful and complete education, with strict discipline, but displayed an ungovernable temper, and on attaining his majority became notorious for his profligacy and extravagance. He contracted a marriage with Mrs. Fitzherbert, December 21, 1785; but in 1787, to obtain Parliamentary assistance for his debts, he allowed Fox to deny the marriage in Parliament. On April 8, 1795, again to liquidate his debts, he married his cousin, Caroline Amelia Elizabeth of Brunswick (q.v.). They had one daughter, the Princess Charlotte Augusta, born January 7, 1790, who married Prince Leopold, afterwards King of Belgium, but died in childbed, November 6, 1817. George deliberately deserted his wife shortly after his daughter's birth, and his conduct toward her, his attempts to procure a divorce, his numerous mistresses, and general behavior, made him extremely unpopular, notwithstanding his cleverness, versatility, and gracious manner, which among a certain class of associates earned him the title of 'the first gentleman in Europe.' From a spirit of antagonism he supported the Whig opposition, and his father's insanity was partly due to his misconduct. He became Prince Regent in 1811, and King at his father's death, on January 29, 1820. The Napoleonic wars; the War of 1812-15 with the United States; the aid rendered to the Greeks by the British fleet in the battle of Navarino (1827), which secured the independence of Greece; and the passing of the Roman Catholic

Emancipation Bill (1829), are the notable events of his reign. He died at Windsor, June 26, 1830. Consult: McCarthy, *History of the Four Georges and of William IV.* (4 vols., London, 1884-1901); Thackeray, *Four Georges* (London, 1861); Lady Bury, *Diary of the Times of George IV.* (London, 1838); Croly, *Life of George IV.* (London, 1830); Huish, *Memoirs of George IV.* (London, 1830); Langdale, *Memoirs of Mrs. Fitzgerald* (London, 1856); Holland, *Memoirs of the Whig Party* (London, 1854); Fitzgerald, *Life of George IV.* (London, 1881).

GEORGE I. (1645—). King of Greece since 1863. He is the second son of King Christian IX. of Denmark, and served for some time in the Danish Navy. After the deposition of King Otto in 1862, the National Parliament in the following year conferred the crown on Prince William of Denmark, as George was then called, who, with the concurrence of his own family and the consent of the great Powers, ascended the throne of Greece as George I. He was married at Saint Petersburg to Princess Olga, daughter of Grand Duke Constantine, October 27, 1867. The King has consistently pursued a Pan-Hellenic attitude, as shown especially in the war with Turkey (1897). See GREECE.

GEORGE V. (1819-78). The last King of Hanover. He was the son of Ernest Augustus (q.v.), and when he ascended the throne in 1851, on the death of his father, he was afflicted with blindness. He entertained exaggerated ideas of the sacredness of the royal power, and lent himself to the plans of the reactionary party. He was a bitter foe to Prussia, and joined Austria against her in 1866. After Austria's defeat Hanover became a part of Prussia, and King George went to Vienna and then to Paris, where he continued to agitate against Prussia. In 1868 he relinquished his claims to Hanover for the sum of 16,000,000 thalers; but his enmity to Prussia declared itself so strongly that the sum was not paid, but was held by the Government as the 'Guelph Fund' (q.v.). The Duke of Cumberland, son of George V., having disclaimed in 1892 all intentions of pursuing an anti-Prussian attitude, the revenues of the fund have since been paid to him.

GEORGE II. (1826—). Duke of Saxe-Meiningen and Hildburghausen, born at Meiningen, a son of Duke Bernhard II. He was educated at Bonn and Leipzig, and succeeded upon the resignation of his father in 1866. He is known as a patron of the drama, and advanced histrionic art by organizing, with the assistance of his intendant and manager, Ludwig Chronnegk, a troupe of actors who played in Europe and America.

GEORGE, Prince of Denmark (1653-1708). Husband of Queen Anne of England. He was the son of Frederick III. of Denmark. By Anne, whom he married in 1683, he had seventeen children, all of whom died before their mother became Queen of England. Prince George was devoid of talent and ambition, but was brave and humane. Through his wife's influence he deserted James II. in the hour of need. After the triumph of the Prince of Orange, Prince George was naturalized and created Duke of Cumberland. He was present at the battle of the Boyne, and when his wife ascended the throne he was created Lord High Admiral, an office in which he acquit-

ted himself quite badly. He had very little influence in English politics, though Anne was very fond of him.

GEORGE, called **THE BEARDED** (1471-1539). Duke of Saxony. He was the eldest son of Albert the Brave, founder of the Albertine line of dukes. He received a theological education at Meissen and Leipzig, and succeeded his father in 1500. He was a good ruler, kindly and accessible to his subjects. Though he agreed with Luther as to the need of reform in the Church, the Duke did not acquiesce in the change in dogma advanced by him, and he soon became an ardent opponent of the Reformation, especially after the famous debate between Luther and Eck at Leipzig in 1519. He persecuted the Lutheran clergy who had broken their vows of celibacy, and died in great grief at the thought of being succeeded by a fervent Protestant, his brother Henry.

GEORGE, called **PISIDA**, 'the Pisidian.' A prominent churchman and writer of Constantinople in the latter half of the seventh century. He held various offices in the 'Great Church' (of Saint Sophia), and is thought to have accompanied the Emperor Heraclius on his expedition against the Persians (A.D. 622). He was the author of many poems of a historical or religious character, in which he celebrated the wars of Heraclius, and discussed the theological questions of the day. His verse is correct and elegant, and he was greatly admired by the Byzantine writers.

GEORGE, FREDERICK WILLIAM ERNEST (1826-1902). Prince of Prussia, general and author. He entered the Prussian Army in 1836, was advanced to the rank of lieutenant-general in 1860, and subsequently became general of cavalry (1866). His dramatic works, published under the name of G. Conrad, are very numerous, and several of them have been publicly performed, and are still sometimes played. They include: *Wo liegt das Glück?* (1877); *Don Sylvio* (1877); *Elektra* (1877); *Yolanthe* (1877); *Medea* (1877); *Sappho* (1887). Although not strikingly original, these plays are skillfully constructed. Prince George also studied music, and in his youth was a pianist of some skill.

GEORGE, HENRY (1839-97). An American economist, born in Philadelphia, Pa. When fourteen years old he was forced to leave school, and to seek work in order to support himself. After shipping as foremast boy on a vessel bound for Melbourne and Calcutta, he learned the printer's trade, and in 1858 worked his way to California. At this time the excitement attending the discovery of gold in Fraser River, B. C., was at its height; and Henry George worked his way to Victoria on a sailing vessel. After enduring many privations he returned to San Francisco, where he found work in a printing office. As the business of the printing office grew slack, he secured a position in a rice-mill. For the next few years he drifted from one employment to another, always in financial straits, due to no lack of energy on his own part. In 1861, in company with five other printers, he undertook to publish a daily newspaper, the *Evening Journal*, but this venture also proved unsuccessful. In 1865 he began to write for the press; and it is noteworthy that one of his earliest productions urges workmen to think about political and social condi-

tions, to find if it be possible to "check the tendency of society to resolve itself into classes that have too much or too little." At this time he was engaged as a reporter on the *San Francisco Times*, where he was quickly promoted to the position of chief of staff. In 1866 he wrote a letter to the *New York Tribune* attacking the Central Pacific Railroad and the Wells, Fargo Express on the ground of their monopolistic extortions. In 1869 he wrote for the same paper a letter on the Chinese question, which gained the warm commendation of John Stuart Mill. The great fortunes acquired in California through the rapid increase in the value of land fixed his attention upon the land problem; and in a pamphlet published in 1871, entitled *Our Land Policy*, he advanced most of the ideas that later appear in *Progress and Poverty*—that the value of land represents in the main a monopoly power, and that the entire burden of taxation should be levied upon it, thus freeing industry from taxation, and equalizing opportunities by destroying monopoly advantage.

Progress and Poverty, George's most important work, was first published in 1879. At first it attracted little attention and found few buyers, but in a few years it attained extraordinary popularity, especially in England, where the Irish land problem was the burning question of the day. Interest in the book increased at home, and by 1883 Mr. George found himself regarded as the apostle of a new social creed. From this time his activities were engaged chiefly in lecturing both in America and in the United Kingdom, and in writing articles for papers and magazines on the land question and on other economic and political subjects. His literary activities brought him but little pecuniary return, and he remained in straitened circumstances until the end of his life. In 1886 George became a candidate for the mayoralty of New York City, but was defeated by Abram S. Hewitt. In 1897 he again ran for Mayor, but died before election day.

The chief contributions of Henry George to economic science are to be found in *Progress and Poverty*. *The Science of Political Economy*, published after his death, contains little that is of value. The main thesis of *Progress and Poverty*, that economic rent should be confiscated by means of the single tax, has not received acceptance from scientific writers. But the theory of wages which he advanced in opposition to the prevailing "Wages Fund Doctrine," that the laborer is paid, not out of capital, but out of the value which he himself creates, has been adopted by some of the most important economists of the day. For a discussion of the views of Henry George in relation to the Single Tax Theory, see **SINGLE TAX**. Consult George, *The Life of Henry George* (1900).

GEORGE, JAMES ZACHARIAH (1826-97). An American legislator, born in Monroe County, Ga. After serving in the regiment known as the Mississippi Rifles during the Mexican War, he devoted himself to the study of law. Soon after the secession convention in Mississippi, he enlisted in the Confederate Army, and eventually rose to the rank of brigadier-general. As chairman of the Executive Committee of the Democratic Party (1875-76) he became a conspicuous factor in the political agitation of that period. He was ap-

pointed Chief Justice of Mississippi in 1879, and two years later was sent to the United States Senate, where he served for three successive terms. He was distinguished alike as jurist and statesman, and during his career in the Senate displayed exceptional oratorical ability and unusual power of logical reasoning. As a jurist he participated prominently in the preparation of the present Constitution of Mississippi.

GEORGE, LAKE. A lake in eastern New York, near the border of Vermont (Map: New York, G 2). It is about 36 miles long from south to north, and from one to four miles wide, generally shallow, but in some places very deep. It is connected with Lake Champlain on the north. Lake George is one of the most beautiful of the lakes of the United States. It is a favorite resort for artists and tourists. Its waters are singularly clear; it is dotted with charming islands, and the scenery of its banks, where the mountains reach elevations of over 2000 feet, is most picturesque. Great historical interest attaches to it in events connected with the French and Indian War and the War of the Revolution. The ruins of Fort Ticonderoga are on the waterway connecting the two lakes. Lake George was discovered early in the seventeenth century by the French missionaries. It was named by the English after George III., though it is sometimes known by the Indian name Horicon. The State has appropriated 35 acres of land on its shores to be called the Fort George Battle Park. On this there is to be erected a soldiers' monument.

GEORGE, SAINT (?-303). The patron saint of England. Little is known of his life, the reports concerning him being largely legendary. Although frequently confounded (as, for example, by Gibbon) with George of Cappadocia, the Arian leader, he lived at an earlier period than the latter. He is said to have been a person of consequence, born at Lydda, or at Ramleh, Palestine, and educated in Cappadocia, who embraced Christianity, attained high rank under Diocletian, and suffered martyrdom in Nicomedia in April, 303. He was extremely popular with the English Crusaders, and was adopted as the tutelary saint of England during the reign of Edward III. He is also the patron of Russia and Portugal. Churches and religious establishments have borne his name from the earliest times. He is venerated not only by the Western and Eastern churches, but also by the Mohammedans as Ghergis or El Khouder. The red cross of Saint George on a white ground was long worn as a badge by the English soldiery, and is now displayed on the Union Jack. The well-known story of the combat between Saint George and the Dragon first appears in the Middle Ages in the *Legenda Aurea* of Jacobus de Voragine. Consult Flemming, *Saint George of England* (New York, 1901).

GEORGE-A-GREENE, THE PINNER OF WAKEFIELD. A comedy (1595) ascribed to Robert Greene on the evidence of certain obscure and contradictory manuscript notes on the title-page of a copy now in the possession of the Duke of Devonshire. At any rate, the reputed author acted the part of the Pinner. The sources are an early prose romance entitled *The History of George-a-Greene*, and a ballad called *The Jolly Pinner of Wakefield with Robin Hood, Scarlet, and John*.

GEORGE BARNWELL, OR, THE LONDON MERCHANT. A bourgeois tragedy in prose, by George Lillo, produced at Drury Lane, June 22, 1731. It concerns the temptation, fall, and death of a London apprentice. It was founded on a seventeenth-century ballad (Percy, *Reliques*, 3d series, bk. iii. No. 6). Consult Cibber's *Life of Lillo*.

GEORGE ELIOT. The pseudonym of Mary Ann Evans, the English novelist. See ELIOT, GEORGE.

GEORGE FREDERICK, Prince of Waldeck. A German soldier. See WALDECK, GEORG FRIEDRICH.

GEORGE JUNIOR REPUBLIC. A community of boys and girls near Freeville, New York, about nine miles east of Ithaca. It was founded in 1895 by Mr. William R. George, of New York, for the purpose of affording neglected, reckless, and unfortunate children an opportunity to acquire the qualities necessary for their future welfare in life, and was the outcome of an experiment which Mr. George had been conducting for some years by taking every summer from 150 to 250 children of the slums to spend their vacation with him at his country home.

The constitution of the miniature republic is modeled upon that of the United States, with elective officers, a legislature (first a town meeting and later two branches), a judicial system, and administrative machinery. At first Mr. George was president, with adults in the higher offices, but since 1896 the boys have filled all offices, Mr. George retaining a veto power. Each citizen was obliged to work or starve: he could work for Mr. George for six hours a day, or for citizen contractors, who purchased licenses for the different kinds of business from Mr. George, or in the school. Nothing could be obtained in the community except by purchase in the citizens' own tin coin (now aluminum), which at the end of the summer was redeemed in United States money, or supplies to take home. In the first year a number of practical questions were met by the youthful legislators: a depreciated currency, a tariff question, woman's suffrage, and a trust among hotel proprietors. Children from any part of the United States may be consigned to the guardianship of the trustees by parents or public authorities. The age of admission is twelve to eighteen years. The republic has a number of buildings, with simple accommodations which are used for school, government purposes, workshops, hotels, restaurants, store, bank, and library. Cottages are being built to give home life in place of that of the hotels. The kinds of work carried on under efficient directors are: farming (the trustees own or control 240 acres), carpentry (the boys put up new buildings), printing, dressmaking, scientific cooking, domestic service, care of the place, and school. All children under sixteen must attend the republic's primary and grammar school. The ambitious later go to the town high school, and a few have entered college.

Association (July, 1899); *Address to Twenty-eighth National Conference of Charities and Correction* (1901); *The Citizen*, a monthly publication of the George Junior Republic.

GEORGE OF CAPPADOCIA. Arian Archbishop of Alexandria, 356-361. He was a native of Epiphania, in Cilicia, yet he is always called a Cappadocian, though such only by ancestry. Our knowledge of him comes from his adversaries. They say that he began life as a parasite; then obtained a contract to furnish supplies for the army, embezzled the funds, and had to abscond to escape the indignant soldiers whom he had cheated of their rations. He seems to have lived for some time at Constantinople. It is not known when or how he obtained ecclesiastical orders, but in 356 he turns up as Bishop of Alexandria after the banishment of Athanasius. He had the support of the Arian faction and the Emperor Constans. His cruelty and oppression were such that a rebellion broke out and he had to flee for his life. He was restored by a military demonstration, but did not mend his ways. A few days after the accession of Julian the populace arose *en masse*, dragged him out of prison, where he had been placed by the magistrates for safety, paraded him with every indignity through the streets on a camel, burned his dead body, and cast the ashes into the sea. He is represented as ignorant not only of the Scriptures and theology, but even of letters. Yet it is said he owned a fine library which Julian had preserved for his own use.

GEORGE OF TREBIZOND (c.1396-1486). A scholar famous in connection with the revival of the study of Greek in Italy. He was born in the isle of Crete, but was descended from a family of Trebizond. A noble Venetian, Francesco Barbaro, invited him to Venice, where he became professor of rhetoric and philosophy. As secretary to Pope Eugenius IV. and later to Pope Nicholas V., he occupied a conspicuous position at Rome as a Greek scholar and as a translator of Greek authors into Latin. The inaccurate character of his work provoked the criticism of contemporary scholars, especially of Cardinal Bessarion. He was an ardent advocate of the Aristotelian system of philosophy, and engaged in controversy with his contemporary, the Platonic philosopher, Gemistus Plethon. Among his writings are *Rhetorica* (1470), and *Comparationes Philosophorum Platonis et Aristotelis* (1523).

GEORGES, zhôrz, MARGUERITE JOSÉPHINE WEIMAR, known as Mlle. Georges (1787-1867). A French tragic actress of great beauty and talent, born at Bayeux. When she appeared at the Théâtre Français in 1802 as Clytemnestra, she made an unusual sensation. In 1808 she suddenly deserted her position and went to Russia. She played before Napoleon at Dresden in 1812, however, and in 1813, under the patronage of Hortense, was allowed to return to the Comédie Française, but left that stage definitely in 1816. Talma was one of her teachers. She devoted herself upon the stage to the romantic movement led by Victor Hugo and Alexandre Dumas, and in their works won some of her greatest triumphs. Among her famous rôles were Dido, Semiramis, Lucrezia Borgia, and Mary Tudor. Her later years of retirement were unhappy, largely through the caprices that had marred her career, and the comparative poverty which ensued.

GEORGE SAND, *Fr. pron.* zhôrzh sänd. See SAND, GEORGE.

GEORGE'S CHANNEL. See SAINT GEORGE'S CHANNEL.

GEORGES DANDIN, zhôrzh dän'dän'. The title of a comedy by Molière (1668), perhaps built upon one of his previous farces, produced first at Versailles. Its story goes back to Boccaccio, and is of a highly satirical character.

GEORGETOWN. The capital of British Guiana, situated on the right bank of the River Demerara, one mile from its mouth (Map: Guiana, British, F 2). It is well built, and its streets are regular and well shaded by trees. The houses are generally of wood. Some of the streets are traversed by canals. Among the public buildings may be mentioned the Anglican Cathedral, the museum, with its library, the Colonial Hospital, orphan asylum, Queen's College, teacher's seminary, seamen's home, etc. There are also botanical gardens, schools, theatres, barracks, street-railways. Georgetown is connected by rail with Mahaica. Along the banks of the river extends the 'Ring,' a promenade sheltered with cabbage-palms. The city is supplied with water from artesian wells. The harbor provides good anchorage, and has a mole and fortifications. The climate is exceedingly unhealthful, owing to the swampy nature of the surrounding country. The commerce is considerable, the chief exports being sugar, coffee, and rum. The population in 1891 was 53,176, of whom only about 5000 were whites.

GEORGETOWN. A city of the British Straits Settlements. See PENANG.

GEORGETOWN. A railway junction in Ontario, Can., twenty-five miles west of Toronto (Map: Ontario, C 4). Population, in 1901, 1313.

GEORGETOWN. A seaport town of Prince Edward Island, Can., situated on a peninsula formed by the Cardigan and Brudenell rivers, 39 miles east of Charlottetown by rail (Map: Prince Edward Island, G 3). It has steamboat communication with various ports, and carries on a considerable trade in agricultural produce. A United States consular agent is resident here. Population, 1500.

GEORGETOWN. A town and the county-seat of Clear Creek County, Colo., 52 miles west of Denver, on the Colorado and Southern Railroad (Map: Colorado, E 2). It has important gold and silver mining interests, and is popular as a summer resort because of its picturesque location and healthful climate. Population, in 1890, 1927; in 1900, 1418.

GEORGETOWN. A town and the county-seat of Sussex County, Del., 40 miles south by east of Dover; on the Philadelphia, Wilmington and Baltimore Railroad (Map: Delaware, Q 6). It is in an agricultural region, and has canning interests. Population, in 1890, 1353; in 1900, 1658.

GEORGETOWN. Formerly a town in the District of Columbia, now included within the limits of Washington (q.v.).

GEORGETOWN. A city and the county-seat of Scott County, Ky., 12 miles north of Lexington; on the Cincinnati, New Orleans and Texas Pacific, the Louisville Southern, and the Frankfort and Cincinnati railroads (Map: Kentucky, G 2). It is primarily a residential place, and

is the seat of Georgetown College (Baptist), established in 1829. The city is in an agricultural and stock-raising section, and has brick-works, flouring-mills, and manufactures of hemp and bagging. "The Royal Spring," rising in the centre of the city and flowing 200,000 gallons per hour, supplies the city with water and furnishes power for an ice plant, street-railway, flour-mill, and other industrial establishments. Settled in 1776, Georgetown was first incorporated in 1790, and was chartered as a city of the fourth class in 1894. The government is administered by a mayor, chosen every four years, and a unicameral council, elected on a general ticket. Population, in 1900, 3823.

GEORGETOWN. A village and the county-seat of Brown County, Ohio, 42 miles east by south of Cincinnati; on the Cincinnati, Georgetown and Portsmouth Railroad (Map: Ohio, C 8). It is the centre of a tobacco-growing district, and has some manufactures. Limestone is quarried in the vicinity. Population, in 1890, 1473; in 1900, 1529.

GEORGETOWN. A city and the county-seat of Georgetown County, S. C., at the head of Winyah Bay, about 55 miles northeast of Charleston; on the Georgetown and Western Railroad (Map: South Carolina, E 3). It is a seaport of some importance, the market for a fertile agricultural region traversed by 1000 miles of navigable rivers that empty into the bay; has steamship communication with New York, Charleston, and Wilmington, and exports rice, cotton, turpentine, shingles, lumber, fish, etc. Georgetown, settled about 1700, and incorporated in 1805, is famous as the landing-place of Lafayette on his first visit to the United States. The government is administered under a charter of 1892, which provides for a mayor, chosen biennially, and a council elected at large. Population, in 1890, 2895; in 1900, 4138.

GEORGETOWN. A city and the county-seat of Williamson County, Tex., 30 miles north of Austin; on the San Gabriel River, and on a branch of the International and Great Northern Railroad (Map: Texas, F 4). It has cotton-gins, cottonseed-oil mills, and planing-mills, and is the seat of Southwestern University (Methodist Episcopal, South), founded in 1873. In Page Park are mineral wells, which analysis shows to be similar to the famous Karlsbad springs. Settled in 1854, Georgetown was incorporated twenty years later, and is governed under revised statutes of 1895 by a mayor and council, elected biennially on a general ticket. Population, in 1890, 2447; in 1900, 2790.

GEORGETOWN UNIVERSITY. An institution of higher education, situated at Georgetown, D. C. It was founded in 1799 by members of the Roman Catholic Church, and was in 1805 transferred to the Society of Jesus in Maryland, in whose control it remains. By a Congressional act of 1815 the university was empowered to grant academic degrees, and in 1833 the Holy See authorized it to confer degrees in the name of the Church, in philosophy and theology. The university consists of the college, the school of medicine, organized in 1851, and including a school of dentistry, and the school of law, organized in 1870. The college comprises the graduate school, organized in 1856; the under-

graduate department; and the astronomical observatory, established in 1842. A preparatory school, with a student enrollment of about 150, is also connected with the university. The scheme of instruction is, in general, conducted in accordance with the famous *Ratio Studiorum* of the Jesuits; the supervision of students is closer than in most denominational colleges of equal standing, and the standard of scholarship is very high, especially in Latin, philosophy, logic, and English. The elective system has not been introduced. Degrees are conferred in arts, philosophy, medicine, dentistry, and law.

GEORGIA (Pers. *Gurjistan*, Arm. *Vrastan*, Lat. *Iberia*, Russ. *Grusia*; influenced in popular etymology by the name of the patron saint *George*). A region in Transcaucasia, constituting, until the year 1799, an independent kingdom, and now forming the main part of the Russian governments of Tiflis and Kutais. It comprises the ancient Iberia, Colchis, and Albania. The native name of the country is *Kathli*, or *Sakarthvélo*.

Tradition traces the origin of the Georgians to Thargamos, a great-grandson of Japhet. Mtskhethos, the supposed builder of Mtskhetha, the ancient capital, near Tiflis, is a prominent figure in their legendary history. They are known to have submitted to Alexander the Great, and to have been freed from foreign rule and united in one kingdom by Pharnabazus (B.C. 324). Georgia was Christianized during the fourth century. A Sassanide dynasty was established in A.D. 265, and continued with a half-century's interregnum until 787, when the long line of Bagratian sovereigns (see BAGRATIDES) came to the throne. The latter drove out the Arab invaders who had subjected the Sassanide princes, reunited the disorganized country, and advanced its civilization and material welfare. In the eleventh century the country was temporarily brought under the yoke of the Seljuk Turks, but regained its independence under David III. (1090-1125). Until the thirteenth century, when it was conquered by the Mongols, Georgia prospered greatly, and increased in extent under a series of able sovereigns. Under Queen Tamara (1184-1212), who married a Russian prince, and thus initiated the intimate connection of Georgia with Russia, the country attained the height of its prosperity and power. Toward the end of the fourteenth century Timur subdued Georgia, but was expelled in the beginning of the next century by George VII. Alexander I., who succeeded George VII., divided the kingdom among his three sons. Each of these States was again divided, and at one time twenty-six different princes reigned in Georgia. The history of Georgia now falls into two parts: that of the Eastern States, Kartli and Kakheti; and that of the Western States, including Imeritia, Mingrelia, and Guria. This division was fatal to the independence and power of Georgia. From the sixteenth to the eighteenth century the Eastern States were oppressed, by Persia, and in 1799 George XIII. resigned in favor of Paul, Emperor of Russia. In 1802 the Emperor Alexander proclaimed the territory a Russian province. Of the three States forming Western Georgia, Guria fell into the hands of Russia in 1801, and formally surrendered itself to that empire by the treaty of 1810; Mingrelia was virtually added to Russia in 1803; Imeritia

had been acquired by Russia toward the close of the eighteenth century. See **GEORGIAN LANGUAGE**; **GEORGIANS**.

GEORGIA (named in honor of George II. of England). A South Atlantic State, and one of the original thirteen States of the American Union (Map: United States, J 4). It is bounded on the north along the parallel of latitude 35° N. by Tennessee and North Carolina, on the east by South Carolina and the Atlantic Ocean, on the south by Florida, and on the west by Alabama. Georgia is the largest State east of the Mississippi, the area being 59,475 square miles, of which 495 square miles is water. The extreme length from north to south is 320 miles, and the greatest breadth 259 miles.

TOPOGRAPHY. The State lies in both the Appalachian and coastal plain regions, so that the surface is divided between highlands and lowlands. The eastern chain (Blue Ridge) of the Appalachians, after crossing the North Carolina boundary, terminates in the northern part of the State. It has an elevation of from 3000 to 5000 feet, the latter limit being attained by only a few peaks, of which the highest is Sitting Bull Mountain, 5046 feet above the sea. Bordering the Blue Ridge on the west is the Cohutta group, a continuation of the Unaka Mountains of Tennessee, while the northwestern corner of the State is crossed by the Lookout and Sand Mountain ranges of the Alleghanies, which terminate in Alabama. An area of about 6000 square miles in northern Georgia has an elevation of 1000 feet or more. South of the Appalachian foothills there is a broad area of uplift, the Piedmont plateau, sloping toward the Atlantic, and terminating near the middle of the State in the coastal plain. From the southern limit of the plateau region to the Florida and Atlantic borders, the surface is little diversified except where dissected by erosion into low hills and stream-valleys. The lands bordering directly on the coast are flat, and but slightly raised above sea-level. The Okefinokee Swamp, which extends across the State line into Florida, occupies an area 45 miles long by 30 miles wide. It contains several open lakes, but there are numerous islands and intersecting ridges that support heavy forests. Chickamauga National Military Park (q.v.) is situated in the northwest corner of the State.

Georgia has an extensive drainage system, including a few rivers of moderate size. The Savannah River, on the eastern boundary, drains most of the eastern section. It is navigable for ocean-going craft to Savannah, and for boats of 150 tons to Augusta. The Altamaha, with its head-streams, the Oconee and the Ocmulgee, flows through the central part, and its waters are open to navigation by light-draught boats as far as Milledgeville and Macon. Western Georgia lies largely within the basin of the Appalachicola, which is formed by the confluence of the Flint and Chattahoochee rivers, both rising in the northern part of the State. Boats ascend the Flint to Albany, and the Chattahoochee to Columbus. Among the other important streams are the Ogeechee, Satilla, and the Withlacoochee. When the rivers pass from the plateau region to the coastal plain, cataracts and waterfalls are usually present; they are located approximately along a line running through Augusta, Macon, and

Columbus, and are the source of the industrial activity of these cities.

CLIMATE AND SOIL. The climate of Georgia shows a wide range between the mountains, where the average annual temperature falls below 40° F., and the extreme south, where the average reaches 70°. In southern Georgia the climate resembles that of northern Florida; the winters are mild with few frosts and rarely snow, the summers long and hot. The northern part has a salubrious climate, the winters and summers being free from extremes. The mean temperatures for the year in the leading cities are as follows: Atlanta, 61°; Augusta, 64°; Athens, 63°; Rome, 62°; Americus, 68°; and Brunswick, 69°. The rainfall is greatest in the extreme north, and smallest in the eastern part, averaging about 49 inches for the whole State.

The soils exhibit a diversity of characters, corresponding to the difference in composition of the underlying rocks from which they have been derived. In the northern part sands and clays predominate, but in the extreme northwestern section, which is underlaid largely by limestone, the soil is loamy and possesses great fertility. Within the limits of the coastal plain the surface varies from sand to loam and heavy clay. The bottom lands along the rivers contain sufficient organic matter to make them extremely productive.

For Flora and Fauna, see paragraphs under **UNITED STATES**.

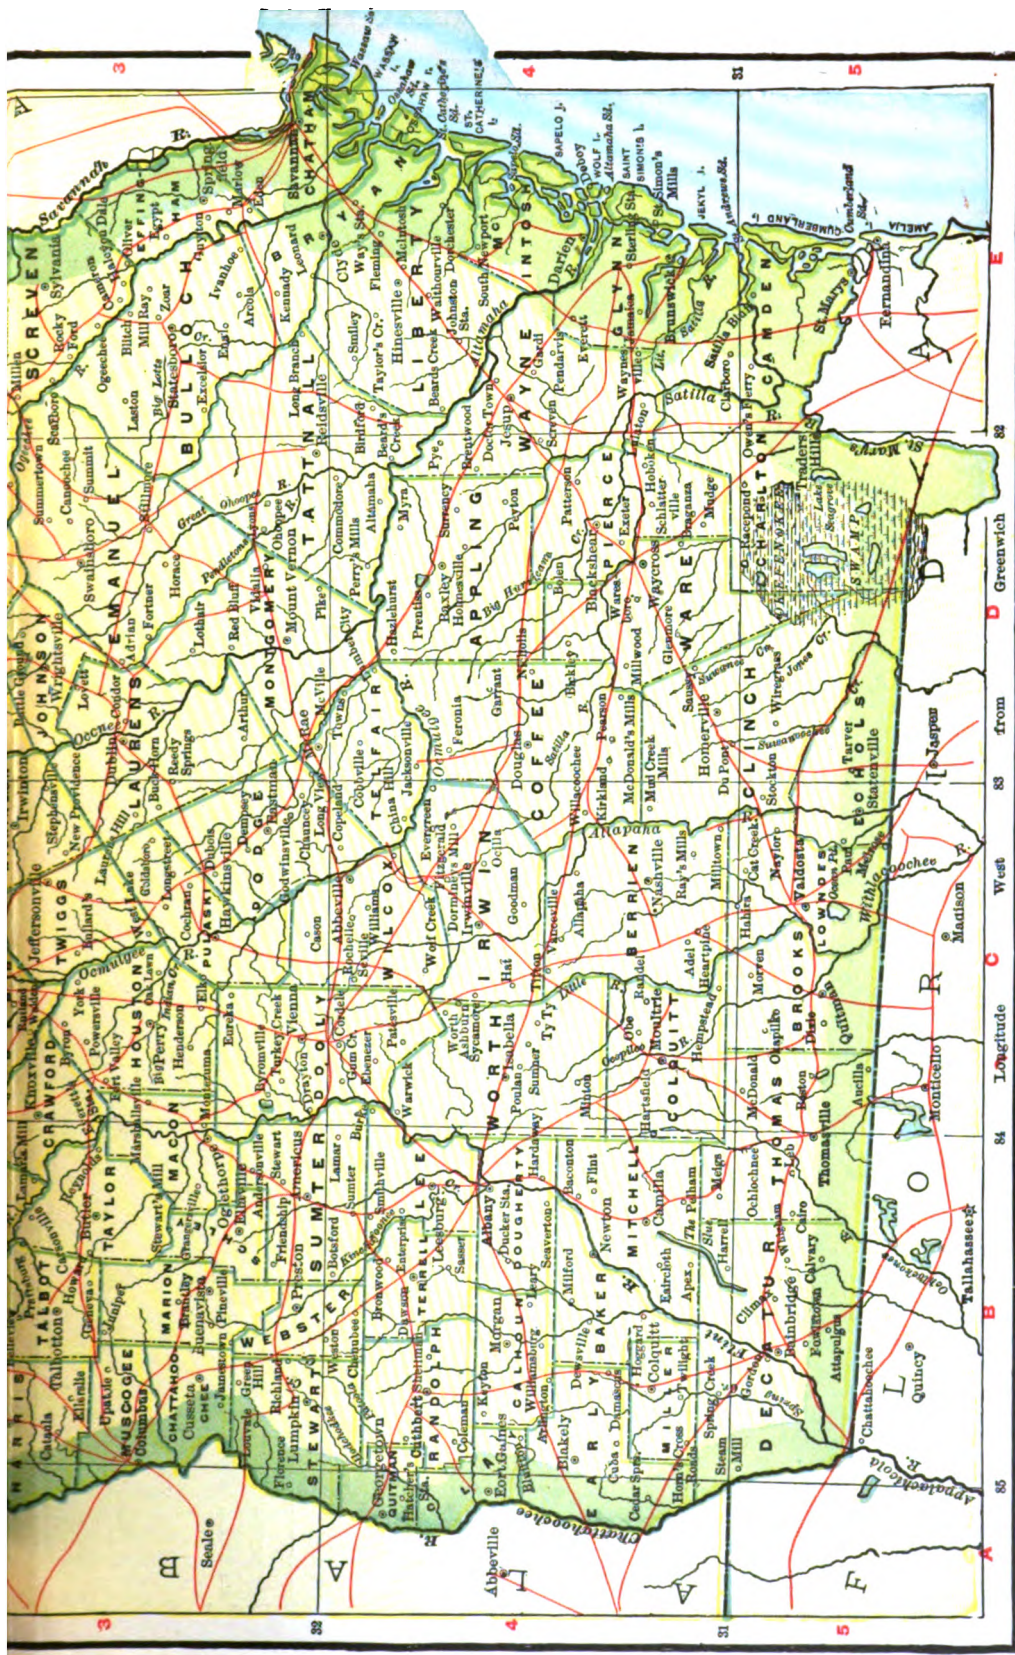

GEOLOGY. The State falls within three geological provinces or regions: the Paleozoic region in the northwest, which conforms approximately to the area occupied by the western chains of the Appalachians; the region of crystalline rocks comprising the remainder of northern Georgia, and extending southward of a line running through Augusta, Macon, and Columbus; and the coastal plain. In the Paleozoic region the rocks are mostly sandstones, limestones, and shales. The region of crystalline rocks is underlaid by granite and gneisses of Archæan age. Within the coastal plain the formations are loosely textured sands, clays, marls, and limestones, and belong to recent geological periods, the Tertiary and Quaternary.

MINERAL RESOURCES. Gold was found in White County in 1829, and ten years later the gold-mining industry had reached such importance that a branch mint was established at Dahlonega. Both quartz and placer mines occur, but most of the output at the present time is made from the former type of deposits, which occur along the southern slopes of the Blue Ridge. Iron ore is mined at several localities in the Paleozoic region, where there are also valuable deposits of ochre, manganese, and bauxite under exploitation. Among non-metallic products, coal, clay marble, and granite are most important. The coal-fields are located in Dade and Walker counties, and are an extension of the Warrior field of Alabama. Brick-clays and fire-clays are widely distributed throughout the State, but mining is limited practically to localities near the larger towns. The marble industry for several years past has steadily grown in importance, owing to the reputation which Georgia marble has gained all over the United States as a valuable building and ornamental stone. Various qualities of granite suitable for building, street

paving, and monumental work are quarried, and the State's resources in this stone are inexhaustible. Among the other mineral products of Georgia are silver, copper, pyrite, graphite, asbestos, talc, mica, barite, slate, marl, limestone, and sandstone.

MINING. The marble-quarries had no commercial value prior to 1884. Prior to 1894 the annual value of the product was less than \$300,000, but in that year it advanced to over \$700,000, where it has since remained. The granite-quarries yield an annual product valued at more than \$400,000. Some limestone is quarried and converted into lime. The output of coal for the last decade in the nineteenth century averaged about \$250,000 annually; that of iron ore almost reached that amount. The total gold production of the State from 1829 to 1900, inclusive, is estimated at \$16,891,000; the recent production amounts to about \$150,000 in annual value. Bauxite, first mined in 1889, has, during the decade, varied from 1000 to 7000 tons in annual production. The State produces nearly one-half the manganese obtained in the United States.

FISHERIES. There were in 1897 1800 men employed in the fisheries of Georgia, and the product for that year was valued at \$170,600, an increase of 38 per cent. over 1890. Oysters and shad constituted the bulk of the catch.

AGRICULTURE. Agriculture is the leading industry of the State. Of the total land area 69.9 per cent. (1900) is included in farms, and of this 40.2 per cent. is improved. The largest farm acreage recorded was in 1800, but the largest improved acreage was reached in 1900, a large increase having been made in each decade since 1870. The large plantations have been broken up and rented to negro farmers. The average size of farms has consequently decreased until in 1900 it was 117.5 acres, a little over one-fourth as large as that in 1850, while the rented farms have increased rapidly in number, amounting in 1900 to 59.9 per cent. of the total. About 37 per cent. of the farms are operated by colored farmers, and over 86 per cent. of these are rented. The negro farmer limits himself largely to the raising of cotton—being encouraged in this by the prevailing system of crop mortgaging, and by his disinclination to adopt new methods. As a result three-fourths of the total number of farms cultivated by negroes are rented and devoted to the raising of cotton.

of the total crop receipts. The Civil War resulted in a decrease in the area devoted to cotton, but since 1870 every decade has shown an increase. For several years Georgia has ranked second among the cotton-growing commonwealths. Georgia is the largest producer of sea-island cotton, although this variety covers less than five per cent. of its cotton-growing area. Cotton has been so long king in Georgia that little improvement was observed as regards general agriculture until latterly, when there has been a marked advance. Cereals are of especial importance in the northern part of the State. Corn, the leading cereal, as indicated above, represents almost five times the area of all the other cereal crops. In the last decade of the century the acreage of corn increased 34.7 per cent. Oats and wheat are of about equal importance. In the last decades of the nineteenth century there were large decreases in the acreage of oats, and in the period 1880-90 this decrease was also shared by wheat, which, however, revived in the following decade. The yield per acre of cereals is small. Rice constitutes an important crop in the coast counties, where in 1900 63.4 per cent. of its entire acreage was located. The hay and forage crops are relatively of little importance. Sugar-cane is grown in increasing quantities, and the larger part of the crop is used in the manufacture of syrup. Some sorghum is also raised. Georgia ranks second among the States in the raising of peanuts, the area devoted to them having almost doubled in the decade 1890-1900, the extreme southern counties being the largest producers. In recent years fruit and vegetable growing has increased rapidly. The sweet potato is the most important vegetable, in the production of which the State ranks next to North Carolina. Owing to its situation, the State commands the earliest Northern markets for vegetable and fruit products. The State ranks first in the production of watermelons, with an acreage of 27,874 reported in 1900. The number of peach-trees increased from 2,787,000 in 1890 to 7,668,000 in 1900, constituting in the latter year 68.2 per cent. of the total number of fruit-trees of all varieties. Small plants are not extensively cultivated.

The following comparative table, taken from the census returns of 1900, includes the most important farm crops and varieties of farm animals, and shows the changes which have occurred during the decade ending with that year:

YEAR	Cotton, acres	Corn, acres	Oats, acres	Wheat, acres	Rice, acres	Hay, acres	Sugar, acres	Potatoes (sweet), acres	Peanuts, acres
1900.....	5,343,063	3,477,684	318,433	319,161	21,998	137,312	26,056	70,620	100,589
1890.....	3,345,104	2,582,316	519,886	196,633	18,126	68,318	20,238	71,399	52,226

YEAR	Dairy cows	Other neat cattle	Horses	Mules and asses	Sheep	Swine
1900.....	276,024	623,467	127,407	207,840	258,894	1,424,296
1890.....	287,717	586,209	103,501	157,377	440,459	1,396,362

In the swampy regions in the southern part of the State there is much waste land, and also in the mountains of the northern part. Between these two sections lies the cotton belt. The total area devoted to cotton exceeds that of any other crop, amounting in 1899 to 41.8 per cent. of the total crop area, and yielding 56.7 per cent.

STOCK-RAISING. As is common in regions where cotton is the principal crop, stock-raising is not of very great importance. While there was a significant increase in the industry during the last decade of last century, it has not regained the prominence it held prior to the Civil War. With the exception of mules and asses, more

domestic animals of all kinds were reported in 1850 than in any succeeding census year. The increase in cotton production after the Civil War diminished the grazing area, and hindered the revival of the stock-raising industry. It is noteworthy that whereas horses greatly outnumbered the mules prior to the Civil War, this ratio is now reversed.

MANUFACTURES. Because of its industrial importance, Georgia has long been known as the 'Empire State of the South,' and has played a leading rôle in the recent industrial awakening of that section. A number of conditions favor the growth of manufacturing interests, chief of which is the great annual output of raw material. While outranked by the Carolinas in the manufacture of cotton, and by Alabama in that of iron, Georgia has a greater variety of manufacturing interests, and excels these two States in the sum total of manufactured products. The wide distribution of water-power is another favorable factor, as is also the cheaper labor

value of the product from \$12,000,000 to \$18,500,000. A noteworthy beginning was made in the manufacture of hosiery and knit goods. Still more striking was the progress made in the manufacture of cottonseed oil and cake. The oil is used in the production of oleomargarine, cottolene, compound lard, for illuminating purposes, and as a substitute for olive oil. The cake or meal is valuable for stock food, and is also used in the manufacture of commercial fertilizers, in which Georgia outranks the other Southern States. The State exceeds all others in the manufacture of cotton-gins. The recent increase in wheat-raising resulted in giving a new impetus to the flour-milling industry, the value of the product of flour and grist mills having increased during the decade from \$5,200,000 to \$8,300,000. The car-shop and machine-shop products also show a good growth. The following table indicates the development during the last decade of the century of the eleven leading industries:

INDUSTRIES	Year	Number	Capital	Value of products including custom work and repairing
Total for selected industries for State.....	1900	3,301	\$61,341,596	\$72,715,693
	1890	1,673	38,425,143	41,763,950
Increase, 1890 to 1900.....	1,628	\$22,916,453	\$30,951,743
Per cent. of increase.....	97.3	59.6	74.1
Per cent. of total of all industries in State.....	1900	44.0	68.3	68.2
	1890	39.0	67.5	60.6
Textiles: Total.....	1900	98	\$25,606,170	\$20,266,712
	1890	71	18,084,708	12,375,724
Cotton goods (including cotton small wares).....	1900	68	24,222,169	18,544,910
	1890	53	17,664,675	12,035,629
Hosiery and knit goods.....	1900	16	928,887	1,230,801
	1890	4	121,484	166,850
Woolen goods.....	1900	14	455,114	491,001
	1890	14	298,539	173,245
Oil, cottonseed, and cake.....	1900	43	4,098,668	8,064,112
	1890	17	992,131	1,670,196
Cars and general shop construction and repairs, by steam railroad companies.....	1900	32	1,408,592	3,062,283
	1890	11	450,512	892,610
Fertilizers.....	1900	41	6,663,618	3,367,353
	1890	44	5,501,881	5,026,034
Flouring and grist mill products.....	1900	1,123	2,504,033	8,330,439
	1890	719	2,347,835	5,190,311
Foundry and machine-shop products.....	1900	87	3,396,141	3,506,427
	1890	52	2,107,969	2,272,653
Lumber and timber products.....	1900	1,254	11,802,716	13,704,923
	1890	449	5,019,635	6,545,195
Lumber, planing-mill products, including sash, doors, and blinds.....	1900	99	2,074,226	4,302,976
	1890	82	1,677,880	3,548,972
Turpentine and rosin.....	1900	524	3,785,432	8,810,468
	1890	228	2,242,592	4,242,255

of the region—a result of the low cost of living. Again, the efforts of the State through expositions, technical education, and of the municipalities in exempting manufacturing establishments from taxation, have encouraged their growth. The number of wage-earners employed in manufacturing increased 60 per cent. during the last decade of the century, the census of 1900 showing that 5 per cent. of the total population were thus employed. Of these, 10,900 were women and 6370 children. The value of manufactured products increased during the decade from \$68,900,000 to \$106,600,000. The manufacture of cotton products leads in importance, and there are but three New England and two Southern States which surpass Georgia in this industry. The cotton-goods establishments increased from 53 in 1890 to 68 in 1900, and the

The four largest cities of the State produced less than one-third of the total product, their increase being 17.6 per cent. against 54.9 per cent. increase for the entire State.

FORESTS AND LUMBERING. The forests are almost as important as the cotton-fields as producers of raw materials. An area of 16,000 square miles, chiefly in the southern part of the State, is covered with forests of the long-leaf pine, while in the central and northern districts there are immense forests of hard woods, oak, hickory, maple, and other varieties. It is estimated that 71 per cent., or 42,000 square miles, of the State's area is forest-covered, of which 23,800 are included in farms, and 18,200 are not. The entire forest product almost doubled in value during the decade 1890-1900. The timber products in 1900, valued at \$13,700,000 (see

accompanying table), were largely of pine, which was shipped mainly to the Eastern States, though a portion of it went to foreign markets. The hard woods are largely used in the production of furniture. The planing-mill products, including sash, doors, etc., were valued at \$4,300,000. From the pine forests in the southern counties are secured enormous quantities of turpentine and rosin almost equal in value to the timber products themselves. The product increased during the decade from \$4,200,000 to \$8,000,800 in that region.

TRANSPORTATION AND COMMERCE. The superior transportation facilities of Georgia are largely responsible for its advanced industrial position among the Southern States. Railway construction dates from an early time. The Central of Georgia was built from Savannah to Macon in 1833. In 1860 the mileage of 1420 was exceeded by only five other States. The period from 1880 to 1890 showed an increase from 2460 to 4600 miles. In 1900 the mileage was 5650. There are 57 lines in the State, of which the longest are the Central of Georgia, Southern Railway, Seaboard Air Line, Plant System, and the Georgia. The State Railway Commission fixes rates, and the companies are subject to penalties for their violation. The railroads of Georgia no longer question the constitutionality of this commission. The State has recently taken a decided stand in behalf of good highways, and it now has several hundred miles of macadamized roads. The law enables the counties to assess special road taxes, besides a commutation tax on all males, and provides for the employment of convict or free labor. Many of the counties have taken advantage of these provisions. The number of large rivers offers advantages of water navigation to a large portion of the State. The Savannah on the east is navigable to Augusta, and the Chattahoochee on the west to Columbus, giving an outlet to the Gulf, while the intervening streams, Flint, Altamaha, and others, are navigable for considerable distances. The city of Rome, in the northwest portion of the State, has the advantages of water navigation through the Coosa and Oostanaula rivers. Though the coast-line is not extensive, there are the excellent harbors of Savannah, Brunswick, and Saint Mary's, the former ranking eighth in order of importance as to foreign commerce among American ports, being the largest Atlantic port south of Baltimore. The foreign exports from Savannah in 1901 exceeded \$46,738,967, and from Brunswick \$7,952,637. The largest part of this was manufactured cotton; other important items were naval stores (spirits of turpentine and rosin) and fertilizers.

BANKS. There were, in 1900, 171 State banks in operation, with \$8,735,327 capital, \$22,009,064 deposits, and \$27,753,942 loans. There were also 27 national banks with a capital of \$3,556,000, 22 private banks with \$605,123 capital, and 11 loan and trust companies with a capital of \$1,194,650. It is necessary to have a capital stock of \$25,000 in order to establish a State bank.

GOVERNMENT. The present Constitution was ratified by a vote of the people in December, 1877. Proposed amendments must receive a two-thirds majority vote in each House, and a majority vote of the electors qualified to vote for members of the Assembly, each amendment being

VOL. VIII.—28.

voted on separately. A two-thirds vote of the members of each House is required in order to call a constitutional convention. The right of suffrage is limited to men twenty-one years of age who have been citizens of the State one year and of the county six months, and have paid assessed taxes, and registered.

EXECUTIVE. The Governor, Secretary of State, Comptroller-General, and Treasurer are elected by the people. The Governor, who holds office for two years, may serve two terms consecutively, but is then ineligible for four years. The President of the Senate and the Speaker of the House, respectively, succeed to the Governorship in case that office has become vacant. The Governor has the usual power of granting reprieves, pardons, etc. A two-thirds vote of each House overcomes the Governor's veto. The right of veto may be exercised against any item of an appropriation bill.

LEGISLATIVE. Senators (44) and Representatives (175) are chosen for two years. There are 44 Senatorial districts, composed of contiguous undivided counties. Representatives are elected from counties on the basis of population, and the counties can neither be joined nor divided. The elections are biennial in October of the even years. Sessions of the Legislature are annual, and limited to fifty days; pay of members is \$4.00 per day and mileage. The seat of a member of either House shall be vacated on his removal from the district or county from which he was elected. The House of Representatives has the power of impeachment and the Senate the right to try impeachments. Money appropriations must originate in the House of Representatives. The general appropriation bill can embrace only the ordinary expenses, and every other subject of appropriation must be included in a bill by itself. Every bill requires a majority vote of all the members elected to each House.

JUDICIAL. The Supreme Court consists of a chief justice and five associate justices, chosen by popular election for terms of six years. There is a Superior Court judge for each judicial circuit, the judge being elected by the General Assembly for the term of four years. The Superior Court must sit in each county not less than twice in each year. The powers of a court of ordinary and of probate are vested in an ordinary for each county, and in each militia district the voters elect a justice of the peace, whose term of office is four years, as is also that of the county ordinary. The people elect an Attorney-General for the State, and the General Assembly elects a Solicitor-General for each judicial court.

OTHER CONSTITUTIONAL AND STATUTORY PROVISIONS. Legal interest is seven per cent., and the rate allowed by contract is eight. Judgments outlaw in seven years, notes in six years, and open accounts in four years. Cruel treatment; habitual intoxication; willful desertion for three years; conviction for offense involving moral turpitude, and under which the person has been sentenced for two years or longer, are the chief causes for divorce. The concurrent verdicts of two juries at different terms of the court are necessary in order to secure a total divorce. Property owned by a woman at marriage and that subsequently gained by her are her own, and inalienable. The State cannot make an agreement with any corporation the effect of which is to lessen competition or encourage monopoly.

MILITIA. In 1898 the total organized militia of the State numbered 3963 men, of whom 390 were in the cavalry, 142 in light batteries, and 3416 in the infantry. In 1900 the total number of males of militia age was 409,186.

FINANCE. The State Constitution provides that the bonded debt of the State shall never be increased, except for war purposes, and that all debt created to supply deficiencies in revenue shall not exceed \$200,000. Constitutional limitations are also placed upon the debt-making power of the political divisions of the State. In September, 1900, the State debt amounted to \$7,831,500. The receipts for the fiscal year ending 1900 amounted to \$3,542,069, of which \$1,929,587 was raised by the general tax. After the school expenditures, the largest items of expenditure are for the public debt, and for pensions to Confederate soldiers and their widows.

POPULATION. The population of Georgia has remained remarkably stationary, the State never having risen above the ninth nor fallen below the thirteenth place in rank; at present holding the eleventh place among the States. It is, after Texas, the most populous of the Southern States, though the density of population (37.6 per square mile) is exceeded in some others. In 1790 the population was 82,500; in 1850, 906,000; in 1860, 1,057,000; in 1870, 1,184,000; in 1880, 1,542,000; in 1890, 1,837,000; in 1900, 2,216,000. The absolute gain for the last decade exceeded that of any preceding decade, and the per cent. of gain, 20.6, was almost identical with that of the United States. As is general throughout the South, the foreign-born element is very small (12,403), while the negro population (1,035,000) constitutes almost one-half the total for the State, surpassing that of any other commonwealth. The rate of increase among the negroes, however, during 1890-1900 was less than that among the whites. The negroes greatly predominate in the southern part of the State, in some of the counties outnumbering the whites four to one. In the mountainous portion north of Atlanta the ratio is reversed in favor of the whites. Among the negroes the females outnumber the males by about 1500. The State contains 19 places with a population in excess of 4000, constituting 13.9 per cent. of the total population. Four cities contain a population exceeding 20,000: Atlanta, 89,800; Savannah, 54,200; Augusta, 39,400; and Macon, 23,206. Atlanta is the capital. The State has 12 Representatives in the Lower House of Congress.

RELIGION. The Baptist and Methodist denominations predominate, the former having about half the religious membership of the State—368,000, of whom 175,000 are colored. The Methodists number (1900) 272,000, of whom 100,000 are colored. Of the smaller denominations, the Presbyterians have 18,000 members; the Catholics, 20,000; Christians, 9800; and the Congregationalists, 4300. There are 6200 Hebrews.

EDUCATION. The unsatisfactory state of education which has long existed in Georgia has been incidental to the unsettled and changing industrial conditions, and the strained social situation, complicated by the race problem. The rural problem in education, difficult of solution in States more fortunately conditioned, is especially aggravated in Georgia. Small schools are common, little having been done in the way of centralization. Each county has a supervisor,

and better supervision is gradually being exercised. A graded system is being adopted, and the efficiency of the teacher is being raised by means of numerous institutes and normal schools. The most determined efforts, however, are seriously handicapped because of the insufficiency of the school fund, for which the Constitution is partly responsible. It contains a provision requiring that before levies for the support of county schools shall be made, two successive grand juries shall recommend such levy, and that two-thirds of the qualified voters shall then ratify the action of the grand jury—a requirement most difficult to fulfill. The main dependence is therefore upon State taxes. The amount received from this source, though small, is increasing almost every year. From \$150,789 in 1880, it rose to \$638,656 in 1890, and to \$1,505,127 in 1900. Other public funds added to this, principally through local taxation, raised the total expenditure for 1900 to \$1,980,016, or a little over two dollars and a half for each child five to eighteen years old.

The rural teachers receive on an average less than \$130 per year. The school year is short, averaging only 112 days. The white schools are not infrequently extended by means of private subscriptions. The building of schoolhouses and their repair are very largely dependent upon private effort. In 1900 the number of children five to eighteen years of age was estimated at 786,920, of whom 482,673 were enrolled in the public schools. This was a marked increase in the per cent. of enrollment, and particularly in the attendance, over earlier years. No law making education compulsory has been passed. According to the census of 1900, there were 158,247 illiterate males of voting age, of whom 125,791 were colored. In 1900 over 52 per cent. of the negroes ten years of age and over were illiterate, only three States showing a higher per cent., but this was a decrease of nearly 10 per cent. for the decade ending with that year. The illiterate native whites ten years of age and over were less than 12 per cent. of the native white population of that age, a per cent. which was exceeded in eight other States and Territories.

High schools are maintained in the larger towns. The University of Georgia, located at Athens, was opened in 1801, and is the first chartered State university in America; the institution is assisted greatly through private munificence. The State also maintains a normal school at Athens; a normal and industrial school (for girls) at Milledgeville; the North Georgia Agricultural College, at Dahlonega; a State Industrial College for negroes near Savannah; and a technological school at Atlanta, under the management of the State University. Private or denominational interests have established a large number of institutions, varying greatly in magnitude and in the standard maintained, but called indiscriminately universities or colleges. The Baptists maintain Mercer University at Macon, and four other institutions for higher education. The Methodists maintain the Wesleyan Female College at Macon, Emory College at Oxford, and a number of others. The Presbyterians support the Oglethorpe University at Atlanta, and the Rome Female College at Rome. The Morris Brown College, Clarke University, Atlanta University, and Spelman Institute (female), all at Atlanta, are for colored students. Of the large

number of undenominational schools, the most noteworthy is the Lucy Cobb Institute at Athens.

CHARITABLE AND PENAL INSTITUTIONS. The State Lunatic Asylum is located near Milledgeville, and includes separate buildings for white and black inmates, free to bona fide citizens of Georgia. In 1900 it contained 2550 individuals, and there were 150 others confined in the county jails, the asylum having been filled to its utmost capacity. There are a State institution for the deaf and dumb at Cave Spring, and an academy for the blind at Macon. There are also private institutions, such as the Female Asylum at Savannah, the Augusta Orphan Asylum at Augusta, and orphan homes of the Methodist, Episcopal, Baptist, and Hebrew organizations.

A recently adopted State law puts the control of State convicts in the hands of agents or lessees. A State commission has administrative authority over the State institutions, and the above provision is carefully carried out. The same law seeks to attain the same end in control of county chain-gangs, but in this instance it is generally violated, as are also the provisions intended to prevent the products of their labor from coming into competition with the products of free labor, and to restrict the gangs to public works. Female convicts, infirm males, and all boys under fifteen years old are placed on a farm apart from able-bodied men.

HISTORY. Georgia was originally part of the vast domain of the Cherokee and Creek Indians, themselves the successors of a superior race, whose ruined mounds still exist. De Soto, in 1540, penetrated its interior, and Ribault, in 1562, visited its coast. Though included in the grant to the Carolina proprietors, the English did not occupy the region, and their claim was denied by the Spanish, who had already worked its mines. In June, 1717, the tract between the Savannah and Altamaha rivers, extending westward to the Pacific Ocean, was granted to Sir Robert Montgomery to be held as a distinct province under the title of the Margravate of Azilia. As it was not settled in the time required, it lapsed to the proprietors, from whom the British Government purchased, in 1730, seven-eighths of the territory, which it ceded by the charter of June 8, 1732, to a body of trustees organized for the purpose of "establishing the Colony of Georgia in America." Before this—February, 1732—the remaining one-eighth had been acquired from Lord Carteret. Chief among the trustees was General James Oglethorpe, who desired to found an asylum for the poor debtors of England and for the Protestant refugees of Europe. The Government desired to defend the Carolinas against the Spanish and Indians of Florida, and to divert from the Spanish and French their trade with the Cherokees. The Colony was the only one of the original thirteen to receive aid from the British Government. Oglethorpe landed at Charleston, January 13, 1733, and after negotiations with the Creek Indians, took up land on the site of Savannah, February 13th. The rules for the Colony required land to be held in tail male and on military service. The introduction of rum and of slaves was forbidden. In 1733 fifty Jewish colonists arrived, and these were followed in 1734 by Lutheran refugees from Germany (Salzburgers). In 1736 a colony of Highlanders ar-

rived, and with them John and Charles Wesley, whose strict religious discipline made them unpopular, and shortly led to their return to England. In 1738 George Whitefield founded the orphanage of Bethesda, near Savannah. Though generously aided, the Colony did not flourish. The system of land tenures was oppressive, the scarcity of servants hindered agriculture, and the absence of restrictions in South Carolina drew many settlers there. In 1738 many colonists petitioned for the introduction of slavery. In 1740 Oglethorpe led the troops of Carolina and Georgia in an invasion of Florida, and in 1742, by his strategy, drove off a Spanish fleet that attacked the forts on the Altamaha. Slavery was introduced in 1749, the system of land tenure was changed in 1750, and the first Provincial Assembly met at Savannah in January, 1751. In 1752 the charter was surrendered, and Georgia became a royal province. In 1753 the first General Assembly met at Savannah.

Well governed and generously treated by Parliament, Georgia had little cause to aspire after independence, but Saint John's Parish sent a delegate to the second Continental Congress in March, 1775, and its example was followed by the other parishes. In 1778 the British captured Savannah, and in 1779 Augusta and Sunbury. An attempt by the Americans and French to retake Savannah was unsuccessful (October, 1779), and it was held by the enemy till 1782. The first State Constitution was framed in February, 1777, and in January 2, 1788, the Federal Constitution was ratified. A second State Constitution was adopted in 1789, and a third in 1798, when the importation of slaves was forbidden, and the boundaries of the State were defined as extending to the Mississippi on the west, and the Saint Mary's River on the south. The capital was moved to Louisville in 1795, and to Milledgeville in 1807. The enmity of the Indians had been aroused early in the history of Georgia; from 1783 to 1790 there were troubles with the Creeks and the Cherokees, and from 1790 to 1835 the lust for Indian lands was the chief force that shaped politics. In 1802 the State ceded its territory west of the Chattahoochee to the United States in return for \$1,250,000 and the promise that the Federal Government would undertake to extinguish peaceably all Indian titles within the State of Georgia. Large cessions were made by the Creeks to the United States in 1814, after they had been defeated in a sanguinary war, and the territory of the lower Cherokees was acquired in 1817. In 1825 the Creek Indians relinquished to the United States all their lands within the limits of Georgia, and Governor Troup, proceeding on the theory that the inherent title of the Commonwealth in the land had thus been freed from all incumbrance, ordered the survey of the relinquished territory. The Indians, however, repudiated their agreement on the ground of fraud, and this led to a conflict between the Governor and the National Administration (1826), in which the State successfully defied the power of the General Government. After the same manner, the Georgia Legislature, in 1827, extended the criminal jurisdiction of the State over a part of the lands held by the Cherokees, thus asserting the incompatibility of an Indian com-

monwealth existing within the limits of the State with the sovereign power of that State. The Supreme Court, in 1832, declared all such laws void, but its decision was disregarded by the State authorities. The Creeks were expelled in 1832, and in 1835 the Cherokees ceded to the United States all of the disputed territory, removing from the State in 1838.

The Whig Party was always strong in Georgia, and when the secession movement broke out there was a powerful Unionist element in the State. The radical party, however, prevailed and, on January 19, 1861, a convention passed an ordinance of secession by 208 votes against 89. During the war the State bore more than its share of misfortune. (For military operations in Georgia, see CIVIL WAR.) Great commercial depression was followed by actual deprivation. In 1863 there was want in northern Georgia, and in 1864 the northwestern part of the State was laid waste, and scores of thousands were living on Government bounty. At the end of the war it was estimated that four-fifths of the public wealth had been destroyed. The arbitrary acts of the Confederate Congress had been resented by the State authorities, and as early as 1863 there was a large faction in favor of reconstruction. The State was under military rule until June, 1865. On October 30th a convention of delegates at Milledgeville repealed the ordinance of secession; on November 7th the war debt of the State was repudiated, and a new constitution adopted; and on December 5th the Legislature ratified the Thirteenth Amendment. In 1866, however, the Legislature refused to ratify the Fourteenth Amendment, and by the reconstruction acts of March, 1867, Georgia came once more under military rule. A constitutional convention assembled in December, 1867, and in April 25, 1868, a new constitution was adopted by popular vote. The Legislature chosen at the same time complied with the demands of the reconstruction acts, and elected United States Senators. In July General Meade declared civil government restored, but as the Legislature afterwards expelled its colored members, on the ground of ineligibility, and failed to ratify the Fifteenth Amendment (1869), the State was again excluded from Congress, and again subjected to military rule, under which the expelled negroes were reseated, and the Fourteenth and Fifteenth amendments ratified, February, 1870. Georgia's representatives in Congress were not admitted till January, 1871. During this period trouble was caused by the Ku-Klux Klan (q.v.).

Business activity recommenced immediately after the war, and, owing to its splendid resources, the State prospered in spite of a long period of misgovernment. Under the wasteful administration of Rufus B. Bullock, Governor from 1868 to 1871, the public debt was increased from \$5,000,000 to \$16,000,000; the larger part of this debt was contracted through the fraudulent indorsement of railroad bonds, which the State later repudiated. Before 1880 charges of embezzlement were frequently brought against public officials, in particular against the State treasurers. Legislation during the period was concerned in great measure with railway affairs the railroads for the most part being under Government control. After 1880 economic development became especially marked as manufac-

tures of cotton, iron, steel, and oil spread over the northern part of the State, and the mining of coal grew to large proportions. The Cotton Exposition of 1881, and the Cotton States and International Exposition of 1898, both held at Atlanta, testified to the prosperity of the State. The division of races continued clean-cut; and though there was no disposition among the better class of whites to hinder the negro in the exercise of his civil rights, political equality was begrudged him, and social equality absolutely denied. As late as 1891 the Legislature decreed that separate public conveyances be provided for whites and negroes, and as late as 1897 the appointment of a negro as postmaster was made impossible by public opinion. Instances of mob law and racial feud were frequent after 1894.

In national politics the State was Democratic throughout the nineteenth century, except in 1840 and 1848, when it cast its electoral vote for the Whig candidate. In State politics, Georgia, since 1874, has been immaculately Democratic, and since 1882 the Republicans have not participated in the State elections. From 1890 to 1898, however, the Populist Party was very powerful. The present Constitution was adopted in 1877, when Atlanta was made the capital.

Consult: Jones, *The History of Georgia*, to 1783 (Boston, 1883); McCall, *History of Georgia*, to 1816 (Savannah, 1816); Stephens, *War Between the States* (Philadelphia, 1879); Avery, *History of Georgia from 1850 to 1881* (New York, 1884).

GEORGIA, STRAIT OF. The main section of the arm of the North Pacific Ocean which separates Vancouver Island from the mainland. It lies between Vancouver on the west and British Columbia on the east (Map: British Columbia, D 5). It averages perhaps 25 miles in width, and is comparatively deep, having soundings of over 1000 feet. It receives the water of the Fraser River (q.v.) and some smaller streams, and communicates with the open ocean by Queen Charlotte Sound in the north, and by the Strait of Juan de Fuca in the south.

GEORGIA, UNIVERSITY OF. An institution of higher education, chartered in 1785, and formally opened at Athens, Ga., in 1801. Its government is vested in a board of trustees appointed by the Governor. At the outbreak of the Civil War the faculty and most of the students joined the Confederate Army, and the institution remained closed until 1866. The proceeds of the sales of lands received by Georgia under the United States Land Grant Act of 1862 were transferred to the university in 1872, and the university, which in its inception was designed as a classical school, has, since the close of the Civil War, broadened its scope, and in 1902 comprised: Franklin College; the State College of Agriculture; the Graduate School; the Law School; the North Georgia Agricultural College, situated at Dahlonega; the Medical College, situated at Augusta; the School of Technology, situated at Atlanta; the Normal and Industrial School for Girls, situated at Milledgeville; the State Normal School; and the Industrial College for colored persons, which includes a well-equipped trade department. The total attendance, including 658 preparatory students, in 1902 was 2689. The library contains about 30,000 volumes, and the university owns twelve buildings. The running expenses of the university are partly defrayed by an annual State grant of \$8000.

GEORGIA BARK. See PINCKNEYA.

GEORGIAN (jôr'jan) **ARCHITECTURE.** The style of architecture in England prevailing during the reigns of the four Georges, and corresponding to the Colonial style in the United States. It was an adaptation of the Italian or Palladian style to English requirements, in which it lost the greater part of the sculpture and carved ornament of the Italian prototype, but gained, on the other hand, in freedom and picturesqueness of detail, and never fell into the extravagances and had taste of contemporary Italian work. Hawksmoor, James Gibbs, the architect of Saint-Martin's-in-the-Fields, London, Colin Campbell, the Adam brothers, Sir William Chambers, architect of Somerset House, London, Robert Taylor, and George Dance, are among the most notable architects of this period, to which American architecture owes the models which, in the second half of the eighteenth century, were followed generally in the design of the so-called Colonial churches and mansions of New England and the South. This neo-classic style was merged during the later Georgian period into the

modern style, and lasted, roughly, from c.1715 to 1800.

GEORGIAN BAY. An eastern extension of Lake Huron in the Province of Ontario, Can., about 120 miles long and 50 miles wide, and with depths exceeding 300 feet in the southwestern section (Map: Ontario, C 2). It is partly cut off from Lake Huron by a peninsular extension of Ontario and Manitoulin Island, and is connected with the lake by a short channel 20 miles wide south of this island, and by the long North Channel north of it.

GEORGIAN, or IBERIAN, or GRUSINIAN LANGUAGE. The principal language of the Caucasian group of dialects. This family of languages is divided into North and South Caucasian, the former group comprising Abkhasish, Avarish, Kasikumük or Lak, Arkish, Hürkanish, Kürinish, Udish, Tchetchentsish, and Thushish, and the latter division consisting of Georgian itself, Mingrelish, Lazish, and Suanish. The Caucasian languages, which are, broadly speaking, agglutinative in type, although they show inflection in many instances, are comparatively poor in vowels, but they abound in difficult combinations of consonants, especially of gutturals and sibilants. The noun and the verb are highly complicated, and the North Caucasian distinguishes in gender between the six categories of animate and inanimate, rational and irrational, masculine and feminine. The number system in most of the dialects is vigesimal. The Georgian is the only Caucasian dialect that has developed a literature; it begins with a translation of the Bible in the eighth century. This literature is written in a modified Armenian script, and it is quite considerable in extent. It embraces poetry, romance, history, and theology, and it reached the period of its highest development during the seventeenth and eighteenth centuries.

BIBLIOGRAPHY. The best general outline of the Caucasian languages, including Georgian, is that of Friedrich Müller in *Grundriss der Sprachwissenschaft*, vol. iii., sec. 2 (Vienna, 1887). Consult also: Erckert, *Die Sprachen des kaukasischen Stammes* (Vienna, 1895); Brosset, *Éléments de la grammaire géorgienne* (Paris, 1836); *Dictionnaire géorgien-russe-français* (Saint Petersburg, 1840); Leist, *Georgische Dichter verdeutsch* (Leipzig, 1887).

GEORGIANS. The Georgians, or Kartvelians, form the southern group of peoples of the Caucasus, which includes the following stocks, whose languages appear, though in part only distantly related, to have had a common origin: (1) The Georgians proper, or Grusians, with the Khevsurs, Thushes, Pshavs, and other mountain tribes, the Imers, the Gurians, etc.; (2) the Mingrelians, with the Lazes, Abkhasians, etc.; (3) the Suanitians, or Swans, of Kutais. Physically the Georgian peoples are of the white, not the yellow race, but rather mixed, the Georgians proper being brachycephalic, the Imers and Mingrelians more or less dolichocephalic; the Imers, too, have a less oval face, but Pantiukhoff (1893) considers them to represent best the primitive Georgian race, while Ripley (1899) takes the Mingrelian as typical of this group. The physical beauty of the men and women of the Georgians proper has long been famous, but Chantre (1885) and after him Ripley style it "a perfectly formal, cold, and unintelligent beauty, in no

wise expressive of character." Like the Circassians, the Georgians furnished slaves and women for the harems of Turkey, Egypt, etc. The ugliest and most degenerate representatives of the group are to be found among the Suanians, with whom goitre and cretinism prevail to a considerable extent. The Georgians have resided in their present habitat 4000-5000 years, and the human remains found in the caves of Kutais suggest a longer period for man's existence in this region. Some authorities, however, think that at the time of their appearance here the primitive Georgians were already somewhat cultured by earlier residence farther south in contact with ancient Aryan or Semitic civilizations in Asia Minor. Later on the Georgians seem to have furnished copper, antimony, etc., to these same civilized centres. Some hold that the primitive inhabitants of the region about Lake Van (the authors of the Vannic inscriptions, and the possessors of a certain amount of indigenous culture) and the so-called Mitani were of the Georgian stock. The Georgians proper are the best-known sections of the group. Russian intermixture appears to have stimulated to a certain degree the poetical and general literary genius of this people. Besides the material about the Georgians in von Erckert's *Der Kaukasus und seine Völker* (1887), and Chantre's *Recherches anthropologiques dans le Caucase* (1885-87), reference may be made to Leist's *Georgische Dichter verdeutscht* (1887); Wardrop's *The Kingdom of Georgia* (1888); Leist's *Georgien: Natur, Sitten und Bewohner* (1885), etc.

GEORGIAN SERIES. See CAMBRIAN SYSTEM.

GEORGIAN VERSION. See BIBLE.

GEORGICS, jôr'jiks. A didactic poem by Vergil, begun at the suggestion of Mæcenas, and dedicated to him. It is an agricultural work in four books, of which the first treats of the cultivation of the fields, the second of trees, the third of horses and cattle, and the fourth of bees. Around these subjects Vergil collected all the experience of the old Italians, and associated them with great beauty of style and illustration. The poem is in hexameters, and represents the most perfect work of the poet in versification. It was composed between B.C. 37 and 30.

GEOTEUTHIS (Neo-Lat., from Gk. γῆ, *gê*, earth + τευθίς, *teuthis*, cuttlefish). A fossil cuttlefish-bone, found in the Upper Liassic beds of England, Germany, and France. Its form is that of a flat, thin wedge. Its chief interest lies in its frequent association with the petrified ink-bag of the same animal. This ink-bag has been hardened to a glistening black mass, which can be dissolved and used for water-color drawing in much the same manner as is the modern sepia. See articles CEPHALOPODA; CUTTLEFISH; SEPIA; SQUID.

GEOTROPISM IN PLANTS (from Gk. γῆ, *gê*, earth + τροπή, *trôpê*, a turning, from τρέπειν, *trepein*, to turn). The sensitiveness of plant organs to gravity. The attraction of the earth acts as a stimulus to which the organ responds in a manner comparable to that exhibited in heliotropism, chemotropism, etc. Different organs respond to this stimulus in different ways. Primary roots (i.e. those originating from the embryo itself) are positively geotropic. They normally grow

with their tips directed toward the centre of the earth. If placed in any other position they bend so that the axis of the growing portion regains its normal direction. In these organs the receptive (or perceptive) region is in the extreme tip,

FIG. 1. POSITIVE GEOTROPISM.

Root of pea: a, with terminal portion marked into zones 1 mm. long and laid horizontal; b, the same after 6 hrs.; c, the same after 24 hrs. The 3d to 7th zones have grown most in length. The curvature is not usually so sharp, but all growing zones bend.

while the active or curving region lies two or three millimeters back of the tip. The attraction of gravity sets up a disturbance (the nature of which is not yet certainly known) in the receptive region, and this is propagated backward through the intervening cells to the region of curvature. Here the disturbance causes an alteration in growth such that the side of the root directed upward grows more rapidly than the other side, thus producing a curvature which ultimately directs the tip downward again (Fig. 1). Many other plant organs besides primary roots are positively geotropic. Among these are the rhizoids (q.v.) of many lower plants, stalks of certain fruits and fruit clusters, many aerial roots, etc.

The primary shoots of most plants are apogeotropic (negatively geotropic)—i.e. they

FIG. 2. NEGATIVE GEOTROPISM.

Radical leaves of onion with basal growth, which have erected themselves from the horizontal, because growth on under side is accelerated by gravity.

normally direct their tips away from the centre of the earth. This kind of sensitiveness is called apogeotropism or negative geotropism (Fig. 2). In such organs the receptive region is

not so well marked off from that of bending as in roots. It may extend throughout the whole growing region. Also any region where growth is taking place has the power of curving under this influence. The response is similar to that in roots, but in shoots the region where growth is accelerated is on the under side when placed horizontal. In certain regions where growth has ceased it may be renewed under the influence of geotropic stimulation, and curvature may then ensue. Examples of this are found in the mature joints of grass-stems; also in those of the common wandering-Jew (*Tradescantia*). These bend sharply when placed horizontal, in which position they are stimulated by gravity (Fig. 3).

Many organs, such as ordinary foliage leaves, lateral branches, lateral roots, rhizomes, runners, etc., usually show another form of response to this stimulus. Their normal position is horizontal, and, if displaced, they return to this position by bending. This tendency is dependent on diageotropism. The stalks of certain flowers, such as those of *Narcissus* and pansy, are diageotropic, so that the flower faces laterally. In dorsiventral organs, e.g. many leaves, diageotropic response may consist of two movements, a curvature which results in bringing the main axis into the horizontal plane, and a torsion of the whole organ which brings its two surfaces into their normal relation to the surface of the earth.

FIG. 3. NEGATIVE GEOTROPISM.

a, A shoot of *Tradescantia*, pinned to cork by lowest internode in a horizontal posture, has erected its tip, because the growth of the base of each internode has been accelerated by the stimulus of the gravity; b, a longitudinal section through the growing region of an internode after induced growth.

Still another form of geotropic curvature is shown by the growing regions of twiners, like the hop (Fig. 4), morning-glory, and bean. If the tip of the stem of such a plant be directed upward, gravity will exert an influence upon it which results in the acceleration of growth along one side. This produces a lateral nodding. But as soon as the tip begins to nod, the region of

accelerated growth migrates to the flank. The apex is thereby swung to the right or left, describing an irregular circle, clockwise or counter-clockwise, according to the plant. What determines these directions is not known. It differs among species of the same family or the same genus, and in some cases even in the plants of the same species. The tendency to respond is termed lateral geotropism, and it is on account of this property that such plants are enabled to twine about a support.

All geotropically sensitive organs may be constrained to grow in a horizontal direction, in spite of the stimulus of gravity, if they are slowly rotated on a horizontal axis by means of a clinostat (q.v.). In order to produce bending the stimulus must affect the organ in a one-sided manner. When a plant is rotated on the clinostat all parts are successively directed toward the centre of the earth, for equal periods of time. Hence there is as much tendency to bend in one direction as in another, and the resultant growth is uniformly accelerated on all sides.

FIG. 4. LATERAL GEOTROPISM.

Tip of a twiner, the hop vine, showing low coils first formed, and the retarded development of the upper leaves. After Kerner.

Geotropism only in part determines the final position of subterranean plant organs. Hydrotropism, chemotropism, traumatotropism, etc., all have their effect, and the final position is the resultant of all these reactions. The position of aerial organs is determined largely by geotropism and heliotropism (q.v.). It is difficult to analyze any response and tell to what factor it is due. This can be done best by the use of the clinostat, varying the position of the axis according to the needs of the experiment. See also APOGEOTROPISM; DIAGEOTROPISM.

GEPHYRÆA (Neo-Lat. nom. pl., from Gk. γέφυρα, *gephyra*, bridge). A class of Annulata, containing certain marine worms devoid of segmentation in the adult condition, and the larvæ of which are typical trochospheres. The class includes *Siphunculus*, *Echinus*, *Bonellia*, and a few other forms.

GEPIDÆ, jép'ī-dē. A people of Gothic affinities, who in the third century lived on the shores of the Baltic, near the river Vistula. With the Goths they advanced southward and established themselves in what is now the western part of Hungary. They were subjugated by Attila (q.v.), but after his death rose and drove out the Huns. They were defeated by Theodoric the Ostrogoth King, in 489, and in 566 they were conquered by the Lombards. After this the name

disappeared, the remnants of the nation being swallowed up by the Avars.

GEPPERT, gēp'pĕrt, KARL EDUARD (1811-81). A German philologist. He was born at Stettin and was educated at Breslau, Leipzig, and Berlin, where he was professor from 1846 until his death. His works include: *Ueber die Aussprache des Lateinischen im ältern Drama* (1858); *Ueber den Ursprung der Homerischen Gesänge* (1840), a polemic directed against Ritschl; *Die altgriechische Bühne* (1843); and editions of the *Capituli* (1859); the *Truculentus* (1863); the *Pænulus* (1864); the *Epidicus* (1865); the *Casina* (1866); and other classics. His researches as to the Roman stage, especially as to the plays of Plautus, are valuable, and several public performances of the comedies *Trinummus*, *Menæchmi*, and *Rudens* were organized by him.

GERA, gā'rā (OHG. *Geraha*). The capital of the German Principality of Reuss (younger branch), situated on the White Elster about 44 miles east-southeast of Weimar (Map: Germany, E 3). It is well laid out, having been almost entirely rebuilt since the fire of 1780. One of the oldest and most prominent buildings is the Rathaus, erected in 1573-76, on the site of the old thirteenth-century building. The churches are of comparatively recent construction. The palace of the Prince, the theatre, and the post-office are noteworthy buildings. Gera has many excellent educational and benevolent institutions, including a number of manual schools. Its industrial output is important. Among the industries is the manufacture of woollens, introduced from Flanders at the end of the sixteenth century. Gera has an annual production of woollens of over \$14,000,000, and exports considerable quantities to the United States. Other manufactures are carpets, harmonicas, machinery, brick, leather, tobacco, jewelry, etc. There is also an extensive trade in oil, spirits, and drugs. Population, in 1890, 39,670; in 1900, 45,640, principally Protestants. Gera is first mentioned under its present name in the twelfth century, when it belonged to the Abbey of Quedlinburg. It passed to the House of Reuss at the beginning of the fourteenth century.

GERACE, jā-rā'chā. A city in South Italy, 60 miles northeast of Reggio, beautifully situated near the Ionian Sea, on a slope of the Apennines (Map: Italy, L 9). The ruins of the ancient city, Locri Epizephyrii, founded in the seventh century B.C., given laws in the sixth century by Zaleucus, and celebrated by Pindar and Demosthenes for its wealth and cultivation of art, are now concealed by an orange grove. The columns of the cathedral, which was rebuilt after the earthquake of 1783, are ancient. There are iron and coal mines and marble-quarries, and the soil of the district is rich, producing grain, olives, and grapes, the last of exquisite quality. Population of commune, in 1881, 9511; in 1901, 10,595.

GERAINT, ge-rānt'. A knight in the Arthurian legends. He appears in the *Mabinogion* romance, *Geraint the son of Erbin*, the source of which is Chrestien de Troyes's *Erec et Enide*, and in Tennyson's idyll *Geraint and Enid*.

GERALD DE BAR'RI. See GIRALDUS DE BARRI.

GERALDINE, jēr'al-dīn, THE FAIR. The lady to whom the Earl of Surrey's sonnets are ad-

dressed; now identified with Lady Elizabeth Fitzgerald, daughter of the ninth Earl of Kildare and, at the time the poems were begun (1537), only nine years old.

GERALDINI, jā'rāl-dē'nē, ALESSANDRO (1455-1525). The first Roman Catholic Bishop of Santo Domingo. He was born at Amelia, Italy, was educated as a soldier, and in 1475-76 served with the Spanish army against Portugal. Remaining in Spain, he took holy orders, became a friend and counselor of Archbishop Mendoza, of Toledo, and by him was introduced to the Court of Castile, where his learning won for him an appointment as tutor to the royal princesses. His influence at the Court of Ferdinand and Isabella is said to have obtained for Columbus his first interview with the sovereigns. Later in life Geraldini was engaged at various times on important diplomatic missions, both for the Papacy and for Spain, and held in succession the title to several Italian bishoprics. In 1520 he became the first Bishop of Santo Domingo, and proceeded at once to his new diocese, where he lived for the remainder of his life, and where he exerted his power and influence to make amends for the ruinous policy that had hitherto marked Spanish rule in the island. He wrote a valuable narrative of his voyage to America, and a description of Santo Domingo, in his *Itinerarium ad Regionem sub Equinoctiali Plaga Constitutas Alexandri Geraldini Amerini, Episcopi Civitatis S. Dominici apud Indos Occidentales* (1631). He is the author of a life of Catharine of Aragon, wife of Henry VIII. of England, in hexameter verse, and of several religious treatises.

GERANIA'CEÆ. See GERANIUM.

GERANIUM (Lat., from Gk. γέρανον, *geranon*, crane's-bill, from γέρας, *geranos*, crane). A genus of dicotyledonous plants, the type of the order Geraniaceæ, of which the most important genera are Geranium, Pelargonium, and Erodium. The genus embraces a large number of species, unequally distributed throughout the world. A dozen species are indigenous to Great Britain, of which number the stinking crane's-bill, or herb Robert (*Geranium Robertianum*), is a common weed. It is a low, spreading herb, with deeply divided leaves and small flowers, and has been used medicinally as an astringent. It is also found in parts of the United States. Alum Root (q.v.), a North American species, with flowers of considerable beauty, is the most valuable medicinally of all the species. It is very astringent and abounds in tannin, a character which belongs to some extent to many species of the genus. The common name, 'crane's-bill,' is given to many of the species of Geranium, on account of the long-beaked fruit, which in splitting aids in scattering the seeds. Geranium tuberosum, of Southern Europe, and Geranium dissectum, the wild carrot of Australia, produce edible tubers. The species of Geranium are not extensively cultivated, the plants so widely grown under that name being species of the genus Pelargonium, of which there are about 125 species, mostly natives of the Cape of Good Hope. These plants are prized on account of the colors of the flowers and the shape and marking of the leaves. Many hybrids have been produced, and there is hardly a better-known window plant. They are easily propagated by cuttings, requiring a light, rich soil and good drainage. A number of species

produce tuberous edible roots, as *Pelargonium triste*, of the Cape of Good Hope. The leaves of *Pelargonium acetosum* and *Pelargonium peltatum* are acid and edible. Two species of *Erodium* (*Erodium cicutarium* and *Erodium moschatum*, known as *Alfilaria*) occur abundantly over a large extent of the Pacific Coast region, where they are considered valuable forage plants, since they spring up rapidly after rains and furnish excellent pasturage, and are readily eaten when green by all kinds of stock. When dry they become very brittle, and are of little value. They seldom attain a height sufficient to admit of being cut for hay. A related species (*Erodium cygnorum*) is considered one of the most valuable forage plants for the drier portions of Australia.

GERANIUM.

tum are acid and edible. Two species of *Erodium* (*Erodium cicutarium* and *Erodium moschatum*, known as *Alfilaria*) occur abundantly over a large extent of the Pacific Coast region, where they are considered valuable forage plants, since they spring up rapidly after rains and furnish excellent pasturage, and are readily eaten when green by all kinds of stock. When dry they become very brittle, and are of little value. They seldom attain a height sufficient to admit of being cut for hay. A related species (*Erodium cygnorum*) is considered one of the most valuable forage plants for the drier portions of Australia.

GÉRARD, zhá'rär', BALTHASAR (1558-84). A French religious fanatic. He was born at Villafons, Franche-Comté, and under the name of François Guion entered the service of William of Orange in order to assassinate the latter, which resolution he carried out July 10, 1584, as the Prince was leaving his palace at Delft. Gérard was put to death by quartering two weeks later. His family was afterwards ennobled by Philip II.

GÉRARD, CÉCILE JULES BASILE (1817-64). A French traveler, better known as 'Gérard the Lion-hunter.' His adventures in Algeria were chronicled in *La chasse au lions* (1855), and *Gérard, le tueur des lions* (1858). In 1863 he started on a tour of exploration in West Africa, and met his death by drowning the following year.

GÉRARD, CONRAD ALEXANDRE (1729-90). A French diplomat, brother of Gérard de Rayneval (q.v.), born at Massevaux, Upper Alsace. He entered the diplomatic service, and served as secretary of the French legation at Mannheim from 1753 to 1759, and secretary of the French Embassy at Vienna from 1761 to 1766. In July of the latter year he was recalled to Paris to become secretary of the Council of State and chief clerk in the Bureau of Foreign Affairs. Early in 1778, under instructions from Vergennes,

he conducted the negotiations with the American representatives, Franklin, Deane, and Lee, which resulted in the signing of the two treaties with the United States on February 6, 1778, by which France openly espoused the cause of the struggling Colonies. In March, 1778, he sailed to America with d'Estaing's fleet, as the first accredited Minister from France to the United States. This post he held until superseded by Luzerne, in September, 1779. His activity in America consisted chiefly in subsidizing writers—of whom Thomas Paine was the best known—to create a sentiment favorable to a closer French alliance, and in somewhat questionable relations with various members of Congress, who were the recipients of 'gifts' from him. His communications to Congress were, for the most part, oral addresses delivered at their secret sessions. During his residence in America he received the degree of LL.D. from Yale, and on his return to France was made a Councilor of State.

GÉRARD, ETIENNE MAURICE, Count (1773-1852). A Marshal of France, born at Damvilliers, in Lorraine. As a volunteer of 1792, he served under Dumouriez and Jourdan, and after the Peace of Campo-Formio (1797) went to Vienna with Bernadotte, whose chief of staff he became in 1805. His gallantry at Austerlitz (1805) made him brigadier-general. He was present at the battle of Jena (1806), and on the morning after Wagram (1809) he was made Baron of the Empire. He fought in Spain and in Russia, and practically gained the victory at Bautzen (1813) for Napoleon, who made him count and general of division. During the campaigns of 1814 he commanded at La Rothière and Montereau. After the first restoration he was named Grand Cross of the Legion of Honor, and Chevalier of Saint Louis, and received various high appointments. On the return of Napoleon from Elba, Gérard joined him, and fought splendidly under Grouchy at Ligny (June 16, 1815). Had his advice been followed, Grouchy would have gone more quickly to the aid of Napoleon, on the 18th of June, and Waterloo might have been averted. After the second restoration Gérard was obliged to leave France, and did not return till 1817. He was elected a member of the Chamber of Deputies in 1822; took an active part in the Revolution of 1830, and commanded the troops appointed to maintain order in Paris. In the same year Louis Philippe appointed Gérard Minister of War, a post which he resigned soon after. In the following year he was made Marshal of France, and given the command of the expedition to Belgium, in which he distinguished himself by taking Antwerp in December, 1832. In 1835 he succeeded Marshal Mortier as Grand Chancellor of the Legion of Honor.

GÉRARD, FRANÇOIS PASCAL, Baron (1770-1837). A French historical and portrait painter. He was born in Rome, March 4, 1770, and in 1782 came to Paris with his father, an employee of the French Ambassador in Rome. He first studied sculpture under Pajou, but soon took up painting under David (q.v.), and became one of his most famous pupils. His works are in the style of David, but somewhat superior in color. In 1789 he received a second-class medal for his picture "Joseph Recognized by His Brothers." In 1795 his "Blind Belisarius," now at

Saint Petersburg, attracted much attention. Of his remaining classical subjects the best known are: "Psyche Kissed by Cupid" (1798), in the Louvre; the "Three Ages" (1806), now in the Museum of Naples; "Homer" (1811) and "Daphnis and Chloe" (1824), also in the Louvre. He also painted large historical canvases, among which are the "Battle of Austerlitz" (1811) and the "Entrance of Henry IV. into Paris" (1814), in the Museum of Versailles. Both of these paintings are well known through engravings. The former was commissioned by Napoleon, who thought highly of Gérard; the latter brought him the title of Baron, and appointment as Court painter to Louis XVIII., and the cross of the Legion of Honor. Among his other famous paintings are the "Pestilence at Marseilles" and the "Coronation of Charles IX." (Versailles).

Gérard was also successful as a portrait painter, working in the smooth and elegant manner popular at that time, although he did not give much character to his subjects. The best of his portraits are perhaps those of the painter Isabey and of his daughter, in the Louvre. His portraits include those of Moreau, Talleyrand, Napoleon (Dresden), and two of Josephine, the Empress Marie Louise, and the King of Rome—three hundred in all. He died in Paris, January 11, 1837. Consult: Adam, *Les œuvres du Baron François Gérard* (Paris, 1852-57); Henri Gérard, *Correspondance de François Gérard* (ib., 1867).

GERARD, jè-rärd', JOHN (1545-1612). An English herbalist. He was born at Nantwich, Cheshire, and after spending some time in traveling, settled in London. For more than twenty years he acted as superintendent of the gardens of Lord Burghley, Secretary of State to Queen Elizabeth, and had a considerable reputation as barber-surgeon, becoming master of the company in 1608. In 1596 he published a catalogue of plants cultivated in his own garden, 1039 in number, inclusive of varieties of the same species. The following year appeared his well-known *Herball*, an adaptation of the *Stirpium Historiæ Pemptades* of Rembert Dodoens (1583). A second edition with considerable improvements and additions was brought out by Thomas Johnson in 1633, who also brought out a third in 1636. Linnaeus named the genus *Gerardea* in honor of Gerard.

GÉRARD DE NERVAL, zhá-rär' de nâr-väl', name adopted by Gérard Labrunie (1808-55). A French poet, dramatist, novelist, and miscellaneous writer, born in Paris. His translation of *Faust*, produced in 1828, gained Goethe's approval, and was in part adopted by Berlioz for his symphonic legend, *La damnation de Faust*. His short stories, *Les illuminés* and *Contes et facettes* (1852), suggest a mind verging on insanity; his *Scènes de la vie orientale* (1848-50) rank among the most brilliant pages in French of exotic description. Gérard's *Works* were collected in 5 vols. (1868). He died by suicide. For his biography, consult Delvan (Paris, 1865) and Tournoux (Paris, 1888).

GÉRARD DE RAYNEVAL, de rä'n-väl', JOSEPH MATHIAS (1746-1812). A French diplomat, brother of Conrad Alexandre Gérard (q.v.), born at Massevaux, Upper Alsace. He entered the French diplomatic service, in 1767, as chargé d'affaires at Ratisbon, and was promoted to a similar position at Danzig in 1769. In the fall

of 1782, while Franklin, Jay, and Adams were negotiating with the French and English representatives at Paris for the conclusion of peace in America, Vergennes secretly dispatched Gérard de Rayneval to London, primarily for the purpose of patching up difficulties between Spain and England. The American commissioners, however, got wind of the mission, and became convinced that Vergennes was dealing falsely with them, and that he was arranging a secret treaty with England whereby their western boundary, fishery rights, and so forth, would be restricted. It was this belief that led them to break off the three-cornered negotiations, and, contrary to the instructions of Congress, to conclude a preliminary treaty of peace with the British representatives without further consultation with Vergennes. From 1783 to 1792 Gérard de Rayneval was Minister to England, and conducted numerous negotiations during this critical period with great tact and ability. He lived in retirement during the Revolution, and after it engaged in journalism and the study of history and international law, on which he wrote several works of value, such as *Institutions du droit de la nature et des gens* (1803). Consult Masson, *Le département des affaires étrangères pendant la révolution* (Paris, 1877).

GÉRARDMER, zhá-rär'mär' (Fr., Lake of Gérard; named in honor of Gérard of Alsace, who built a tower on the shore of the lake about 1070). A pretty mountain town, capital of a canton in the Department of Vosges, France, on the Gérardmer Lake, about 33 miles by rail from Epinal (Map: France, N 3). It has a large trade in the well-known 'Gérome' cheese, and has some manufactures of linen. Owing to its picturesque position in the Vosges, it is well patronized, and is the usual starting-point of excursions into the mountains. Population, in 1901, 9104.

GERARDO DALLE NOTTI, jâ-rär'dô däl'lâ nôt'tè. See HONTHORST, GERARD VAN.

GERARD THE GREAT. See GROOTE.

GERASA, jër'à-sâ (Lat., from Gk. Γέρασα). A city of Palestine in Roman times, situated among the mountains of Gilead, about 20 miles east of the Jordan, a like distance north of Philadelphia, 22 miles from Pella, and 6 miles north of the Jabbok. It is now called Jerash, and has been identified by Sir George Grove with Ramoth-gilead. It is well watered by an unfailing stream which empties into the Jabbok. Gerasa is first mentioned as having been captured about B.C. 83 by Alexander Jannæus of the Maccabean line. It was rebuilt by the Romans in B.C. 65. Under Vespasian it was captured by Lucius Annius, plundered and burned. It was a member of the Decapolis (q.v.), and in the time of the Antonines (A.D. 138-180) was one of the most important cities of Syria. In early Christian times it was the seat of a bishopric, but subsequently sank into decay. The ruins are beautiful and extensive. Great portions of the wall are in good preservation, and many columns are still standing on their pedestals. There are remains of buildings and a triumphal arch. Photographs of the ruins were published by the Palestine Exploration Fund in 1867. It is hardly possible to connect Jerash with the 'country of the Gerasenes' mentioned in certain accounts as the scene of one of Christ's miracles. See GERASENES, COUNTRY OF THE.

GERASENES, gër'á-sénz, COUNTRY OF THE. Probably the true scene of the miracle of Jesus in connection with the legion of demons and the herd of swine (Matt. viii. 28-34; Mark v. 1-20; Luke viii. 26-39). The name of the people is variously given as Gadarenes, Gerasenes, and Gergesenes, the best readings, followed by the Revised Version, seeming to be Gerasenes in Mark and Luke, and Gadarenes in Matthew. The situation of Gadara (q.v.) does not meet the requirements, and Gergesenes is best explained as a not unnatural corruption of Gerasenes. It is out of the question, however, to refer the miracle to the neighborhood of Gerasa, the modern Jerash (see GERASA). The most probable identification is with the modern Kersa or Gersa, a ruined village on the east side of the Lake of Gennesaret, about half way between the northern and southern extremities.

GERBER, gër'bër, ERNST LUDWIG (1746-1819). A German musical lexicographer. He was born at Sondershausen, a son of Heinrich Nikolaus Gerber, Court organist in that city. After studying law at Leipzig, he devoted himself more exclusively to music, and succeeded to his father's position in 1775. For ten years he was engaged in collecting material from every part of Europe for his celebrated *Historisch-biographisches Lexikon der Tonkünstler* (1790-92), which work, though out of date, has never been excelled in Germany and still furnishes valuable material to those engaged in musical research. A supplementary edition was subsequently published under the title *Neues Historisch-biographisches Lexikon der Tonkünstler* (4 vols., 1812-14). Gerber's extensive collection of books and musical manuscripts was purchased by the Gesellschaft der Musikfreunde of Vienna and furnished the nucleus of the large library afterwards formed by that society.

GERBER, JOHANN GOTTFRIED HEINRICH (1832-). A German engineer. He was born at Hof, Bavaria, and was educated at Nuremberg and Munich. He built the bridge across the Isar at Grosshesselohe, and designed many large bridges in South Germany. The so-called 'cantilever system,' the germ of which may be seen in the labors of Pope, Canfield, and others, was patented by him under the name of "Träger mit freischwebenden Stützen," and first practically applied by him at Regnitz. The publications of Gerber include: *Die Rheinbrücke bei Mainz* (1863); *Die Isarbrücke bei Grosshesselohe* (1859); and *Träger mit freiliegenden Stützpunkten* (1870).

GERBER, KARL FRIEDRICH WILHELM VON (1823-91). A German jurist and statesman, born at Ebeleben, and educated at Leipzig and Heidelberg. He assisted in the codification of the German commercial and marine laws, and in 1871 became the successor of Falkenstein as Minister of Education in Saxony. In 1891 he was appointed president of the Saxon Ministry. New laws on education were enacted during his administration, and the relation between the Catholic Church and the State was more clearly defined. His *System des deutschen Privatrechts* (17th ed. 1895) is considered the standard authority on that subject.

GERBERT, zhär'bär'. See SYLVESTER.

GERBERT, gër'bärt, MARTIN, Baron von Hornau (1720-93). A Roman Catholic prelate and

writer on Church music. He was born at Horb on the Neckar, and received his education chiefly at the Jesuit School of Freiburg in Bresgau. He joined the Order of the Benedictines in the Monastery of Saint-Blaise in 1737, became priest in 1744, was soon thereafter appointed professor of theology, and was chosen abbot in 1764. From 1759 to 1762 he traveled in Germany, Italy, and France, chiefly with a view of obtaining access to the old collections of musical literature contained in the libraries of the monasteries. In 1774 he published at Saint-Blaise *De Cantu et Musica Sacra*; in 1777, *Monumenta Veteris Liturgiæ Alemannicæ*, four parts; and in 1784, in three volumes, *Scriptores Ecclesiastici de Musica Sacra*, a collection of the principal writers on Church music from the third century till the invention of printing. This work has been of very great importance for the history of music, by preserving writings which otherwise might either have perished or remained unknown. He is also the author of *Codex Epistolaris Rudolphi I.* (1772) and *Historia Nigræ Silvæ Ordinis Sancti Benedicti* (1783-88). He died at Saint-Blaise May 3, 1793.

GERBI, jër'bi, **GERBA**, jër'bä. See JERBA.

GERBIL, jër'bíl (from Fr. *gerbille*, from Neo-Lat. *Gerbillus*, diminutive of *gerbua*, variant of *jerboa*, from Ar. *yarbū*, flesh of back and loin). Any of several rat-like rodents inhabiting Africa, Asia, and Southern Russia. About fifty species are known, forming a subfamily, *Gerbillinæ*, of the rat family (*Muridæ*), characterized by tufted tails and long and powerful hind limbs, giving them much the appearance of *jerboas* (q.v.), and enabling them to progress in long leaps, with great rapidity. They live underground, in extensive connected burrows. They are fawn-colored, very lively, emit an offensive odor, and are extraordinarily prolific. Well-known species are the Egyptian gerbil (*Gerbillus Egyptiacus*) and the East Indian gerbil (*Gerbillus Indicus*), which is strictly nocturnal and often colonizes in or near cultivated fields, where it does serious damage to grain crops.

GERBO'A. See JERBOA.

GERFALCON, jër'fä'k'n. See GYRFALCON.

GERHARD, gër'härt, EDUARD (1795-1867). A German archæologist. He was born in Posen, and after studying at Breslau and Berlin, he, in 1816, took up his residence at Breslau. The reputation he acquired by his *Lectiones Apolloniæ*, published in the same year, led soon afterwards to his being appointed professor at the Gymnasium of Posen. On resigning that office in 1819, on account of weakness in the eyes, he traveled in Italy, and in 1822 he took up his residence in Rome, where, with a view of prosecuting his archæological studies, he remained until 1837. In that year he received an appointment as archæologist in the Berlin Museum. In 1844 he became professor in the university and member of the Royal Academy. He died May 12, 1867. During his long stay in Italy he cooperated in Platner's *Beschreibung der Stadt Rom*, and in 1829 was one of the leading spirits in the foundation of the Instituto di Corrispondenza Archeologica, now the Imperial German Archæological Institute, of which he was vice-secretary. Gerhard's great service to archæological study was in the publication of important groups of monu-

ments, and in promoting an orderly classification. Such a worker was much needed at this time, when the excavations at Vulci and elsewhere in Etruria increased so suddenly the mass of early vases and other small objects. For artistic beauty and style Gerhard had little perception; his interest was largely antiquarian, and it is characteristic of him that he was attracted by the Etruscan art, generally of little interest to the artist. His writings are widely scattered in the volumes of the Archaeological Institute, the Berlin Academy, and various periodicals. Many of these are collected in the *Gesammelte academische Abhandlungen und kleine Schriften* (Berlin, 1866-68). Among his larger works are: *Rapporto intorno i vasi Volcenti* (1831); *Antike Bildwerke* (1827-44); *Auserlesene griechische Vasenbilder* (1839-58), still the best single collection of Greek vases; a publication of selected vases from the Berlin collection *Griechische und etruskische Trinkschalen* (1843); *Etruskische und campanische Vasenbilder* (1843); *Apulische Vasen* (1846); *Trinkschalen und Gefässe* (1848-50); *Etruskische Spiegel*, 4 vols. (1843-68), 5th vol. by Klugmann and Körte (1884-97). With Panofka he prepared a catalogue of the Naples Museum in 1828, and in 1836 one of the antiques in the Berlin Museum. Though Gerhard's *Griechische Mythologie* (1854-55) is still valuable, his mythological work, as well as his interpretation of works of art, suffers from his overestimate of the importance of the mysteries and their symbolism. Consult Jahn, *Eduard Gerhard, ein Lebensabriss* (Berlin, 1868).

GERHARD, JOHANN (1582-1637). One of the ablest and most learned German exponents of Lutheran orthodoxy. He was born at Quedlinburg, October 17, 1582. In his fifteenth year he came under the personal influence of Johann Arndt (q.v.), author of *Das wahre Christentum*, and resolved to study for the Church. Soon after entering the University of Wittenberg (1599) he began to waver in this determination, and ultimately interested himself for two years in the study of medicine, but in 1603 resumed his theological studies at Jena, and in the following year received a new impulse from Winkelmann and Mentzer, at Marburg. Having graduated and commenced lecturing at Jena in 1605, he in 1606 received and accepted the Duke of Coburg's invitation to the superintendency of Heldburg and mastership of the gymnasium; soon afterwards he became general superintendent of the duchy, in which capacity he was much and usefully engaged in the practical work of ecclesiastical organization until 1616, when he found a more congenial sphere in the senior theological chair at Jena, where the remainder of his life was spent and where he died, August 17, 1637. His most famous works are: *Loci Communes Theologici* (1610-22), and his *Sacred Meditations* (1606), which have been translated into several languages. His life was written in Latin by Fischer (Leipzig, 1723), and in German by Boettcher (Dresden, 1858).

GERHARDT, gér'hárt, DAGOBERT VON (pen-name 'Gerhard von Amyntor') (1831—). A German soldier, poet, and novelist, born at Liegnitz. After attending the university he entered the Prussian Army, and advanced to the rank of major. He was severely wounded in the assault upon the fortifications of Düppel during the

Danish War of 1864, and in 1867 was employed by Moltke on the General Staff at Berlin. He served in the Franco-German War, 1870-71. He has become known chiefly through his numerous novels, such as *Der neue Romanzero* (2d ed. 1883); *Eine moderne Abendgesellschaft*, treating of the Jewish question (3d ed. 1881); *Gerke Sutcliffe* (3d ed. 1890); *Durch Nacht zum Licht* (1887); *Die Cis Moll Sonate* (1891). His earlier works include the *Hypochondrische Plaudereien* (4th ed. 1875, new series; 3d ed. 1890).

GERHARDT, EDUARD (1813-88). A German architectural painter, born at Erfurt. He studied architecture in Cologne, and under Semper in Dresden, but in 1838 took up painting at Munich. A series of fine views of Cologne Cathedral attracted the attention of Frederick William IV. of Prussia, whose assistance enabled Gerhard to continue his studies (1848) in Italy, Spain, and Portugal. Summoned afterwards to Lisbon to instruct the princes of the royal family, he returned in 1851, and settled in Munich. He excelled in depicting Moorish architecture, his oil paintings and water colors being of equal merit, as may be judged by "The Palace of the Inquisition at Cordova" (1857); "Lion Court in the Alhambra" (1861); "Interior of Saint Mark's, Venice" (1864), all in the New Pinakothek, and by "The Alhambra by Moonlight," "The Generalife," "The Comares Tower," and two views in Venice, all in the Schack Gallery, Munich.

GERHARDT, KARL FRIEDRICH (1816-56). An eminent French chemist, born at Strassburg. At the age of fifteen he was sent to the Polytechnic School at Carlsruhe, where his attendance at Walchner's lectures first awakened in his mind a taste for chemistry. After two years he removed to Leipzig, where he attended the lectures of Erdmann, which seem to have developed in him a passion for questions of speculative chemistry. On his return home he reluctantly entered upon the business of his father, who was a manufacturer of chemical products, but in his twentieth year he enlisted in a regiment of chasseurs. He soon, however, found military life as insupportable as a commercial career. He therefore purchased his discharge and set out for the laboratory of Giessen, where he worked under Liebig's superintendence for eighteen months. In 1838 he arrived in Paris, and there was cordially welcomed by Dumas. In the laboratory of the Jardin des Plantes he soon commenced, jointly with Cahours, his important researches on the essential oils. In 1844 he was appointed professor of general chemistry in the faculty of sciences at Montpellier. About this time he published his *Précis de chimie organique*. In 1848 he resigned his chair and returned to Paris, in order to follow out uninterruptedly his special investigations, and in that city he established, between the years 1849 and 1855, in successive memoirs, his views of series and his theory of types. It was there, also, that he gave to the scientific world his researches upon the anhydrous acids and the oxides. In 1855 he was made professor of chemistry at Strassburg and corresponding member of the Academy of Sciences of Paris. All his ideas and his discoveries are embodied in his *Traité de chimie organique* (4 vols., 1853-56). He had hardly completed the correction of the last proof of this great work,

when, after an illness of only two days, he died at the very period when he seemed to be beginning to enjoy the fruits of his labor. See *CHEMISTRY*; *AVOGADRO'S RULE*.

GERHARDT, PAULUS, or **PAUL** (1607-76). After Luther, the greatest of German hymn-writers. He was born in Saxony, studied at Wittenberg, and became pastor at Mittenwalde. In 1657 he removed to Berlin, and in 1669 to Lübben, Saxony, where he died in 1676. He was an active supporter of the Lutherans in their controversies with the Reformed churches. Among his most familiar hymns are "O sacred head once wounded" (English by J. W. Alexander); "Commit thou all thy griefs;" and "Jesus, Thy boundless love to me" (English by John Wesley). Consult the critical editions of his hymns by Bachmann (Berlin, 1866), and Goedeke (Leipzig, 1877); his life by Langbecker (Berlin, 1841); Kelly, *Gerhardt's Spiritual Songs* (London, 1867). The first collection of his hymns appeared in 1667.

GERHARDUS MAGNUS. See *GROOTE*.

GERHART, EMANUEL VOGEL (1817—). An American minister of the German Reformed Church. He was born at Freeburg, Pa., and was educated at Marshall College and at the Mercersburg Theological Seminary. After acting as president of Heidelberg College, he occupied for some time the chair of theology in the Theological Seminary at Tiffin, Ohio, whence he was called to the presidency of Franklin and Marshall College in 1855, where he also lectured on mental and moral philosophy. In 1868 he was appointed professor of philosophy at the Reformed Church Seminary, Lancaster, Pa. He edited Rauch's *Inner Life*; his original publications include *Philosophy and Logic* (1858).

GERHOH, gër'hô, or **GERHOCH VON REICHERSBERG**, gër'hók fôn rik'ërs-bërk (1093-1169). A German theologian, born at Polling, near Weilheim, Bavaria. In 1132 he was appointed by Archbishop Conrad to the chief jurisdiction of the canonry of Reichersberg, in which position he became conspicuous as a reformer of the institution. In his work *De Investigatione Antichristi* he severely criticises the ecclesiastical conditions of his time. The work is historically valuable also in its bearing upon the Second Crusade. Gerhoh's "Commentary on the Psalms" was published in the *Thesaurus Anecdotorum* (1728).

GERI (gä'rè) **AND FREKI**, frä'kè. The wolves of Odin (q.v.). They lie at his feet as he is seated on his throne in Valhalla, ready to feast with his chosen heroes. Odin himself needs no food, so he gives all the meat that is set before him to his wolves.

GÉRICHAULT, zhä'rè'kô', JEAN-LOUIS ANDRÉ THÉODORE (1791-1824). A French painter, the leader of the Romantic School in its revolt against the tyranny of Classicism of David. His temperament was too vivid and sympathetic to tolerate the formal and conventional. The realities of his time appealed to him too intensely to permit his mind to rest upon the unrealities of the Classical School. As a realist, however, the scope of Géricault is limited.

Géricault was born at Rouen September 26, 1791. The family moved to Paris soon afterwards, and the boy entered the Lyceum Louis-

le-Grand. He left this school in 1808. He first entered the atelier of Carle Vernet (q.v.), and in 1810 he went over to the atelier of Guérin, but there was never any artistic sympathy between master and pupil. Much of his time was spent in Versailles, where he found the stables of the palace open to him, and where he gained his knowledge of the anatomy and action of horses.

At the Salon of 1812 Géricault exhibited one of the best known of his pictures, "A Cavalry Officer on Horseback." His "Wounded Cuirassier" was exhibited in the Salon of 1814, but was not especially successful. Géricault in a fit of disappointment entered the army and served for a time in the garrison of Versailles. In 1816 he went to Italy, and, after a month in Florence, settled in Rome for two years. The work of the Italian masters affected him powerfully, that of Michelangelo appealing especially to his temperament. The productions of this period are perhaps the most vigorous of his entire career. They are mainly in the form of drawings, of which many have been preserved. The finest of these are a series of studies for a picture which he intended to paint of the horse-race in the Corso during Carnival. The painting called the "Raft of Medusa," now in the Louvre, has come to be deemed one of the most powerful productions of the French School. At the exhibition of 1819, however, it was placed too high, and was received very coldly. Géricault carried the picture to England, where he exhibited it at a shilling admission, realizing 17,000 francs. During his stay in England Géricault associated much with Charlet, the lithographer and caricaturist. There are many of his powerful plates in collections throughout Europe. Géricault modeled frequently. Some bronzes and wax sketches by him are in existence, the finest of them being an anatomical study of a horse.

Soon after his return to Paris in 1822 Géricault was injured by a fall from a horse, and spent the rest of his life in extreme distress. He died in Paris January 26, 1824. Consult: Clément, *Géricault: Etude biographique et critique* (Paris, 1868); Brownell, *French Art Classic and Contemporary* (New York, 1901).

GERICKE, gä'rik-ë, WILHELM (1845—). A German orchestral conductor. He was born at Gratz, Austria, and early gave evidence of a strong musical temperament. In 1862 he entered the Vienna Conservatory, where he studied under Dessoff. Leaving the conservatory in 1865, he became kapellmeister of the theatre at Linz, and in 1874 received the appointment of second kapellmeister of the Vienna Court Opera, of which Hans Richter (q.v.) was first kapellmeister. On the retirement of Brahms from the conductorship of the Gesellschaftsconcerte in 1880, Gericke succeeded him, and became also the conductor of the Singverein. His fame as a conductor, and particularly as a drill-master, induced the Boston (Mass.) Symphony Orchestra to secure him as its leader. From 1884 to 1889 he held the baton of the organization and succeeded in placing it in the front rank of the world's great orchestras. In 1889 he returned to Vienna, and to the leadership of the Gesellschaftsconcerte (Nikisch succeeding him in Boston), but resigned again in 1895. Three years later he once more took charge of the Boston Orchestra, succeeding Emil Paur. He has published many works for the

orchestra, besides much pianoforte and chamber music; but it is principally through his artistic interpretations, skillful leading, and painstaking drill that he has attained his high rank as conductor.

GERING, gä'ring, ULRICH (c.1440-1510). A Swiss printer. He was one of the printers called by Guillaume Fichet, then rector of the Sorbonne, to put up the first printing-press ever used in France. In this he was assisted by Michel Friburger and Martin Crantz.

GERIZIM, gër'î-zim. See EBAL AND GERIZIM.

GERLACH, gër'låg, ERNST LUDWIG VON (1795-1877). A Prussian statesman, born in Berlin. He became one of the leaders of the Prussian High-Church Party, and was president of the Magdeburg Superior Court from 1844 to 1874. In 1849 he founded the *Neue Preussische Zeitung*, in which he freely expressed his ultra-conservative views. In 1858 he retired from the leadership of his party. He published a pamphlet, *Die Annexionen und der norddeutsche Bund* (1866), denouncing the annexations of 1866 and the exclusion of Austria from the German Bund.

GERLACH, FRANZ DOROTHEUS (1793-1876). A Swiss historian and philologist, born at Wolfshagen, near Gotha, and educated at Göttingen. He was professor at the University of Basel from 1820 until shortly before his death, and during the greater part of that time also occupied the position of chief librarian at that institution. He was distinguished chiefly for his pedagogical ability. His works include a German translation of Livy (1856-73), with an introductory volume entitled, *Die Geschichtschreiber der Römer von den frühesten Zeiten bis auf Orosius* (1855); and editions of Tacitus's *Germania* (1835); Sallust (1823-31); *Lucilius* (1846); and *Nonius Marcellus* (1842).

GERLACH, OTTO VON (1801-49). A German theologian. He was born in Berlin; studied law at Heidelberg and Göttingen, and theology at Berlin, preached for a time in the latter city, and became Court chaplain in 1847. Together with his brothers, Ludwig von Gerlach and Gen. Leopold von Gerlach, he was an upholder of orthodoxy in Prussia. He wrote a commentary on the Bible.

GERLACH, THEODOR (1861-). A German composer, born at Dresden, and for a time the pupil of Fr. Wüllner, and a student of the University of Berlin. His cantata, *Luthers Lob der Musica*, first given in Italy, in 1884, drew on him the attention of the musical world, and paved the way for the success which followed. In 1885 he became kapellmeister of the Sondershausen Theatre, and a year later of the German Opera in Posen. The success which greeted his *Epic Symphony* gained for him the appointment of Hofkapellmeister at Coburg in 1891, followed three years later by his appointment as kapellmeister at Cassel. He is a remarkably prolific as well as successful composer, his works embracing every branch of musical composition. He wrote both music and text of a three-act opera, *Matteo Falcone* (1898), which was received with great favor upon its production in Hanover.

GERLACHE, zhär'lash', ETIENNE CONSTANTIN, Baron de (1785-1871). A Belgian states-

man and historian, born in Luxemburg. In 1824 he was elected as Deputy from the Province of Liège to the Second Chamber of the States General. Together with the most enlightened of the Belgians he advocated separation from Holland. At the time of the Revolution, as president of the committee appointed to revise the Constitution, he advocated complete political and religious liberty, and hence opposed the Duc de Nemours on the ground that the latter's election was a sort of annexation to France. He was head of the deputation sent to offer the crown to Prince Leopold of Saxe-Coburg. In 1831 he became president of the Chamber of Representatives, and in that capacity received the oath exacted from the King by the Constitution, and the following year was appointed first president of the Court of Cassation, which position he held until 1867. In 1843 the King conferred on him the title of Baron. After his election as Deputy in 1824, he supported the Catholic Party, and was regarded as one of their chief leaders. Gerlach was also widely known as a writer. His *Histoire du royaume des Pays-Bas, depuis 1814 jusqu'en 1830* (1839), is a severe attack upon the Dutch Government. Besides some works on contemporaneous history, he published *Salluste et quelques-uns des principaux historiens de l'antiquité considérés comme politiques, comme écrivains et comme moralistes* (1859). His collected works were published in six volumes in 1875.

GERLAND, gër'lânt, GEORG KARL CORNELIUS (1833-). A German geographer and ethnologist. He was born at Cassel, and was educated at Marburg and Berlin. In 1875 he was appointed professor of geography and ethnology at Strassburg. His principal works relate to anthropology, and include: *Ueber das Aussterben der Naturvölker* (1868); *Atlas der Ethnographie* (1876); *Die Zukunft der Indianer* (in the *Globus*, 1879); and "Atlas der Völkerkunde," in Berghaus, *Physikalischer Atlas* (7th part, 1891-92).

GERM. See BACTERIA; DISEASE, GERM THEORY OF.

GERMAIN, jër-män', GEORGE SACKVILLE, Viscount SACKVILLE (1716-85). An English soldier and politician. He was born in England and accompanied his father, the Duke of Dorset, to Dublin on his appointment as Lord Lieutenant of Ireland in 1731. Sackville, as he was called up to 1770, was educated at Trinity College, Dublin, and in 1737 was commissioned a captain in the Sixth Dragoon Guards. Promoted lieutenant-colonel of the Twenty-eighth Foot, he served with his regiment under Cumberland in Flanders, being wounded at Fontenoy in May, 1745. He was made a colonel in 1746. During his father's second term as Lord Lieutenant of Ireland (1751-56) Sackville acted as his principal secretary, and as Secretary of War for Ireland. In 1758 he took part in the expedition to Saint-Malo (France), and in the same year accompanied the third Duke of Marlborough as second in command of the English troops sent to Hanover to aid Prince Ferdinand of Brunswick in his operations against the French. Sackville succeeded to the command of the British contingent after the death of Marlborough, but for his refusal to obey Ferdinand's orders at the victorious battle of Minden (August, 1759), he was

dismissed from the army. Charges of cowardice were brought against him, which at a court-martial, held in 1760, were not proved, but his dismissal was approved on the ground of insubordination, he was declared unfit for military command, and was dismissed from the Privy Council by George II. Sackville's political career had begun in 1741, in which year he was elected to represent Dover in Parliament, and he had continued as a member of the House from some constituency ever since. Shortly after George III. became King his name was restored to the list of privy counselors, and he began to take an active part in the debates in Commons as a supporter of Lord North. The first actual mark of favor shown him was his appointment as Vice-Treasurer of Ireland, a position he held during 1765-66. In 1769 he was declared by some, without much reason, to be the author of the *Junius Letters*. He assumed the name of Germain in 1770. From 1775 to 1779 he was a lord commissioner of trade and plantations, and at the same time Secretary of State for the Colonies, which position he held until the resignation of Lord North in 1782. In this latter position, in which he had in charge the actual conduct of the war in America, he did much to inbitter the Americans against the mother country by his advocacy of harsh measures, by the employment of Continental mercenaries and Indians, and by his continued opposition to all propositions looking toward peace. After the fall of the North Ministry he was created Viscount Sackville and retired from public life.

GERMAN, J. EDWARD (1862—). An English orchestral composer. He was born at Whitchurch in Shropshire, and after preliminary instruction under local teachers, became a student at the Royal Academy of Music, where he studied from 1880 until his graduation in 1887 as an associate, the fellow's degree being granted him in 1895. In 1889 he became director of music at the Globe Theatre, London. Although he is the composer of an operetta, *The Rival Poets* (1886), several symphonies, and considerable chamber music, it is through his incidental music to several of Shakespeare's plays, as *Richard III.*, *The Tempest*, *Romeo and Juliet*, *As You Like It*, and *Henry VIII.*, that he has become well known. The three dances from the music to the last-named play are popular throughout the world, and particularly in the United States.

GERMAN BAPTIST BRETHERN, THE. A considerable body of Christians, also known as Dunkers, and among themselves as Brethren, whose faith and practice are not generally known outside of the localities in which they live. Thus the reiterated statements that they are celibates, that they discourage marriage, that they do not marry outside of their own fraternity, that they keep the seventh day as the Sabbath, that they live in communities, and other similar errors set forth in the books, always have been without foundation. The movement which resulted in the closer organization of the German Baptist Brethren grew out of the great religious awakening which occurred in Germany in the latter part of the seventeenth century, when large numbers, becoming dissatisfied with the lack of spirituality in the State Church, withdrew from its communion. They organized at Schwartzau, Germany, in 1708, with Alexander Mack as their

first minister; but in no way do they regard him as the founder of the Church.

Driven by persecution to Wittgenstein, they rejected all human creeds, and accepted the Gospel of Jesus Christ as their rule of faith and practice. The Church suffered from persecution, and finally emigrated (1719-29) to America, settling near Germantown, Pa., where the first church in this country was organized in 1723. Among the early emigrants was Christopher Saur, who was the first in America to print the Bible in a European tongue. From this nucleus the Church spread southward and westward, and flourishing congregations are now to be found in most of the States. They are, however, most numerous in Pennsylvania, Maryland, Virginia, Ohio, Indiana, Illinois, Iowa, Missouri, Nebraska, Kansas, and North Dakota. At the annual conference held at Lincoln, Neb., in 1901, twenty-five States and five foreign countries were represented. They now number about 100,000 communicants, have 720 congregations, with 2600 ministers, who, as a rule, serve without salary. They are largely engaged in agricultural pursuits. Seven colleges receive a fair support. These are located at Bridgewater, Va.; Uniontown, Md.; Elizabethtown and Huntingdon, Pa.; North Manchester, Ind.; Mount Morris, Ill.; and McPherson, Kan. Missions have been established in Denmark, Sweden, France, Switzerland, Asia Minor, and India. The Missionary Society has an endowment fund exceeding a quarter of a million dollars. A large and well-appointed publishing house, located at Elgin, Ill., is owned by the Church. The *Gospel Messenger*, the Church paper, has a circulation of over 20,000, and other publications enjoy a large patronage.

In doctrine the Brethren are strictly orthodox. They hold the Bible to be the inspired and infallible word of God, and accept the New Testament as their only rule of faith and practice. They believe in the Trinity, in the divinity of Christ and of the Holy Ghost, and in future rewards and punishments. In the subtleties of speculative theology they take but little interest. Faith, repentance, and baptism are held to be the conditions of salvation. These three constitute true evangelical conversion, and upon them rests the promise of the forgiveness of sins and the gift of the Holy Ghost. In practice they follow closely the Scripture teaching, and observe the primitive simplicity of the Apostolic Church; hence they regard nonconformity to the world as an important principle. They enjoin plainness of dress, settle their difficulties among themselves without going to law, affirm instead of taking oath, refrain from taking a prominent part in politics, are opposed to secret societies, advise against the use of tobacco, and have a rule more than a century old against the manufacture, sale, and use of intoxicants. As early as 1782 they prohibited slavery, and pronounced in strong terms against the slave trade. They baptize believers only, dipping them face forward at the mention of each name in the Trinity given in the baptismal formula in Matt. xxviii. 19. Communion is observed in the evening, after a full meal called the Lord's Supper. Before the supper the ordinance of foot-washing is observed, the brethren washing one another's feet, and the sisters performing the same service among themselves. After supper, before the communion is taken, the sexes extend the right hand of fellow-

ship and exchange the kiss of peace. Bishops, or elders, ministers in the first and second degree, and deacons, are elected by the congregations. Ministers are advanced from the first to the second degree, and bishops are chosen from the latter, and ordained by the imposition of hands. Congregations are organized into State districts, and both elect delegates to the annual conference, which is the chief ecclesiastical body. Here the fullest and freest discussion of all questions coming before the assembly is permitted. The final decisions are rendered by a two-thirds vote of the delegated body, and are binding on all the churches. Women are eligible to serve as delegates in conference.

In 1881-83 the Church suffered the loss of about 8000 communicants by a division in its ranks, resulting in the secession of two parties, known as the Old-Order and Progressive Brethren. The former objected most seriously to the advance the Church was making in educational, missionary, and Sunday-school work, while the latter insisted strenuously that the Church was too conservative, that the rules laid down by the annual conference were oppressive, and that greater liberty should be enjoyed in matters of dress. After some years of contention, these parties withdrew from the mother Church and formed separate organizations. The Old-Order Brethren now number about 4000. They determinedly oppose higher education, missionary work, Sunday schools, and revival services. They publish a paper, the *Vindicator*, which has a small circulation. In 1890 the Progressive Brethren numbered 8000, and have since then increased, claiming 13,000 in 1900. They have a college at Ashland, Ohio, where their publishing house is also located. The *Evangelist*, their Church paper, circulates generally among the members of their body. For the German Seventh-Day Baptists, an early offshoot of the German Baptist Brethren, see BAPTISTS.

GERMAN BAPTISTS. See BAPTISTS.

GERMAN CATHOLICS. The name given to a sect which originated in Germany in 1844, and had a short existence. In that year Johannes Czerski (q.v.) undertook to found the 'Christian-Apostolic Catholic Congregation,' at Schneidemühl, in Posen. The confession of faith drawn up by Czerski rejected certain doctrines and practices of the Roman Catholic Church, but retained the Nicene Creed, the seven sacraments, and prayer for the dead; it declared the Bible the only sure source of Christian faith. About the same time Johannes Ronge (q.v.) uttered his protest against the exhibition of the holy coat (q.v.) at Treves, and the following year was called to take charge of a large 'German Catholic' congregation at Breslau. Ronge's confession of faith was far more radical than that of Czerski, and had a decided rationalistic tendency. The movement spread with remarkable rapidity, and many similar congregations were formed. In March, 1845, a conference was held at Leipzig and an organization effected. Among the prominent members of this gathering was Robert Blum (q.v.). The movement was forbidden in Austria and Bavaria. By the end of 1846 there were 60,000 German Catholics, more than half of them in Silesia. A second council was held at Berlin in 1847, at which liberal and rationalistic tendencies were still more marked. The decline of the associa-

tion was due to two causes—the active part which many of its members took in politics, and the continual controversy between the adherents to the rationalistic confession of Ronge and those who preferred the more evangelical one of Czerski. After the Revolution of 1848 it rapidly went to pieces. In 1850 it was united with the Free Congregations (q.v.). In 1863 Ronge and Czerski attempted to revive the movement by the 'Religious Reform Union.' It is now practically dead. Consult: Günther, *Bibliothek der Bekenntnisschriften der deutschkatholischen Kirchen* (Jena, 1845); Bauer, *Geschichte der Gründung und Fortbildung der deutschkatholischen Kirche* (Meissen, 1855); Kampe, *Wesen des Deutsch-katholicismus* (Tübingen, 1850); id., *Geschichte der religiösen Bewegung der neuern Zeit* (Leipzig, 1852-60).

GERMANDER (from Fr. *germandrée*, Sp. *camedris*, *camedreo*, from Lat. *chamædrys*, wall-germander, from Gk. *χαμαῖδρως*, *chamaidrys*, germander, from *χαμαί*, *chamai*, on the ground + *δρῦς*, *drys*, oak), *Teucrium*. A genus of numerous and widely distributed species of plants of the order Labiata. The common germander, or wall-germander (*Teucrium chamædrys*), often found on ruined walls in Great Britain, has probably been introduced from the south of Europe. It is a small, almost shrubby perennial, with wedge-shaped ovate, serrate leaves, and whorls of large reddish-purple flowers. It is bitter, somewhat aromatic, and was formerly much used in medicine, particularly as a principal ingredient in a once famous gout medicine called Portland powder. Similar medicinal virtues were ascribed to *Teucrium botrys*, a small annual species common on dry hills in Germany, having aromatic fragrance and yellow flowers. Cat-thyme (*Teucrium marum*), a native of the south of Europe, abounds in a pungent volatile oil, has a camphor-like smell, and, like catmint and valerian-root, is greatly relished by cats. It is often used as a sternutatory. Two species are rather abundant in the United States—wood-sage, or American germander (*Teucrium Canadense*), in low ground in the eastern part of the United States, and *Teucrium occidentale* in the West.

GERMAN EAST AFRICA. The largest and most important colonial possession of Germany. It lies on the east coast of Africa, extending from latitude 1° to about 11° 40' S., and from about longitude 29° to 40° 40' E., with a coastline of 620 miles. It is bounded on the north by British East Africa, on the east by the Indian Ocean, on the south by Portuguese East Africa and British Central Africa, on the southwest by Rhodesia, and on the west by the Congo Free State. A part of the western boundary extends north and south through the middle of Lake Tanganyika; another part of it is washed by the northeastern portion of Lake Nyassa: the northern boundary crosses Victoria Nyanza in latitude 1° S. The area is estimated at 364,000 square miles—almost double the size of Germany. The small island of Mafia, off the coast, also belongs to the colony.

TOPOGRAPHY AND HYDROGRAPHY. The coastal region is a narrow, low plain formed by sedimentary strata and coral limestone. Behind the coastal, jungle-covered plain rises a wide plateau, extending to Tanganyika, from 3000 to

4000 feet in height. It is surmounted in the east by the hills and mountains of Usambara, Useguha, Usagara, and other districts, which extend south to the Rufiji River and inland about 300 miles. This mountain region, some of whose peaks are 6000 feet high, is in great part well watered, well wooded, and fruitful, and its drainage reaches the Indian Ocean through the Pangani, Rufu, Wami, and Rufiji rivers. West of the mountains is a wide steppe region, dry and poverty-stricken, for the mountains between it and the Indian Ocean keep most of the rain-clouds in the east. The thirsty steppe merges gradually into the high fertile plain of Unyamwesi, south of Victoria Nyanza. On the western border of the colony the plateau is broken by the cleft of the Great Rift Valley (q.v.), and also by vertical displacements which have raised the strata west and north of Lake Nyassa into mountains of considerable elevation, some peaks of the Livingstone Mountains reaching 6000 to 9000 feet. The lofty volcanic mass of the Mfumbiro Mountains lies on the northwestern boundary. In the north the plateau is intersected by other rifts, and has been the seat of volcanic activity. Mount Kilimanjaro, an isolated volcanic peak, rising to a height of 19,720 feet, is the culminating point of Africa.

The coast and the bordering mountain region are watered mainly by the rivers Rufu, Pangani, Mgeta, Rufiji, and Rovuma and their tributaries. The interior, which has few perennial streams, is drained into lakes Tanganyika and Victoria Nyanza, and thence into the Congo and the Nile, a few rivers also reaching the Zambezi through Lake Nyassa. None of the rivers is of any importance for navigation, except for stretches here and there where small boats carry produce. There are numerous small lakes in the northern part of the country.

CLIMATE. The climate is tropical and unhealthy; malaria prevails, the mountain regions alone offering a few districts, like western Usambara, that are free from it. On the coast there are two rainy seasons, from the middle of March to the end of May, and from the middle of October to the middle of December; in the interior there is only one rainy season, from November to the end of April. The rainy season is the hottest of the year. The mean annual temperature is about 78° in the coast land, and considerably above that in some parts of the interior.

GEOLOGY AND MINERAL RESOURCES. The plateau region is mainly composed of ancient crystalline rocks, while the coastal plain consists of later sediments. West of the northern end of Lake Nyassa coal of good quality has been found, and several tons have been carried to the lake on the backs of men. The development of these deposits will await better means of transportation. The natives mine sufficient iron for their uses, and gold has been discovered in the southwest, but no mining is yet carried on by the whites.

AGRICULTURE. Agriculture and cattle-raising are the chief occupations of the settled natives. Millet is grown in most parts of the colony, while wheat, sesame, tobacco, and rice are confined to certain localities. Bananas are cultivated chiefly on the coast. The German Government is furthering agricultural development by establishing experimental stations and plantations among the highlands of the northeast part of the

colony, to which the German plantations are still almost wholly confined. Nearly all European vegetables thrive in some of these high districts. Hundreds of thousands of coffee-shrubs have been reared on the German plantations; the crop thrives and exports are increasing. The tobacco crop is rapidly increasing, but it is of poor quality, and is only sold to the natives and Arabs. Cotton has not succeeded, but sugar and copra are important. The collecting of india-rubber makes steady progress. The commerce of the colony is chiefly in the hands of German firms. The chief exports are rubber, cereals, and coffee, while the imports consist mostly of provisions, textiles, hardware and iron, and rice. The total trade of the colony for 1900 amounted to somewhat less than \$3,750,000, of which the exports amounted to a little over one-third. The trade is largely with Zanzibar, British India, and Germany, and passes chiefly through the ports of Dar-es-Salaam, Bagamoyo, Pangani, Kilwa, Lindi, Mikindani, and Tanga. In 1899 there were in the colony over 100 trading and industrial companies, not including numerous small Indian concerns. The colony has regular steam communication with Germany and Bombay. The three boundary lakes are navigable by steamers. The main roads are generally good, the Government having constructed over 1000 miles of roads for wheeled traffic. The Usambara Railway line was completed in 1901 for about 45 miles. It has been in operation from Tanga to Muheso since 1895, and is being extended through Usambara to Korogwe. The chief ports are connected by telegraph with Zanzibar.

At the head of the colony is the Governor, appointed by the Emperor. The whole colony is divided into eight districts and fourteen stations, the former administered by distinct officers and councils. The German army of occupation numbers over 1700 men, of whom over 1500 are colored. There are Government schools at Dar-es-Salaam, Tanga, and Bagamoyo. The revenue of the colony is derived chiefly from import duties and a hut tax, and covers only a small portion of the expenditures. Thus, in the budget for 1901 the latter are estimated at \$2,927,400, including over \$1,000,000 for railway construction and about \$550,000 for the colonial army. The revenue for the same year is given as \$770,000, necessitating an Imperial subvention of over \$2,000,000.

According to an enumeration of 1900, the colony had a population of over 6,100,000, including 1139 Europeans (872 Germans). The natives are of the Bantu race, but there is also a strong Asiatic element on the coast. The seat of government is Dar-es-Salaam (q.v.).

HISTORY. German colonization on the east coast of Africa began in 1884, when an expedition sent by the German Colonization Society (established in the same year) secured by treaty the territories of Useguha, Nguru, Usagara, and Ukami. In 1885 the German East African Company came into existence, and during 1885-86 succeeded in extending its dominions along the coast from Somaliland to the mouth of the Rovuma, with the exception of the territory around Mombasa, then in the possession of the British. By the Anglo-German agreement of 1886 the northern boundary of the colony was fixed, and the dominions of the Sultan of Zanzibar on the mainland reduced to a narrow strip

along the coast. The southern boundary of the colony was fixed in 1887. In the following year an agreement was reached with the Sultan of Zanzibar by which the latter ceded his possessions on the mainland to the company for an annual rental. An outbreak of the Arabs on the coast prevented the agreement from going into effect, and as the German forces then present in the colony were insufficient to cope with the rebels, the latter soon made themselves masters of all the seacoast towns, with the exception of Dar-es-Salaam and Bagamoyo. At the beginning of 1889 the company appealed to the German Government, and a military force of 800 colored troops, under the command of German officers, was dispatched to the colony. The rebellion was suppressed within a year. By a second agreement with Great Britain, in 1890, the Territory of Vitu, then within the German sphere of influence, was exchanged for Helgoland (q.v.), in the North Sea. The Sultan of Zanzibar renounced his claim to the coast for the sum of 4,000,000 marks (\$952,000), and on January 1, 1891, the colony came under the control of the German Government. GERMAN EMPIRE. See GERMANY.

GERMAN EVANGELICAL PROTESTANT CHURCH. The name given collectively to a number of independent German churches in the United States, mostly west of the Alleghany Mountains. No general organization of these churches has been instituted; but a union of ministers has been formed, which is called 'The German Evangelical Protestant Ministers' Association of North America.' This body is of comparatively recent origin, although some of the churches whose ministers are affiliated with it are old. It is founded on the basis of the principles of the United Church of Prussia of 1817. Its purposes, as set forth in its published organs, are to furnish a worthy representation of the German Evangelical Protestant Church in North America; to promote the association of the ministers, for mutual assistance, advancement in knowledge, and greater practical efficiency for their work and for the benefit of their congregations; and to secure the preservation of the independence, while promoting the connection, of the German Evangelical Protestant congregations and ministers. The doctrinal principle of the union is the Gospel of the Lord Jesus Christ, the interpretation of which is left to the judgment of the believer, enlightened by the Christian idea. The Association is composed of three district associations—those of Cincinnati, of Pittsburg, and the Western District Association—and is under the management of a central board, or *Behörde*, consisting of a president, a treasurer, a secretary, and three trustees. The congregations have no part in it. It maintains an orphans' home and a home for the aged, near Pittsburg; aids in the support of the Protestant orphans' homes in Cincinnati and Saint Louis; and assists other benevolent institutions when required. Preparations are making for the establishment of a ministers' seminary at New Bremen, Ohio. The periodical organ of

the Association, the *Kirchenzeitung*, is published weekly at Cincinnati and monthly at Pittsburg. A periodical for youth, the *Christlicher Jugendfreund*, is published semi-monthly. The book list of the publishing house at Cincinnati comprises a small number of books of elementary religious instruction, devotional books, and the *Protestantischer Volkskalender*. The present (1902) number of ministers in the Association is about one hundred, some of them having charge of two or more congregations; and the number of members in the congregations is estimated by the secretary of the *Central Behörde* to be about 20,000.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA, THE.

A Church organized October 15, 1840, when six German ministers doing missionary work in Missouri and Illinois met at Gravois Settlement, Mo., and formed the 'German Evangelical Association of the West.' Most of its early ministers had been ordained in the Evangelical Church of Prussia, some had been sent out by the Basel and other missionary societies, and a large number of the members of their congregations had been attached to the United Evangelical Church in their native land. Other Evangelical unions were organized in other parts of the country, and in time were united with this one; the 'German Evangelical Church Association of Ohio' in 1858, the 'German United Evangelical Synod of the East' in 1860, and the 'Evangelical Synod of the Northwest' and the 'United Evangelical Synod of the East' in 1872. As these unions were effected the name of the Church was changed to 'Evangelical Synod of the West' in 1866, and the 'German Evangelical Synod of North America' in 1877. The doctrinal position of the Church, as defined in the declaration in its constitution (section 2), is that it "considers itself a part of the Holy Christian Church, and as such does acknowledge the Holy Scriptures of the Old and New Testaments as the only true and infallible guide of faith and life, and accepts the interpretation of the Holy Scriptures given in the symbolical books of the Lutheran and Reformed churches in so far as they agree. In all points of difference the Evangelical Church refers to and abides by the words of the Holy Scriptures, availing itself of that liberty of conscience which, as a component part of the basis of man's ultimate responsibility to God Himself, is the inalienable privilege of every believer." The chief governing body is the General Synod, which meets every four years, and is composed of pastoral, lay, and teacher delegates, chosen by the district meetings. The Church is divided into seventeen districts, which have charge of local affairs, with officers responsible to the General Synod or its president. The work of home missions, carried on under supervision of the various district boards and the General Board for Home Missions, and aided by the Church Extension Fund, covers ninety-five fields, and is supported at an annual expenditure of from \$18,000 to \$22,000. The foreign-mission work is under the charge of a separate board, and includes, in the Central Province of India, 4 principal stations, 27 minor stations, 23 schools, and an asylum for lepers, with 4291 Church members and 1137 pupils, and 373 orphans cared for. The mission employs 107 persons, and the expenditure upon it in 1900-01 was \$25,494. The

institutions of learning comprise the *Proseminar*, at Elmhurst, Ill., and Eden Theological Seminary, Saint Louis, Mo., which provide courses of four years for teachers and seven years for theological students. The charitable institutions are: Six orphan homes, five deaconesses' homes, an emigrant mission at Baltimore, Md., provision for superannuated ministers and for widows and orphans of deceased ministers and teachers, hospitals, etc. In 1900-01 the synod had 922 ministers, 1153 congregations, 203,574 communicants, 10,144 teachers and 100,177 scholars in Sunday schools, 486 parochial schools, and aggregate annual contributions for the propagation of the Gospel of about \$95,660. Provision for supplying the Church with its own literature is made at Eden Publishing House, Saint Louis, Mo. Until recently the literature has been all in German. To meet the rapid Anglicization of the children of the Church, the publication of periodicals and the preparation of books in English has been entered upon. Among the books in English already published are a large hymnal, Sunday-school hymns, catechisms, question-books, text-books, and elementary works. The periodicals of the synod are: *Der Friedensbote* (weekly); *Der Deutsche Missionsfreund* (monthly); *Magazin für evangelische Theologie und Kirche* (bi-monthly); *The Messenger of Peace* (monthly); *Evangelical Companion* (monthly); and children's and Sunday-school periodicals—all published at Saint Louis, Mo.

Consult: Schory, *Geschichte der deutschen evangelischen Synode von Nord-Amerika* (Saint Louis, 1889); Behrendt, *Die Heidenmission der deutschen evangelischen Synode von Nord-Amerika* (Saint Louis, 1901); Hermann Baltzer, *Adolf Baltzer, Ein Lebensbild aus der deutschen evangelischen Kirche Nord-Amerikas*; the *Festschrift zur Erinnerung an das goldene Jubiläum des evangelischen Prediger-Seminars, 1850-1890*, has historical value.

GERMANIA. The general name under which the Romans designated a great part of modern Germany, and, in addition, two districts, respectively, in the east and in the extreme north of Gaul, called Germania Superior (or Prima) and Germania Inferior (Secunda). Germany proper was styled Germania Magna, Germania Trans-Rhenana ('beyond the Rhine'), or Germania Barbara. The boundaries of the region comprehended under these designations were the Rhine and Celtic Gaul on the west; on the east, the Vistula and the Carpathian Mountains; on the south, the Danube; and on the north, the sea, which was divided by the Cimbric Chersonesus (Jutland) into the German and the Suevic (Baltic) seas. The first occurrence in connection with the history of the people of Germania with which we are acquainted was the appearance of warlike tribes of Cimbri and Teutones in the present Styria, where they defeated the Roman consul Papirius, in the year B.C. 113. Eleven years later they again came into collision with the Roman arms, but the result was their signal defeat by Marius. The names Germani and Germania do not seem to have been appellations in use among the people themselves, and it is probable that the Romans borrowed them from the Gauls, in whose language the word *gairm*, a loud cry, may possibly have served to designate this people, whose habit it was to accompany

their attack on an enemy by loud cries. The Tungri were the first German people that crossed the Rhine, but other tribes soon followed; and when Julius Cæsar opened his Gallic campaigns, B.C. 58, he found the Germanic nations of the Triboci, Nemetes, and Vangiones in possession of the districts lying between the left bank of the Rhine and the Vosges, while he even encountered a rival pretender to the supremacy of Gaul in the person of Ariovistus, the leader of the Suevic tribe of the Marcomanni. The Germanic peoples west of the Rhine were reduced to subjection with the rest of Gaul, while the Tencteri and Usipetes, who had invaded Belgium, were driven, together with the Sicambri, across the Rhine to their former settlements by the victorious general, who for the first time (B.C. 55) led a Roman army into Trans-Rhenic Germany. The quiet which Cæsar's victories had secured in the Rhenish districts was again so seriously disturbed by the Usipetes and several of the neighboring tribes in the year B.C. 16, that Augustus, who had hastened to Gaul on the outbreak of disturbances, saw that stringent measures must be adopted to keep the Germans in check, and sent Drusus at the head of eight legions into Germany. The first step of the Roman general was to dig a canal ('fossa Drusiana') from the Rhine to the Yssel, by which the Roman galleys could sail from the heart of the continent to the ocean; and so successful were his measures, that in the course of four campaigns he had carried the Roman arms as far as the Albis (Elbe), subdued the Frisii, Batavi, and Chauici in the north, and defeated the Catti of the Menus (Main) districts. Drusus, who died B.C. 9, began the series of forts, bridges, and roads which were completed and extended under succeeding commanders. The attempt made by Varus, under the direction of Augustus, to introduce the Roman provincial forms of administration into Germany, brought, however, a sudden check to the advance and consolidation of Roman power; for the tribes of Central Germany, indignant at this attempted subversion of their national institutions, ranged themselves under the leadership of Arminius, a chief of the Cherusci, who organized a general revolt. The result of this movement was the destruction, in the *Salutis Teutoburgiensis*, in A.D. 9, of the three legions commanded by Varus, and the subsequent loss of all the Roman possessions between the Weser and the Rhine. The news of this disastrous event threw the city of Rome into consternation. Germanicus, who was sent forth in A.D. 14 to restore Roman supremacy, would probably have again wholly subjugated the Germanic tribes had he not been recalled by Tiberius in the midst of his victories. From this time forth the Romans ceased their attempts to conquer Germany, and contented themselves with repelling the incursions which the tribes made on their frontiers, and endeavoring by their influence to foster the intestine disturbances which were perpetually generated through the ambition and jealousy of rival leaders, such as Arminius, Marbadius, and the Goth Catualda. After the murder of Arminius by his own people, the power of the Cherusci declined, while the Longobards and Catti began to assert a recognized preponderance among the neighboring tribes. Occasional encounters took place between the people of Central Germany and the legions who guarded the well-protected Roman boundary-line, which extended from the

Rhine to the Taunus, and from thence to the Danube; and from time to time the Batavi and other warlike tribes of the north and northwest, who, like them, had been brought into partial dependence on the Romans, rose in formidable insurrection; but after Trajan had restored order and strengthened the forts, peace remained undisturbed in the north, till the beginning of the third century, while, with the exception of the sanguinary war of the Marcomanni and Quadi under Marcus Aurelius, which began about the year A.D. 166, there was a similar absence of hostilities in the south. But with the third century the tide of war turned, and the Romans were now compelled to defend their own empire from the inroads of the numerous Germanic tribes, foremost among whom stood the powerful confederacies of the Alemanni and Franks. In their track followed, during the next two centuries, successive hordes of the Vandals, Suevi, Heruli, Goths, and Longobards, who soon formed for themselves States and principalities on the ruins of the old Roman provinces. From this period almost down to the establishment of the Western Empire in the person of Charlemagne, the history of Germany is a blank; but the condition of the country when he entered on the possession of his German patrimony showed that since the retirement of the Romans the lesser tribes had become gradually absorbed in the larger, for on his accession the land was held by a few great nations only, as the Saxons, Frisians, Franks, Swabians, and Bavarians, whose leaders exercised sovereign power within their own territories, and, in return for military services, parceled out their lands to their followers.

The knowledge which we possess of the habits and government of the ancient Germans is principally derived from the *Commentaries* of Cæsar and the *Germania* of Tacitus. According to the Roman historians, the Germans were a people of high stature, fair complexion, and red or yellow hair, endowed with great bodily strength, and distinguished for an indomitable love of liberty. The men delighted in active exercises and the perils of war, and the women, whose chastity was without reproach, were held in high esteem. Each master of a family had absolute power over those of his household. Their habitations were generally separate, and surrounded by their several stalls and garners; for although there were villages whose inhabitants made common use of the fields and woods surrounding them, the Germans seem to have preferred isolated and detached dwellings to aggregate settlements. Towns and cities they long regarded with aversion, as inimical to personal freedom. In regard to their political organization, it would appear that several villages formed a 'hundred,' several hundreds one 'gau,' and several gaus one 'tribe.' In each tribe the people were divided into four classes—nobles, freemen, freedmen or vassals, and slaves. The King or chief was elected from among the nobles; but his power was very limited, and the government of the several tribes seems to have been democratic rather than monarchical.

The religion of the Germans, which is shrouded in great obscurity, was based upon myths of the creation of the world, and the existence of gods having the forms and attributes of a perfect humanity. The different tribes had all their special gods or demigods, who were often their own leaders or chiefs, to whom the attributes of the god

to whose worship they were most partial were ascribed. It is generally said that the Germans had neither temples nor statues. Both Cæsar and Tacitus expressly affirm this, but it cannot be regarded as literally true, for Tacitus himself mentions a temple of a goddess Tanfana among the Marsians; and at a later period we find Christian missionaries exhorting the Germans to change their pagan temples into Christian churches, while we also read of the destruction of pagan idols. Nevertheless, the religion of the Germans was mainly carried on in the open air in groves and forests, and on heaths and mountains. Although a priestly order also existed among the Germans, yet each master of a household performed religious services for himself and his family within his own homestead. A knowledge of the will of the gods and the events of the future was sought by divination, from observations of the flight of birds, the rushing of waters, and other similar signs, in the interpretation of which women were thought to be especially skilled. Belief in a future life, and in an abode after death for those who had deserved well in this life, was cherished among the Germanic races, who had a strong faith in retributive justice, whose sway they believed would be extended over the gods by involving them in a universal annihilating conflict as the punishment of their evil deeds, after which a new world was to arise, guarded by a pure and perfect race of gods. In addition to the higher deities, the Germans peopled every portion of space with a class of subordinate beings who pervaded the earth, air, and water, in the shape of elves, nixies, kobolds, dwarfs, and giants; while Norns and Valkyrs stood apart from either grade of spiritual existence as the representatives of destiny like the Moiræ and Parcæ of the Greeks and Romans. Consult: Tacitus, *Germania*; Cæsar, *De Bello Gallico*, book vi.; Kingsley, *The Roman and the Teuton* (London, 1887).

GERMANICUS CÆSAR (B.C. 15-A.D. 19). A distinguished Roman general. He was the son of Nero Claudius Drusus and Antonia, daughter of Marcus Antonius, and niece of Augustus, and was born in September, B.C. 15. He was adopted in the year A.D. 4 by Tiberius, whom he accompanied in the war waged against the Pannonians and Dalmatians, for the purpose of securing the German frontiers after the defeat of Varus. After having been consul in A.D. 12, he was appointed in the following year to the command of the eight legions on the Rhine. On the death of Augustus, in A.D. 14, the soldiers revolted, demanding higher pay and a shorter period of service. Germanicus hastened from Gaul (where he happened to be at the time) to remind them of their duty. The soldiers urged him to seize upon the supreme power, but he refused. He, however, granted their demands, though his colleague, A. Cæcina, secretly massacred the ring-leaders at night. Germanicus now led the legions over the Rhine below Wesel, attacked the Marsi during a nocturnal festival, and destroyed their celebrated temple of Tanfana. In A.D. 15 he made a second inroad into Germany. Proceeding from Metz into the country of the Catti, he destroyed their chief town of Mattium (Maden, near Gudensberg). On his return, his assistance was implored by the ambassadors of Segestes (always a firm ally of the Romans), who was besieged by his son-in-law, Arminius, the con-

queror of Varus. This was at once given, and Thusnelda, the heroic wife of Arminius, fell into the hands of the Roman general. Arminius, burning with anger and shame, now roused the Cherusci and all the neighboring tribes to war. Germanicus, in consequence, commenced a third campaign. He separated his army into three divisions. The main body of the infantry was led by Cæcina through the country of the Bructeri, the cavalry under another general marched through Friesland, while Germanicus himself sailed with a fleet through the Zuyder-Zee into the German Ocean, and proceeded up the River Ems, where he joined the others. The united divisions now laid waste the country in the neighborhood of the Teutoburg Forest, and gathering up the bones of Varus and his legions, which had lain there for six years, buried them with solemn funeral honors. A victory gained by Arminius induced Germanicus to make a hasty retreat, during which he lost part of his fleet in a tempest. Cæcina, who retreated by land, sustained severe losses at the hands of the pursuing Germans. Before the fleet of 1000 vessels, which Germanicus had built at Batavia, was equipped, he was recalled over the Rhine in A.D. 16 by news of the beleaguering of the recently acquired fortress of Aliso, on the Lippe. The Germans were repulsed, and the funeral mound in the Teutoburg Forest, which they had thrown down, was again erected. Germanicus now sailed with his fleet again into the Ems, pressed forward to the Weser, which he crossed, and completely overthrew Arminius in two battles. Nevertheless, he resolved to return, and on his way again lost the greater part of his fleet in a violent storm. In order to prevent this mishap from giving courage to the Germans, he once more, in the same year, marched into the country of the Marsi, and dispatched his lieutenant Silius against the Catti. Tiberius, jealous of his glory, recalled him, and feigning good-will, bestowed upon him the honor of a triumph, in which Thusnelda appeared among the captives. To rid himself of Germanicus, whose popularity seemed to render him dangerous, Tiberius sent him, in A.D. 17, with extensive authority, to settle affairs in the East, at the same time appointing Piso Viceroy of Syria, who everywhere counteracted the influence of Germanicus. Germanicus died at Epidaphnæ, near Antioch, October 10, A.D. 19, probably of poison. He was deeply lamented by both the inhabitants of the provinces and the citizens of Rome, whither his ashes were conveyed, and deposited by his wife, Agrippina, in the mausoleum of Augustus. Agrippina herself and two of her sons were put to death by order of Tiberius; her third son, Gaius (afterwards the Emperor Caligula), was spared. Of the three daughters who survived their father, Agrippina became as remarkable for vices as her mother had been for her virtues. Besides his splendid generalship, Germanicus was conspicuous for his magnanimity, benevolence, finely cultured understanding, and personal purity of life. He wrote several works of a rhetorical character, which have been lost; but of his poetical works, we possess an epigram, a version of the *Phænomena* of Aratus, and fragments of a work of the same character, entitled *Diosemeia*, or *Prognostica*, compiled from Greek sources. Germanicus's literary remains were first published at Bologna, in 1474. The latest edition is that of Breysig (Berlin, 1867).

GERMANIUM (Neo-Lat., from Lat. *Germania*, Germany). A metallic chemical element discovered by Winkler in 1886 in the mineral argyrodite, of which it forms about 9.6 per cent. Its properties had been previously predicted, from the periodic law (q.v.), by the Russian chemist Mendelëeff, who gave it the provisional name of *eka-silicon*. It is found in small quantities in various minerals, from which it is obtained as a sulphide, and then reduced to the metallic condition by heating in hydrogen.

Germanium (symbol, Ge; atomic weight, 72.3) is a grayish-white lustrous brittle metal that melts at about 900° C., and has a specific gravity of 5.5. It combines with oxygen to form a germanic oxide and a germanious oxide, and with other elements to form a series of germanic and germanious salts.

GERMAN IVY, *Herniaria glabra*. A clinging plant often seen in parlor or garden culture, indigenous to Southern Africa. It bears clusters of yellow flowers, and the stems grow eight or ten feet high. It is well adapted to window culture. See **IVY**.

GERMAN LANGUAGE. A sister language of English and Frisian, these three together constituting what is generally called the 'West-Germanic' or 'West-Teutonic' division of the Germanic group of the Indo-Germanic languages. German as a general term includes both the High and Low German dialects. But High German being the literary language and the language of the educated classes, the term German is frequently used as equivalent to High German.

AREA OF THE GERMAN LANGUAGE. The area of the German language is not identical either with that of the German stock or that of the German Empire. Thus, in the larger part of Eastern Germany (the country east of the rivers Elbe and Saale), the German-speaking population is, as far as the race is concerned, largely of Slavic, or, in some cases, Baltic origin. In this region the boundary between Slavs and Germans has been subjected in course of time to various changes. At the earliest historic period (at the time when Tacitus wrote his *Germania*) Eastern Germany was held by Germanic tribes. Later on, probably in the sixth century, the inroad of the Slavs began, who by the middle of the eighth century had succeeded in crowding the Germans back even beyond the left banks of the Elbe and Saale. From the time of Charlemagne to the present date the Slavonization of the East has been followed by its Germanization, or rather re-Germanization. Except among the Wends or Lusatian-Sorbs around Cobus in Brandenburg, and the Lithuanians in the northeastern corner of East Prussia, German is now spoken throughout those parts of Prussia which constituted the kingdom at the time of the accession of Frederick the Great (1740). It is only by many of the geographical names (including such familiar names as Pomerania, Silesia, Berlin, Danzig, Dresden, Leipzig, etc.) that the former extent of the Slavic settlements in Germany may still be traced. Toward the end of the eighteenth century, however, when in 1772, 1793, and 1795—under Frederick the Great, and his successor, Frederick William II.—the Kingdom of Poland was divided between Russia, Austria, and Prussia, a new lot of Slavic inhabitants, and this time mostly of Polish extraction, fell to Prussia.

(which already possessed a large Polish population in Silesia) as its share in the partition; with the result that at present Polish is the mother tongue of about one-tenth of the whole population of Prussia.

If we turn to other parts of Germany, we meet with Danes in the northern portion of the Prussian District of Schleswig, which until 1864 belonged to Denmark, and with Frenchmen in the western portion of the Reichsland of Alsace-Lorraine, which was retaken from France after the war of 1870-71.

Of the 56,000,000 inhabitants of the German Empire returned in the census of 1900, upward of 4,200,000 were entered as speaking foreign languages. Of this number, nearly 3,330,000 were Poles (including Kassubs and Mazurs), 107,000 Czechs and Moravians, 93,000 Wends, 106,000 Lithuanians, nearly 224,000 French, 141,000 Danes, 80,000 Dutch, 66,000 Italians, and 20,000 Frisians.

German is the vernacular of almost the whole of Luxemburg, of the greater part of Switzerland, and of portions of Austria-Hungary. In Luxemburg the German-speaking population in 1900 amounted to 221,000 (out of a total population of 236,500), in Switzerland to 2,319,000 (or 69 per cent. of 3,325,000), in Cisleithan Austria to 9,171,000 (or 36 per cent. of 25,633,100), in Hungary to 2,135,181 (or 12 per cent. of 19,254,559).

Russia, too, has a German element of some importance. There are many German settlements in the Southern Russian provinces, one of them, founded in 1768 (between Kamyshin and Volsk on the Volga), consisting of 173 villages, and covering an area not much smaller than that of the Kingdom of Saxony. German has, moreover, from the thirteenth century on been the language of the educated classes in the Baltic provinces of the Russian Empire (i.e. in Courland, Livonia, and Esthonia). As regards the numerical strength of the German element, the latest accessible statistics are those of 1883, in which they are reckoned as forming 1.5 per cent. of the population of European Russia. If we apply this ratio to the census of 1897, when the population of European Russia was 105,542,033, the number of German inhabitants would amount to about 1,500,000.

Outside of Europe the largest number of Germans is found in the United States, whose German-born population amounts to about 3,000,000. For the city of New York alone the census of 1900 gives the German-born population as 322,343. In addition to these we have the 'Pennsylvania Germans' or 'Pennsylvania Dutch,' whose dialect is still the vernacular of many districts in the State of Pennsylvania. An exact count of the Pennsylvania Germans has apparently never been made. Their number is by no means identical with that of the Pennsylvanians of German descent. There is a large German population in Brazil and Argentina, as well as in Canada and other parts of the British Empire, and there are many Germans scattered in all parts of the world.

Altogether German is nowadays spoken by about 75,000,000 people. German thus ranks third in number among the four leading languages of Europe, the first being English, the second Russian, and the fourth French.

Our figures for German do not include the

Dutch language. For although Dutch, from a linguistic point of view, represents the Low German branch of the Franconian dialect, it has developed a literary language of its own, and, therefore, is to be regarded as a separate language. In like manner Flemish is left out of consideration.

On distribution, consult: Kiepert, *Uebersichtskarte der Verbreitung der Deutschen in Europa* (Berlin, 1887); Nabert, *Karte der Verbreitung der Deutschen in Europa* (Glogau, 1891, in 8 sections); id., *Das deutsche Sprachgebiet in Europa* (Stuttgart, 1893); Hübner, *Geographisch-statistische Tabellen aller Länder der Erde* (51st edition, Frankfurt, 1902).

THE GERMAN DIALECTS. From the earliest times German has been divided into several dialects. Of course, these dialects must not be regarded as representing a corrupted form of the written language. On the contrary, they are—in Germany, as elsewhere—the natural and genuine offshoots of the language, whereas the written language represents one of their number artificially restrained in its natural development. It is only by drawing constantly on the dialectic vocabulary and by adapting itself more or less to the grammar of the living dialects that the written language succeeds in sustaining its vitality.

Except in the territory formerly held by the Slavs, the distribution of the German dialects has within the last thousand years undergone few changes, and a map of the Old High German dialects may be brought up to date with comparatively slight alterations. There is little doubt that dialectic differences were originally the outcome of ethnographical divisions of the German tribes, and since as early as the third century A.D. we meet with tribal unions, such as the Alemanni, the Franks, and the Saxons, we may date back to this time the origin of the corresponding dialects. At first the differences between these dialects were slight; but in the course of several centuries they became more pronounced.

One event in the history of the German language is in this respect of special importance, the second or High German shifting of consonants. This second shifting is similar to the first, which had occurred several centuries earlier; so similar, indeed, that the formula known as 'Grimm's law' (q.v.) applies, with slight modifications, to the second as well as to the first shifting. There are, however, some important differences. First: While by the first shifting three classes of sounds (the *tenues*, *mediæ*, and *aspirates*) were concerned, the second is limited to only two classes, the *tenues* *p*, *t*, *k*, and the *mediæ* *b*, *d*, *g*. Second: While the first shifting is essentially the same in all Germanic languages, the second or High German shifting varies from dialect to dialect. In some of the dialects the shifting of the *tenues* and *mediæ* is almost as systematic as in the case of the first shifting, whereas in others it is confined to only a few among the six consonants concerned.

The second shifting began in the seventh century A.D. It started from the Alps in the most southern region of the German territory, and spread with unbroken force over the Alemannic and Bavarian dialects. It then advanced, with

diminishing energy, farther north into the Franconian territory, making its entry from the southeast, and progressing from there along the Main and Rhine rivers. By the time it had reached Cologne most of its energy was spent, and soon afterwards, after crossing the 51st degree of latitude, it came to a stop entirely, without reaching the northern Franconian or the Saxon dialects.

As a result of the second shifting we have a clearly defined division of the German dialects into three main groups (the second having various subdivisions), according to the degree in which they have been affected by the shifting.

I. *Upper German*.—The dialects in which the second shifting has been carried out to its full extent. They are divided into (1) *Alemannic* (west of the River Lech), and (2) *Bavarian* (east of the Lech). The Alemannic is again subdivided into (a) South Alemannic in Switzerland and in the southern districts of Baden and Württemberg, (b) Alsatian, (c) Swabian. The subdivisions of the Bavarian are: (a) Upper Bavarian and Austrian, which constitute the main body of the Bavarian dialect; (b) the dialect of the Upper Palatinate (*Oberpfalz*) in Northern Bavaria, west of the Bohemian Forest. It may be noted that the German dialects spoken in Hungary (especially in the Transylvanian Saxon Land) belong to the Midland, not to the Upper German type. It may be inferred from their dialect that these Germans are immigrants from Western Germany, and that most of them came from the lower Rhine.

II. *Midland German*.—The dialects which have been affected by the shifting in a lesser degree. Among these are:

(1) *East Franconian* (the dialect of the old Duchy of Franconia Orientalis), which is of special interest, as it exhibits the shifting in the form in which it has found its way into the literary language of Modern German. The tenuis *t* and *p* are shifted in Modern German in two different ways, to *z* and *pf*, respectively, both at the beginning of a word and after consonants (e.g. Engl. *to* = Ger. *zu*, Engl. *heart* = Ger. *Herz*, Engl. *penny* = Ger. *Pfennig*, Engl. *stump* = Ger. *Stumpf*), and to *zz* (= Mod. Ger. *ss*) and *ff* after vowels (e.g. Engl. *eat* = Ger. *essen*, Engl. *ape* = Ger. *Affe*). The tenuis *k* is shifted to *ch* after vowels (e.g. Engl. *make* = Ger. *machen*), while it remains unchanged when initial (e.g. Engl. *can* = Ger. *kann*). The dental media *d* is always shifted to *t* (e.g. Engl. *deal* = Ger. *Teil*, Engl. *side* = Ger. *Seite*), whereas the labial and the guttural mediae are not affected by the shifting. North of the East Franconian we find:

(2) The *Thuringian* dialect, which by the colonization of the former Slavic territory has spread to the east over what is now the Kingdom of Saxony, and the Prussian Province of Silesia, giving rise there to the Upper Saxon or Misnian (*Meissnisch*) and to the Silesian dialects. At an earlier date Thuringian apparently differed but little from East Franconian. But in course of time the differences have become more pronounced, especially so if we compare the Upper Saxon and Silesian with the Franconian dialects. Thus it is characteristic of the Saxon dialect that it has almost lost the distinction between voiced and voiceless consonants, so that at present the mediae *b*, *d*, *g*, are not distinguished in pronun-

ciation from the tenuis *k*, *t*, *p*. West of Thuringian and East Franconian there follows:

(3) *Rheno-Franconian* (the dialects of the former Franconia Rhenensis, of the Palatinate of the Rhine, and of the larger part of Hesse). It is chiefly from the dialect of the Palatinate that the Pennsylvania German in America has developed. The shifting differs from that of East Franconian and Modern German, especially in that initial *p* and initial *d* have not been shifted (e.g. Engl. *pipe* = Penn. Ger. *paife*, Modern German *Pfeife*, Engl. *deal* = Penn. Ger. *dcl*, Modern German *Teil*). Still more limited is the shifting in

(4) *Middle-Franconian* (the dialects spoken along the banks of the Moselle and of the Rhine from Coblenz to Düsseldorf). Middle Franconian is characterized by the fact that *t* is kept—in accordance with Low German—in a few pronominal forms, while otherwise it is shifted to *z* or *ss*, as in High German. We find, therefore, e.g. in Cologne *et*, *dat*, *wat* = Engl. *it*, *that*, *what*; but *zo* = Modern German *zu*, Engl. *to*, and *wiess* = Modern German *weiss*, Engl. *white*.

The Upper German and the Midland German dialects are both comprehended under the term 'High German,' in distinction from the remaining group, the 'Low German.'

III. *Low German*.—The dialects which have not been reached by the second shifting. These include not only the *Platt* or *Platt-deutsch* in Northern Germany, but also the dialects of Belgium and Holland (with the exception, of course, of the French and the Frisian districts of the Low Countries). We have two divisions:

(1) *Low Franconian*, or the German dialects in the northeastern corner of Rhenish Prussia, and the adjoining Flemish and Dutch dialects in Belgium and Holland.

(2) *Low Saxon*, or the Low German dialects of Westphalia, Oldenburg, Hanover, Brunswick, Holstein, Mecklenburg, and the Prussian provinces of Brandenburg, Pomerania, and East and West Prussia. It is to be noted that east of the Elbe, in the former Slavic territory, the Low German has (except in Holstein, Mecklenburg, and Pomerania) generally undergone a mixture with Midland German dialects.

The lack of the shifting is, of course, merely a negative criterion, and if we comprehend Low Franconian and Low Saxon under one group, we ought not to overlook the fact that the former was at an earlier date more closely connected with the Franconian dialects in Midland Germany. Its vocalism is, in fact, to this day nearer to that of High German and of the Midland German dialects than to that of the Low Saxon.

Low Saxon is subdivided into two distinct dialects, Northern Saxon (or Low Saxon proper) and Westphalian; the latter including in addition to the Prussian Province of Westphalia, also the northern portions of Waldeck and Hesse, the whole of Lippe, and part of Southern Hanover (e.g. Osnabrück). The principal difference between the two lies in the fact that in the Westphalian dialects we find a rather complicated vocalism, and generally an abundance of diphthongs, whereas Northern Saxon has few diphthongs, and altogether a very simple vowel-system.

For a complete list of grammatical treatises and dictionaries on the German dialects down to

1890, consult Mentz, *Bibliographie der deutschen Mundartenforschung* (Leipzig, 1892); for a briefer list, Kauffmann, in Paul, *Grundriss der germanischen Philologie*, i. (2d ed., Strassburg, 1901). As to poems, fiction, etc., written in these dialects, there is no later attempt at a bibliography than the one made by Carl H. Herrmann, in his *Bibliotheca Germanica* (Halle, 1878). Collections of specimens from the various dialects are: Firmenich's *Germaniens Völkerstimmen* (3 vols. and appendix, Berlin, 1841-66), very complete and interesting; and Welcker's *Dialektgedichte* (2d ed., Leipzig, 1899), a smaller anthology.

A dialect map of the earlier periods is found in Piper's *Verbreitung der deutschen Dialekte bis um das Jahr 1300* (Lahr, 1880). For the modern dialects the maps by Bremer, in Brockhaus's *Konversations-Lexikon*, new 14th ed., vol. iv. (Leipzig, 1901; art. "Deutsche Mundarten"), and by M. Maurimann, in Meyer's *Konversations-Lexikon*, vol. iv., 5th ed. (Leipzig, 1894; art. "Deutsche Sprache"), will be found the most serviceable. A comprehensive dialect map of Germany was undertaken many years ago by G. Wenker. After the first number had appeared (Strassburg, 1881; now out of print) the plan of the work was changed, so as to give a separate map to the dialectic forms of a single word. In its present form this *Sprachatlas* will probably not be published, but the single maps are deposited in manuscript in the Royal Library of Berlin. By January, 1902, the number of finished sheets (each three forming one map) amounted to no less than 610. This work has originated a new method for the cartography of living dialects. The dialect-map in Paul, *Grundriss der germanischen Philologie* (2d ed., Strassburg, 1901), should also be consulted.

OLD AND MIDDLE HIGH GERMAN. In the history of High German three main periods are distinguished—Old High German, from the eighth century to about 1100; Middle High German, from about 1100 to 1500; Modern German, from about 1500 to the present time. These periods apply both to dialects and to the literary language. It is, however, only in Modern German that the literary language has become distinctly separated from the dialects. In Middle High German we have only the beginnings of a literary idiom, while in Old High German there is no trace of a common written language in distinction from the dialects. The dates given are meant only to fix roughly the beginning and the end of each period. There is, in fact, no distinct break in the development of the High German language, but rather a gradual transition from one period to the other.

Old High German is characterized especially by the preservation of full vowels in its inflectional endings, e.g. *nimu*, *neman*, *tagum*, *hano*, *hanin*, *zungân*.

In Middle High German these vowels are uniformly weakened to *e*, so that, e.g. the above words appear in the following form: *nime*, *nemen*, *tagen*, *hane*, *hanen*, *zungen*. Traces of this weakening appear first in the Franconian dialect, and become more general toward the end of the eleventh century. Many instances of full vowels, however, in inflectional endings are still found in the Middle High German literature of the early twelfth century, so that the period from about

1080 to 1150 may be regarded as a transition period from Old High German to Middle High German.

There is, as has been stated, in Middle High German no generally accepted literary language as one is found in the written language of Modern German. Thus, Heinrich von Veldeke's language points as clearly to the Low Franconian dialect as does Hartmann von Aue's to the Swabian. But, on the other hand, in the case of Wolfram von Eschenbach, who was born in the Franconian portion of Bavaria, it is difficult to determine how far he used his own dialect and how far he gave the preference to the Swabian. Most of the leading poets of this period lived in that part of Germany where the 'Upper German' dialects were found, especially in Alsace, Swabia, Bavaria, and Austria. Hence it is only natural that there should have developed in Southern Germany a tendency to a certain uniformity in the written language as to grammatical forms and literary expression. This does not mean that the Middle High German poems belonging to this group entirely lost their local coloring; it means only that their language rose to a certain extent above the level of the dialects, in that certain dialectic peculiarities were avoided, while others were apparently regarded as unobjectionable. The fact, in any case, remains that in the works of Hartmann von Aue, Gottfried von Strassburg, Walther von der Vogelweide, and also in the *Nibelungenlied* and *Gudrun*, we find essentially the same language. If we were to identify this language with a single dialect we should probably call it Swabian, though it has been recently proved that it omits several of the salient features of the Swabian dialect of this period. It must, therefore, be regarded as the literary form of the Swabian dialect, risen to the rank of the literary language of Southern Germany generally, though it appears with slight variations in the different provinces.

The period of 'classical' Middle High German—in other words, the time of the hegemony of literary Swabian—comes to an end in the latter half of the thirteenth century. From about 1250 we have a transition period, during which the leadership is gradually passing to the Midland German dialects.

Convenient helps to the study of Old High German are Braune, *Abriss der althochdeutschen Grammatik* (3d ed., Halle, 1900), or Wright, *Old High German Primer* (Oxford, 1888), and Braune, *Althochdeutsches Lesebuch* (5th ed., Halle, 1902). The most complete Old High German dictionary is Graff, *Althochdeutscher Sprachschatz* (7 vols., Berlin, 1834-46). This excellent work is unfortunately arranged according to roots, but the seventh volume contains an alphabetical index by Massmann.

There are numerous Middle High German grammars and readers, e.g. Wright, *Middle High German Primer* (2d ed., Oxford, 1899); Paul, *Mittelhochdeutsche Grammatik* (5th ed., Halle, 1900); Michels, *Mittelhochdeutsches Elementarbuch* (Heidelberg, 1900); Weinhold, *Mittelhochdeutsche Grammatik* (2d ed., Paderborn, 1883); id., *Mittelhochdeutsches Lesebuch*. The standard dictionaries of Middle High German are Benecke, *Mittelhochdeutsches Wörterbuch*, edited by Müller and Zarncke (3 vols., Leipzig, 1854-66); Lexer, *Mittelhochdeutsches Handwörterbuch* (3 vols., Leipzig, 1872-78); id.,

Mittelhochdeutsches Taschenwörterbuch (6th ed., Leipzig, 1901).

MODERN GERMAN. It is characteristic of the literary language of Modern German that it is based on the Midland German rather than on the Upper German dialects. The points in which it differs from the Middle High German 'Literary Swabian' are especially these: (1) the M. H. G. long vowels *i*, *u*, *û* (the latter spelled *iu* in M. H. G.) have been changed to the diphthongs *ei*, *au*, *eu*; e.g. M. H. G. *min* = M. Ger. *mein*, M. H. G. *hûs* = M. Ger. *Haus*, M. H. G. *hiute* = M. Ger. *heute*; (2) the M. H. G. diphthongs *ie*, *uo*, *üe*, have been changed to the long vowels, *i* (spelled *ie*), *u*, *ü*; e.g. M. H. G. *spiegel* = M. Ger. *Spiegel* (i.e. *spigel*), M. H. G. *muot* = M. Ger. *Mut*, M. H. G. *behüeten* = M. Ger. *behüten*; (3) the M. H. G. short vowels *a*, *e*, *i*, *o*, *û*, have been lengthened in stressed 'open' syllables (i.e., in stressed syllables ending in a consonant); e.g. M.H.G. *name* = M. Ger. *Name* (pron. *nâme*), M. H. G. *nemen* = M. Ger. *nehmen*, M. H. G. *gebliben* = M. Ger. *geblieben*, M. H. G. *oben* = M. Ger. *oben* (pron. *öben*), M. H. G. *über* = M. Ger. *über* (pron. *über*); (4) initial *s* has passed into *ß* (spelled *sch*) before *l*, *m*, *n*, *w*; e.g. M. H. G. *slagen* = M. Ger. *schlagen*, M. H. G. *smenze* = M. Ger. *Schmerz*, M. H. G. *sniden* = M. Ger. *schneiden*, M. H. G. *swære* = M. Ger. *schwer*; (5) the difference in the strong preterit between the stem-vowel of the singular and that of the plural is generally discarded; e.g. M. H. G. *ich bleip*, *wir bliben* = M. Ger. *ich blieb*, *wir blieben*, M. H. G. *ich half*, *wir hulfen* = M. Ger. *ich half*, *wir halfen*. There are in addition to these differences many others, but those mentioned stand first in importance.

In almost every case we are able to trace the origin and the spread of these changes in the Midland German dialects for a long time before they were incorporated in the literary language. Of special interest is the diphthongization of Middle High German *i*, *u*, *û*, in that this was originally an Austro-Bavarian peculiarity, which spread from Bavaria and Austria over East Franconia, and from here over the neighboring Midland German districts.

The history of the Modern German written language may be traced back to the middle of the fourteenth century, when, under the Emperor Louis the Bavarian (1314-47), the Imperial Chancery adopted German instead of Latin in its official documents. There existed at this time in the different parts of Germany several *Kanzleisprachen*, or official languages. The mutual intercourse between the various centres furnished the basis for greater uniformity, and it is only natural that the language of the Imperial Chancery should have gained a predominating influence. The dialect adopted by the Imperial Chancery was essentially that of the Imperial Court, which at the time of the Luxemburg emperors (1347-1437) was stationed at Prague. It was accordingly a dialect whose consonantism was East Franconian, and in which the Middle High German long vowels *i*, *u*, *û* had been replaced by the Austro-Bavarian diphthongs *ei*, *au*, *eu*. The adoption of this dialect by the Imperial Chancery led to its introduction, in the second half of the fifteenth century, into the chanceries of the neighboring principalities of Saxony and Thuringia. A further step was its adoption, be-

tween 1480 and 1500, by the Meissen and Saxon municipalities and courts and by the universities of Leipzig and Wittenberg. By 1500 it had become, in Saxony and Thuringia, not only the generally accepted official language, but was also largely used in private correspondence and as the written language among the educated classes.

The popular belief which ascribes to Luther the foundation of the Modern German literary language is not well founded. When, in 1522, Luther published his translation of the New Testament, he simply made use of a written language which was by this time pretty firmly established. Luther's own words bear witness to this, for he says in his *Table Talk* (ch. lxix.): "I have no particular language of my own in German, but use the common German language so that both High and Low Germans may understand me. I follow the language of the Saxon Chancery, which all the princes and kings in Germany take as their model; all the free Imperial cities and all the courts of princes write according to the Chancery of the Saxons and of our prince. Hence it is the most common German language. Emperor Maximilian and the Elector Frederick, Duke of Saxony, have thus united into one fixed language the German languages of the Roman Empire." This much is true, that Luther's translation of the Bible, his catechisms, his hymns, and his numerous pamphlets were largely instrumental in spreading this language from Midland Germany over the whole of the German Empire, and in overcoming the obstacles which for a long time militated against its acceptance as the written and literary language of all Germany. The latter result was achieved in the course of the sixteenth and seventeenth centuries, when first (between about 1550 and 1600) Northern Germany, afterwards Southern Germany, and finally Switzerland joined the movement. It is hardly before about 1750 that the literary language can be said to have received its present form.

BIBLIOGRAPHY. General works: Breul, *Handy Bibliographical Guide to the Study of German* (London, 1895); Strong and Meyer, *History of the German Language* (London, 1886); Behaghel, *Die deutsche Sprache* (2d ed., Leipzig, 1902); Pietsch, *M. Luther und die hochdeutsche Schriftsprache* (Breslau, 1883); Burdach, *Die Einigung der neuhochdeutschen Schriftsprache* (Halle, 1884); Kluge, *Von Luther bis Lessing* (3d ed., Strassburg, 1897).

Grammars: (a) Historical: Grimm's *Deutsche Grammatik* (4 vols., rev. ed., Berlin and Güttersloh, 1870-78) is rather a comparative grammar of the Teutonic languages; Wilmanns, *Deutsche Grammatik* (vols. i. and ii., 2d ed., Strassburg, 1897-99; vols. iii. and iv. have not yet appeared). (b) Practical: Blatz, *Neuhochdeutsche Grammatik* (2 vols., 3d ed., Karlsruhe, 1895-96); Sanders, *Wörterbuch der Hauptschwierigkeiten der deutschen Sprache* (24th ed., Berlin, 1892), a grammar in alphabetical order; Thomas, *A Practical German Grammar* (New York, 1895); Bierwirth, *The Elements of German* (ib., 1900); Harris, *German Lessons* (Boston, 1892).

Dictionaries: (a) Historical and etymological: Grimm, *Deutsches Wörterbuch* (Leipzig, 1854 et seq.), will consist of sixteen volumes (counted as vols. i.-xiii.), of which nine have appeared; Sanders, *Wörterbuch der deutschen*

Sprache (3 vols., Leipzig, 1860-65); the *Eränzungs-Wörterbuch der deutschen Sprache* (Berlin, 1885), by the same author, is a supplement to the preceding; Heyne, *Deutsches Wörterbuch* (3 vols., Leipzig, 1890-95); id., *Deutsches Wörterbuch, Kleine Ausgabe* (in 1 vol., ib., 1896); Kluge, *Etymologisches Wörterbuch der deutschen Sprache* (6th ed., Strassburg, 1899; an English translation of the 4th ed., London, 1891). (b) Practical: Flügel, *Universal English-German and German-English* (4th ed., 3 vols., Brunswick, 1891), and Muret, *Encyclopedic English-German and German-English Dictionary* (4 vols., Berlin, 1894-1901), are the two most comprehensive English-German dictionaries. Other recent and very useful works are: Flügel-Schmidt-Tanger, *Dictionary of the English and German Languages for Home and School* (2d ed., 2 vols., Brunswick, 1897), and the new edition, by A. Schröer, of Grieb's *English-German and German-English Dictionary* (10th ed., 2 vols., Stuttgart, 1898-1902; all the editions of Grieb previous to this one are antiquated). Among the one-volume dictionaries the one by Weir (Cassell's *New German Dictionary*, London, 1888, identical with Heath's *New German Dictionary*, Boston, 1888), deserves special mention.

SPELLING AND PRONUNCIATION. Germany has an orthographical problem of her own, although a less complicated one than England and America. The spelling of Modern German had become pretty well settled in the latter half of the eighteenth century, when Gottsched (*Deutsche Sprachkunst*, Leipzig, 1748) and Adelung (*Anweisung zur deutschen Orthographie*, ib., 1788) were the chief authorities; and there were only slight changes (due especially to the grammatical works of J. Chr. A. Heyse) in the early nineteenth century. More recently, however, when the works of Jakob Grimm and his followers had led to a better understanding of the history of the German language, and when phonetics had become an essential element in the study of grammar, a more radical reform than that attempted by Heyse was advocated by many scholars. Opinions, however, differed as to whether the reform should rest primarily on an historical or a phonetic basis. The uncertainty in orthographical matters was on the increase, and in 1876 the Prussian Government decided to call to Berlin a conference of German philologists, principals of schools, and publishers. This conference had no immediate practical outcome, though its transactions were instrumental in clearing the way for subsequent regulations. Four years later the Prussian Minister of Instruction (von Puttkamer) introduced in the Prussian schools a uniform spelling, the rules for which are contained in the *Regeln und Wörterverzeichnisse für die deutsche Rechtschreibung* (Berlin, 1880). This *Preussische Schulorthographie*, however, could only mean a temporary solution of the difficulty. Its rules were often (e.g., as to the use of *th* and *t*) complicated and generally of such a character as to satisfy neither the conservatives nor the advocates of reform. It became finally necessary for the Prussian Government to call at Berlin in 1901 a second conference, in which the Southern German States and the Austrian and Swiss governments were also represented. The result is the revised edition (*Neue Bearbeitung*) of the above-mentioned *Regeln und Wörterverzeichnisse* (Berlin,

1902). The new regulations are simpler than the former ones, although they imply more radical changes. They have been introduced in both German and Austrian (and also Swiss) schools, and have at the same time been adopted by most of the leading newspapers. There is every prospect that for all practical purposes the problem of spelling has been successfully solved for a long time to come.

With the pronunciation of German the case is different. Neither has there been nor is there at present a generally recognized standard pronunciation; so that in this respect the union of Northern and Southern Germany is not yet perfected. In Southern and Midland Germany the difference between the literary language and the dialect is not fundamental enough to consider the two as different languages. We find, therefore, that the pronunciation even of cultured people is almost always more or less tinged by their native dialect. The Swabians, the Swiss, the Austrians, and the Saxons are, as a rule, easily recognized by their pronunciation. In Northern Germany the Low German dialects and the literary idiom are regarded as different languages. But as High German here has been for several centuries the language of the educated classes, it has again developed local peculiarities and dialectic differences of its own.

It is claimed by many that the language of the theatre—which, if not entirely so, is, on the whole, uniform throughout Germany—must be regarded as dialect-free and as the standard pronunciation. This contention, however, is contradicted by others, who maintain that the pronunciation of the stage, while essentially Southern German, is partly based on arbitrary regulations, and that it has no legitimate claim to the position of a standard pronunciation outside of the theatre. It is not very likely that the question of pronunciation will be satisfactorily settled within the present generation.

GERMAN LITERATURE. FIRST PERIOD (600-800). German literature, as distinct on the one hand from writing in German and on the other from such Teutonic writing as the Bible translations of Ulfilas, begins after the triumphs of the great migration and the conquest of the Empire. Forces that had been engaged in the struggle for dominion turned, about the year 600, to the glorification of the nation's heroes, almost at the same time that similar conditions were forming the Anglo-Saxon epic in England. But the songs of warrior gods and heroes exist only in tradition, and a few late recorded fragments, such as the *Hildebrandslied*. Then, with the segregation of the High Germans and their partial conversion, literary activity is largely absorbed by the Church and its interests, and from having been national becomes general, catholic. That there must have been a considerable body of German poetry in this period, both in Upper and Lower Germany, is made probable by

allusions in Latin authors. The central figures around whom the saga-cycles gathered were Ermenrich (Ermanaricus), a Gothic king of the fourth century, Theodoric the East Goth, Attila the Hun, the Burgundian Gunther (Gundicarius), and probably a little later and farther to the north, Siegfried, whom some, however, have thought possibly identical with the Arminius who defeated the Roman legions under Varus. All these sagas, or elements from them, seem to have been connected with one another before the close of the first period. The number of these epic songs was sufficient to suggest to Charles the Great the possibility of collecting them, and he gave orders to that effect. Of the result no trace has survived.

SECOND PERIOD (800-1100). The new temper shows itself in visions of judgment (*Muspilli*), lives of saints, epic Gospel narratives (*Heliand*) or harmonies (*Otfrid*), with an occasional monastic excursion into the political field (*Ludwigslied*). But already under the Othos the national spirit was reviving, and Frederick Barbarossa made the people once more conscious of a national mission that found a literary impulse in contact with the culture of the West and South through military expeditions and of the East through the Crusades. This appears first in the religious epics of the eleventh century (*Judith*, *Exodus*), legends of the various Marys, and episodes in the life of Christ. The German writing of this period hardly equals in interest or literary value that produced in contemporary England or France, but there are signs, especially at the close of the eleventh century, of a refining of the national taste. Of political ballads we have first the *Ludwigslied*, written late in the ninth century to celebrate a victory of Louis III. over northern tribes, and a song celebrating the reconciliation of Otho I. and his brother Henry, and there are also clear traces of others on the romantic adventures of the rebellious Duke Ernst of Swabia, a popular hero for his resistance to Conrad II. A long Latin epic on Walter of Aquitania, telling of his flight with his bride from the Court of Attila and his combat with King Gunther at Worms, attests a German original. In all these the native spirit dominates, as the old pagan superstitions do in a few incantations, such as the Meisburg songs. But, as is natural, the chief survivals of the writings of this time are from the poems with which churchmen sought to supplant the older sagas and to tame the national spirit. Best of these is the Low German or Old Saxon *Heliand* (Saviour), written in alliterative verse, apparently by a Saxon and at the request of Louis the Pious. The Gospel narrative is followed, but Christ becomes a German prince, the disciples are His thanes, and the local color is often naively Teutonic. *Otfrid's Krist*, with the same theme, is High German, and therefore more sophisticated, more didactic also. It is the first German rhymed verse. *Muspilli*, which is Bavarian, is of a more independent fancy in its apocalyptic vision; it retains the alliteration of the saga-epic, and mingles Christian and pagan elements in a way that strikingly illustrates the popular religious conceptions of High Germans of the ninth century. The most noteworthy German writer in Latin of this period was Notker Labeo (d.1022), a philosophic monk of Saint Gall, a translator of Aristotle and Boëthius.

THIRD PERIOD (1100-1300). The effect of the

Crusades was twofold. They revived epic memories of Charlemagne and Roland and of the triumphs of Alexander. The response was immediate. Before 1130 there was a *Rolandslied* and an *Alexanderlied*. Tales of German adventure soon followed (*Rother*, *Herzog*, *Ernst*, *Orendel*). Political, intellectual, and literary horizons widened together under the rule of Frederick II., and German literature blossomed into its first classical period. Growing ever more self-conscious, more national, during the closing years of the twelfth century, it greets us on the threshold of the thirteenth with its *Iliad*, the *Nibelungenlied*, and its *Odyssey*, the *Gudrun*. Here the people speak; meantime the Court circle is giving us the philosophic epics of Wolfram von Eschenbach, the popular poetic tales of Gottfried of Strassburg and Hartmann von Aue, the stirring political songs of Walther von der Vogelweide, and the melodious chorus of the Minnesingers. The forerunners of these Court poets were Lambrecht, Conrad, and Heinrich von Veldeke. Their successors show a rapid decline due to over-production and artificiality. Literature begins to yield in interest to history, form to matter, and lyric poetry follows close in the wake of the epic decline, so that by 1300 chivalrous love poetry is dead in Germany. There is in the treatment of the chivalric epics the same confusion of persons and their dates that is indicated in the remains of the earlier period. Rother is made grandfather of Charles the Great, but much that is told of him belongs to Roger of Sicily; the historic Duke Ernst is fused with the historic Ludolf, son of the Emperor Otho, who was also a rebel, and the resultant creation becomes a romantic Crusader, a mediæval rival of Ulysses in his wanderings and of Sindbad in his adventures among pygmies, giants, cyclops, and magnetic mountains. Orendel becomes also a sort of Ulysses, and German romantic fancy is found playing also with the Irish argonaut Saint Brendan, while it makes of the English martyr-King Oswald a half comic amorous Crusader. This free treatment of Christian saints implies a less serious view of the great issues of life, as though the Crusaders had made men more tolerant as they saw their Emperor Frederic II. contending with Saladin for the palm of magnanimity. Walther von der Vogelweide is bold in his teaching of a philosophic toleration, and a crusading poet says that at Acre you could hardly tell Christians from Jews or heathens. It was an age of awakening that found its first strong national voice in Heinrich von Veldeke, and it is not by chance that the recognition of his poetic primacy is associated with the Whitsuntide of 1284, when 70,000 German knights gathered at Mayence as guests of Barbarossa at the knighting of his sons. That event was an epoch in the national life, and the place that Veldeke won there by his *Encide* marked no less an epoch in German heroic verse. But from this time Latin sources of inspiration proved less congenial than the Franco-Celtic, and from that time the Court epic deals prevailingly with legends of Arthur, of the Grail, and of Charles the Great.

The masterpieces of this period are embraced within thirty years, from 1190 to 1220. Here is found the work of Hartmann von Aue (q.v.), Gottfried von Strassburg (q.v.), Wolfram von Eschenbach (q.v.), and Walther von der Vogelweide (q.v.). Here, too, the popular epics Gu-

drun (q.v.) and the *Nibelungenlied* (q.v.). The outburst was natural and spontaneous; all classes shared in it. The *Heldenbuch*, compiled and in part written in the fifteenth century by Kaspar von der Rhön, is but a working over of the embarrassment of the epic wealth of this earlier period. And among the *Minnesingers* the great Walther had worthy though unequal compeers in Heinrich von Morungen, Reinmar der Alte, and Gottfried von Neifen. Beginning in imitation of the Troubadours, they attain soon to a genuine expression of lyric emotion, and to originality of form which is sometimes artificial, but seldom without witness to a sense of beauty and a keen appreciation of melody, which is as surprising in the suddenness of its diffused manifestation as it is in the speed of its decline.

With the second quarter of the thirteenth century artificiality gains the upper hand in Ulrich von Liechtenstein (d.1255), and vulgarity in Neidhard von Redenthal (d.1240), and in Tannhäuser (d.1270) the dignity of lyric poetry is sacrificed wholly to a rather coarse spirit of comedy. The seriously minded express themselves didactically. Here again the best are first. Freidank's *Bescheidenheit*, Thomasin von Zerklare's *Wälsche Gast*, show a lofty ideal of morality not without a touch of enthusiasm. Their successors Reimar von Zweter, Heinrich Frauenlob, Hugo von Trimberg, the anonymous collection *Der Winsbecke*, and the didactic *Krieg auf der Wartburg*, a supposed tournament of poets of an earlier age, all tend to the commonplaces of 'proverbial philosophy.' This change marks a shifting in social ideals. Knighthood had become less important; knights less able, perhaps, less willing, to be patrons of song. The *Minnesingers* (q.v.) are becoming *Meistersingers* (q.v.). Nuremberg, a trading city, is to become the literary centre, and to apply to poetry the commercial and economic spirit by which it had won political recognition. Prose begins to claim a place in the sermons of Brother Berthold (d.1272), of Regensburg, the greatest orator of the century, and codes of local law, *Sachsenspiegel* and *Schwabenspiegel*, are formulated in the mother tongue.

FOURTH PERIOD (1300-1624). In Germany as in France the fourteenth century shows a shifting in political life that is reflected in literature. Its beginning is distinctively aristocratic; at its close it is as distinctively bourgeois, though artificial still. This shifting is marked by the rise of the free cities and their literary guilds and *Meistersingers*. This is the century also of the founding of the first five German universities—Prague (1348), Vienna (1365), Heidelberg (1387), Erfurt (1392), which exist to-day, and Cologne (1388), since abandoned—whose influence was more favorable to scholasticism than to literary art. Life grew more serious, more realistic. The drama is its chief field (Hans Sachs). Social and political satire is cultivated (*Reinhard der Fuchs*). Didactic poetry (Sebastian Brant) and prose narrative (*Eulenspiegel*) is often crassly realistic. The scholarship of Germany expresses itself chiefly in Latin. "This whole period, extending into the seventeenth century, produced no poetic work of art that could satisfy even elementary demands in purity of form" (Scherer).

In prose, on the other hand, the early fourteenth century counts three great preachers, Meis-

ter Eckhart (d.1328), Heinrich Suso (d.1366), and Johannes Tauler (d.1361), mystics all. Eckhart was distinguished for the boldness and originality of his speculations, Suso for his chivalrous, if not quixotic, devotion to transcendental truth, Tauler for the sanity of his sanctity. All found readers, and each in his way helped to prepare Germany for the Reformation and for Luther. Narrative prose chronicles were now written in German and lay open to all readers. The Limburg Chronicle (1336-98), the Alsace Chronicle (1386), and the Thuringian Chronicle (about 1430) have literary as well as historical significance, and suggest the gradual preparation of Germany to welcome and use the invention of printing. With it came the revival of classical studies. New universities were founded in the course of the fifteenth century at Rostock, Greifswald, Tübingen, Leipzig. The Humanists, though they wrote almost wholly in Latin, become a force to be reckoned with in German culture. The restlessness of the people under the tyranny of princes and the abuses of the Church is witnessed by swarms of little tales in prose and verse, *Volksbücher*, miracle plays, Shrove Tuesday plays (*Fastnachtsspiele*), and polemic satire, of which the most striking examples are Thomas Murner and Geiler von Kaisersberg, both popular preachers. In such a period Emperor Maximilian's (d.1519) attempt to revive the taste for romance by the autobiographic *Weiss Kunig* and by *Theuerdank* (written at his suggestion by Melchior Pfünzig) was foredoomed to failure.

The literature of the Reformation period in its intensity of purpose sacrifices all charm and grace of form. It is a literature of combat, direct, trenchant. Luther's Bible is its great monument; to it Germany owes the inestimable gift of a common speech. Ulrich von Hutten is the satirist of the Reformation in verse and dialogue, ardent, bold, an enthusiast of political and religious emancipation. He was chief among the authors of the cleverest satire of the period, the *Epistolæ Obscurorum Virorum*. Allied to Hutten in aim, but with greater scholarship, was Johannes Fischart, translator of Rabelais, with whose spirit he had a strong affinity, preferring prose to poetry as a vehicle of thought and molding words to his purpose with singular freedom. Other prose writers of the sixteenth century were the artist Dürer (q.v.), the historians Thurnmeier (d.1534), Sebastian Franck (d.1545), and the Swiss Tschudi (d.1572); the Catholic theologian Agricola (d.1566), more noted for his collection of German proverbs; the Protestant Reformer Zwingli (d.1531), and later the successors of the religious mystics, Johann Arndt (d.1621) and Jakob Boehme (d.1624).

In poetry the sturdiest figure of the Reformation period is Hans Sachs (q.v.), who, as well as Fischart, wrote secular verse also. *Reineke Fuchs* was imitated by Rollenhagen in *Der Froschmeuseler*. The drama was very widely cultivated as a means of polemic and popular appeal alike by the Catholics and Reformers, the Humanists and the vulgar. The noblest poetic expression of the time is, however, its religious lyric. Many hymns of Luther, a few of Hans Sachs, Nicolaus Hermann, Paul Ebers, and Philip Nicolai, still survive in popular use. These hymns were second only to Luther's Bible in their appeal to the national heart.

FIFTH PERIOD (from Opitz to Klopstock, 1624-1748). The recreation of literature after the Thirty Years' War was begun in the pedantic spirit of Opitz by a literary society of university men, chiefly at first in Hamburg and Leipzig. The names that emerge from the general mediocrity are those of the religious poet Gerhardt (1607-76), the novelist Grimmelshausen (1625-76), and toward its close the critic Gottsched (1700-66), whom this period leaves engaged in a controversy with the heralds of the new period, Bodmer (1698-1783) and the school of Zurich, as to whether French or English poets were the most worthy of imitation, since it was admitted that one must imitate somebody. This period closes, or rather the classical period begins, with the publication of the first cantos of Klopstock's *Messias*.

The Thirty Years' War deferred the development of the national consciousness which the Reformation had promised. For political or social aspirations the conditions were unfavorable, as they were also to the spread or even the maintenance of culture. It was natural that men of a literary cast of mind should take refuge in the consolations of pietism and should express their emotions in religious lyric. Besides Gerhardt the chief Protestant hymn-writers of the seventeenth century are Johann Rist (d.1667), Joachim Neander (d.1688), and Louise of Brandenburg, wife of the Great Elector (d.1667). The best Catholic lyricist is the Jesuit Friedrich Spee, whose work belongs to the war period, for he died in his prime in 1635.

Secular poetry either sinks into vulgarity or loses touch with the people through academic affectations. First of the pedantic academics was the *Fruchtbringende Gesellschaft*, formed on the Della Cruscan model under the patronage of Leopold of Anhalt-Dessau (1617). This found fashionable imitation, and even in bourgeois Nuremberg the *Pegnitzschäfer* displaced the ancient order of Mastersingers in popular regard. The first name-worthy poets to arise in these academic schools were Weckherlin (d.1653) and Opitz (d.1639). The appearance of the latter's prosodical treatise, *Die Deutsche Poeterey*, is sufficiently epoch-marking to form the starting-point of a period. It was the trusted guide of several generations of verse-makers. Among his followers, the Silesian School, the chief are Paul Fleming (d.1640) and Andreas Gryphius (d.1664), who extended the principles of Opitz to the drama and was first to introduce the 'regular' five-act tragedy to Germany. To the Silesian School may be reckoned also the epigrammatist Logau (d.1655) and the psalmist Joachim Rachel (d.1699). The Low German humorist Lauremberg (d.1659) may be named also, and Philip von Zesen (d.1689), who founded in Hamburg an academic literary association, *Deutschgesinnte Gesellschaft*, to cultivate linguistic purity.

The first Silesian School, the purists, was succeeded by a second, the Euphuists, or better, 'Marinists,' disciples of the extravagant Italian stylist Marini. The first impulse to this aberration came from Nuremberg and the *Pegnitzschäfer*. Its noteworthy names are Hoffmannswaldau (d.1679) and Lohenstein (d.1683). A little later French influence asserts itself, and Boileau finds disciples of his *Art poétique* in Canitz (d.1699), Besser (d.1729), and König (d.1744).

Of the prose of this period Grimmelshausen's *Simplicissimus* (1659) has almost alone asserted successfully a right to live. But beside this satirical novelist of the Thirty Years' War may be named Moscherosch (1601-69), for his imitation of the satires of Quevedo, the historians Sigmund von Birken and Gottfried Arndt, the Persian traveler Olearius, the eccentric Protestant pastor Schupp, and the priest Abraham a Sancta Clara, and the voluminous but unreadable romance writers, Buchholtz, von Ziegler, and Duke Anton Ulrich of Brunswick, to be followed by multitudinous 'Robinsonaden,' in imitation of Defoe's masterpiece.

As before the Reformation, so at the turn of the century, it is the preachers and religious, metaphysical, or pietistic thinkers who give the first promise of intellectual revival. With the pietists Spener (1635-1705) and August Hermann Francke (1663-1727) comes Leibnitz (1646-1716), the brilliantly original philosopher, who indeed wrote little in German, finding French or Latin more to his purpose. More prosaic was his disciple Wolf (1679-1754), who wrote in German, and the popularizer Thamasius (1655-1728), editor of the first German magazine and commendable for his successful agitation against the juridical persecution of witchcraft. Meantime Nature was timidly reasserting her rights in poetry in the epigrams (1697) of Wernicke, and the lyrics of Günther (1695-1723), while Brockes (1680-1747) directed the attention of his countrymen from the French to the English poets by precept and by example. He translated Thomson's *Seasons*. A revival of classical studies may also be noted, but it is to England that the literary youth of Germany is looking at the close of this Fifth Period.

SIXTH PERIOD. From the *Messias* to the death of Goethe (1748-1832). The reign of Frederick II. represents a progress in German letters and æsthetic taste that is hardly paralleled in history. When he came to the throne (1740) Herder (1744-1803), Goethe (1749-1832), Schiller (1759-1805), and Richter (1763-1825) were not yet born, Wieland (1733-1813) was a child of seven, Lessing (1729-81) a boy of eleven, Klopstock (1724-1803) a youth of sixteen, Gellert (1715-69) adolescent at twenty-five. When he died (1786) Lessing had closed his epoch-making career, Wieland, Herder, and Klopstock had passed their zenith, Goethe had completed the first period of his unchallenged mastery, and Schiller was becoming his worthy compeer. Here as in the Third Period a revival of national pride led to a revival of national literature. The Seven Years' War made Prussia a rallying-point of German national feeling, such as had not existed for centuries.

Noteworthy poets contemporary with the youth of Klopstock are the descriptive, didactic, and scientific Haller (1708-77), and the genial narrative and lyric verse-writer Hagedorn (1718-54). The Leipzig school of criticism led by Gottsched (1700-66) continued its conservative protest alike against the Anglophile school of Zurich, headed by Bodmer (1698-1783) and Breitinger (1701-76), and the amiable and popular Gellert (1715-69), chief representative of the younger writers of Leipzig. Name-worthy among the forerunners of the classical period are the satirist Rabener (1714-71), the epigrammatist Kistner (1719-1800), the essayist Cramer (1752-

1807), imitator of Steele, and C. F. Weiss (1726-1804), first to make successful literary appeal to German youth and childhood.

The new literary life is first fully felt in Gleim's (1719-1803) *Lieder eines preussischen Grenadiers* (1758). Associated with Gleim in what is known as the Halle School were Uz (1720-96) and Götze (1721-81); the literary connection with these of the poet of nature, Ewald von Kleist (1715-59), of Ramler (1725-98), a martial lyricist, of Hölz (1748-76), and of the idyllist Gessner (1730-87), is less intimate. The religious lyric tradition is meantime continued by von Zinzendorf (1700-60).

Klopstock meantime gave copious utterance to the subjectivity and sentimentalism of his generation, but did more for poetic technique than for public taste. Even his patriotic dramas and songs had value chiefly as examples and suggestions to Heinrich von Kleist (1777-1811). The whole tendency of Frederick's influence, direct and indirect, was to turn away from sentimental enthusiasm and pietistic mysticism toward realistic study and practical activity. This appears strikingly in the popular philosophic movement, which derives in part from the French encyclopædists, but more from Shaftesbury and Locke. Its leaders were Moses Mendelssohn (1729-86) and Friedrich Nicolai (1733-1811), both of Berlin, with whom it is convenient to associate Thomas Abbt (1738-66), Georg Sulzer (1702-79), and Johann Engel (1741-1802). Among the popular historians Möser (1720-94) deserves note, and in criticism Johann Winckelmann (1717-68) and Christian Gottlieb Heyne (1729-1812).

All these belong in their cast of mind to the forerunners of the classical generation. The full force of the inspiration and emancipation that came from the triumphs of Frederick II. to the German literature that he affected to despise first appears clearly in the development of the genius of Wieland (1733-1813), who in educating Duke Karl August of Weimar gave the new literature a genial home and kindly fostering. Meantime the sterner spirit of Lessing was breaking down and building up in æsthetics the drama, philosophy, and religion. The authors and scholars of Weimar and the neighboring Jena entered into his labors through Herder (1744-1803), while the young Goethe brought hither the fresh sap of the spring-tide of storm and stress to be clarified and strengthened before it was itself revived by Italian naturalism. But the effervescence is in no way confined to Weimar or to Lessing and Goethe. One feels it seething in the young Schiller, in Lenz (1751-92), Bürger (1747-94), Klinger (1752-1831), Wagner (1769-1812), Leisewitz (1752-1806), and in the multitude who thought themselves geniuses of a *Geniezeit*. Of cardinal importance to the writers and the æsthetics of the succeeding decade was Kant (1724-1804), by his *Critique of Pure Reason* (1781), who, as well as his successors, Fichte (1762-1814), Schelling (1775-1854), Hegel (1770-1831), rivaled the writers of imaginative literature in their claim on the attention of all serious minds.

With Goethe's return from Italy (1788) there comes a movement toward classicism, order, correctness, repose, or at least restraint. In inaugurating this Goethe continues the work of Lessing, and after six years wins the coöperation of

Schiller. A classical school is formed, while around these play the chartered libertines of genius, with Richter (1763-1825) as their leader, and usher in the Romantic School, whose rise and decline Goethe lived to witness. The history of this school resolves itself into a struggle to turn the objective idealism of the classicists into a subjective one, that set the imagination to overcome reality. To realistic and plastic antiquity they opposed the fantastic Middle Ages and the opulent fancies of the East. In philosophy this school substitutes the mystic or ironical idealism of Fichte and Schelling for the rationalism of Kant. The leaders here are the Schlegels (q.v.), the Brentanos (q.v.), Novalis (q.v.) (1772-1801), von Arnim (q.v.) (1781-1831), Tieck (q.v.) (1773-1853), Eichendorff (q.v.) (1788-1857), Fouqué (1777-1843), Chamisso (q.v.) (1781-1838), Hoffman (q.v.) (1776-1822), and on the borderland of the movement the dramatist Heinrich von Kleist (1777-1811), the Platonic theologian Schleiermacher (q.v.) (1768-1834), the novelist Hauff (1802-1827), the patriot-poet Uhland (q.v.) (1787-1862). Several of these outgrew their romanticism, and when Goethe died it had become more a thing of the past than even the classic realism against which it had rebelled. Heine claimed justly to be at once the last romantic lyricist and the first of the modern school. Among the lesser writers of the turn of the century there may be named the once famous idyllist and still respected translator Johann Voss (1751-1826); the poet Mathias Claudius (1740-1815); the sentimentalist Jung-Stilling (1740-1817); the lyric imitators of Schiller, Matthiessen (1767-1831) and Salis-Seewis (1762-1834); Platen (1796-1835) as master of metrical technique; the popular and prolific dramatists Iffland (1759-1814) and Kotzebue (1761-1819); the philosophical sentimentalist Friedrich Jacobi (1743-1819); Werner (1768-1823), who earned transitory fame for 'tragedies of fate,' and found imitators in Müllner (1774-1829), Houwald (1778-1845), and even the young Grillparzer (1791-1872); the patriot poets Körner (1791-1813), Arndt (1769-1860), and Rückert (1788-1866). Among the more distinguished literary scholars of the period may be named the historians Spittler (1752-1810), Johannes von Müller (1752-1809), Schlosser (1776-1861), Niebuhr (1776-1831), and von Raumer (1781-1873).

SEVENTH PERIOD. From Heine to Hauptmann (1832-1900). This period, though excluding the earlier work of Heine, embraces that which entitled him to be called 'the continuator of Goethe.' It was Heine that transferred into the political and social field the activity of Goethe in a literary one, and perceived more clearly than any other in Germany the hollowness of inherited social conditions. In an age of democratic upheaval he bore the banner of revolutionary reform, and as he grew more realistic he came more in touch with the questioning dissatisfied spirit of an age that had parted from its old ethical moorings and had not yet found a new anchorage. He was less positive therefore than Goethe, but "incomparably the most important figure of that quarter of a century that follows Goethe's death" (Matthew Arnold). His influence can be seen in almost every field, though what he wrought by lyric poetry has come to be more and more the function of the novel and of drama. The more noteworthy

poets of the generation preceding the Franco-German War and the foundation of the German Empire were: Freiligrath (1810-76); von Dingelstedt (1814-81); Kinkel (1815-82); von Redwitz (1823-91); Anastasius Grün (1816-76); Scheffel (1826-86); F. W. Weber (1813-94); Simrock (1802-76); Jordan (born 1819); Bodenstedt (1819-92); Lingg (1820—); Geibel (1815-84); Fontane (1819-98); and the composer Wagner (1813-83).

Fiction in this period shows a blending of that of Wieland, of Goethe, and of Schlegel. But from its beginnings it is, as a result of the French upheaval of 1830 and the romantic movement there, predominately social, especially after the German movement of 1848. The 'Young Germany' of 1833-35, begun by Wienburg, headed by Gutzkow, supported by Laube and Börne, was essentially political. With Heine and the women Rahel Varhagen, Bettina von Arnim, and Charlotte Stieglitz it tended to a strike for social freedom, for 'the emancipation of the flesh,' and this is strongly marked in the earlier novels of Luise Mühlbach (1814-73), Luise Ashton, Ida Frick, Ida Hahn-Hahn (1805-73), Fanny Lewald (1811-89), and in her younger days Marlitt (1825-87). These emancipationists make of the novel a political pamphlet. Though there was some reaction after 1848, fiction turning for a time from the political to the purely literary field, and to the historical novel, of which Alexis (1798-1871), Spindler (1795-1855), Laube (1806-84), and Scheffel (1826-86) were the chief representatives.

The serious drama in the period before the Franco-Prussian War is best represented by Gutzkow (1811-78), Laube (1806-84), Hebbel (1813-64), Moser (1803-67), and Heyse (1830—). Melodrama is represented by Friedrich Halm (1806-71), Charlotte Birch-Pfeiffer (1800-68), and Salomon von Mosenthal (1821-77); comedy by Freytag (1816-95) and Benedix (1811-73). The most distinguished critic of the period is Gervinus (1805-71); its best-known historians, Menzel (1798-1873), von Ewald (1803-75), and later Mommsen (1817—). Ranke (1795-1886), Droysen (1806-84), and Ernst Curtius (1814-96). The most renowned scholars of this period were the brothers Jakob (1785-1863) and Wilhelm Grimm (1786-1859). In formal philosophy its most distinguished names are Schopenhauer (1788-1860), Lotz (1817-81), Ulrici (1806-84), Ueberweg (1826-71); Schwegler (1819-57), Kuno Fischer (1824—), and von Hartmann (1842—).

In the generation following the Franco-Prussian War antiquarian fiction was cultivated by Ebers (1837-98), while the tradition of the national and political novel was continued in the work of Dahn (1834—) and Freytag (1816-95); Meyer (1825-89); Gottschall (1823—), and a numerous group of minor writers among whom Spielhagen (1829—) is chief. Romanticism is continued in Keller (1819-89), Storm (1817-88), and Marlitt (1825-87); and the naturalistic movement makes itself felt in Heyse (1830—), Wilbrandt (1837—), Sudermann (1857—), Lindau (1839—), and in its extreme form in Mauthner (1849—), Ring (1817-1901), and Kretzer (1854—); while Jensen (1837—) and Marie von Ebner-Eschenbach (1830—) represent a psychologic school, and in Lola Kirschner (1834—) and Baroness von Suttner (1843—) the social

and democratic interest is again obvious. As an offshoot of this last we have the village fiction of Auerbach (1812-82), Anzengruber (1839-89), Rosegger (1843—), and Raabe (1831—). Exotic sensation is cultivated by Franzos (1848—) and Sacher-Masoch (1836—), and urban humor by Stinde (1841—) and Eckstein (1845-1900). The most powerful writers of fiction during the period are Heyse, Dahn, and Freytag.

The patriotic lyrists of the new Empire were many. One may note Geibel and Redwitz, Becker (1828-91), and Jensen (1837—). More detached from politics are Heyse and Baumbach (1840—), and the peasant poet Johanna Ambrosius (1854—). The epic tradition is continued by Julius Wolff (1834—), and intransigent innovation in epic form is attempted by Bleibtreu (1859—), Holz (1863—), Heinrich Hart (1855—), and his more talented brother Julius (1859—).

In historical drama, besides Heyse, Wildenbruch (1845—), Greif, and Wilbrandt (1837—) were striking writers; in melodrama, Ganghofer, (1855—); and for the peasant drama, Anzengruber (1839-89). Comedy, largely French in technique and commercial in spirit, was cultivated by L'Arronge (1838—), Paul Lindau (1839—), Blumenthal (1852—), and the late-awakened genius of Moser (1825—). The greatest of modern German dramatists, democratic and somewhat socialistic in tendency, naturalistic in technique, are Sudermann (1857—) and Hauptmann (1862—), but the national patriotic drama is still best represented by Wildenbruch.

BIBLIOGRAPHY. Of histories of German literature in German the most readable is Scherer (8th ed., Berlin, 1899; Eng. trans. Oxford, 1886); the most recent, Bartels, *Geschichte der deutschen Litteratur* (Leipzig, 1902). Consult also: Koberstein, *Grundriss zur Geschichte der deutschen Nationallitteratur* (5th ed., by von Bartsch, Leipzig, 1872-74), more compendious, and Vilmar, *Geschichte der deutschen Nationallitteratur* (25th ed., Marburg, 1900), more popular, though uncritical. Wackernagel (2d ed., Basel, 1879-94) is valuable for its copious references, and Kurz (Leipzig, 1876) for its illustrative extracts. German poetry is fully treated by Gervinus, *Geschichte der deutschen Dichtung* (5th ed., Leipzig, 1874); Goedeke, *Grundriss der Geschichte der deutschen Dichtung* (Dresden, 1884-1900). For special periods see: Uhland, *Geschichte der altdeutschen Poesie* (Stuttgart, 1865); Biedermann, *Deutschland im 18. Jahrhundert* (Leipzig, 1875-80); Hettner, *Litteraturgeschichte des 18. Jahrhunderts* (4th ed., Brunswick, 1879-95); Julian Schmidt, *Geschichte der deutschen Litteratur von Leibniz bis auf unsere Zeit* (Berlin, 1886-96); Gottschall, *Deutsche Nationallitteratur des 19. Jahrhunderts* (7th ed., Breslau, 1901); Stern, *Die deutsche Nationallitteratur vom Tode Goethes bis zur Gegenwart* (4th ed., Marburg, 1900); Haym, *Die romantische Schule* (Berlin, 1870); Prölls, *Das junge Deutschland* (Stuttgart, 1892); id., *Geschichte des neuern Dramas* (Leipzig, 1880-83); Meyer, *Die deutsche Litteratur des 19. Jahrhunderts* (Vienna, 1901). English histories of German literature published before 1880 are negligible. Among later books the translation of Scherer (see above) is still the best, but Francke, *Social Forces in German Literature* (1896), shows independent, critical originality. Briefer

histories are Bostwick and Harrison, *Outlines* (London, 1883); Sellss, *Critical Outline* (trans., London, 1884); Wells, *Modern German Literature* (Boston, 1895); Bossert, *Histoire de la littérature allemande* (Paris, 1901); and Robertson, *A History of German Literature* (Edinburgh, 1902). Taylor, *Studies in German Literature* (New York, 1879); and MacCallum, *Studies in High German and Low German Literature* (London, 1884), are occasionally useful.

GERMAN METHODISTS. See EVANGELICAL ASSOCIATION.

GERMAN MILTON, THE. A title occasionally given Klopstock (q.v.), author of the *Messias*.

GERMANO, jār-mā'nō, SAN. A city in South Italy, the name of which was changed in 1871 to Cassino (q.v.) (Map: Italy, H 6).

GERMAN OCEAN. See NORTH SEA.

GERMAN PLATO, THE. A name given to Friedrich Heinrich Jacobi.

GERMAN POLITICAL PARTIES. See POLITICAL PARTIES, paragraph on *Germany*.

GERMAN REFORMED CHURCH. See REFORMED CHURCH IN THE UNITED STATES, GERMAN.

GERMAN SCALE. In music, the scale of the natural notes, represented by A, H, C, D, E, F, G; not A, B, C, etc. The B is reserved for B flat, and its place is supplied by substituting the letter H.

GERMAN SEVENTH-DAY BAPTISTS. See paragraph on *Baptists, German Seventh-Day*, under BAPTISTS.

GERMAN SILVER. An alloy of copper, zinc, and nickel. It was originally made at Hildburghausen, Germany, and had the composition of copper 40.4 parts, nickel 31.6 parts, zinc 25.4 parts, and iron 2.6 parts. As this alloy came into more extensive use, different proportions of the ingredients were used. As an alloy intended to replace silver, it is made of copper 50 parts, nickel 25 parts, and zinc 25 parts. When an exceedingly malleable alloy is desired, the proportion of nickel is reduced to 20 parts, and that of zinc increased to 30 parts. A tough and malleable alloy is made of copper 60 parts, nickel 20 parts, and zinc 20 parts. German silver is harder than silver, and takes a high polish. It is used as a substitute for silver in making castings—e.g. for bells, candlesticks, and especially as a foundation for plated ware. It must, however, be remembered that German silver is readily attacked by weak acids, like vinegar, and that its use at table, unless properly coated, may give rise to poisoning. *Packfong*, an alloy made by the Chinese, is of similar composition.

GERMAN SOUTHWEST AFRICA. The oldest colony of Germany (Map: Africa, F 7). Fronting on the west coast of Africa, it is bounded by Portuguese West Africa on the north, by British South Africa on the east and south, and by the Atlantic Ocean on the west. Estimated area, 322,450 square miles. The coast-line is about 950 miles long, and almost at its middle is the British port of Walfish Bay, which with the adjacent territory (area, 430 square miles) forms a part of Cape Colony (q.v.).

TOPOGRAPHY. Three natural regions are recognized—the coastal region, the highland, and the Kalahari Waste, the western part of which is in the German territory. The coastal region is under the double influence of the cold coast waters coming partly from the south, rising partly from the ocean depths, and cooling the atmosphere to a considerable degree, and of the south-east trade winds, which, blowing from the land instead of from the sea, give the climate an almost rainless character. The coast is bordered therefore by a belt of sand about 10 miles wide, behind which rises a barren steppe from 40 to 50 miles in width. This valueless coastal zone is succeeded by the wide belt of highlands extending from north to south. The predominant features of these highlands, several hundred miles in width, are the mountains to the north of the Tropic of Capricorn, and a great tableland in the south, which is cut up by deep valleys into high plateaus. The highest elevations are among the mountains of Damaraland, where there are many summits from 3000 to 6000 feet high, the culminating point being Omatako Mountain, whose height is 8800 feet. The eastern part of the highlands slopes gradually to the Kalahari Desert (q.v.), with which they merge.

Three harbors are of commercial importance. Walfish Bay belongs to Great Britain; Angra Pequena, notwithstanding its natural advantages, is of small present value, owing to the barrenness of the surrounding country; Swakopmund (the mouth of the Swakop River) is the harbor most important for German interests, because it is through the valley of the Swakop that the highland—the valuable part of the country—may most easily be reached. The only perennial rivers are the Cunene and Kubango, on the northern boundary, and the Orange, on the southern boundary.

With a cool coast, sparse vegetation, and no standing waters, the climate, except in the extreme north, is healthful. In spite of their elevation, the highlands are warmer than the coast, and although the uplands are very dry, there are many thunder-storms in the warmer part of the year, when the stream-beds fill and the parched valleys for a short time are green with verdure.

AGRICULTURE. These elevated valleys are the only parts of its colonial possessions to which Germany is inviting its peasantry to emigrate. Many European field crops and vegetables may be grown along the streams and near the wells where the farmers procure water for their tilled lands. While the white population is still small, it is larger than in all the other German colonies together, and includes over 1000 Boers, who went to these highlands to raise cattle, because they would not live in the Transvaal under the British flag. Cattle-raising is the chief industry of the white immigrants and the natives. The comparatively low and fairly well watered lands of the extreme north (Amboiland) are tilled by the Bantu natives, but the health conditions there are not favorable for the white race.

Gold and copper are believed to exist in paying quantities, but mining is not yet developed, except to a small extent along the completed portion of the railroad now building.

The commerce of the colony is so far of small importance, and shows a far larger increase in imports than in exports. The exports, chiefly

guano from the coast, cattle, skins, hides, ivory, and ostrich feathers, increased from \$297,720 in 1897 to \$333,000 in 1901. The imports, principally foodstuffs, iron and iron products, textiles, beer, cigars, etc., increased from \$1,163,186 in 1897 to \$2,128,000 in 1901. Germany occupies the first rank with regard to the import trade of the colony, and Cape Colony the second. The trade passes chiefly through the port of Swakopmund. The transportation facilities are limited. In the interior the bull-cart is the chief means of transportation. A main road runs from north to south, and is connected with the coast. The Government railroad line from Swakopmund to Windhoek, 237 miles in length, was officially opened for general traffic on June 20, 1902. A telegraph line connects Swakopmund and Windhoek, and the former is also connected with the cable line from England to Cape Colony. A regular steamship line connects Swakopmund and Hamburg, calling on the way to and from Cape Colony. Windhoek, the seat of government, among the mountains, has the brightest prospects among all the settlements, because it is nearest to the chief port. Otavi also promises well, on account of the copper deposits near it.

The administration is in the hands of a Governor, who is assisted by district officers. The colony is divided for administrative purposes into six districts. There is a colonial army of nearly 800 men, exclusively Germans. The budget for 1901 balanced at \$2,546,600, including an Imperial contribution of \$2,213,400. The population is estimated at 200,000. The whites numbered 3639 in 1901, including 2222 Germans. The natives are sharply divided from one another by the topographic aspects of the interior. Bantu tribes (Ovambos, Herero, and others, among whom the Herero are greatest in number and political power) inhabit the mountain regions of the north, and Hottentots, or Nama, the aboriginal people of South Africa, the southern plateaus (Nama Land). The chief native tribes are the Ovambos, in the north of the colony, and the Damaras, in the central part. A sparse population of Bechuanas and Bushmen dwell on the uninviting plains of the Kalahari Desert.

HISTORY. In 1883 the German merchant Lüderitz, of Bremen, established a trading station at Angra Pequena, and secured by purchase the surrounding territory, which he named Lüderitzland, and which he ceded to the German Government in 1884. By treaties with the native chiefs the German Government obtained territorial and mining concessions in the interior, and by treaties with Portugal and Great Britain in 1886 and 1890 respectively, the northern, eastern, and southern boundaries of the colony were fixed. In 1888 the Herero chief Kamaherero of Otyimbingwe decided to revoke the mining concessions granted by him to the Germans in 1885, and as the colony was at that time practically without an army, the settlers thought it safer to leave the territory of Otyimbingwe and await reinforcements from Germany at Walvis Bay. With the arrival of troops the conquest of the interior was begun anew, and by 1898 German supremacy had been practically established over the entire territory.

lin, 1899); Hermann, *Viehzucht und Bodenkultur in Südwestafrika* (Berlin, 1900).

GERMAN THEOLOGY. As the theology of the original home and chief seat of Protestantism, and as a doctrinal system which has experienced great vicissitudes, German theology has a peculiar interest and value to the historical student.

I. **THE FOUNDATION.** The fundamental element of the Reformation was the spiritual change of regeneration, out of which sprang the conception of justification. This was 'by faith' because it had come in the midst of an experience of real and living contact with God. The Nicene foundation was retained because of the experience of the saving work of Jesus Christ, whose divine nature was thus made certain. The Augustinian anthropology was retained because it most accorded with the sense of helplessness in sin, and with the experience of divine deliverance. The preaching of Luther may be summed up as a preaching of Christ as a living Redeemer by one who claimed a personal experience of what he preached. Melancthon began the process of teaching and formulating the new theology at an early date (1520). By the year 1530 a mature and well-balanced sketch of the reformed doctrine could be prepared for presentation to the Diet of Augsburg. This 'Confession' explicitly rejects those features of the Catholic system which Protestantism (q.v.) has united in regarding as errors, and briefly gives assent to the doctrines declared to be the common basis of all Christian churches. It is distinguished by the following doctrines: justification by faith, which is 'imputed for righteousness'; obedience to God's law, not required as a condition of 'meriting justification,' but springing out of faith because God desires it; the Church, 'the congregation of saints and true believers'; two sacraments; prevenient grace; the guilt and personal origination of sin. The personal attitude of Luther toward the Scriptures was quite free. The canonicity of any book was determined by its relation to Christ. The authority of the Scriptures he rested upon the testimony of the Spirit. His views of the bondage of the will were extreme, and his doctrine of predestination absolute. By the time when the Formula of Concord was written (1576), predestination was identified with election to life alone. Thus the tendency of this theology was from life to doctrine.

II. **THE PERIOD OF FORMAL ORTHODOXY.** When the main doctrine of the new system had been determined, the attention of theologians was naturally directed from the search after new truths to the formulation and adjustment of the truths already gained, and to their defense. This was the more necessary because of the foundation of the Order of Jesuits, especially established to counteract Protestantism, among the first members of which were accomplished theologians and disputants, such as Bellarmine. Hence there arose a series of great constructive Lutheran theologians, of whom the principal were Calixtus, Calov, Johann Gerhard, Baier, Chemnitz, Hunnius, Hutten, Quenstedt. The early portion of this period was also distinguished by the production of great hymns, and by very effective evangelical preaching. But as interest concentrated upon doctrine, the religious

life began to wane. The system also underwent serious modifications. The doctrine of justification by faith lost its place as the controlling element in the system. The change may be seen in the modification of the doctrine of the Scriptures. The freedom of Luther disappears, the testimony of the Spirit is undervalued, theories of divine dictation arise, and finally the authority of the Church is sometimes declared to be enough to maintain the canonicity of a book. The immense havoc wrought by the Thirty Years' War completed the demoralization of both religion and theology.

III. THE PERIOD OF PIETISM. Some theologians had protested against the scholastic tendency of theology, but without effect. It was arrested by a remarkable revival of practical religion, which spread over Germany. This commenced through the instrumentality of Johann Arndt, who (1605-09) published, in four volumes, *True Christianity*—a book intended to arouse persons of all classes, but especially ministers and students, to practical and heartfelt religion, as well as to purify the corrupt morals of the age. It produced a powerful impression. The movement thus commenced was greatly advanced by Spener (1635-1705). He established religious meetings, called 'colleges of piety.' This name led to the movement being called pietism. It spread rapidly through Germany, and at first without excitement or opposition. But as the effect increased, popular agitation was awakened, and violent tumults arose which, beginning in Leipzig, extended through the Lutheran churches in the different States of Europe. And from this time, in all cities, towns, and villages where Lutheranism was established, there appeared suddenly persons, of various ranks and of both sexes, who declared that it was their mission to uproot iniquity, spread true religion through the world, and impart to the Church of Christ wiser rules than those which then prevailed. In their writings, in public discourses, and in private conversations they explained the means necessary for accomplishing their plans, which they proposed to do without introducing any change into the doctrine, discipline, or government of the Lutheran Church. The University of Halle, founded 1694, became the home and centre of pietism. The orphan house, established in that city by Francke, was one of its most efficient instrumentalities, because a living proof that it was able, not only to resist religious error, but also to supply the gravest wants of life. During the thirty years after the university was founded, it educated 6000 theologians. Its Oriental college prosecuted diligently the study of the biblical languages, and sent out missions to Mohammedans and Jews. From Halle the new life was diffused over Europe. The larger cities showed signs of reviving faith, and even the universities, which at first had violently opposed the movement, became its friends. Pietism was extended into Württemberg and the University of Tübingen by the labors of Bengel, the critic, exegete, and theologian of the movement, and into Moravia by those of Zinzendorf; Zurich, Basel, Bern, and many other large towns admitted it. It went as far east as the Baltic, and as far north as Norway and Sweden. Many of the Continental courts were influenced by it. The Reformed Church was awakened; England

and the Netherlands received the new movement with joy.

The movement did not fail to stir up prolonged controversy between the pietists and the theologians. Among the results of this are to be numbered the historical labors to which the mediating school turned its attention, in which Mosheim bore a leading part. Modifications of orthodoxy were also made in the direction of curtailment; the guilt of original sin was made to depend upon consent to Adam's sin; inspiration was weakened; justification was confounded with sanctification; the Trinity, incarnation, and atonement were regarded as mysteries which it was useless to attempt to comprehend. The experiential proof of Christianity was more and more abandoned, and an external, philosophic proof substituted in its place. The school of Wolf sought to demonstrate Christianity mathematically. The idea of God was derived from the light of nature; the holiness of God in the presence of guilt proved the necessity of the revelation of an atonement, if atonement is possible and capable of being known. Now it is possible, and its predicates constitute the criteria of a revelation, to which criteria the Scriptures correspond. The proof of the Scriptures was later still more externalized. The argument ran from authenticity and genuineness to historical credibility, thence to the sinlessness and miracles of Christ, which are to be credited, thence to His promise to the disciples of inspiration, and thence to the authority of the inspired Scriptures. This is an essential change from the method of the Reformation.
